God's goodneſs the acceptance of thoſe praiſes, that are improved, as well as occaſioned, even by their being made partakers of his glory. Nay, in the prophet *Iſaiah*'s extatick viſion, the Seraphim themſelves, that are introduced, as anſwering one another's glad acclamations to God, are likewiſe repreſented, as covering (out of reſpect) their faces with their wings. But, *Pyrocles*, as I was ſaying, this unavoidable diſability to ſay things worthy of God need not at all trouble us; ſince we pay our homages to one, whoſe goodneſs our expreſſions can as little equal, as they can his other attributes. He that created us, will not impute it to us, that we act but as creatures; and ſince he has declared, that *where there is a willing mind, a man is accepted according to what he has, and not according to what he has not*; the impotence I have been ſpeaking of, ought to bring us rather joy than trouble, ſince the infinite diſtance betwixt us, without leſſening his favourable acceptance of our praiſes, ſuppoſes the boundleſs perfections of him, whom thoſe praiſes (through his goodneſs) help to give us an intereſt in; and no ſon would repine at his royal father's greatneſs, how immenſe ſoever, being ſure, that greatneſs would not leſſen his kindneſs. For it is leſs deſirable to be able to deſcribe the power and excellencies of him we have an intereſt in, than to have an intereſt in one, whoſe power and goodneſs exceeds whatever we can ſay or fancy of them.

Iſa. vi. 2.

2 Cor. viii. 12.

To conclude, *Pyrocles*, ſince on the one ſide God is moſt truly ſaid in the ſcripture to be ſo *glorious, that he is exalted above all bleſſing and praiſe*, and conſequently, though *I could* (to uſe St. *Paul*'s phraſe) *ſpeak with the tongues of men and angels*; yet the higheſt things I could ſay of the divine perfections, muſt needs be therefore far below them, becauſe a creature were able to ſay them. And, ſince on the other ſide, it is of us men, that God vouchſafes to ſay, *whoſo offereth praiſe, glorifieth me*; and his tranſcendent excellency is ſo far from being inconſiſtent with a reſembling graciouſneſs, that ſuch a benignity is one of the moſt conſpicuous parts of it: I will not forbear to pay my praiſes unto one, whoſe deſerving infinitely more than I can offer keeps him not from accepting as much leſs than he deſerves. But then I muſt not preſume to *fill my mouth with his praiſes*, without ſenſibly acknowledging, that there is not any ſubject, whereon my expreſſions can more want eloquence, than on this ſubject; even eloquence it ſelf would want expreſſions.

Nehem. ix. 5. 1 Cor. xiii. 1.

Pſal. xxiii.

CERTAIN

CERTAIN PHYSIOLOGICAL ESSAYS, AND OTHER TRACTS;

Written at diſtant Times, and on ſeveral Occaſions.

[In the ſecond Edition, ſome of the Tracts were enlarged by Experiments, and the work increaſed by the addition of a Diſcourſe about *ABSOLUTE REST* in Bodies.]

An Advertiſement to the Reader: Prefixed to the firſt Edition, put forth *A. D.* 1661.

THE publiſher deſires, that the reader ſhould be informed, that neither were the following treatiſes written near about the ſame time (ſome of them being divers years older than ſome others) nor yet are they now publiſhed in the ſame order that they were written in. For the firſt of theſe diſcourſes (though penned about four years ſince) was not only written after the ſecond, third, and fourth, but after divers other eſſays, which the author has yet lying by him among his papers; it being intended for a kind of introduction to all thoſe treatiſes, which under ſeveral names, but chiefly that of *Phyſiological Eſſays*, the author had then compoſed. But having, during the late confuſions, ſo diſpoſed of his papers to ſecure them, that he could not himſelf ſeaſonably recover them; and being engaged by promiſe to ſome friends, to let about half a dozen of his ſmall tracts come abroad into the world by ſuch a time, he was fain to ſend the following treatiſes to the preſs as they came, ſome at one time, ſome at another, to his hands. And this his occaſions did now and then reduce him to do in ſuch haſte, that he could not attend the correcting either the printer's lapſes or his own, and particularly was obliged, partly by haſte, and partly by a diſtemper in his eyes, to ſend away the *Hiſtory of Firmneſs* without ſo much as reading it over. All which it is hoped the equitable reader will conſider in his favour, and bear with what may be imputable to ſuch circumſtances.

I Should add nothing further, were it not that to ſave the reader the trouble of gueſſing, who is meant by that *Pyrophilus*, to whom moſt of the following treatiſes are addreſſed, I think it requiſite to inform him, that the perſon veiled under that name, is that hopeful young gentleman, Mr. *Richard Jones*, only ſon to the Lord Viſcount *Ranelagh* and an excellent Lady, ſiſter to the author.

A

PROËMIAL ESSAY,

WHEREIN, WITH SOME

Conſiderations touching EXPERIMENTAL ESSAYS in general,

Is interwoven ſuch an Introduction to all thoſe written by the Author, as is neceſſary to be peruſed for the better underſtanding of them.

I KNOW not, *Pyrophilus*, whether what you will meet in the enſuing diſcourſes will prove worthy of your taking notice of; yet I dare tell you, that if all my endeavours to ſerve you were not duties, I ſhould think I might deſerve your thanks for venturing to write them for your ſake. For I am ſufficiently ſenſible, both how unlearned I am, and in how learned an age I preſume to write: nor has the great number of thoſe eſcaped my obſervation, who finding it a much eaſier taſk to cenſure experimental compoſures than to write ſuch, endeavour to acquire the title of judicious, by condemning all things, that themſelves have not written, or thought on. And indeed, *Pyrophilus*, I had, beſides theſe, ſo many other diſcouraging conſiderations in my eye, whilſt I was ſetting down the following eſſays, that I ſhould ſcarce have proſecuted a deſign ſo full of trouble, and ſo unlikely by its ſucceſs to make amends for it, if I had thought it free, for the ſecuring of my own quiet and credit, to ſuppreſs obſervations which might prove ſerviceable to you, who having ſufficiently converſed with books, are now deſirous to begin to converſe with things themſelves. But I muſt confeſs, I look upon experimental truths as matters of ſo great concernment to mankind, that in ſpite of the juſt ſenſe I have of my own diſabilities, I am deterred from complying with thoſe inclinations and motives that endear ſilence to me, by conſidering the fate of him, who though he had leſs entruſted to him than any of his companions, was yet ſeverely puniſhed for burying his ſingle talent. And though, *Pyrophilus*, I could not without ſuch reluctancy reſolve to write, yet I found it much more uneaſy to reſolve to write ſo ſoon. For I could not but conſider, that being yet but very young, not only in years, but, what is much worſe, in experience, I have yet much more need to learn, than ability to teach. And I conſidered too, that after a man is grown ſomewhat acquainted with things themſelves, and has taken ſome general notice of the cognations, differences, and tendencies of their properties, he may every day ſo much improve his knowledge, that I am apt to think, that if God ſhould be pleaſed to protract my life a few years longer, I ſhall at the end of them be able to look upon what I have hitherto written with pity, if not with bluſhes. And I have often obſerved, that it is wont to happen in the productions of the mind, as in thoſe of the body. For as thoſe, that apply themſelves to procreation too young, and before they have attained to their full vigour and ſtrength, do generally both hinder their own growth, and become the parents but of weak and ſhort-lived children; ſo they, that too early, and before their judgment and experience be fully ripe, addict themſelves to write books, do commonly both hinder their own proficiency in knowledge, and write but immature, and therefore ſeldom laſting treatiſes. Nor ſhould I, *Pyrophilus*, have ever prevailed with my ſelf to preſent you ſo early theſe diſcourſes, ſince, by keeping them longer by me, I might eaſily by ſecond thoughts, and freſh experiences, be enabled to correct and enrich them, did not the frequent and dangerous diſtempers, to which my very ſickly conſtitution has of late rendered me too obnoxious, make me juſtly doubt, whether or no, if I ſhould long forbear to write, death would not ſooner come than the expected maturity of age and judgment. And though I had no ſuch conſideration to move me to make haſte to tender to you the enſuing diſcourſes, yet this would ſuffice to engage me to preſent them you with all their preſent defects; that if I ſhould keep them till I can make them leſs unworthy of you, I muſt keep them till you are grown paſt the need of them.

AND now that I have told you, *Pyrophilus*, both why I have written the enſuing diſcourſes, and why I keep them not by me long enough to preſent them you with fewer imperfections; I ſuppoſe you will expect, that I ſhould next tell you, why I have caſt them into eſſays, rather than into any other form. To ſatisfy you about this particular, *Pyrophilus*, I muſt freely acknowledge to you, that it has long ſeemed to me none of the leaſt impediments of the real advancement of true natural philoſophy, that men have been ſo forward to write ſyſtems

of it, and have thought themſelves obliged either to be altogether ſilent, or not to write leſs than an entire body of phyſiology: for, from hence ſeem to have enſued not a few inconveniences.

AND firſt, when men, by having diligently ſtudied either chymiſtry, anatomy, botanicks, or ſome other particular part of phyſiology, or perhaps by having only read authors on thoſe ſubjects, have thought themſelves thereby qualified to publiſh compleat ſyſtems of natural philoſophy, they have found themſelves, by the nature of their undertaking, and the laws of method, engaged to write of ſeveral other things than thoſe, wherein they had made themſelves proficients; and thereby have been reduced, either idly to repeat what has been already, though perhaps but impertinently enough, written by others on the ſame ſubjects; or, elſe to ſay any thing on them rather than nothing, leſt they ſhould appear not to have ſaid ſomething to every part of the theme, which they had taken upon themſelves to write of.

IN the next place, the ſpecious and promiſing titles and comprehenſive method of theſe ſyſtems have been often found to perſuade unwary readers, that all the parts of natural philoſophy have been already ſufficiently explicated; and, that conſequently it were needleſs for them to put themſelves to trouble and charges in making further inquiries into nature, ſince others having already ſufficiently made it their buſineſs to inveſtigate and explicate phyſiological truths, our buſineſs needs now be no more than to learn what they have taught, and thankfully to acquieſce in it.

NOR has the ſyſtematical way of writing been prejudicial only to the proficiency of ſome readers, but alſo to the reputation of ſome writers of ſyſtematical books. For it not unfrequently happens, that when a writer, to vent ſome few peculiar notions or diſcoveries of his own, preſumes to write a whole body of philoſophy, what is truly his own, though excellent in its kind, is either loſt in the croud of the things he has borrowed from others, and ſo comes to be over-looked, or at leaſt not ſufficiently taken notice of, by the reader; or elſe the unwelcome, and yet in ſuch compoſures ſcarce evitable, repetition of many things, that others had, I know not how often, written before, occaſions the laying aſide of the whole book, as a rhapſody of trite and vulgar notions, ſcarce worth the peruſing. And by this means the author often loſes the reputation of his peculiar notions, as well as the reader the benefit of them; and that, which would have made an excellent and ſubſtantial eſſay, paſſes but for a dull and empty book.

BUT the worſt inconvenience of all is yet to be mentioned; and that is, That whilſt this vanity of thinking men obliged to write either ſyſtems or nothing is in requeſt, many excellent notions or experiments are, by ſober and modeſt men, ſuppreſſed; becauſe ſuch perſons being forbidden by their judgment and integrity to teach more than they underſtand, or aſſert more than they can prove, are likewiſe forbidden by cuſtom to publiſh their thoughts and obſervations, unleſs they were numerous enough to ſwell into a ſyſtem. And indeed it may be doubted, whether the ſyſtematical writers have not kept the world from much more uſeful compoſures than they have preſented it with. For there are very few men, if any at all, in the world, that are enriched with a competent ſtock of experiments and obſervations to make out clearly and ſolidly, I ſay not all the phænomena of nature, but all thoſe, that belong to chymiſtry, anatomy, or any ſuch conſiderable ſubordinate doctrine of phyſiology. And thoſe very men, that are diligent and judicious enough to ſtudy proſperouſly any of thoſe parts of phyſiology, are obliged to ſpend ſo much time in the accurate proſecution of that, and are wont to be thereby made ſo wary, and ſo thoroughly acquainted with the difficulty of phyſiological inveſtigations, that they will leaſt of all men be forward to write ſyſtems.

AND what I ſay, *Pyrophilus*, of the inconveniences, that have hitherto been obſerved to flow from men's forwardneſs to write entire bodies of philoſophy, may be, in its degree, applied to the practice of thoſe, that pretend to give us compleat accounts of chymiſtry, or almoſt (I ſay almoſt) any other conſiderable and comprehenſive part of natural philoſophy: though I deny not, that in ſuch attempts, which are much leſs difficult than the former, ſome men have done mankind conſiderable ſervice, though they have not fully performed what the titles of their writings ſeem to promiſe. Nor am I ſo rigid as to be unwilling, that, from time to time, ſome very knowing writer ſhould publiſh a ſyſtem of phyſiology, or any part of it, according to the beſt authors and obſervations of that time: for ſuch a work may be uſeful, partly, for the inſtructing of youth in ſchools and academies; and partly, that men may have, from time to time, an inventory of what hath been already diſcovered; whereby the needleſs labour of ſeeking after known things may be prevented, and the progreſs of mankind, as to knowledge, might the better appear. But then it is to be wiſhed, that ſuch writings were not publiſhed but by very intelligent perſons, nor till ſome conſiderable improvement have been made in knowledge ſince the laſt work of that nature. Nor would I be thought to diſallow ſuch writings of very learned men, as though they may bear very general titles, yet are not publiſhed by their authors as compleat bodies or ſyſtems of phyſiology, but rather as general principles, (almoſt like the hypotheſes of aſtronomers) to aſſiſt men to explicate the already known phænomena of nature. For of ſuch kind of writings, if their authors be (as for the moſt part they are) ſubtle and inquiſitive men, there may be very good uſe, not ſo much by their gratifying the intellect with the plauſible account of ſome of nature's myſteries; as becauſe on the one ſide their writers, to make good their new opinions, muſt either bring new experiments and obſervations, or elſe muſt conſider thoſe, that are known already, after a new manner, and thereby make us take notice of ſomething in them unheeded before; and on the other ſide,

the curiosity of readers, whether they like or disapprove the hypothesis proposed, is wont to be thereby excited to make trial of several things, which seeming to be consequences of this new doctrine, may, by their proving agreeable or repugnant to experiment, either establish or overthrow it.

AND that you may know, *Pyrophilus*, what kind of writings I mean, I shall name to you the learned *Gassendus* his little *Syntagma* of *Epicurus*'s philosophy, and that most ingenious gentleman Monsr. *Descartes* his principles of philosophy. For though I purposely refrained, though not altogether from transiently consulting about a few particulars, yet from seriously and orderly reading over those excellent (though disagreeing) books, or so much as Sir *Francis Bacon*'s *Novum Organum*, that I might not be prepossessed with any theory or principles, till I had spent some time in trying what things themselves would incline me to think; yet beginning now to allow my self to read those excellent books, I find by the little I have read in them already, that if I had read them before I began to write, I might have enriched the ensuing essays with divers truths, which they now want, and have explicated divers things much better than I fear I have done. But of such writers the number is yet (and will I fear always be) so small, that I shall not need to make many exceptions, when I treat of the usefulness of writing books of essays, in comparison of that of writing systematically: or, at least, *Pyrophilus*, whilst I presume not to judge of other men's abilities, I hope it may be lawful for me to confess freely to you concerning my self, that I am very sensible of my being far from having such a stock of experiments and observations, as I judge requisite to write systematically; and I am apt to impute many of the deficiencies to be met with in the theories and reasonings of such great wits as *Aristotle*, *Campanella*, and some other celebrated philosophers, chiefly to this very thing, that they have too hastily, and either upon a few observations, or at least without a competent number of experiments, presumed to establish principles, and deliver axioms. For it very rarely otherwise happens, than that theories, that are grounded but upon few and obvious experiments, are subject to be contradicted by some such instances, as more free and diligent inquiries into what of nature is more abstruse, or even into the less obvious qualities of things, are wont to bring to light. I remember, that being once at *Leyden*, I was brought to the top of a tower, where, in a darkened room, (such as is now used in many places to bring in the species of external objects,) a convex glass, applied to the only hole, by which light was permitted to enter, did project upon a large white sheet of paper, held at a just distance from it, a lively representation of divers of the chief buildings in the town; all which, upon the admission of more light into the room, by opening the window, did immediately disappear. And methinks, *Pyrophilus*, that in divers of the philosophical theories, that have been formerly applauded, something not unlike this may be easily observed: for though, whilst they are looked on with such a weak and determinate degree of light, they may appear very artificial and well-proportioned fabricks, yet they appear so but in that twilight, as it were, which is requisite to their conspicuousness. For if but a full light of new experiments and observations be freely let in upon them, the beauty of those (delightful, but fantastical) structures does immediately vanish.

AND truly, *Pyrophilus*, if men could be persuaded to mind more the advancement of natural philosophy than that of their own reputations, it were not, methinks, very uneasy to make them sensible, that one of the considerablest services, that they could do mankind, were to set themselves diligently and industriously to make experiments and collect observations, without being over-forward to establish principles and axioms, believing it uneasy to erect such theories, as are capable to explicate all the phænomena of nature, before they have been able to take notice of the tenth part of those phænomena, that are to be explicated. Not that I at all disallow the use of reasoning upon experiments, or the endeavouring to discern as early as we can the confederations, and differences, and tendencies of things: for such an absolute suspension of the exercise of reasoning were exceeding troublesome, if not impossible. And, as in that rule of arithmetick, which is commonly called *regula falsi*, by proceeding upon a conjecturally-supposed number, as if it were that, which we inquire after, we are wont to come to the knowledge of the true number sought for; so in physiology it is sometimes conducive to the discovery of truth, to permit the understanding to make an hypothesis, in order to the explication of this or that difficulty, that by examining how far the phænomena are, or are not, capable of being solved by that hypothesis, the understanding may, even by its own errors, be instructed. For it has been truly observed by a great philosopher, that truth does more easily emerge out of error than confusion. That then, that I wish for, as to systems, is this, that men, in the first place, would forbear to establish any theory, till they have consulted with (though not a fully competent number of experiments, such as may afford them all the phænomena to be explicated by that theory, yet) a considerable number of experiments, in proportion to the comprehensiveness of the theory to be erected on them. And, in the next place, I would have such kind of superstructures looked upon only as temporary ones; which though they may be preferred before any others, as being the least imperfect, or, if you please, the best in their kind that we yet have, yet are they not entirely to be acquiesced in, as absolutely perfect, or uncapable of improving alterations.

IT were very possible, *Pyrophilus*, to let you see, that all that has been said to recommend to you that form of writing, which (in imitation of the French) we call essays, is but a part of what may be pertinently said to the same purpose. But because this introductory discourse it self is to be but an essay, not a book, I dare not

not long inſiſt upon the advantages of this ſort of diſcourſes. Only becauſe I think, that if I could engage you, *Pyrophilus*, and ſuch other ingenious perſons, to caſt their phyſiological obſervations and reflections into experimental eſſays, I ſhould thereby do real learning no trifling ſervice, by bringing ſo uſeful a way of writing into the requeſt it deſerves; upon this conſideration, I ſay, I muſt beg leave to repreſent to you this great conveniency of eſſays, that as in them the reader needs not be clogged with tedious repetitions of what others have ſaid already, ſo the writer, having for the moſt part the liberty to leave off when he pleaſes, is not obliged to take upon him to teach others what himſelf does not underſtand, nor to write of any thing but of what he thinks he can write well. And if ſuch eſſays be but as they ſhould be competently ſtocked with experiments, it is the reader's own fault, if he be not a learner by them: for indeed when a writer acquaints me only with his own thoughts or conjectures, without inriching his diſcourſes with any real experiment or obſervation, if he be miſtaken in his ratiocination, I am in ſome danger of erring with him, and at leaſt am like to loſe my time, without receiving any valuable compenſation for that great loſs: but if a writer endeavours, by delivering new and real obſervations or experiments, to credit his opinions, the caſe is much otherwiſe; for let his opinions be never ſo falſe, his experiments being true, I am not obliged to believe the former, and am left at liberty to benefit my ſelf by the latter; and though we have erroneouſly ſuperſtructed upon his experiments, yet the foundation being ſolid, a more wary builder may be very much furthered by it in the erection of more judicious and conſiſtent fabricks. Such a writer, if I be not wanting to my ſelf, will certainly teach me uſeful truths, and if it be not my fault, he can lead me into no errors; and oftentimes the very experiments, that he delivers, beſides that they may be applicable to many other purpoſes unthought of by him, may be either ſufficient, or at leaſt helpful to the very diſcovery of the erroneouſneſs of the opinions they are alledged to countenance: and I may account, that a man, that gives me, together with his conjectures (though erroneous) in matters of phyſiology, ſome noble experiment or obſervation, by which he pretends to verify them, does me no greater injury, than *Galileo* upon his firſt invention of the teleſcope would have done an aſtronomer, if he had told him, that he had diſcovered in heaven thoſe imaginary new ſtars, which a late mathematician has fancied himſelf to have deſcried there, and at the ſame time had made him a preſent of an excellent teleſcope, with expectation that thereby the receiver ſhould be made of the giver's opinion; for by the help of his inſtrument the aſtronomer might not only make divers uſeful obſervations in the ſky, and perhaps detect new lights there, but diſcern alſo his miſtake, that gave it him.

AFTER what has been ſaid, *Pyrophilus*, of the uſefulneſs of experimental eſſays, we muſt proceed to ſay ſomething concerning the manner of writing them: but becauſe you will alſo expect to receive ſome account of the enſuing diſcourſes, I ſhall not treat of thoſe two ſubjects a-part, but, in diſcourſing of the following eſſays, ſhall take occaſion to acquaint you with part of my thoughts concerning ſuch kind of compoſures in general, the other conſiderations belonging to the ſame ſubject being already upon ſeveral occaſions diſperſed among, and to be met with in the enſuing diſcourſes themſelves.

AND firſt, as for the ſtyle of our experimental eſſays, I ſuppoſe you will readily find, that I have endeavoured to write rather in a philoſophical than a rhetorical ſtrain, as deſiring, that my expreſſions ſhould be rather clear and ſignificant, than curiouſly adorned: for to a ſubject of the ſerious and important nature of phyſiology that ſaying may unqueſtionably be applied, *Ornari res ipſa negat, contenta doceri.* And certainly in theſe diſcourſes, where our deſign is only to inform readers, not to delight or perſuade them, perſpicuity ought to be eſteemed at leaſt one of the beſt qualifications of a ſtyle; and to affect needleſs rhetorical ornaments in ſetting down an experiment, or explicating ſomething abſtruſe in nature, were little leſs improper, than it were (for him that deſigns not to look directly upon the ſun it ſelf) to paint the eye-glaſſes of a teleſcope, whoſe clearneſs is their commendation, and in which even the moſt delightful colours cannot ſo much pleaſe the eye, as they would hinder the ſight. And that it may not be ſuſpected, that thoſe, that would not have it requiſite to imploy a florid ſtyle in treating of philoſophical ſubjects, do but in their own excuſe deny the neceſſity of ſuch rhetorical embelliſhments as they are not able to afford their compoſures, give me leave to ſubjoin, that it was not an unpoliſhed naturaliſt, but that prince of orators, *Cicero* himſelf, who made this ſtudious declaration; *Omne* (ſays he) *quod de re bona dilucidè dicitur, præclarè mihi dici videtur: iſtiuſmodi autem res velle ornatè dicere, puerile eſt; planè autem & perſpicuè expedire poſſe, docti & intelligentis viri.* But I muſt not ſuffer my ſelf to ſlip unawares into the common place of the unfitneſs of too ſpruce a ſtyle for ſerious and weighty matters; and yet I approve not that dull and inſipid way of writing, which is practiſed by many chymiſts, even when they digreſs from phyſiological ſubjects. For though a philoſopher need not be ſollicitous, that his ſtyle ſhould delight its reader with his floridneſs, yet I think he may very well be allowed to take a care, that it diſguſt not his reader by its flatneſs, eſpecially when he does not ſo much deliver experiments or explicate them, as make reflections or diſcourſes on them: for on ſuch occaſions he may be allowed the liberty of recreating his reader and himſelf, and manifeſting, that he declined the ornaments of language, not out of neceſſity, but diſcretion, which forbids them to be uſed, where they may darken as well as adorn the ſubject they are applied to. Thus (to reſume our former compariſon) though it were fooliſh to colour or enamel upon the glaſſes of teleſcopes, yet to gild or otherwiſe

otherwiſe embelliſh the tubes of them, may render them more acceptable to the uſers, without at all leſſening the clearneſs of the object to be looked at through them.

AND as for exotick words and terms borrowed from other languages, though I expect, that perſons not converſant in the philoſophical compoſures written (eſpecially of late) in our language will be apt to ſuſpect me for the willing author of divers new words and expreſſions; yet as for you, *Pyrophilus*, who peruſe other than moral, theological, and hiſtorical books in Engliſh, and find how much uſe is made in them of exotick terms, I hope you will find, that I have not at all affected them, but have rather ſtudiouſly declined the uſe of thoſe, which cuſtom has not rendered familiar, unleſs it be to avoid the frequent and unwelcome repetition of the ſame word, (ſo troubleſome to the ear, and ſo much forbidden by orators) or for ſome peculiar ſignificancy of ſome ſuch word, whoſe energy cannot be well expreſſed in our language, at leaſt without a tedious circumlocution. And in ſuch caſes, *Pyrophilus*, I ſuppoſe a writer may be allowed to uſe exotick terms; eſpecially when cuſtom has not only denizen'd them, but brought them into requeſt. For, as in the faſhions of clothes, though perhaps fools begin them, yet wiſe men, when they are once generally received, ſcruple not to follow them, becauſe then obſtinately to decline them would be as ridiculouſly ſingular as at firſt it would have been to begin them: ſo in exotick words, when cuſtom has once made them familiar and eſteemed, ſcrupulouſly to decline the uſe of them may be as well a fault, as needleſly to imploy them: for it is not the uſe, but the affectation of them, that is unworthy a philoſopher. And from the latter of thoſe I hope I have kept my ſelf far enough; for I ſhould think my ſelf guilty of a very childiſh vanity, if the uſe I made of languages were ſo to write as to be the leſs underſtood. But beſides the unintentional deficiencies of my ſtyle, I have knowingly and purpoſely tranſgreſſed the laws of oratory in one particular, namely, in making ſometimes my periods or parentheſes over-long: for when I could not within the compaſs of a regular period compriſe what I thought requiſite to be delivered at once, I choſe rather to neglect the precepts of rhetoricians, than the mention of thoſe things, which I thought pertinent to my ſubject, and uſeful to you, my reader. And for this fault, *Pyrophilus*, ſince I have made my ſelf guilty of it but for your ſake, I think I ought to obtain your pardon at leaſt as eaſily as my own, ſince barely to keep you from loſing any thing, that I conceived might be ſerviceable to you, I knowingly expoſe my ſtyle to be cenſured as diſproportionate to it ſelf.

THE next thing, *Pyrophilus*, of which I am to give you an account, is, why I have in the enſuing eſſays delivered many experiments and obſervations, which may ſeem ſlight and eaſy, and ſome of them obvious alſo, or elſe perhaps mentioned by others already. To ſatisfy you about this, I muſt inform you, that many of the particulars, which we are now conſidering, were in my firſt deſign collected in order to a continuation of the Lord *Verulam*'s *Sylva Sylvarum*, or natural hiſtory. And that my intended centuries might reſemble his, to which they were to be annexed, it was requiſite, that ſuch kind of experiments and obſervations, as we have been newly ſpeaking of, ſhould make up a conſiderable part of them. And indeed it were to be wiſhed, that ſuch inquiſitive perſons, as cannot be at the charge, or have not the opportunity, of making new experiments, would buſy themſelves, as they have opportunity, in induſtriouſly collecting and carefully ſetting down the phænomena to be met with without the aſſiſtance of new experiments, eſpecially ſuch particulars, as ſeem either to be of moment in order to the hinting or confirmation of ſome conſiderable truth, or to the detection of ſome applauded error, or elſe to have been, though obvious enough, yet little taken notice of. For I am confident, that very much may be done towards the improvement of phyſiology by a due conſideration of, and reflexion on, the obvious phænomena of nature, and thoſe things, which are almoſt in every body's power to know, if he pleaſe but ſeriouſly to heed them; and I make account, that attention alone might quickly furniſh us with one half of the hiſtory of nature, as well as induſtry is requiſite, by new experiments, to enrich us with the other. And therefore I confeſs I think my ſelf beholden to him, that firſt makes me take notice of what I might eaſily have known, but heeded not before; it not ſeldom happening, that we are prejudiced by, though we do not complain of that ignorance, from which we might relieve our ſelves, if we did but diligently turn our eyes to the obſervations, wherewith even neighbouring and familiar objects would, if duly conſulted, preſent us. But I digreſs; and therefore muſt ſtep back into the way, and tell you, that the reaſons, why I firſt deſigned the narrative of what I had tried and obſerved for a continuation of Sir *Francis Bacon*'s Natural Hiſtory, you will meet with in my preface to that ſpecimen of the intended continuation, which I have given in thoſe of my eſſays, that treat of promiſcuous experiments: and the reaſon, why I have ſince declined that ſuccinct way of writing, is, for the ſake of *Pyrophilus*, that I might have, in a more free and uncircumſcribed way of diſcourſing, a greater liberty to inſiſt on and manifeſt the reaſonableneſs of ſuch animadverſions, as I thought ſeaſonable for a perſon, who, though a great proficient in the other parts of philoſophy, is but a beginner in experimental learning. And the ſecond reaſon, why I have often made uſe of ſeemingly ſlight experiments, is, becauſe ſuch are more eaſily and cheaply tried, and they being alleged for the moſt part to prove ſome aſſertion, or credit ſome admonition, I thought their eaſineſs or obviouſneſs fitter to recommend them, than depreciate them; and I judged it ſomewhat unkind, or at leaſt indiſcreet, to refer you moſt commonly for proof of what I delivered, to ſuch tedious, ſuch difficult, or ſuch intricate proceſſes, as either you can ſcarce

well make, unleſs you be already, what I deſire my experiments ſhould help to make you, a ſkilful chymiſt; or elſe are as difficult to be well judged, as the truth they ſhould diſcover is to be diſcerned. I was alſo hopeful, that the eaſineſs of divers things inviting you to make trial of them, and keeping you from being diſappointed in your expectations, the ſucceſs of your firſt attempts would incourage you to make trial alſo of more nice and difficult experiments. And till you have tried them, do me the right to think, that I deal not unſincerely with you.

THE reaſons of my having divers times recorded experiments, which you may have formerly met with, and perchance even in printed books, I have elſewhere deduced in a peculiar diſcourſe on that ſubject; and therefore ſhall now only add, that by reaſon of my being as yet a ſtranger to the German tongue, wherein the moſt and beſt chymical books are ſaid to be written, I may have ſet down divers chymical experiments and obſervations, that are extant already in that Hermetical language, (if I may ſo call it) without having had them from their Dutch publiſhers, or ſo much as dreamed of their having been divulged by any man. I have likewiſe in my preface to the eſſays, that you will meet with under the title of *Promiſcuous Experiments*, given you an account, why I have not refrained from mentioning divers things, which may ſeem very ſlight, becauſe very obvious: and I have long had thoughts to inform you in an intire diſcourſe to be written onpurpoſe, why I think, that even the trivial, and therefore ſlighted, truths of phyſiology ought not to be deſpiſed. And for my own part, I ſhall not ſcruple to confeſs to you, that I diſdain not to take notice even of ludicrous experiments, and think, that the plays of boys may ſometimes deſerve to be the ſtudy of philoſophers: for as when we go a hunting, though the flight of the hare and the purſuit of the dogs be to us but ſport and recreation, yet the beaſts themſelves are extreamly earneſt, the one to ſave his threatened life by flight, and the other to overtake his deſired prey; ſo nature acts very ſeriouſly in all the other things, that we make ſports with, and is in very good earneſt, whether we men be ſo or no.

PERHAPS you will wonder, *Pyrophilus*, that in almoſt every one of the following eſſays I ſhould ſpeak ſo doubtingly, and uſe ſo often, *perhaps*, *it ſeems*, *it is not improbable*, and ſuch other expreſſions, as argue a diffidence of the truth of the opinions I incline to, and that I ſhould be ſo ſhy of laying down principles, and ſometimes of ſo much as venturing at explications. But I muſt freely confeſs to you, *Pyrophilus*, that having met with many things, of which I could give myſelf no one probable cauſe, and ſome things, of which ſeveral cauſes may be aſſigned ſo differing, as not to agree in any thing, unleſs in their being all of them probable enough; I have often found ſuch difficulties in ſearching into the cauſes and manner of things, and I am ſo ſenſible of my own diſability to ſurmount thoſe difficulties, that I dare ſpeak confidently and poſitively of very few things, except of matters of fact. And when I venture to deliver any thing, by way of opinion, I ſhould, if it were not for mere ſhame, ſpeak yet more diffidently than I have been wont to do. It is not, that I at all condemn the practice of thoſe inquiſitive wits, that take upon them to explicate to us even the abſtruſeſt phænomena of nature; for I am ſo far from cenſuring them, that I admire them, when their endeavours ſucceed, and applaud them even where they do but fairly attempt. But I think it is fit for a man to know his own abilities and weakneſſes, and not to think himſelf obliged to imitate all that he thinks fit to praiſe. I know alſo, that the way to get reputation is to venture to explicate things, and promote opinions; for by that courſe a writer ſhall be ſure to be applauded by one ſort of men, and be mentioned by many others; whereas by the way of writing, to which I have condemned myſelf, I can hope for little better among the more daring and leſs conſiderate ſort of men, ſhould you ſhew them theſe papers, than to paſs for a drudge of greater induſtry than reaſon, and fit for little more, than to collect experiments for more rational and philoſophical heads to explicate and make uſe of. But I am content, provided experimental learning be really promoted, to contribute even in the leaſt plauſible way to the advancement of it; and had rather not only be an under-builder, but even dig in the quarries for materials towards ſo uſeful a ſtructure, as a ſolid body of natural philoſophy, than not do ſomething towards the erection of it. Nor have my thoughts been altogether idle and wanting to themſelves, in framing notions, and attempting to deviſe hypotheſes, which might avoid the deficiences obſerved in other men's theories and explications: but I have hitherto, though not always, yet not unfrequently, found, that what pleaſed me for a while, as fairly comporting with the obſervations, on which ſuch notions were grounded, was ſoon after diſgraced by ſome further or new experiment, which at the time of the framing of thoſe notions was unknown to me, or not conſulted with. And indeed I have the leſs envied many (for I ſay not all) of thoſe writers, who have taken upon them to deliver the cauſes of things, and explicate the myſteries of nature, ſince I have had opportunity to obſerve, how many of their doctrines, after having been for a while applauded, and even admired, have afterwards been confuted by the diſcovery of ſome new phænomenon in nature, which was either unknown to ſuch writers, or not ſufficiently conſidered by them. For I have found it happen, as well to many others (that have publiſhed their opinions) as to me (who have been more private in my gueſſes) in our theories built on either too obvious or too few experiments, what is wont to happen to the falſifiers of coin; for as counterfeit pieces of money will endure ſome of them one proof, as the touch-ſtone, others another, as aqua fortis, ſome a third, as the hammer or the ſcales, but none of them will endure all proofs; ſo the notions I mention (in which ſort I fear too

great a part of thoſe hitherto extant may be comprized) may agree very fairly with this or that or the other experiment; but being made too haſtily, and without conſulting a competent number of them, it is to be feared, that there may ſtill after a while be found one or other, (if not many) their inconſiſtency with which will betray and diſcredit them.

I HAVE notwithſtanding all this, on ſome occaſions, adventured to deliver my opinion; not that I am very confident of being leſs ſubject to err in thoſe particulars, than in any of the others, wherein I have refrained from interpoſing any conjecture; but becauſe I would manifeſt to you, that I ſcruple not to run the ſame venture with thoſe incomparably better naturaliſts, that have thought it no diſgrace in difficult matters rather to hazard the being ſometimes miſtaken, than not to afford inquiſitive perſons their beſt aſſiſtance towards the diſcovery of truth.

AND becauſe, *Pyrophilus*, in the reaſons and explications I offer of natural effects, I have not for the moſt part an immediate recourſe to the magnitude, figure, and motion of atoms, or of the leaſt particles of bodies, I hold it not unfit to give you here ſome account of this practice; not ſo much for the ſake of thoſe few paſſages in my eſſays, that may be concerned in it, as for that of many learned men, eſpecially phyſicians, whoſe uſeful writings being to be undervalued, and are in danger to be deſpiſed, by an opinion taken up from the miſ-underſtood doctrine of ſome eminent Atomiſts, as if no ſpeculations in natural philoſophy could be rational, wherein any other cauſes of things are aſſigned than atoms and their properties. I conſider then, that generally ſpeaking, to render a reaſon of an effect or phænomenon, is to deduce it from ſomething elſe in nature more known than itſelf; and that conſequently there may be divers kinds of degrees of explication of the ſame thing. For although ſuch explications be the moſt ſatisfactory to the underſtanding, wherein it is ſhewn, how the effect is produced by their more primitive and catholick affection of matter, namely, bulk, ſhape and motion; yet are not theſe explications to be deſpiſed, wherein particular effects are deduced from the more obvious and familiar qualities or ſtates of bodies, ſuch as heat, cold, weight, fluidity, hardneſs, fermentation, *&c.* though theſe themſelves do probably depend upon thoſe three univerſal ones formerly named. For in the ſearch after natural cauſes, every new meaſure of diſcovery does both inſtruct and gratify the underſtanding; though I readily confeſs, that the nearer the diſcovered cauſes are to thoſe, that are higheſt in the ſcale or ſeries of cauſes, the more is the intellect both gratified and inſtructed.

I THINK it therefore very fit and highly uſeful, that ſome ſpeculative wits, well verſed in mathematical principles and mechanical contrivances, ſhould employ themſelves in deducing the chiefeſt modes or qualities of matter, ſuch as are heat, cold, *&c.* and the ſtates or conditions of it, (if we think fit to diſtinguiſh theſe from its qualities) as fluid, firm, brittle, flexible, and the like, from the above-mentioned moſt primitive and ſimple affections thereof. And, I think, the commonwealth of learning exceedingly beholden to thoſe heroick wits, that do ſo much as plauſibly perform ſomething in this kind. But I think too, we are not to deſpiſe all thoſe accounts of particular effects, which are not immediately deduced from thoſe primitive affections of either atoms, or the inſenſible particles of matter; but from the familiar, though not ſo univerſal, qualities of things, as cold, heat, weight, hardneſs, and the like. And perhaps it would be none of the leaſt advantages, which would accrue to Naturaliſts from a ſatisfactory explication of ſuch qualities by the moſt primitive and ſimple ones, that it would much ſhorten the explication of particular phænomena. For though there be many things in nature, that may be readily enough made out by the ſize, motion, and figure of the ſmall parts of matter; yet there are many more, that cannot be well explained without a great deal of diſcourſe, and divers ſucceſſive deductions of one thing from another, if the purpoſed effect muſt be deduced from ſuch primary and univerſal cauſes; whereas if we be allowed to take the notions of cold, heat, and the like qualities for granted, the explications and proofs may be much more compendiouſly made. He gives ſome reaſon, why ſtones and iron, and all other heavy bodies, will ſwim in quickſilver, except gold, which will ſink in it; that teaches, that all thoſe other bodies are *in ſpecie*, (as they ſpeak,) or bulk for bulk, lighter than quickſilver, whereas gold is heavier. He, I ſay, may be allowed to have rendered a reaſon of a thing propoſed, that thus refers the phænomenon to that known affection of almoſt all bodies here below, which we call gravity, though he does not deduce the phænomenon from atoms, nor give us the cauſe of gravity; as indeed ſcarce any philoſopher has yet given us a ſatisfactory accountof it. So if it be demanded, why, if the ſides of a blown bladder be ſomewhat ſqueezed betwixt one's hands, they will, upon the removal of that which compreſſed them, fly out again, and reſtore the bladder to its former figure and dimenſions; it is not ſaying nothing to the purpoſe, to ſay, that this happens from the ſpring of thoſe aërial particles, wherewith the bladder is filled, though he, that ſays this, be not perhaps able to declare, whence proceeds the motion of reſtitution, either in a particle of compreſſed air, or any other bent ſpring.

AND as for the reaſons of things aſſigned by phyſicians, they muſt be by moſt of them deſpiſed, unleſs we will allow of ſuch explications, as deduce not things from atoms or their affections, but only either from ſecondary qualities, or from the more particular properties of mixt bodies. If a phyſician be aſked, why rhubarb does commonly cure looſeneſſes, he will probably tell you as a reaſon, that rhubarb is available in ſuch diſeaſes, becauſe it hath both a laxative virtue, whereby it evacuates choler, and ſuch other bad humours as are wont, in ſuch caſes, to be the peccant matter; and an aſtringent quality, whereby it afterwards ar-

reſts the flux. But if you further aſk him the reaſon, why rhubarb purges, and why it purges choler more than any other humour; it is ten to one he will not be able to give you a ſatisfactory anſwer. And indeed, not only the manner, whereby purgative medicines work, but thoſe other properties, whereby ſome bodies are diuretick, others ſudorifick, others ſarcotick, *&c.* are not, I fear, ſo eaſy to be intelligibly made out as men imagine, and yet a ſkilful phyſician would juſtly think himſelf wronged, if the reaſons he renders of things in his own profeſſion were denied the name of reaſons, becauſe made without recourſe to atomical principles. And indeed, there are oftentimes ſo many ſubordinate cauſes between particular effects and the moſt general cauſes of things, that there is left a large field, wherein to exerciſe men's induſtry and reaſon, if they will but ſolidly enough deduce the properties of things from more general and familiar qualities, and alſo intermediate cauſes (if I may ſo call them) from one another. And I am the more backward to deſpiſe ſuch kind of reaſons, becauſe I elſewhere declare, that there are ſome (for I do not ſay, many) things, as particularly the origin of local motion, of which, even by the atomical doctrine, no phyſical cauſe can well be rendered; ſince either ſuch things muſt be aſcribed to God, who is indeed the true, but the ſupernatural cauſe of them; or elſe it muſt be ſaid, (as it was by the old Epicureans) that they did ever belong to matter: which, conſidering that the notion of matter may be compleat without them, is not to give a phyſical efficient cauſe of things in queſtion, but in effect to confeſs that they have no ſuch cauſes. But of this elſewhere more.

IN the mean time, that you may not be drawn away to undervalue ſuch writers as I have been pleading for, nor think you ought to refrain from writing what occurs to you, though true and uſeful, unleſs you deduce it, or at leaſt can do ſo, from the Epicurean notions; I ſhall here briefly repreſent to you, (what perhaps you will not hereafter think a deſpicable ſuggeſtion) that there are two very diſtinct ends, that men may propound to themſelves in ſtudying natural philoſophy. For ſome men care only to know nature, others deſire to command her; or, to expreſs it otherwiſe, ſome there are, who deſire but to pleaſe themſelves by the diſcovery of the cauſes of the known phænomena; and others would be able to produce new ones, and bring nature to be ſerviceable to their particular ends, whether of health, or riches, or ſenſual delight. Now as I ſhall not deny, but that the atomical, the Carteſian, or ſome ſuch principles, are likely to afford the moſt of ſatisfaction to thoſe ſpeculative wits, that aim but at the knowledge of cauſes; ſo I think, that the other ſort of men may very delightfully and ſucceſsfully proſecute their ends, by collecting and making variety of experiments and obſervations; ſince thereby learning the qualities and properties of thoſe particular bodies they deſire to make uſe of, and obſerving the power that, divers chymical operations, and other ways of handling matter, have of altering ſuch bodies, and varying their effects upon one another, they may, by the help of attention and induſtry, be able to do many things, ſome of them very ſtrange, and more of them very uſeful in human life. When a gunner or a ſoldier employs gun-powder, it is not neceſſary, that he ſhould conſider, or ſo much as know, of what, and of how many ingredients (much leſs of what kind of atoms) it is made, and the proportion and manner, wherein they are mingled; but the notice experience gives him of the power of that admirable concrete, as it is made up and brought to his hands, ſuffices to enable him to perform things with it, that nothing but their being common and unheeded can keep from being admired. The phyſician, that has obſerved the medicinal virtues of treacle, without knowing ſo much as the names, much leſs the nature of each of the ſixty and odd ingredients, whereof it is compounded, may cure many patients with it. And though it muſt not be denied, that it is an advantage as well as a ſatisfaction, to know in general, how the qualities of things are deducible from the primitive affections of the ſmalleſt parts of matter; yet whether we know that or no, if we know the qualities of this or that body they compoſe, and how it is diſpoſed to work upon other bodies, or be brought on by them, we may, without aſcending to the top in the ſeries of cauſes, perform things of great moment; and ſuch, as, without the diligent examination of particular bodies, would, I fear, never have been found out *à priori*, even by the moſt profound, contemplators. We ſee that the artificers, that never dreamed of the Epicurean philoſophy, have accommodated mankind with a multitude of uſeful inventions. And *Paracelſus*, who (beſides that he ſeems none of the moſt piercing and ſpeculative wits) ſure had little recourſe to atomical notions, if he ever ſo much as heard of them, was able to perform ſome things, that were truly admirable, beſides thoſe he vainly boaſted of; as may appear not only by what I elſewhere repreſent, but by what *Oporinus* himſelf (as ſeverely as he otherwiſe writes againſt his deſerted maſter) confeſſes he ſaw of the ſtupendous cures, which *Paracelſus* wrought with his famous *Laudanum*, (whatever he made it of.) But we need not go far to find a noble example to our preſent purpoſe, ſince we ſee, that the bare making of trials with the load-ſtone, and irons touched by it, though the experimenters were ignorant (as ſome fear we yet are) of the true and firſt cauſes of magnetical phænomena, have produced inventions of greater uſe to mankind, than were ever made by *Leucippus*, or *Epicurus*, or *Ariſtotle*, or *Teleſius*, or *Campanella*, or perhaps any of the ſpeculative deviſers of new hypotheſes; whoſe contemplations aiming for the moſt part but at the ſolving, not the increaſing or applying, of the phænomena of nature, it is no wonder they have been more ingenious than fruitful, and have hitherto more delighted than otherwiſe benefitted mankind: I ſay hitherto, becauſe though experience warrants me ſo to ſpeak now, yet I am not unwilling to think, that hereafter, and perhaps

in

in no long time, when phyſiological theories ſhall be better eſtabliſhed, and built upon a more competent number of particulars, the deductions, that may be made from them, may free them from all imputation of barrenneſs. But of theſe things I otherwhere (though not, as I remember, in any of the following eſſays) more fully diſcourſe.

AND therefore I ſhall now reſume the ſubject, that occaſioned this long excurſion, and add to what I ſaid in excuſe of my venturing ſometimes to deliver ſomething as my opinion in difficult or controverted caſes, that I muſt declare to you, *Pyrophilus*, that as I deſire not my opinions ſhould have more weight with you, than the proofs brought to countenance them will give them; ſo you muſt not expect, that I ſhould think my ſelf obliged to adhere to them any longer, than thoſe conſiderations, that firſt made me embrace them, ſhall ſeem of greater moment, than any that I can meet with in oppoſition to them. For *Ariſtotle* ſpoke like a philoſopher, when to juſtify his diſſent from his maſter *Plato*, he ſaid, among other things, that for the ſake of truth, men (eſpecially being philoſophers) ought to overthrow even their own tenets (Δόξει δ' ἂν ἴσως βέλτιον εἶναι, καὶ δεῖν ἐπὶ σωτηρίᾳ γε τῆς ἀληθείας καὶ τὰ οἰκεῖα ἀναιρεῖν, ἄλλως τε καὶ φιλοσόφους ὄντας.) And though for a man to change his opinions, without ſeeing more reaſon to forſake them than he had to aſſent to them, be a cenſurable levity and inconſtancy of mind; yet to adhere to whatever he once took for truth, though by acceſſion of more light he diſcover it to be erroneous, is but a proud obſtinacy, very injurious to truth, and very ill becoming the ſenſe we ought to have of human frailties. And it ought to be eſteemed much leſs diſgraceful to quit an error for a truth, than to be guilty of the vanity and perverſeneſs of believing a thing ſtill, becauſe we once believed it. And certainly, till a man is ſure he is infallible, it is not fit for him to be unalterable.

Ethic. Nicom. l. 1. cap. 6.

YOU will eaſily diſcern, *Pyrophilus*, that I have purpoſely, in the enſuing eſſays, refrained from ſwelling my diſcourſes with ſolemn and elaborate confutations of other men's opinions, unleſs it be in ſome very few caſes, where I judged, that they might prove great impediments to the advancement of experimental learning; and even ſuch opinions I have been wary of meddling with, unleſs I ſuppoſed I could bring experimental objections againſt them. For it is none of my deſign to engage my ſelf with, or againſt, any one ſect of Naturaliſts, but barely to invite you to embrace or refuſe opinions, as they are conſonant to experiments, or clear reaſons deduced thence, or at leaſt analogous thereunto; without thinking it yet ſeaſonable to contend very earneſtly for thoſe other opinions, which ſeem not yet determinable by ſuch experiments or reaſons. And indeed, to allude to our former compariſon, I would endeavour to deſtroy thoſe curious but groundleſs ſtructures, that men have built up of opinions alone, by the ſame way (and with as little noiſe) by which ſuch fantaſtical ſtructures, as thoſe I mentioned to have ſeen at *Leyden*, may be demoliſhed. To deſtroy which, it were needleſs to bring battering engines, ſince nothing is requiſite to that effect but an increaſe of light. And experience has ſhown us, that divers very plauſible and radicated opinions, ſuch as that of the unhabitableneſs of the torrid zone, of the ſolidity of the celeſtial part of the world, of the blood's being conveyed from the heart by the veins (not the arteries) to the outward parts of the body, are generally grown out of requeſt, upon the appearing of thoſe new diſcoveries, with which they are inconſiſtent, and would have been abandoned by the generality of judicious perſons, though no man had made it his buſineſs, purpoſely, to write confutations of them: ſo true is that vulgar ſaying, that *Rectum eſt index ſui & obliqui.*

BUT when at any time, *Pyrophilus*, I have been induced to oppoſe others, as I have not denied my ſelf the freedom, that is requiſite unto loyalty to truth; ſo I have endeavoured to uſe that moderation, and civility, that is due to the perſons of deſerving men. And therefore you ſhall find me not only in one eſſay oppoſe an author, whom in another I applaud; but ſometimes you may find me commending a writer in the very ſame page, perhaps, where I am endeavouring to diſprove his opinions: for I love to ſpeak of perſons with civility, though of things with freedom. Nor do I think it reaſonable, either that any man's reputation ſhould protect his errors, or that the truth ſhould fare the worſe for his ſake, that delivers it. And as for the (very much too common) practice of many, who write, as if they thought railing at a man's perſon, or wrangling about his words, neceſſary to the confutation of his opinions; beſides that I think ſuch a quarrelſome and injurious way of writing does very much miſbecome both a philoſopher and a Chriſtian, methinks it is as unwiſe, as it is provoking. For if I civilly endeavour to reaſon a man out of his opinions, I make my ſelf but one work to do, namely, to convince his underſtanding; but, if in a bitter or exaſperating way I oppoſe his errors, I increaſe the difficulties I would ſurmount, and have as well his affections againſt me as his judgment: and it is very uneaſy to make a proſelyte of him, that is not only a diſſenter from us, but an enemy to us. And that which makes me the more diſlike the bitter way of diſputing, which I am reprehending, is, that I have often obſerved, that though one of the diſputants alone be at firſt in the fault, yet the other is moſt commonly drawn to ſhare in the guilt, though, to contract it, he muſt imitate his adverſary. For as a mad dog, by biting others, is wont to make thoſe he bites run mad like himſelf, and do promiſcuous miſchief; ſo theſe ſo provoking writers are wont to enrage thoſe they offend, and infect them alſo with their own virulent diſtemper. But, *Pyrophilus*, when I ſpeak of dealing reſpectfully with thoſe I diſſent from, I would be underſtood of ſuch, as have well deſerved of experimental learning, or at leaſt been candid and ſober inquirers after truth. For, as I think, that it would much diſcourage any prudent perſon from venturing to communicate

what

what he thinks he knows to the world, to find, that an error proceeding from human weakneſs, or the darkneſs and abſtruſity of things, ſeldom eſcapes being detected without being made matter of diſgrace or reproach to the author: ſo, on the other ſide, when vain writers, to get themſelves a name, have preſumed to obtrude upon the credulous world ſuch things, under the notion of experimental truths, or even great myſteries, as neither themſelves ever took the pains to make trial of, nor received from any credible perſons that profeſſed themſelves to have tried them; in ſuch caſes, I ſee not how we are obliged to treat writers, that took no pains to keep themſelves from miſtaking or deceiving, nay, that cared not how they abuſe us to win themſelves a name, with the ſame reſpect, that we owe to thoſe, who, though they have miſſed of the truth, believed they had found it, and both intended to deliver it, and took ſome (though not proſperous) pains, that they might convey nothing elſe to us.

I FEAR it will be requiſite, *Pyrophilus*, to tell you, why in ſome of the following eſſays you will meet with many paſſages tranſcribed out of other authors, and in ſome very few or none at all. And therefore to give you firſt a ſhort account of the particular mentioned laſt, I muſt mind you, that it was moſt ſuitable both to my humour and deſign, to deliver only thoſe things, wherewith my own obſervations, or trials, or thoughts, had furniſhed me, without troubling you with the repetition of thoſe things, which had been delivered by others already; thoſe kind of repetitions, unleſs they be made upon ſome ſuch grounds as we ſhall preſently mention, ſeeming to me to be as vainly as ambitiouſly affected by many writers, and being deſervedly troubleſome to judicious readers, who can eaſily diſcern, that they add much more to the bulk of books than of knowledge. But this notwithſtanding, *Pyrophilus*, I thought my ſelf obliged on ſome occaſions, for your ſake, to overcome my natural averſeneſs to ſtuff any writings of mine with paſſages tranſcribed from thoſe of others, partly for the reaſons elſewhere inſiſted on, and partly for divers others. As firſt, becauſe ſome particulars are of that ſtrangeneſs, and of that moment, that they need and deſerve to be verified by more than a ſingle atteſtation. Next, becauſe according to the Greek proverb, κοινὰ καινῶς, it is not properly to ſay over the ſame thing again, when the obſervation, experiment, or other paſſage of an author, is either illuſtrated, or otherwiſe improved by the repetition, or elſe applied to ſome purpoſe differing from that, to which the author brought it: that being applicable to many a ſingle experiment or obſervation, which *Seneca* ſomewhere ſays, *Nulla res conſummata eſt dum incipit*; and, *Etiamſi omnia à veteribus inventa ſunt, hoc ſemper novum erit, uſus, & inventorum ab aliis ſcientia & diſpoſitio.* And thirdly, becauſe as the planets and other ſtars have (according to aſtrologers) in their great ſynods or conjunctions, much more powerful, and ſometimes other influences on the air and ſome other ſublunary parts of the world, than are aſcribed to one or two of them out of that aſpect; ſo divers particulars, which whilſt they lay ſingle and ſcattered among the writings of ſeveral authors were inconſiderable, when they come to be laid together in order to the ſame deſign, may oftentimes prove highly uſeful to phyſiology in their conjunction, wherein one of them may ſerve to prove one part or circumſtance of an important truth, and another to explicate another, and ſo all of them may conſpire together to verify that ſaying, *Et quæ non proſunt ſingula, multa juvant.* It may then, I hope, ſuffice to juſtify me on this occaſion, that not appealing to other writers as to judges, but as to witneſſes, nor employing what I have found already publiſhed by them barely as ornaments to imbelliſh my writings, and much leſs as oracles by their authority to demonſtrate my opinions, but as certificates to atteſt matters of fact, I may hope, that their teſtimonies will as well be illuſtrated by mine, as mine by their's, and that all of them may contribute to your better information.

Quæſtion. Natural. lib. 6. cap. 5. *Epiſtola* 64.

AND if, *Pyrophilus*, you grant, that upon theſe conſiderations I have not done amiſs to apply to my purpoſe divers of thoſe things, which I found delivered pertinently to them by thoſe writers, which I chanced to caſt mine eyes on, I ſuppoſe you will not think I need to make you an apology, for my having made moſt uſe of the paſſages of thoſe writers, which I ſuppoſe will be moſt difficult to be met with (ſuch as are many books of navigation and other voyages) and eſpecially of French books not yet tranſlated into Engliſh or Latin. And I think I ſhall leſs need to make an excuſe for my having for the moſt part ſet down the paſſages I recited in the author's own words, that being one of the readieſt ways I know to ſatisfy the reader, and avoid injuring the writer. And indeed, I have met with abundance of quotations, wherein the tranſcriber doth ſo miſtake, or ſo miſ-repreſent the cited author's meaning, ſometimes out of inadvertence, but ſometimes too I fear out of indulgence to his own hypotheſis, that if ever I ſhould be tempted to trouble the world with any of my thoughts, I would beſeech my readers, not to look upon any thing as my opinion or aſſertion, that is not delivered in the intire ſeries of my own words; leſt a tranſcriber ſhould make me deliver thoſe things reſolutely and dogmatically, which I deliver but heſitantly and conjecturally; and leſt I ſhould ſeem to ſet down thoſe things poſitively as proceſſes, for whoſe ſucceſs I undertake, which I record but by way of narrative.

FOR my ſo frequently mentioning what I have borrowed from other writers, or received from my friends, I expect to be excuſed by that of *Pliny*, *Benignum eſt (ut arbitror) & plenum ingenui pudoris, confiteri per quos profeceris.* Though I have ſeen divers modern writers, that ſo boldly uſurp the obſervations and experiments of others, that I might juſtly apply to them what the ſame *Pliny* annexes; *Scito enim, conferentem authores me deprehendiſſe à juratiſſimis & proximis veteres tranſcriptos ad verbum neque nominatos, &c.* If other

writers ſhould not prove more equitable (for I will not ſay more thankful) than ſuch as theſe, they would quickly diſcourage thoſe, whoſe aims are not very noble and ſincere, from gratifying the publick with inventions, whoſe praiſe and thanks would be uſurped by ſuch as will not name them. But perhaps they would be more juſt, if they reflected on what our author further adds, *Obnoxii profectò animi & infelicis ingenii eſt, deprehendi in furto malle, quam mutuum reddere, cum præſertim ſors fiet ex uſura.*

AND now I have ſaid this concerning the paſſages I have borrowed from other authors, it will not be improper to add ſomething about thoſe I have declined to borrow. For you may poſſibly marvel, that in divers of the hiſtorical parts of my writings I have omitted ſuch teſtimonies either of *Pliny*, *Solinus*, *Ariſtotle*, *Theophraſtus*, *Ælian*, or, perchance, ſome of the antient phyſicians themſelves (who yet, as more converſant with things, are uſually more credible) as ſeem very pertinent to my diſcourſe, and fit to prove what I deſign. But when I ſhall come to entertain you about natural hiſtory, I doubt not but to ſatisfy you with the reaſons I ſhall offer you of this practice. In the mean time, I ſhall only tell you in ſhort, that though I have a juſt reſpect for thoſe great names I have mentioned; yet the ſenſe I have of the difficulties I have found to make and relate an obſervation accurately and faithfully enough for a naturaliſt to rely on; and the occaſions I have had of looking into divers matters of fact delivered in their writings, with a bold and impartial curioſity; have made me conclude ſo many of thoſe traditions to be either certainly falſe, or not certainly true, that except what they deliver upon their own particular knowledge, or with peculiar circumſtances, that may recommend them to my belief, I am very ſhy of building any thing of moment upon foundations, that I eſteem ſo unſure, and much leſs upon the ſuſpected paſſages, that *Wecker*, *Paracelſus*, *Porta*, &c. abound with. And therefore (though I well enough know, how much I impoveriſh my diſcourſe by this niceneſs) yet I do not think it fair to imploy that as an argument to convince you, that has not that operation upon me myſelf. And I rather take notice of my forbearing to make uſe of the hiſtorical traditions and chymical or magical ſecrets, that I meet in the above-mentioned authors, or any other makers of collections, unleſs the narrative be (as I was ſaying) expreſly enough delivered upon the writer's perſonal knowledge, or that of ſome other credible witneſs; not only becauſe I would give you an account, why ſeveral of my writings are unfurniſhed with what moſt readers look on as the richeſt ornaments of other men's; but becauſe if this warineſs could be introduced, it would be the moſt effectual way of perſuading men to write thoſe kind of tracts I would recommend, phyſiological eſſays. For he, that will confine himſelf ſo ſtrictly, will ſcarce be often tempted, on phyſical ſubjects, to write either ſyſtems or volumes.

ANOTHER thing, *Pyrophilus*, I muſt needs advertiſe you of in reference to the enſuing diſcourſes; which is, that beſides thoſe deficiencies in point of ratiocination, which are due to my perſonal diſabilities, I have purpoſely let paſs ſome few (and but very few) inferences, which I diſcerned well enough not to be cogent, becauſe I was willing to acquaint you upon ſome particular occaſions with all the experiments then occurring to me, which I thought might contribute to the illuſtration of the ſubject in hand; though each of them apart did not irrefragably, nor indeed ſo much as ſtrongly infer the concluſion, in order to which they ſeemed to have been mentioned as premiſſes. And this practice I made the leſs ſcruple of, becauſe I was willing to exerciſe thereby your reaſoning faculty, and try how far you would diſcern the tendency of ſeveral things, all of them pertinent enough to the ſubject in hand, but not all of them concluding to the main deſign, in order whereunto they were alledged. And I ſuppoſed, that the things by me mentioned, though not concluſive, being yet experimental, the mention of them, which in a ſtrictly logical way of reaſoning muſt have been forborn, might well make you amends for the exerciſe, to which I intended they ſhould put your reaſon.

THERE remains yet one thing, *Pyrophilus*, of which I ſuppoſe you will expect I ſhould give you an account; and that is, why in the enſuing eſſays I have mentioned divers experiments, which I have not plainly and circumſtantially enough delivered. To ſatisfy you concerning which, I muſt repreſent to you, firſt, that though for your ſake I have oftentimes, contrary to my reaſon and genius, delivered things, to make them more clear, in ſuch a multitude of words, that I now ſeem even to my ſelf to have in divers places been guilty of verboſity; yet in ſome other paſſages, treating of things, which uſe had rendered very familiar to me, I may have, to ſhun prolixity, unawares ſlipt into the contrary extreme. Secondly, there are ſome mechanical experiments, wherein I have purpoſely omitted ſome manual circumſtances, becauſe I was unwilling to prejudice ſome ingenious tradeſmen, who make either a livelihood, or at leaſt a gain, by the ſale of the productions of ſuch experiments. And I made the leſs ſcruple to conceal ſuch mechanical circumſtances, (if I may ſo call them) becauſe they were not neceſſary to the phiſiological knowledge of the experiments; in naming of which, my intention was to teach you rather philoſophy than trades. Thirdly, I mention ſome things but darkly, either becauſe I received them upon condition of ſecrecy, or becauſe ſome ingenious perſons, that communicated them to me, or others to whom I imparted them, do yet make, and need to make, a pecuniary advantage of them. Fourthly, And ſome things, that, either having been the fruits of my own labours, or obtained in exchange of ſuch, are freely at my own diſpoſal, I have not yet thought fit ſo plainly to reveal, not out of any envious deſign of having them buried with me, but that I may be

always provided with ſome rarity to barter with thoſe ſecretiſts, that will not part with one ſecret but in exchange for another, and think nothing worth their deſiring, that is known already to above one or two perſons. And I think it very lawful to reſerve always ſome concealed experiments by me, wherewith to obtain the ſecrets of others, which being thereby gained, the other (as being no longer neceſſary to the former end) may freely be communicated.

AND think not, *Pyrophilus*, that the bare mention of an experiment as having been perfomed, though the way of making it be concealed, is of no uſe, if the relator of the experiment be a perſon, that may ſafely be crecited: For it is ſomething, to be aſſured, that ſuch and ſuch things have been really performed, and conſequently are poſſible to be done, though we be not particularly acquainted with the means of performing them. And he tells you ſomething, that tells you upon his own knowledge, that in ſuch or ſuch bodies, or ways of operating on them, conſiderable things of ſuch or ſuch a nature are to be met with. And for my part, when I go a hawking or ſetting, I think my ſelf beholden to him, that aſſures me, that in ſuch a field there is a covey of partridges, though he does no more towards the giving me them. And it is obvious, how much *Europe* is beholden to *Columbus* for the detection of many countries in *America*, which were not diſcovered by him, nor perhaps till long after his death, becauſe he firſt informed us knowingly, that there were unknown regions beyond that vaſt ocean, which ſevers the old world from the new. But I begin to digreſs, and therefore ſhall proceed to tell you, that I am the leſs troubled at my omiſſion of the circumſtantial parts of ſome experiments, becauſe I think it will be much for your advantage to try them over again your ſelf. And as I have taken care by the truth of the experiments I have delivered, to ſecure your ſucceſs, in caſe you try them aright; ſo I cannot be very ſorry, that you ſhould in ſome particulars have a kind of neceſſity laid on you to exerciſe your own induſtry, and thereby increaſe your experience.

BUT beſides all that has been ſaid, *Pyrophilus*, I muſt freely confeſs to you, that there is one thing particularly relating to your ſelf, which has made me refrain from delivering, in the enſuing eſſays, ſome of the chief chymical proceſſes, wherewith they might have been enriched. For not yet knowing with what ſeriouſneſs you will addict your ſelf to promote experimental philoſophy, nor what uſe you will make of what has been unveiledly communicated to you, I was ſomewhat unwilling, that ſome things, which had coſt me a great deal of pains, ſhould yet fall into any man's hands, that ſcorns to purchaſe knowledge with ſome pains; and I was deſirous, in caſe you ſhall prove as induſtrious as I hope you will, to have ſomething by me to encourage and cheriſh your induſtry, which may be more ſuitable to your improved knowledge. For I muſt confeſs to you, that in reference to the chymical proceſſes extant in the following diſcourſes, I look upon moſt of them but as trifles, not only in compariſon of thoſe things, which a knowing chymiſt might have delivered on the ſame ſubjects, but even in regard of divers proceſſes (not impertinent to thoſe diſcourſes) wherewith I my ſelf, (as little as I am a pretender in theſe matters) am not unacquainted: and perhaps I would have given to the following treatiſes the title of trifles, inſtead of that of eſſays, if I had not been afraid of diſcouraging you thereby, and if the chymical part of them had been the chief thing, wherewith I intended to acquaint you in them. But if the reception you give to what we have already written, prove ſuch as may encourage us to proceed, we may perhaps, if God be pleaſed to vouchſafe us life and opportunity, be invited to impart to you thoſe more conſiderable chymical experiments, which either the communication of our friends, or our own labours, have preſented us. For it will be much in the power of the entertainment, which theſe papers ſhall meet with, to make them either the beginning of our labours of this nature, or the end. And in the mean time, I think I may venture to tell you, that, as inconſiderable as I have confeſſed divers of the chymical proceſſes mentioned in the eſſays to be, yet if ever you take the pains (as I hope you will) to write experimental eſſays, and confine your ſelf to take as little upon truſt as I have done, you will perhaps be ready to believe, that ſometimes a ſhort eſſay of this nature, not to ſay ſome one ſingle experiment, may have coſt me more than a whole treatiſe written on ſuch a ſubject, whereon to be able without diſcredit to write books, it is almoſt ſufficient to have read many. And give me leave to add, that as in ſuch kind of compoſures, oftentimes the enabling himſelf to give a conſiderable advertiſement, or even hint, may coſt the writer more than the making of ſeveral experiments; ſo it may be alſo more beneficial to the reader than the knowledge of them. For we muſt not always meaſure the conſiderableneſs of things by their moſt obvious and immediate uſefulneſs, but by their fitneſs to make or contribute to the diſcovery of things highly uſeful. As, if it be true, what is reported by good authors of the hazel wand, or *virgula divinatoria*, though the hazel tree be much leſs conſiderable in reference to its fruit, or immediate productions, than a peach-tree, an orange-tree, or even an apple-tree; yet may it be made much more valuable than any of them, becauſe, whereas they only preſent us with fruits, this may aſſiſt us to diſcover in latent mines ineſtimable treaſures.

I had almoſt forgot to advertiſe you, *Pyrophylus*, that whereas I have not been ſo ſollicitous as moſt writers are wont to be, to ſwell the enſuing eſſays with the enumeration of the various opinions and arguments of authors about the ſubject I treat of, or to adorn them with acute ſentences, fine expreſſions, or other embelliſhments borrowed from eminent writers; it has not been, becauſe I utterly diſlike the making uſe of thoſe paſſages in claſſick or other authors, that may either

give

give (among the admirers of thoſe writers) ſome authority to our thoughts, or very handſomely and emphatically expreſs them. For I remember, I have known it reprehended by learned men in *Epicurus*, that though he wrote very much himſelf, he would not vouchſafe in his writings to quote thoſe of other men. And that I have not refrained from making uſe, now and then, of thoſe philological ornaments of diſcourſe, when they readily occurred to me, and appeared neither impertinent nor prolix, may, I hope, ſuffice to keep me from being ſuſpected of the vanity of thinking my ſelf above other men's aſſiſtance. But the reaſons of my ſo much declining to make uſe of other men's authority, or expreſſions, were chiefly theſe: firſt, That the weakneſs of my eyes has this long time kept me from reading almoſt any books, ſave the Scripture, with ſome critical expoſitions of it, and, here and there, ſome portions of the writings of thoſe that pretend to teach their readers experimental matters: and the unfaithfulneſs of my memory, as to things of no great moment, has made me forget almoſt all the little philological and florid learning I was formerly acquainted with. And really, *Pyrophilus*, as for the books, that treat of natural philoſophy, I am ſo ſenſible of the ſmallneſs of the advantage, which my diſabilities have ſuffered me to make of them, that inſtead of being ambitious to appear a great reader, I could be very well content to be thought to have ſcarce looked upon any other book than that of nature. And in the next place, *Pyrophilus*, though I ignore not, that by this plain and unadorned way of writing, I unkindly deny my eſſays many imbelliſhments, which I might give them, and which perhaps you will think they do abundantly need; yet my frequent diſtempers, journeys, and other avocations, not allowing me ſo much time as I deſired, entertain you on philoſophical ſubjects, I thought it more requiſite to ſpend thoſe confined hours in acquainting you with my own thoughts, ſuch as they are, than with thoſe of other men; unleſs (as I formerly intimated) I can ſome way or other more than barely recite what I recite of theirs. And you will eaſily pardon me the injury, which for your ſake I do my own reputation by this naked way of writing, if you, as well as I, think thoſe the profitableſt writers, or, at leaſt, the kindeſt to their peruſers, who take not ſo much care to appear knowing men themſelves, as to make their readers ſuch.

TWO

ESSAYS,

Concerning the

Unſucceſsfulneſs of EXPERIMENTS,

Containing divers Admonitions and Obſervations (chiefly Chymical) touching that SUBJECT.

Advertiſement about the two following Eſſays.

THE author of theſe diſcourſes had enlarged them, in this ſecond edition, with divers obſervations and experiments, but that he has made uſe of them already in other papers belonging to his Sceptical or doubting Naturaliſt.

The Firſt ESSAY,

Of the Unſucceſsfulneſs of EXPERIMENTS.

I AM very ſorry, *Pyrophilus*, that to the many (elſewhere enumerated) difficulties which you may meet with, and muſt therefore ſurmount, in the ſerious and effectual proſecution of experimental philoſophy, I muſt add one diſcouragement more, which will perhaps as much ſurprize you as diſhearten you; and it is, that beſides that you will find (as we elſewhere mention) many of the experiments publiſhed by authors, or related to you by the perſons you converſe with, falſe or unſucceſsful, (beſides this, I ſay) you will meet with ſeveral obſervations and experiments, which, though communicated for true by candid authors or undiſtruſted eye-witneſſes, or perhaps recommended to you by your own experience, may upon

upon further trial, diſappoint your expectation, either not at all ſucceeding conſtantly, or at leaſt varying much from what you expected.

THIS advertiſement may ſeem of ſo diſcouraging a nature, that I ſhould much ſcruple the giving it you, but that I ſuppoſe the trouble at that unſucceſsfulneſs, which you may meet with in experiments, may be ſomewhat leſſened by your being forewarned of ſuch contingencies: and that if you ſhould have the luck to make an experiment once, without being able to perform the ſame thing again, you might be apt to look upon ſuch diſappointments as the effects of an unfriendlineſs in nature or fortune to your particular attempts, as proceed but from a ſecret contingency incident to ſome experiments, by whomſoever they be tried.

BUT becauſe, *Pyrophilus*, the advertiſement, which I am about to give you, may ſeem, as paradoxical, ſo diſcouraging; it will be but reaſonable, that I preſent you with ſome inſtances of the requiſiteneſs of it: which I ſhall the more willingly do, becauſe thereby I may not only evince the truth of it, but ſomewhat leſſen the deſpondency it is apt to produce, by letting you ſee, that though ſome of your experiments ſhould not always prove conſtant, you have divers partners in that infelicity, who have not been diſcouraged by it.

TO make nice and curious diſtinctions of the ſeveral grounds and occaſions of the unſucceſsfulneſs of experiments, would, perhaps, prove a work of greater difficulty than uſe; and therefore I ſhall content my ſelf groſly to diſtinguiſh the cauſes of that unſucceſsfulneſs, into the particular or miſtaken properties of the materials imployed about them, and ſome ſuch error committed in the handling of theſe materials, as though it hinder the ſucceſs of the experiment, is not eaſy to be diſcerned. Which therefore I mention, that I may diſtinguiſh theſe kind of errors, that I am now to conſider, from thoſe more obvious ones, which proceeding barely from the unſkilfulneſs of the tryers of the experiments, may be eaſily enough diſcerned, and either rectified or avoided by a knowing artiſt, or a perſon well verſed and expert in making thoſe particular experiments, which through that unſkilfulneſs may have miſcarried.

THE materials to be employed about the experiments we are conſidering may alſo admit of ſeveral diſtinctions; as into natural and factitious, ſincere and adulterate, ſimple and compound, *&c.* But we ſhall likewiſe purpoſely forbear the inſiſting on any of theſe, and content our ſelves to caſt what we have to ſay on this part of our theme, into a few and comprehenſive obſervations.

AND in the firſt place we will obſerve, that divers experiments ſucceeded not, becauſe they were at one time tried with genuine materials, and at another time with ſophiſticated ones: and in this caſe it may be all one, as to the event of the experiment, whether the materials, wherewith it was ſucceſsfully tried, were ſophiſticated or not, if thoſe made uſe of in the latter trial were of differing qualities from thoſe employed in the former; becauſe it may very well happen, that ſophiſticated bodies (as we may have occaſion to ſhew hereafter) by the addition of thoſe things, or by that deceitful way of preparation, whereby they have been ſophiſticated, may acquire an aptitude to produce ſuch effects, as, had they not been adulterated, they would not have been fit to do. Now it is ſcarcely imaginable to him, that has not been very converſant with the drugs and ſimples ſold in ſhops, how generally they are adulterated by the fraudulent avarice of the ſellers, eſpecially if they be ſuch, whoſe precioufneſs may make their ſophiſtication very beneficial to them, that practiſe it. It has been lately much complained of by ſome of the cultivators of clover-graſs, that of a great quantity of the ſeed not any graſs ſprung up; which not being imputable to the ſoil, nor the ſower, proceeds, as ſome analogical obſervations make me ſuppoſe, from the effeteneſs (if I may ſo ſpeak) of the ſuperannuated ſeed ſometimes ſold in the ſhops. And upon this ſubject I cannot conceal from you what was lately affirmed to me by one of the eminenteſt and ſobereſt chymiſts of *Amſterdam*, who was alſo an Indian merchant, who aſſured me, that the moſt of the cinnamon and cloves, that is brought into theſe weſtern regions, is defrauded in the *Indies* of much of the fineſt and ſubtileſt aromatical parts, before it be ſent into *Europe*. And to give a more familiar inſtance to our preſent purpoſe, you may be pleaſed to remember, *Pyrophilus*, that in one of the firſt of theſe eſſays, we have made mention to you of great ſtore of living creatures, which we had obſerved in vinegar; of the truth of which obſervation we can produce divers learned and ſevere witneſſes, who were not to be convinced of it, till we had fully ſatisfied them by ocular demonſtration: and yet, *Pyrophilus*, there are divers parcels of excellent vinegar, wherein you may in vain ſeek for theſe living creatures: and we are now diſtilling ſome of that liquor (which if we did not think to be of the ſtrongeſt and beſt ſort, we ſhould ſcarce think worth the being diſtilled for ſpirit) wherein nevertheleſs we can neither by candle-light nor by day-light diſcern any of thoſe little creatures, of which we have often ſeen ſwarms in other vinegars. Of ſuch fraudulent tricks as thoſe lately mentioned, I could eaſily give you divers inſtances, if I were not afraid of teaching fallacies by diſcovering them. But ſome are ſo notorious, or otherwiſe of ſuch a nature, as that it may be more uſeful than dangerous to mention them.

IT is commonly known, that ſublimate is wont to be ſophiſticated with arſnick: and how differing the effects of ſuch ſublimate may be from thoſe of that, which is faithfully prepared, not only upon metals, but (when mercurius dulcis and other preparations are made of it) upon human bodies, they, and ſcarce any but they, who are acquainted with the noxious qualities of arſnick, both to metals and men, can readily imagine. And indeed as for chymical preparations, *Helmont* * was not much in

* *Accipe pulverem* Joannis de Vigo *propria manu paratam, nam alioquin admiſtus minio eſt adulteratus, prout qualcunque medicamen chymicum quod venale exſtat fraude plenum eſt* Helmon. de Febr. c. 14.
Sunt nempe olea eſſentialia venalia, quæque magno ære penduntur, adulterata omnia atque ſinguli, &c. Idem de Feb. c. 15.

the wrong, when he affirmed, there were ſcarce any, vulgarly ſold in ſhops, to be relied on as faithfully prepared. And for my part, I have ſo often met with chymical preparations, which I have found unſincere, that I dare ſcarce truſt any, either in the adminiſtration of phyſick, or ſo much as in the trial of conſiderable experiments, which either my own furnaces do not afford me, or wherewith I am not ſupplied by ſome perſon, of whoſe ſkill and faithfulneſs I have a good opinion. The other day, having occaſion to uſe ſome ſpirit of ſalt, whereof I was not then provided, I ſent for ſome to a chymiſt, who making it himſelf, was the likelier to afford that, which was well made: but though I gave him his own rate for it, at the firſt rectification even in a retort, a ſingle pound afforded us no leſs than ſix ounces of phlegm; and afterwards being further rectified in a high body and gentle heat, the remaining ſpirit parted with a ſcarce credible quantity of the like nauſeous liquor, and after all theſe ſequeſtrations of phlegm, was not pure enough, to perform what we expected from it. Of which complaining to an excellent chymiſt of my acquaintance, he ſent for ſpirit of ſalt to a very eminent diſtiller of it, who gets much by his profeſſion, and paſſeth for a very honeſt man: but this ſpirit, beſides its weakneſs, diſcovered itſelf to be ſophiſticated with either ſpirit of nitre, or aqua fortis, which betrayed itſelf by its peculiar and odious ſmell; whereas ſpirit of ſalt ſkilfully and ſincerely drawn is commonly of a greeniſh colour, bordering upon yellow, and hath uſually a peculiar, and ſometimes (as I can exemplify to you in ſome of mine) a not unpleaſing ſmell. And let me on this occaſion advertiſe you, *Pyrophilus*, that in divers caſes it is not enough to ſeparate the aqueous parts by dephlegmation, as many chymiſts content themſelves to do; but ſome liquors contain alſo an unſuſpected quantity of ſmall corpuſcles of ſomewhat an earthy nature, which being aſſociated with the ſaline ones, do clog or blunt them, and thereby weaken their activity: and therefore ſuch liquors to be well depurated require the being diſtilled off, and that with a ſlow fire, that the dry fæces may be left behind in the bottom of the glaſs. To ſatisfy ſome perſons, that this obſervation is not groundleſs, we have ſometimes taken of the better ſort of ſpirit of ſalt, and having carefully dephlegmed it, removed it into lower glaſſes, (that the leſs heat will ſuffice to make the liquor aſcend) and having gently abſtracted the whole ſpirit, there remained in the bottom and the neck of the retort, whence it was diſtilled, ſo great a quantity of a certain dry and ſtiptical ſubſtance, for the moſt part of a yellowiſh colour, that it ſeemed ſtrange to the beholders, that ſo clear a ſpirit ſhould conceal ſo much of it: and we ourſelves ſhould have wondered at it too, had we not remembered, that in what the chymiſts are wont to call the oil or rectified butter of antimony made with ſublimate, the liquor, though diſtilled and very limpid, almoſt like fair water, conſiſts in great part of the very body of the antimony: which we would here manifeſt, but that we elſewhere do it; and therefore chuſe rather in this place to take notice, that the ſpirit of ſalt after this ſecond depuration was ſo changed, that it ſeemed to be a much nobler, and almoſt another liquor than it was before.

But to return to our ſophiſticated ſpirit; what differing effects would be produced by true ſpirit of ſalt, and that which is mixt with the ſpirit of nitre, he, that knows the great diſparity in the operations of thoſe two liquors, whereof (to mention now no other inſtances) the former will precipitate ſilver, when the latter has diſſolved it, may eaſily inform you. Which inſtances I mention not as the conſiderableſt, which may be produced on this ſubject, but as the freſheſt in my memory.

In the next place, *Pyrophilus*, I obſerve, that even when the materials imployed about experiments are no way ſophiſticated, but genuine, and ſuch as nature has produced them, or art ought to prepare them; even then, I ſay, there may be a very conſiderable diſparity betwixt concretions of the ſame kind and name, and which paſs without ſuſpicion for bodies of perfectly the ſame nature.

This may, to you, *Pyrophilus*, ſeem a great paradox; but perhaps upon examination it will appear a great truth: which becauſe I am, perchance, the firſt, that has ſolemnly aſſerted, I hope I ſhall obtain your pardon, if I inſiſt ſomewhat the longer upon the making it out. For though antimony (and the like is to be underſtood of quickſilver, gold, copper, tin, *&c.*) is wont by almoſt all men without heſitancy to be looked upon as being all of it of the ſame nature as well as denomination; yet he, that will take the liberty to ſuſpect, that they may be deceived in that opinion, and then heedfully obſerve the differing progreſs and event of experiments, may very well diſcern, that there is as well a difference in minerals of the ſame kind, as there is in vegetables and animals of the ſame ſpecies. And as the white roſe, the red roſe, and the damaſk roſe differ much from one another, though all three be roſes; and as the ſour and ſweet orange are very differing betwixt themſelves, and yet both of them from the *China* orange, though all be oranges; and as the hound, the grey-hound, the ſpaniel, the tumbler, the maſtiff, and the water-dog, *&c.* are very diverſly qualified, though all of them be dogs: ſo neither are all the parcels of antimony to be met with in mines or ſhops of altogether the ſame qualities, though all of them be antimonial concretes. There is indeed this difference betwixt the variety to be obſerved in vegetables and animals, and that which is to be found in minerals, that the former is wont to be more obvious to the eye, and betray itſelf by ſome difference to be obſerved, either in the ſize of creatures of the ſame kind, or in ſome peculiar ſhape or colour, by which it is eaſy for nature conſpicuouſly to diſcriminate bodies, that conſiſt of many diſcernably diſtinct parts; whereas minerals appearing to the eye either to be perfectly ſimilar, as metals, or at leaſt to conſiſt but of two or three diſtinct ingredients, as cinnabar, and ſome other mineral concretions, the diverſity to be found

found betwixt minerals of the ſame denomination is hardly to be diſcerned, before experience have diſcovered it.

AND on this ſubject I conſider, that the womb (if I may ſo ſpeak) of a mineral body is not always like that of an animal, a place by a competent and peculiar involving fence ſecured from the intruſion of all bodies not of kin to that included in it: but a mineral being generated in the bowels of the earth, its womb is oftentimes acceſſible and open to other mineral juices or ſteams, that paſs that way, though of never ſo differing natures from that of the more copious mineral. Inſomuch that not only I have had the opportunity to obſerve (not without ſome wonder) minerals of differing kinds, as marchaſites and metals; marchaſites and ſtones, (I mean ſtones properly ſo called) ſalt and ſulphur, and the like, blended in the ſame ſmall lump of matter; but I have ſometimes found, in a great maſs of one ſort of mineral, ſmall parcels of a mineral of a quite differing kind perfectly incloſed in the ſubſtance of the other. But to reſume what we were ſaying before, theſe intruding bodies (if I may ſo ſpeak) being coagulated, and perhaps ripened together with the former by length of time, are not eaſily either ſeparable, or ſo much as diſtinguiſhable at their firſt digging out of the ground, and much leſs after their coliquation. For the ignorant or heedleſs mine-man aiming only at the obtaining a quantity of ſuch a metal, or other mineral, as may be vendible under ſuch a determinate name, has neither the deſign, nor perhaps the ſkill, to make nice ſeparations of the heterogeneous bodies to be met with in his ore, but melts ſo much of them as he can promiſcuouſly together; and then ſells them, not only to the merchant, but the chymiſt, for that metal or mineral, whoſe outward form and properties (as colour, conſiſtence, weight, ſound, *&c.*) it has: though that metal, under whoſe name it paſſes, be indeed but the predominant ingredient of the lump, wherein divers other minerals may in ſmall quantities lie concealed, and yet upon occaſion be diſcovered by exquiſite ſeparations, or diſcover themſelves by unexpected operations, when they meet with bodies fit to act on them, or diſpoſed to receive impreſſions from them.

I WAS lately viſited by an ingenuous goldſmith of my acquaintance, who complained to me, that being wont to buy parcels of gold brought in ſmall pieces, and as it were ſandy corpuſcles, from *Guinea*, or ſome country of that coaſt, though he found it upon all trials very right gold, yet was it ſo very pale, that few but expert goldſmiths would meddle with it, as fearing it had been ſome ſophiſticated metal; adding, that this exceeding paleneſs of it ſometimes reduced him to melt it with very high-coloured gold, or to heighten its tincture with that of copper, to bring it to the colour of ordinary gold.

THE probability of this may be proved by what is related by Monſieur *Flacourt*, governour of the French plantation in *Madagaſcar*, who, in his newly publiſhed hiſtory of that iſland, ſpeaking of the metals of it, ſays, *Il y a bien*, &c. that is, there is certainly gold among the inhabitants of *Madagaſcar*, which has not been brought hither by foreign ſhips: for it is not poſſible, that ſuch ſhips ſhould have left them ſo much of that metal as they have; and beſides, it is of a differing nature from that of Europe, which they call in this country *Voulamene Voutroüa*. He adds, that this gold, which they call gold of *Malacaſſe*, is pale, and is not worth above ten crowns, (or about fifty ſhillings) an ounce; alſo, that the Negroes affirm, that there are many mines of it in the country, where it was formerly digged; that there is three ſorts of it differing in fineneſs from each other, and diſcriminated by the natives by three peculiar names. But that which he adds as moſt conſiderable, is, *that Malacaſſean gold is of ſo very eaſy a fuſion, that it is almoſt as eaſily melted as lead*; whereas we here find the gold we deal with to require conſiderably ſtrong fires, and are wont to caſt in borax to facilitate the fuſion. *Hiſtoire de Madagaſcar, c.* 37.

HAVING, upon occaſion, had the curioſity not long ſince to viſit ſome mines of lead, and other metals, I find, that there is a great difference, and diſcernible even to the eye, betwixt the ſeveral ores; for inſtance, of lead, ſome of which I can ſhew you ſo like ſteel, and ſo unlike common lead-ore, that the workmen upon that account are pleaſed to call it ſteel-ore, which being of more difficult fuſion than ordinary, they are wont to mix it with other ore, which they call firm-ore, to facilitate the melting of it. And I likewiſe took notice of an ore, which for its aptneſs to vitrify, and ſerve the potters to glaze their earthen veſſels, the miners call pottern-ore, and ſell it (at leaſt where I ſaw it digged up) dearer than other ore, from which it differs both viſibly enough, and as the workmen affirm, in divers other (and thoſe leſs obvious) qualities; and yet all theſe ores, after fuſion, do paſs indiſcriminately under the name and notion of lead. In which therefore it is no wonder, that ſeverer inquirers find a great deal of diſparity. I remember I did not long ſince cauſe ſome lead-ore to be tried, which being the moſt promiſing that ever I ſaw, made me ſuppoſe it might contain ſome conſiderable quantity of ſilver: but though it proved ſo rich in lead, as to yield after the rate of ſeventy pound in the hundred, yet one of the moſt expert artiſts in Europe could not extract one grain of ſilver out of it; whereas the lead of very many mines, being ſkilfully examined, will leave behind it, upon the teſt, a proportion of purer ſilver. And though this quantity of ſilver be not conſiderable enough to make ſuch mines as yield it paſs for ſilver-mines, (or, as we are wont to call them, mines-royal) becauſe the ſilver will not quit the coſt of extracting it; yet ſuch mines, though they paſs but for lead-mines with the metaliſt, may appear to be mixt mines to the naturaliſt, who may meet with divers experiments, wherein the little ſilver, that is in them, may make their lead operate differently from that of thoſe ores, which are wholly deſtitute of ſilver.

AND as this diſparity is diſcernible in lead-ores,

ores, ſo it may well be ſuppoſed, that the like would be diſcovered in the ores of other metals, if they were but purpoſely and ſkilfully examined. On which ſubject I remember, that a very experienced perſon in theſe affairs, and otherwiſe very candid and ſober, was lately very deſirous I ſhould procure him ſome tin-ore, alledging, that he had met with a ſort of it, which, after a long digeſtion in lixiviate liquors, afforded him a very conſiderable proportion of the richer metals; inſomuch that having a large quantity of that ore, and finding the experiment on it to ſucceed conſtantly, he promiſed to himſelf a vaſt income by it: but when that ſtock of ore was ſpent, the next that he procured, though with great carefulneſs managed as the former, would by no menns be brought to afford either ſo conſiderable a benefit, or ſo much as any at all. Which brings into my mind, that having once bought a parcel of block-tin, (as the tradeſmen call that, which is of the moſt pure or unmixt, and as yet unwrought) I was deſirous to try, if I could not make a menſtruum to diſſolve it in ſuch manner as aqua fortis diſſolves ſilver, and aqua regis gold; becauſe chymiſts are wont to complain, that though they have a menſtruum or two that will diſſolve crude tin, yet they want one, that will keep it diſſolved, and will not, which aqua fortis will, let it fall into a calx. Having therefore (by a way that I elſewhere teach) prepared ſuch a liquor as was deſired, I evaporated a ſolution of the fore-mentioned tin, and ſetting it to ſhoot, found ſomewhat, to my wonder, that the cryſtals it afforded were not at all like any kind of vitriol, but broad, flat, and exceeding thin, juſt like thoſe of ſilver. Whereupon for further trial, having examined this ſalt by the tongue, we found not, that it had any ſuch taſte as ſkilfully made calx of tin in ſpirit of vinegar, (wherein it is not every calx of *Jupiter* that is ſoluble) which (the laſt time we tried) ſeemed to us to have, as it were, a chalybeate taſte, but ſuch an exceſſive bitterneſs as may be met with in the cryſtals of ſilver made with aqua fortis. Finding alſo this further reſemblance betwixt the ſalts of theſe two metals, that they did both of them preſently dye upon the nails and ſkin a blackneſs, that could not in a ſhort time be waſhed off; we ſhould have ſuſpected, that the menſtruum had exalted the metal diſſolved in it to a greater cognation to ſilver; but having afterwards proſecuted the ſame trial with the ſame menſtruum, and another parcel of block-tin, (the former being caſually loſt) this metal, though bought very ſoon after the other, and, as I remember, at the ſame place, made us conclude, that the event of our trials proceeded from our having lighted upon a lump of tin, that was of a peculiar nature.

I Remember alſo, that a while ſince a learned and inquiſitive friend of mine found in his land a parcel of ore, part of which he ſhewed me, and ſome of which I can ſhew you, but have not yet made trial of it; which ſeemed to me, among others that looked upon it, to be copper ore, and which did indeed, after fuſion, yield very good copper; but the perſons, to whom he committed the examination of the mine, being very inquiſitive, and extraordinarily ſkillful, they did (as one of themſelves immediately after confeſſed to me) find in that ore, beſides the copper, no inconſiderable quantity of ſilver; and in that ſilver (having diſſolved it in aqua fortis) a conſiderable proportion of gold.

But to detain you no longer on this ſubject, give me only leave to ſtrenghen the paradox I have propoſed, by the authority of that great and candid chymiſt *Baſilius Valentinus*, who ſpeaking of antimony, after he hath told us, that there are ſeveral kinds of it, and eſpecially two; the one more mercurial, and of a golden property, witneſſed by the ſhining ſtreaks or beams it abounds with; the other more full of ſulphur, but deſtitute of the golden nature that inriches the former; adds, that there is ſuch a different goodneſs betwixt the ſeveral ſorts of antimony, as there is betwixt the ſeveral ſorts of fleſh or fiſh, which, though agreeing in name, and, if you pleaſe, in nature, do exceedingly differ in point of goodneſs. Which brings into my mind the great difference, which I have found, even viſible to the eye, betwixt the ſeveral ſorts of antimony; and makes me alſo remember, that the other day being by an excellent chymiſt ſhewed a parcel of antimony as a rarity, upon the ſcore of the various-coloured ſulphur, wherewith it was conſpicuouſly inriched, the poſſeſſor of it ſoon after imployed it to make butter of antimony: but though he were very expert in that kind of diſtillation, yet inſtead of the liquor he expected, upon the approach of a gentle fire, he found the neck and body of his retort lined with an antimonial cinnabar, (or at leaſt a red ſubſtance, by him concluded to be ſulphur;) at which being ſurprized, he was pleaſed to withdraw his fire, till he had acquainted me with this accident, and in the yet unbroken retort ſhewed me the cinnabar, which is not wont (as you know) to ariſe till after the butter of antimony is come over, and the remaining matter be urged with a vehement fire. And it is perhaps to the undiſcerned difference of antimonies, that we may ſometimes aſcribe that contingency, which we have divers times had occaſion to take notice of in the making of antimonial cinnabar: for though in our furnaces it hath been very ſucceſsfully made, yet not only we have afterwards failed of making it, but we have ſeen much more expert chymiſts, and who, becauſe of the high value they do (not undeſervedly) place upon that medicine, imploy themſelves oftener than we in making it, divers times unſucceſsfully attempt the preparing it. And it may be perhaps alſo from ſome diverſity either in antimonies or irons, that eminent chymiſts have (as we have obſerved) often failed in their endeavours to make the ſtarry regulus of *Mars* and antimony. Inſomuch that divers artiſts fondly believe and teach (what our experience will not permit us to allow) that there is a certain reſpect to times and conſtellations requiſite to the producing of this (I confeſs admirable) body. Upon which ſubject I muſt not omit

omit to tell you, that a while ſince an induſtrious acquaintance of ours was working on an antimony, which unawares to him was, as we then ſuppoſed, of ſo peculiar a nature, that making a regulus of it alone (without iron) the common way, (for his manner of operation I inquired of him) he found, to his wonder, and ſhewed me his regulus adorned with a more conſpicuous ſtar, than I have ſeen in ſeveral ſtellate regulus's of both antimony and *Mars*. Yet I dare not be too confident that this depended only upon the peculiar nature of that antimony, becauſe ſince that, my own laboratory has afforded me divers ſuch parcels of regulus without *Mars*, (ſome of which I have yet by me very fairly ſtellated) which though made of antimony, that ſeemed (by its various colours) to be more rich than ordinary in ſulphur; yet in regard the antimony did not conſtantly afford a ſtarry regulus, though by the ſame perſon ordered as near as could be after the ſame manner, it did not ſo clearly appear to me, whether the different event of the ſeveral trials proceeded from the peculiar nature of this or that parcel of antimony, or from ſome odd and ſcarce diſcoverable circumſtance in the management of the operation. But in either caſe, the mention of theſe uncertain events will properly enough belong to our preſent diſcourſe.

As in antimony, ſo (as I intimated above) in divers other minerals a conſiderable diverſity may be obſerved: and I remember I was lately preſented with a piece of a mineral, which to me, as well as to the reſt who looked on it, ſeemed to be an ordinary and worthleſs marchaſite; and yet a Dutch merchant (a ſkilful mineraliſt) who was the poſſeſſor of it, was very induſtrious to procure a greater quantity thereof, having in ſome of it, on which he had made trials, found a rich proportion of pure gold. And the ſame gentleman, whoſe copper-ore I formerly mentioned, digging for more of that ore, found lately a quantity of red earth, which by knowing mineraliſts was gueſſed to be but bolus, and indeed looked very like it; but being melted with *regulus Martis ſtellatus* by a ſkilful trier of metals, it divers times richly recompenſed the examiner's curioſity, by affording him many grains of fine gold: and though I doubt, whether this gold proceeded from the bolus, or the regulus melted with it, yet however it may ſerve for an inſtance to ſhew, that ſome mineral bodies, which paſs without diſpute for minerals of ſuch and ſuch a preciſe nature, may have lurking in them minerals of a quite other nature, which may manifeſt themſelves in ſome particular experiments, (wherein they meet with proportionate agents or patients) though not in others.

THAT the talc, which is wont to be employed about coſmeticks, is of very difficult calcination, is ſo known a thing to thoſe, that have tried to calcine it, that I have met with good chymiſts, that have looked on all the calces of talcs but as impoſtures, Nor indeed have we calcined Venetian talc without ſome length of time, and much violence of heat. But among many ſorts of talc we have here in *England*, there is none, which a moderate fire will in leſs than an hour reduce into a ſnow-white calx, of which I had lately a parcel by me; and ſome days ſince I met with another ſort of Engliſh talc which I could ſuddenly calcine even with the flame of a candle. And my experienced friend Dr. *K.* aſſures me, that out of a German talc he met with, he did by digeſting it in a ſtrong ſolution of alcalizate ſalts ſeparate pretty ſtore of good gold, and might have made it a very gainful experiment, if all the talc growing in the ſame place had been of the ſame richneſs. The like almoſt has been affirmed to me by a gentleman of eminency, who told me, that from a certain talc he had out of *Norway*, he had once drawn a pretty quantity of very good gold: and it ſeems indeed, that though ſome have been pleaſed to laugh at all attempts of ſequeſtring any thing from any kind of talc; yet ſome parcels of that mineral afford good ſtore of a tincture, which may, for aught I know, be of a golden nature. For I remember I have met with a kind of darkiſh-coloured talc (whereof I can yet ſhew you a piece) which when I caſt but into aqua regis, the menſtruum manifeſtly worked upon it, and diſſolved its coloured parts in ſuch plenty, that the filtrated ſolution paſſed without ſuſpicion among divers knowing naturaliſts, to whom I ſhewed it, for a fair ſolution of gold. *Paracelſus* himſelf reckons four kinds of talck, red, white, black, and of that colour, which his interpreter tranſlates luteous: and perhaps each of theſe colours compriſes ſeveral kinds of that mineral. And therefore that mineraliſt did not amiſs, when he added in the ſame diſcourſe, after he had mentioned great variety of marchaſites, ſtones, and other minerals, *Sed & hoc verum eſt, in terra multa adhuc condi, quæ mihi incognita ſunt, ſed eadem nec alii norunt. Certum ſiquidem eſt, progreſſu temporis tot tumque varia à Deo adhuc proditum iri, de quibus nemo noſtrûm nedum unquam ſomniavit.*

Paracel. *de Mineral. Tract.* 1.

Paracel. *ibidem.*

IT is vulgarly known, that there is a great difference between vitriols, that are reputed to be meerly of the ſame metal. And not to mention thoſe vitriols, that I have either made or ſeen, of leſs uſual colours; nor to take notice of the veins, ſlate, and even looſe earth, impregnated with copperas that I have had: to paſs by all this (I ſay) as for thoſe vitriol ſtones, whereof we in *England* are wont to make our vitriol, I have ſeen, at the chief work where copperas is made, ſo great a variety of them, (divers of which I have yet lying by me) that I could ſcarcely believe the workmen, when they affirmed them to be all copperas ſtones; and cannot but think it both very likely, that ſome of them contain other mineral ſubſtances beſides vitriol, and very poſſible, that the ſaline parts of thoſe ſtones, upon their ſolution by the rain, may work upon thoſe other ſubſtances formerly concoagulated with them, and thereby imbue ſome parcels of the vitriol made of them with qualities other than are eſſential to the nature of vitriol, or belong ordinarily to it.

THAT there is alſo a difference betwixt thoſe bodies, that paſs under the general name of

common ſalt, cannot but be obvious to any chymiſt, that hath occaſion to make accurate trials on that ſubject. And as for thoſe concretes, that paſs under the name of ſalt-petre, there is probably no ſmall diſparity among them: for beſides the difference, which we have obſerved, and which is obvious enough betwixt good Engliſh nitre, and that which is brought us over from *Barbary*, (which before it is much refined abounds very much with an adventitious ſalt, that taſtes much like ſea-ſalt) beſides this I ſay, thoſe that do uſe both good European and good Eaſt-Indian ſalt-petre aſſure me, they find much difference betwixt them, and give the preference to the latter. And indeed I have often thought I diſcerned a conſiderable difference in the operations of ſeveral kinds of ſalt-petre even after purification: and probably that ſort of ſalt-petre, which near *London* an ingenious man of my acquaintance does ſometimes (but cannot always) make, chiefly out of ſea-ſalt, hath ſome differing qualities from that, which is drawn the common way out of the earth. And indeed ſalt-petre being but a kind of ſal terræ, generated in very differingly-qualified parcels of earth, may probably receive divers qualities from the particular ſoil, wherein it grows, though theſe qualities lie concealed and unſuſpected under the wonted exterior appearance of nitre. Which conſideration brings into my mind what was lately told me by a very ingenious gentleman, concerning one of the eminenteſt of our *London* phyſicians, who was wont, as this confidant of his aſſured me, as an excellent ſecret, to imploy in ſome of his choice remedies that peculiar ſalt-petre, which he had drawn out of the earth digged up in church-yards.

And ſuch kind of differences would probably in other mineral bodies be taken notice of, if men's prepoſſeſſions did not make them aſcribe the variations they meet with in their experiments, rather to any other cauſe, than the unſuſpected difference of the materials imployed about them.

Nor is it only, *Pyrophilus*, among mineral bodies of the ſame name, that ſuch a diverſity is to be found; but, if narrowly looked into, it is very probable, that a greater diſparity may be diſcovered both among vegetables and animals, reputed of the ſame nature, than hath been yet taken notice of. Herbariſts indeed have exerciſed a commendable curioſity in ſubdividing plants of the ſame denomination, and few naturaliſts ignore, that there are (for inſtance) many ſorts of roſes, and of apples, which differ widely betwixt themſelves, as we ſee the difference betwixt the red roſe and the white, betwixt the crab, the pippin, and the pearmain. But beſides theſe differences, which are obvious enough to be regiſtered by botanick authors, there may be more undiſcerned ones (which yet may be conſiderable ones) betwixt the individuals of the ſame ultimate ſubdiviſion of plants, ariſing partly from the temperature of the air, which makes (for example) ſenna growing in *England* to differ much from that, which is denominated from *Alexandria*; partly from the nature of the ſoil, as is obvious in the change produced in wild ſimples tranſplanted into gardens; and partly from many other cauſes, which we have not now leiſure to inſiſt upon. But we ſee oftentimes, that one roſe much differs from another of the ſame kind, and one pearmain from another pearmain. To which we may add, that the upper cruſt or ſurface of the earth being impregnated with ſubterraneal exhalations of ſeveral ſorts, and tempered with variety of juices, it may very poſſibly be, that ſome particular plant may attract ſome ſuch juice out of a determinate ſpot of ground, as may give it exotick qualities, and make it differ even from the neighbouring plants of the ſame kind: to which purpoſe I remember, that travelling divers years ſince from *Geneva* towards *Italy*, I was in my paſſage through *Switzerland* by a gentleman of thoſe parts (whoſe brother had been formerly my domeſtick) invited to his caſtle, and entertained among other things with a ſort of wine, which was very heady, but otherwiſe ſeemed to be ſack; and having never met with any ſuch liquor during my long ſtay in thoſe parts, I was inquiſitive to know whence it was brought: and being anſwered, that it grew amongſt thoſe mountains, I could not believe it, till they aſſured me, that growing on a little ſpot of ground, whoſe entrails abounded with ſulphur, it had from the ſoil acquired its inebriating property, and thoſe other qualities, which made it ſo differing from the wine of the reſt of the vineyards of that country. And now I mention wine, give me leave, *Pyrophilus*, to put you in mind of taking notice, what a great change is made in that liquor, when upon the receſs of the ſpirits and more volatile ſulphureous parts, or elſe the new texture they make with the others, it degenerates into vinegar; and yet how little either diminution of quantity or any other alteration doth appear upon this change to the beholder's eye. And though no body is like to loſe an experiment by miſtaking vinegar for wine, becauſe both thoſe liquors and the changes of them are ſo familiar unto us; and becauſe we are wont to taſte each of them before we imploy it; yet who knows what changes there may be in other bodies, with whoſe alterations we are unacquainted, though the eye, which is oftentimes the only ſenſe employed about judging of them, diſcern no change in them? as may daily be obſerved in the ſuperannuated ſeeds of plants, which, after their having been kept long beyond their due time, loſe all their germinating power, without loſing any of their obvious qualities. And here let me further obſerve to you, that urine is made much uſe of, not only by dyers, but ſeveral other tradeſmen, in divers operations (ſome of which we may elſewhere have occaſion to treat of) belonging to their profeſſions. Now theſe men being wont indiſcriminately to employ urine, without examining, whether it be rich in ſalt or not, and how long it hath been kept, it may not be impertinent to take notice, that chymiſts, who have occaſion to diſtil it often in great quantities, aſſure me, that they find a notable diſparity betwixt urines, that of healthy

and young men abounding much more with volatile ſalt, than that of ſickly or aged perſons; and that of ſuch as drink wine freely being much fuller of ſpirituous and active parts than that of thoſe, whoſe drink is but beer or water. But becauſe the differing ſtrength of urines, though it be very probable, is not ſo eaſily to be ſatisfactorily made out, we ſhall rather inſiſt on this other obſervation confirmed to us by experience, which is, that though tradeſmen are often wont to boil ſuch and ſuch things indifferently in any urine, as if it were all one how new or ſtale it is, they may ſometimes thereby commit conſiderable errors. For recent urine, wherein the ſaline parts are yet intangled among the reſt, will ſuffer it ſelf to be boiled above one half or two thirds away, without the avolation of its volatile ſalt and ſpirits. Whereas urine, that has been divers weeks kept, is liable to a putrefaction, whereby the cement (if I may ſo ſpeak) of the ingredients that it conſiſts of, periſhing, or ſome change of texture occaſioning their disjunction, (if not alſo concurring to produce them) the component parts fall aſunder, and the ſaline particles extricating themſelves from the reſt, will even upon a very gentle heat (as trial made on purpoſe has informed us) fly away, and leave a phlegmatick and unactive liquor behind them. In confirmation whereof I muſt acquaint you, *Pyrophilus*, with what lately befel me in reference to the diſtillation of urine: for having cauſed ſome of it to be buried in earthen veſſels in a dunghill, to be there putrified, for five or ſix weeks, I was by divers occaſional journeys kept from employing it, till it had lain there between four and five months; and obſerving, when I cauſed it to be taken out, that the covers of the veſſels had not been, by him I employed to put them in, well luted on, and beſides were in ſome places crackt, I ſuſpected, that the heat of the dunghill had not only looſened the ſaline parts of the liquor, but driven them away: and accordingly by diſtilling it in a very gentle heat, and in a very high cucurbit, we obtained, inſtead of an active and ſaline ſpirit, a languid and nauſeous phlegm. And how great odds there may be betwixt ſome experiments made with recent and putrified urine, may be eaſily conceived by him, who knows what operations ſalts have in the buſineſs of colours, and is acquainted with their efficacy in thoſe other mechanical experiments, wherein urine is wont to be employed. But I fear I have dwelt too long upon this theme, and therefore I ſhall proceed to the next.

AND in the third place, *Pyrophilus*, I ſhall obſerve to you, that there is a great difference to be found among many things prepared by art, that paſs under the ſame general name: which difference may proceed partly from that, which we have already obſerved to be found in the materials of which ſuch factitious bodies are made, and partly from the way uſed in preparing them. To theſe heads many particulars may be reduced. But we ſhall at preſent reſtrain our ſelves to the mention of two ſorts of prepared bodies, namely, of ſuch as are not purified and exalted enough, and of ſuch as are ſo too much.

AND to begin with the firſt of theſe; it is very certain, that divers chymical experiments delivered by ſober authors have been believed falſe, only becauſe the menſtruums or other materials employed in the unſucceſsful trials of them were not as highly rectified, or otherwiſe as exquiſitely depurated, as thoſe that were uſed by the deliverers of thoſe experiments; ſo that oftentimes the fault of a bad menſtruum is injuriouſly imputed to a good artiſt. That experienced chymiſt *Van Helmont*, in his paradoxical treatiſe of the ſtone, endeavours (as we have elſewhere mentioned) to explicate the manner of its being generated, by the coagulation immediately enſuing upon the mixture of the two volatile ſpirits of urine and of wine. This noble experiment has been by many unſucceſsfully tried, and has been therefore by them diſcredited as a chymical fiction: and indeed the firſt, and I think the ſecond time we attempted to make that coagulum, we found nothing at all of any ſuch thing as we expected upon the confuſion of the two fore-mentioned liquors; which though never ſo much ſhaken, and afterwards permitted to reſt, did never in the leaſt meaſure coagulate, which made us long ſuſpect the experiment; till at length our favourable thoughts of that expert chymiſt making us think it poſſible, that the ſpirits we employed had not been ſufficiently exalted, we dephlegmated ſome by more frequent, and indeed tedious rectifications (which yet proved but neceſſary) and then were ſatisfied by more accurate trials, that *Helmont* had not miſinformed us.

So likewiſe the ſame author in his treatiſe *de Peſte* much extolling, as a friend to the ſtomach, the entrails, the nervous parts, and even the head, the tincture or ſolution of amber made with ſpirit of wine (which medicine is indeed no ignoble one, when adminiſtered to conſtitutions, that can well bear the heat of it) divers phyſicians and chymiſts have attempted the preparing of this tincture with ſuch bad ſucceſs, that they have given out, that either *Helmont* delivered what was not true, or concealed ſome conſiderable circumſtance of the proceſs.

WHEREAS having digeſted ſufficiently dephlegmed ſpirit of wine upon very finely powdered amber, (which, if it be the higher-coloured, yields the deeper tincture) in a very gentle heat, (for the neglect of which caution even expert artiſts have often loſt their pains and glaſſes) we have ſeveral times had a good yellow tincture of amber, which was diſcernable in the menſtruum both by the ſmell and taſte; and to ſatisfy ſome, that ſuſpected the tincture to proceed but from the exaltation of the menſtruum it ſelf by digeſtion, and to manifeſt, that it was a real ſolution of the ſubtiler parts of the amber, we poured ſome drops of it into beer, or water, into which the ſpirit of wine ſuddenly diffuſing itſelf, the diſſolved amber was plainly diſcernable ſwimming like a thin film upon the ſurface of the liquor, whence, little by little, it ſteamed away into the air.

THERE is likewiſe, as we have tried, to be drawn with ſpirit of wine from pure ſalt of tartar a pretty high tincture, and of a taſte, which I thought not unworthy the taking notice of: but

but having a while ſince tried to draw this tincture with ſpirit of wine, which (unknown to me) was much too weak for that purpoſe, after I had kept the glaſs a while in digeſtion, coming to look whether or no the ſpirit was tinged, I found, that the ſalt of tartar had drawn to it ſelf and imbibed the aqueous particles of the ſpirit of wine, and being thereby (for a great part of it) diſſolved into a liquor like that, which is commonly called oil of tartar *per deliquium*, the ſubſiding ſalt was by the interpoſition of that ſaline liquor protected from the action of the ſpirit of wine; which being by this new way dephlegmed, would not mix with the ſaline liquor, but ſwam intirely above it. To which I ſhall only add in general, that the German chymiſts are divers of them ſo accurate in the rectification of their ſpirit of wine, that in *England*, where we are wont to be leſs careful about that particular, it is uſual enough for thoſe experiments of theirs to be unſucceſsfully tried, wherein the alcohol of wine (as they call it) is requiſite.

And as ſpirit of wine, ſo many other menſtruums are made unfit for the perfecting of divers real experiments, barely by their not being ſufficiently freed from their weakning aquoſity.

Nor is it only, *Pyrophilus*, in menſtruums, but in divers other bodies, that the want of an exquiſite depuration may produce in experiments variety of events. As for inſtance, it has been complained of by ſober men, that their preparations of ſilver, though never ſo carefully made, have been apt to produce violent vomits; whereas we have not obſerved a well-prepared medicine of duly refined ſilver to work emetically, even in women and girls, but by ſeige or urine. But we cannot wonder at the violent operation of medicines made of ordinary ſilver: for not only that, which is coined, is wont, as the mint-maſters themſelves have confeſſed to me, to be allayed with ſometimes about a twelfth part, ſometimes a ſmaller or greater proportion of copper, for the greater conveniency of the coin; but even that ſilver, which is commonly at great rates ſold for refined ſilver, is not wont to be ſufficiently freed from its copper. Which I not long ſince manifeſted in the preſence of one of our richeſt and eminenteſt refiners, by diſſolving ſome of his pureſt ſilver in his own aqua fortis; for the greenneſs of the ſolution quickly betrayed the adherency of *Venus* to the ſilver. And no wonder; for I have ſeldom ſeen our chiefeſt refiners blow off from their ſilver upon the teſt above half its weight of lead, whereas we think not our ſilver ſufficiently refined for ſome purpoſes, till it have been freed from five or ſix times its weight of *Saturn*; and then it has ſometimes afforded a ſolution almoſt as clear as water, with only now and then a light touch of ſky-colour, but nothing near ſo high as the ceruleous (liquor that is ſuppoſed to be a true) tincture of ſilver, artificially ſeparated from the reſt of the body.

Now that ill effects by the mixture of copper may be produced in ſuch medicines, as ought to be of pure ſilver, he, that is acquainted with the violent emetick qualities of *Venus*, can ſcarcely doubt. And as in men's bodies, ſo in other ſubjects, thoſe experiments may eaſily deceive the artiſt's expectation, when he hopes to perform with ſilver and copper together thoſe things, which ſuppoſe and require ſilver without copper, or any adventitious metal: and as ſilver, ſo gold is very often employed for pure, when it is not ſo: for even the foliated gold, which is commonly ſold here in *England*, how fine ſoever it is reputed, is not altogether free from the pollutions of other metals; for our gold-beaters, though for their own profit ſake they are wont to uſe the fineſt coined gold they can get, (as that which is capable of the greateſt extenſion under the hammer) yet they ſcruple not to employ coined gold, and that the mint-maſters (as themſelves inform me) are wont to allay with copper or ſilver, to make the coin more ſtiff, and leſs ſubject to be waſhed by attrition. And as for thoſe many goldſmiths and chymiſts, who think their gold moſt requiſitely refined, when they have blown from it on the teſt a due proportion of lead, they may be therein ſometimes miſtaken: for though *Saturn* may carry away withhim all the copper, that did imbaſe the gold, yet he does not likewiſe free it from the ſilver, (for which purpoſe aqua fortis is therefore wont to be uſed) nay, the ſkilfulleſt refiner, that I ever yet knew, hath ſeveral times affirmed to me, that coupling fine gold with lead, the gold has after retained and protected from the fire a proportion of ſilver, that lay lurking in the lead, and was afterwards ſeparated from the gold by aqua fortis, but in ſo ſmall a quantity, that the experiment (the coſt and pains conſidered) was not lucriferous. And of this ſort of inſtances, *Pyrophilus*, more might be preſented, if we did not think prolixity might be unwelcome to you.

But as many experiments ſucceed not according to expectation, becauſe the menſtruums employed about them were not pure enough; ſo ſome miſcarry, becauſe ſuch menſtruums are but too exactly depurated: for it is not ſo much the purity of liquors in their kind, as their fitneſs for the particular purpoſe, to which they are deſigned, that is in experiments to be principally regarded. For inſtance, we have ſometimes, for recreation ſake, and to affright and amaze ladies, made pieces of white paper and linnen appear all on a flame, without either burning, ſindging, or as much as diſcolouring them. This is performed by plunging the paper very thoroughly in weak ſpirit of wine, and then approaching it to the flame of a candle; by which the ſpirituous parts of the liquor will be fired, and burn a pretty while without harming the paper. But if this experiment be tried with exquiſitely rectified ſpirit of wine, it will not ſucceed. Of this phænomenon this plauſible reaſon has been aſſigned, that the flame of the ſpirit of wine is ſo pure and ſubtile, that, like an *ignis lambens*, it will not faſten upon the paper. But experience has informed us, that this conjecture is but a miſtake, for the flame of ſpirit of wine is ſo hot, that I have in lamp-furnaces employed

ſpirit

ſpirit of wine inſtead of oil, and with the ſame flame I have not only lighted paper, but candles, and even melted foliated gold. The true reaſon therefore, why that paper is not burned by the flame, that plays about it, ſeems to be, that the aqueous part of the ſpirit of wine being imbibed by the paper, keeps it ſo moiſt, that the flame of the ſulphureous parts of the ſame ſpirit cannot faſten on it. And therefore when the deflagration is over, you ſhall always find the paper moiſt; and ſometimes we have found it ſo moiſt, that the flame of a candle would not readily light it. And on the other ſide, having purpoſely made trials of plunging paper into ſufficiently dephlegmated ſpirit of wine, the paper not having aqueous moiſture to defend it, was very readily kindled and burned by the flaming ſpirit. And one of our beſt ways to try the pureneſs of ſpirit of wine is grounded on this very ſuppoſition: for dipping it in a cotton-wiek like that of a candle, and ſetting it on fire, if the flame faſten on the wiek, it is a ſign of the goodneſs of the ſpirit; but if it do not, we conclude it to be weak, and not ſufficiently dephlegmed. It hath been likewiſe obſerved, that aqua fortis will work more readily on lead, if it be allayed with water, than if it be purely rectified. I otherwhere alſo mention an aqua fortis I have uſed, which was ſo ſtrong, that it would not well diſſolve ſilver it ſelf, unleſs I firſt diluted it with fair water. And within this very week, wherein I write theſe things, I have had an unwelcome proof, that liquors may by too exquiſite a depuration be made unfit for our purpoſes. For having, to gratify ſome ingenious friends, made a certain menſtruum, wherewith we had formerly done ſome things upon gold, which were (not altogether without cauſe) thought ſtrange enough, we took care at this time to ſeparate it from whatever was either of an aqueous or an earthy nature, more exactly than ever we had formerly done. But coming to make uſe of this ſort of menſtruum, we found to our trouble and loſs, that inſtead of performing its wonted operations upon gold better than before, we could do nothing at all with it: for it will not now by heat it ſelf be brought to touch gold, though that metal were wont to be diſſoluble in it even *in frigido*. And to ſatisfy you, that it was the too exquiſite depuration of this liquor, eſpecially from its terreſtrial parts, that thus unfitted it to touch a metal, which is otherwiſe wont to melt as it were naturally in it without ebullition (almoſt like ice in luke-warm water;) we will ſubjoin, that not only we in vain tried to make it ſerviceable by weakening it with fair water; but having, for trial-ſake, taken a little of this numerical parcel of liquor before it was ſo carefully rectified, we found, that it diſſolved crude gold as well as we had reaſon to expect. And it would be conſidered, whether or no in the extraction of the tinctures of ſeveral bodies, chymiſts do not only put themſelves to a needleſs, but to a prejudicial trouble, when they refuſe to employ any other ſpirit of wine, than that which is highly rectified. For, though in many bodies the parts deſired by the artiſts being the ſulphureous ones, the menſtruum is the better for an exquiſite dephlegmation; yet in divers other concretes the uſeful and efficacious parts have in them ſomething of ſaline, which makes them more free to impregnate copiouſly ſuch liquors, as have ſome aqueous mixed with their ſulphureous parts.

BUT becauſe there is nothing more eaſy than by diluting ſpirit of wine, though never ſo ſtrong, to make it as weak as one pleaſes; and becauſe pure ſpirit of wine is that of all other menſtruums, that chymiſts generally make moſt uſe of, and which coſts them moſt of charge and trouble, (inſomuch that here in *London* that, which is perfectly dephlegmed, is valued, in their ſhops that ſell both, at ten times the price of common ſpirit of wine;) I preſume you will not take it ill, that without being obliged to it by the title of this diſcourſe, I take this occaſion to acquaint you with the way I employ to obtain dephlegmed ſpirit of wine; eſpecially ſince the practice of the common way of frequent rectifications is (not to mention other inconveniences) wont to prove either exceeding tedious, or inſufficient. Put then about an inch thick of tartar calcined to whiteneſs, (for I find it not neceſſary to reduce it to a ſalt) and very dry, into the bottom of a tall and ſlender glaſs body, and pour on it as much ſpirit of wine, that has been but once rectified, as will, when they have been ſhaked together, ſwim above the tartar a finger's breadth (more or leſs in proportion to the tartar you put in) and then the head and receiver being carefully faſtened on again, in a gentle heat draw off the ſpirit of wine, ſhifting if you pleaſe the receiver, when about half is come over, and if need be, rectifying once more all that you diſtil upon dry calx of tartar as before. Whether or no you may meet with this method in ſome chymical books, I know not: but it ſeems, that either it has not been clearly taught, or has been propoſed by ſuſpected authors, or elſe among other proceſſes, by being found in whoſe company it has been diſcredited. For the moſt ancient and experienced diſtillers I have met with, have either contented themſelves to follow the common way of repeated rectifications, though thereby they loſe much time, and much ſpirit of wine; or elſe have had recourſe to peculiar veſſels of ſuch a height, as beſides that they are neither eaſily nor cheaply to be procured, do not, as far as I have hitherto ſeen, excuſe the need of reiterated rectifications. Whereas, when we conſidered, that the fixed ſalt of tartar readily imbibes aqueous bodies, and that yet it will not at all mix with pure ſpirit of wine, it was eaſy to conclude, that the phlegmatick part of the ſpirit of wine would be ſoaked up by the alcalizate ſalt, whereby the inflammable part would be freed from it. And accordingly when we proceeded after the manner above preſcribed, we found, that the liquor, that was produced upon the firſt rectification from the ſalt, being fired in a warm ſilver-ſpoon, did not leave behind it one drop of phlegm, or ſo much as the leaſt moiſture upon the ſpoon; nay, and indeed did endure a ſeverer examen, to which for curioſity's ſake we thought fit to

put it. And when the diſtillation was carefully made, we found by frequently (for trial-ſake) ſhifting the receiver, that all the ſpirit that aſcended was (to ſenſe) equally pure, ſince that which came up laſt of all, even till the calx ſeemed to begin to grow dry, by beginning to cleave at the top, did burn all away, as well as that which came over firſt. And having for further trial taken out the calcined tartar, and diſtilled it with a good fire, it yielded us pretty ſtore of a nauſeous and ſtrongly ſcented liquor, which ſeemed to be but phlegm, both to the taſte, and by its not being at all inflammable, though carefully tried. The ſame calx of tartar being kept in ſome earthen veſſel upon the fire till it be well dried, which will require a good heat, may be employed more than once in this operation. And it was not needleſly that we preſcribed bodies tall and ſlender; for we found not the experiment to ſucceed in large and low ones, and much leſs in retorts, in which the phlegm is wont to riſe together with the ſpirit; yet we found, that provided the diſtillation were made with a ſufficiently mild heat, a glaſs, though very broad, and but moderately high, would ſerve the turn ſo far, as that the firſt half that aſcended (the other being very weak) proved a ſpirit, that in a ſilver-ſpoon would burn perfectly all away. And becauſe white calx of tartar is ſometimes not ſo eaſy to be procured, we will add, that we have for trial-ſake ſometimes ſubſtituted quick-lime, or ſalt of pot-aſhes, (made by a ſingle ſolution, filtration, and coagulation) with no bad ſucceſs, eſpecially in caſe of removing the receiver before the aſcenſion of the laſt part of the liquor, though even that it ſelf has ſometimes from quick-lime come up inflammable enough. And therefore this alcohol of wine we peculiarly call the alcalizate ſpirit of wine; and the rather, becauſe *ſpiritus vini tartarizatus*, which perhaps may be thought the propereſt name for it, is employed by eminent chymical writers to ſignify a different thing. And a practicable way of making ſuch an alcalized and pure ſpirit of wine we thought not unfit to teach you here once for all, in regard the menſtruum is ſo highly uſeful, not only for tinctures, extracts, and many other chymical operations, but in the making of divers philoſophical experiments, and particularly ſome of thoſe, which you may meet with in our writings. And an eminently ingenious perſon (but to me a ſtranger) chancing to get a ſight of this eſſay, was pleaſed to give me thanks for this laſt part of it; becauſe, though he had very often made uſe of ſalt of tartar to improve ſpirit of wine, yet he did it before, not to dephlegm the weaker liquor, but to acuate the ſtrong with the alcali: which though I deny not to be a thing feaſible, yet (as I told him) unleſs it be ſkilfully attempted, the highly rectified liquor, that is poured on, will rather leave ſome of its moſt ſpiritous parts behind, than carry up ſo fixt a ſalt.

The Second ESSAY,

Of Unſucceeding EXPERIMENTS.

WHAT has been already ſaid, *Pyrophilus*, may, I hope, ſuffice to ſhew you, how experiments may miſcarry upon the account of the materials employed in trying them. And therefore we ſhall now paſs on to conſider the contingencies, to which experiments are obnoxious, upon the account of circumſtances, which are either conſtantly unobvious, or at leaſt are ſcarce diſcernible till the trial be paſt. And becauſe theſe circumſtances can hardly be diſcourſed of in an accurate method, (which their nature will ſcarce admit of) I ſhall not tie myſelf to any other order in ſetting down the inſtances, which occur to me on this occaſion, than that wherein they offer themſelves to my memory.

AND firſt I muſt acquaint you with what was not long ſince ſeriouſly related to me by doctor *K.* a perſon exceeding far both from the cuſtom, and, in this particular, from the temptation of telling untruths. He then aſſured me, that lending his laboratory in *Holland* to a friend of his during his own abſence, and leaving in that laboratory among other things great ſtore of aqua fortis of ſeveral compoſitions, which he had made, to employ about his famous ſcarlet-dye, this friend of his ſent him word a while after his departure, that by digeſting gold with an aqua fortis, he had ſeparated the tincture or yellow ſulphur from it, and made it volatile, (the remaining body growing white) and that with this golden tincture he had, not without gain, turned ſilver (as to part of it) into very perfect gold. Upon which advertiſement the doctor ſpeedily returning to his laboratory, did himſelf with the ſame aqua fortis divers times draw a volatile tincture of gold, which did turn ſilver into true gold: and (that I may add that upon the bye, to gratify your curioſity) when I demanded, whether or no the tincture was capable to tranſmute or graduate as much ſilver, as equalled in weight that gold, from whence the tincture was drawn, he aſſured me, that out of an ounce of gold he drew as much ſulphur or tincture, as ſufficed to turn an ounce and a half of ſilver into that nobleſt metal. Which I am the more diſpoſed to believe, partly

partly becauſe my trials permit me not to doubt of the ſeparableneſs of a yellow ſubſtance or tincture from gold; and partly becauſe I am tempted to think, that ſilver may have in it a ſulphur (to ſpeak in the chymiſts language) which maturation is capable to graduate into a golden one, by having been certified by the obſervations of men very experienced in metalline affairs, (and perhaps too by my own) that ſometimes by corroſive liquors (which Sir *Francis Bacon* alſo, if I miſtake not, ſomewhere obſerves) and ſometimes by the operation of common ſulphur (eſpecially well opened, and aſſociated with fit ſalts) ſilver has afforded ſome grains of very pure gold. But our doctor found himſelf much miſtaken in the hopes of growing rich by this experiment; for a while after endeavouring to make it again, his hopes were fruſtrated, which he aſcribes to the aqua fortis, and therefore has attempted the ſame work afreſh. But ſince all his trials have been hitherto fruitleſs, it is not improbable, that the diſappointment proceeded from ſome other more abſtruſe cauſe; for we find ſuch adventures to have ſometimes befallen artiſts irreparably. And *Glauber* alone, if you will therein credit him, tells us of ſeveral ways, by which he made gold once, and could not do it again. Upon which ſubject I muſt not omit thoſe very illuſtrious teſtimonies and inſtances of this nature, that I find recorded by that ornament of his age and quality, the prince of *Mirandola*, in his treatiſe

Lib. 3 cap. 6. de Auro. *Novi* (ſays he) *qui mihi aſſeruerit ſemel ſe ex mobili argento, quod vivum dicitur, ſtabile verumque argentum confeciſſe ſuccis & foliis herbarum, idque vendidiſſe peritis explorandæ metallicæ veritatis; eiſdem mox uſum ſe foliis fruſtra, & quod ſemel perfecerat, nunquam alias, quanquam id ſæpe tentaverit, perficere potuiſſe.*

Alium novi (ſays he further) *qui adhuc apud vivos moratur, cui cum aurum & argentum circiter quindecies per artem effectum eſſet, amiſit artem eam, acceptique oraculo ſocii per quietem habito, id ingratæ mentis vitio contigiſſe. Ut hinc etiam veritatem apoſtolici dicti condiſcamus, Neque qui plantat, neque qui rigat, eſt aliquid, ſed incrementum dat Deus.* And to both theſe narratives our learned prince does in the ſame book add divers others. *Retulit quidam mihi* (ſubjoins he) *ſeſe aurum ex argento faciſſe ſemel magnâ copiâ; ſecundo ſe uſum eiſdem rebus, feciſſe quidem, ſed minimâ ſemper quantitate, ſic ut detrimentum lucro majus eſſe ſupputaverit. Veniſſe in mentem, uti detrimentum effugere poſſit, ſi non ex argento, ſed ex ære melioris conditione metalli, ſeſe conſequi experiretur, idque ſe conjecturis firmis nixum tentaviſſe: cumque in eo fuiſſet, ut rem ſeſe adepturum ſperaret, miris modis eveniſſe, ut nihil omnino conſequeretur.*

Idem (continues the prince) *affirmavit ab amico, qui expertus hoc ipſum fuerat accepiſſe, qui cum ex cinnabari argentum feciſſet optimum, ſæpenumero ſeſe poſtea inſiſtentem operi majore cum diligentia ſemper eventu rei fuiſſe fruſtratum.* And to theſe relations of this famous prince I could add others of ſome acquaintances of mine, who having either once or twice made *luna fixa* (as artiſts call that ſilver, which wanting but the tincture of gold abides the trial of aqua fortis, *&c.*) or ſome other lucriferous experiment, have ſince in vain attempted to do the like again; and yet have their eyes ſo dazzled by the gold and ſilver they have (either ſeparated or) made, that they are not to be prevailed with to deſiſt from proſecuting their uncertain hopes.

THAT divers experiments ſucceed, when tried in ſmall quantities of matter, which holds not in the great, it may ſave you ſomething to be advertiſed of; divers projectors, eſpecially chymiſts, having already very dearly bought the knowledge of that truth, for oftentimes a greater and unwieldy quantity of matter cannot be expoſed in all its parts to a juſt degree of fire, or otherwiſe ſo well managed, as a leſs quantity of matter may be ordered. But this is ſo manifeſt a truth to thoſe, that have dealt much in experiments, that whereas many chymiſts would be vaſtly rich, if they could ſtill do in great quantities what they have ſometimes done in little ones, many have undone themſelves by obſtinately attempting to make even real experiments more gainful.

I HAVE not been very ſollicitous to ſubjoin particulars to the foregoing obſervations, becauſe that by reaſon of the contingency of ſuch experiments, as would be the moſt for my preſent purpoſe, you might poſſibly be tempted to loſe toil and charges upon trials, very likely not only to delude your hopes, but perhaps to make you diſtruſt the fidelity of our relations. Yet for illuſtration-ſake of what we have delivered, I am willing to mention ſome few contingent experiments, that occur to my thoughts.

AND firſt, it is delivered by the Lord *Verulam* himſelf, as I remember, and other naturaliſts, that if a roſe-buſh be carefully cut as ſoon as it has done bearing, it will again bear roſes in the autumn. Of this many have made unſucceſsful trials, and thereupon report the affirmation to be falſe; and yet I am very apt to think, that the Lord *Verulam* was emboldened by experience to write as he did. To clear up which difficulty, let me tell you, that having been particularly ſollicitous about the experiment, I find by the relation both of my own and other experienced gardeners, that this way of procuring autumnal roſes will in moſt roſe-buſhes moſt commonly fail, but in ſome, that are good bearers, it will ſucceed; and accordingly having this ſummer made trial of it, I find, that of many buſhes, that were cut in *June* in the ſame row, the greater number by far promiſe no autumnal roſes, but one, that hath manifeſted it ſelf to be of a vigorous and prolifick nature, is at this preſent indifferently well ſtored with damaſk-roſes. And there may be alſo a miſtake in the kind of roſes; for experienced gardeners inform me, that the muſk-roſe will, if it be a luſty plant, bear flowers in autumn without the help of cutting. And therefore that may be miſ-aſcribed to art, which is the bare production of nature. And cinnamon roſe-buſhes do ſo much better thrive by cutting than ſeveral other ſorts, that I remember, this laſt ſpring, my gardener having (as he told me) about mid *April* (which

was as ſoon as that kind of roſe-buſh had done bearing) cut many of them in my garden, I ſaw about the middle of *June* ſtore of the ſame buſhes plentifully adorned both with buds and with blown flowers.

AN uncertainty not unlike that, which we have newly taken notice of in the experiment of producing autumnal roſes, has been likewiſe obſerved in the attempts, that have been made to make divers ſorts of fruit grow upon the ſame tree. And as for differing ſorts of fruits of the ſame denomination, as apples, pears, *&c.* though ſome ſevere naturaliſts are unwilling to believe, that they can be made to grow upon the ſame tree; yet we dare not imitate their ſeverity, having lately ſeen various ſorts of pears fed by the ſame tree, and elſewhere three and twenty ſorts of apple-grafts flouriſhing upon the ſame old plant, and moſt of them adorned with fruit. Nay, and though the fruits be not of the ſame denomination, yet if they be of kin in nature, they may very poſſibly be brought to grow on the ſame tree: for we lately gathered ripe apricocks and ripe plums upon one tree, from which we likewiſe expect ſome other ſorts of ſtone-fruit. But to make fruits of very differing natures be nouriſhed proſperouſly by the ſame ſtock, is ſo difficult a thing, that we can at moſt but reckon it among contingent experiments. For though *Pliny* and *Baptiſta Porta* relate their having ſeen each of them an example of the poſſibility of producing on one tree great variety of differing fruits; and though ſuch a perſon as the deſervedly-famous aſtronomer Dr. *Ward* aſſures me, that he has particularly taken notice of pears growing upon an apple-tree; and I elſewhere add a reſembling obſervation of ours; yet certainly this experiment has been for the moſt part but very improſperouſly attempted; nor have I yet ever ſeen it ſucceed above once, though tried with very much care and induſtry. And I remember, that this very year, in the ſame garden where I gathered the apricocks and plums above mentioned, I ſaw the cions of a pear-tree ſo ſkilfully grafted upon an apple-ſtock, that it flouriſhed very much with bloſſoms in the ſpring, and gave me great hopes, that it would bear fruit this newly-paſt ſummer, but has deceived my expectation; as divers other plants ſo grafted in the ſame garden have for many years deluded the hopes of the ſkilful maſter of it, who aſſures me, that though divers of them did for ſome years ſucceſſively afford promiſing bloſſoms, yet they all decayed away without bearing any of them any fruit. Which yet may ſeem ſomewhat ſtrange, ſince not only we have this ſummer gathered pears upon a graft, which a divine, to whom the garden belongs, affirmed to have been grafted upon a quince-tree; and the induſtrious *Kircher* tells us, that *Experientia docet Perſicum moro inſitum fructus proferre, &c. de quo nullum eſt dubium utpote vulgare penè:* 'but 'experience tells us, that as little as a white-'thorn and a pear-tree ſeem of kin, a cion of 'the latter will ſometimes proſper well, being 'grafted upon a ſtock of the former.'

Artis Mag. Lucis & Umbræ, lib. 1. p. 3. cap. 6.

To contingent experiments, *Pyrophilus*, you may, if you pleaſe, refer what is delivered by thoſe learned writers, who affirm, that if a lixivium made of the aſhes or fixed ſalt of a burned plant be frozen, there will appear in the ice the idea of the ſame plant; for we have divers times purpoſely made trial of this experiment without the promiſed ſucceſs. And I remember, that in the laſt cold ſeaſon, proper for ſuch trials, I purpoſely made a lixivium of fair water and ſalt of wormwood; and having frozen it with ſnow and ſalt after the manner of congelation elſewhere declared, I could not diſcern in the ice any thing more like to wormwood than to ſeveral other plants. And having about the ſame time, and after the ſame manner, expoſed to congelation a thin phial full of a ſtrong decoction of wormwood, (from which an idea of the plant may be more probably expected) thoſe, to whom I ſhewed it, after it was frozen, could diſcern as little like wormwood in it as my ſelf. It is true, that in both theſe phials the ice ſeemed ſomewhat oddly figured; but it is true alſo, not only that we have obſerved that water, wherein a ſaline body, as ſalt-petre, or ſea-ſalt, or ſugar, *&c.* has been diſſolved, has afforded us ice, which ſeemed to ſhoot into ſeveral figures, but even in ordinary water congealed we have often ſeen ice figured, as if the water had been no elementary body; which needs not be admired, ſince (to omit other cauſes, which may concur to the production of this effect) many waters gliding through earths abounding in ſaline particles of this or that nature, may be eaſily, in their paſſage, impregnated with them; whence perhaps it comes to paſs, that dyers find ſome waters very fit, and others very unfit for the dying of ſcarlet and ſome other colours. And therefore we cannot but think, that the figures, that are oftentimes to be met with in the frozen lixivium or decoction of a plant, will afford but uncertain proofs, that the idea of each, or ſo much as of any determinate plant, diſplays it ſelf conſtantly in that frozen liquor. And I much fear, that moſt of thoſe, that tell us, that they have ſeen ſuch plants in ice, have in that diſcovery made as well uſe of their imagination as of their eyes. And it is ſtrange to obſerve what things ſome men will fancy, rather than be thought to diſcern leſs than other men pretend to ſee. As I remember Mr. *R.* the juſtly famous maker of dioptrical glaſſes, for merriment telling one, that came to look upon a great tube of his of thirty foot long, that he ſaw through it in a mill ſix miles off a great ſpider in the midſt of her web; the credulous man, though at firſt he ſaid he diſcerned no ſuch thing, at length confeſſed he ſaw it very plainly, and wondered he had diſcovered her no ſooner. But yet, *Pyrophilus*, becauſe two or three ſober writers do ſeriouſly relate ſome ſtories of that nature upon their own obſervation, I am content for their ſakes to reckon their experiments rather among the contingent than the abſolutely falſe ones: for it is not impoſſible, but that among the many figures, which frozen liquors do ſometimes put on, there may appear ſomething ſo like this or that plant, that being looked upon

upon with the favourable eye of a prepoſſeſſed beholder, it may ſeem to exhibit the picture of the calcined vegetable: and we ourſelves, not very long ſince, ſetting to freeze in ſnow and ſalt a fine green ſolution of good verdegreaſe (which contains much of the ſaline parts of the grapes coagulated upon the copper by them corroded) obtained an ice of the ſame colour, wherein appeared divers little figures, which were indeed ſo like to vines, that we were ſomewhat ſurprized at the experiment; and that which increaſed our wonder was, that another part of the ſame ſolution being frozen in another phial by the bare cold of the air, afforded us an ice angularly figured, (as we have obſerved the ice of ſaline liquors oftentimes to be) but not at all like that made by the application of ſnow and ſalt. And having, for further trial ſake, ſuffered that ice, wherein the vines appeared to thaw of itſelf, and having then frozen the liquor a ſecond time in the ſame phial, and after the ſame manner as formerly, we could not diſcern, in the ſecond ice, any thing like that, which we had admired in the firſt. And in wine and vinegar, as much as thoſe liquors partake of the nature of the vine, we have not, after congelation, obſerved any peculiar reſemblance of it in figure.

THE mention we have been making of ice brings into my memory another experiment, which may perhaps be reckoned likewiſe among contingent ones, and that is the experiment of burning with ice as with a glaſs lens; which though ſome eminent modern writers preſcribe to be done, without taking notice of any difficulty in it, yet both we and others, that have induſtriouſly enough tried it, have met with ſuch defeating circumſtances in it, eſpecially from the uniform texture wont to be met with in moſt ice, that the making of ſuch burning-glaſſes may be well enough referred to thoſe experiments, whoſe conſtant ſucceſs is not to be relied on, as we elſewhere more particularly declare.

IN the trade of dying there is ſcarce any tinging ingredient, that is of ſo great and general uſe amongſt us as woad or glaſtum; for though of itſelf it dye but a blue, yet it is uſed to prepare the cloath for green and many other of the ſadder colours, when the dyers have a mind to make them permanent, and laſt without fading: but yet in the decocting of woad to make it yield or ſtrike its colour, there are ſome critical times and other circumſtances to be obſerved; the eaſy miſtake of which oftentimes defeats the dyer's expectation to his very great loſs, which ſometimes he knows not to what to impute, of which I have heard ſeveral of them complain: and therefore divers of our leſs-expert dyers, to avoid thoſe hazards, leave off the uſe of woad, though growing plentifully enough here in *England*, and inſtead of it employ indico, though it coſt them dearer, as being brought hither ſometimes from *Spain*, ſometimes from the *Barbadoes*, and oftentimes even from the *Eaſt-Indies*.

OUR *London* refiners, when, to part ſilver and copper, they diſſolve thoſe mixed metals in aqua fortis, are wont afterwards to dilute the glutted menſtruum with ſtore of fair water, and then with copper-plates to ſtrike down the diſſolved ſilver. But becauſe by this manner of proceeding much copper is wont, after the ſeparation of the ſilver, to remain in the menſtruum, as may appear by its high tincture, that this thus impregnated liquor may be improved to the beſt advantage, they are wont to pour it upon what they call whiting, (which is ſaid to be a white chalk or clay finely powdered, cleanſed, and made up into balls) wherewith the tincted parts incorporating themſelves, will, in ſome hours, conſtitute one ſort of verditer fit for the uſe of painters, and ſuch other artificers as deal in colours, leaving the remaining part of the menſtruum an indifferently-clear liquor; whence they afterward, by boiling, reduce a kind of ſalt-peter fit, with the addition of vitriol, (and ſome freſh nitre) to yield them a new aqua fortis.

AND theſe things I mention, *Pyrophilus*, that you may know what I mean, when I tell you, that ſometimes the refiners cannot make this verditer for a great while together, and yet cannot tell, whence their diſability to make it proceeds. Of which contingency I remember I lately heard one of the eminenteſt and richeſt of them ſadly complain, affirming, that neither he, nor divers others of his profeſſion, were able, not long ſince, to make verditer for divers months together; and that ſeveral others were yet at a loſs in reference to that particular: though for his part he had, without knowing the cauſe of this contingency, found a remedy for it, namely, to warm the menſtruum well before it be poured on the whiting; on which, when the liquor was warm, the tincted parts would faſten, though they would not, whilſt (according to the cuſtom of refiners) it was poured on cold.

MAKING likewiſe the other day a viſit to the chief copperas work we have in *England*, one of the overſeers of it, who went along with me to ſhew me the contrivance of it, aſſured me, that divers times, by the miſtake or neglect of a circumſtance in point of time, they had loſt, and are yet ſubject to loſe, ſome thouſands of pounds of vitriol at a time, which in ſpite of their wonted, but not ſufficiently attentive and ſkilful care, would degenerate into an unctuous ſubſtance, not to be reduced into good vitriol again; unleſs by the tedious way of throwing it abroad, and expoſing it with the unprepared ſtones, from which they draw their vitriol, to the rain and ſun to be opened anew, and fitted for the yielding of vitriol after the ſame manner with thoſe crude minerals.

UPON this occaſion I muſt not omit, becauſe much conducing to the ſcope of our preſent diſcourſe, a memorable relation, that I have met with in the Indian Hiſtory of the learned *Joſephus Acoſta*, who diligently ſurveyed the famous and almoſt ineſtimable mines of *Peru*, and (for one that was not a chymiſt) has delivered divers conſiderable and judicious obſervations about them. That which I am now to mention, is in that chapter, where he treats of the ſilver of the *Indies*, ſet down in theſe

Joſephus Acoſta, lib. 4. cap. 5.

words: 'It is ſtrange to ſee not only the difference betwixt the refining of metal by fire, and without it by quick-ſilver, but alſo that ſome of theſe metals, which are refined by the fire, cannot well be molten with any artificial wind, as with bellows, but when it is kindled, and blown with the natural air or natural wind. The metal of the mines of *Porco* is eaſily refined with bellows; and that of the mines of *Potoſi* cannot be molten with bellows, but only by the breath of their guayars, which are ſmall furnaces upon the ſides of the mountains, built expreſsly where the wind lies, within the which they melt this metal: and though it be hard to yield a reaſon of this difference, yet it is moſt certain and approved by long experience.'

IF there be any trade, that obliges the artificers to be aſſiduouſly converſant with the materials they employ, it is that of the glaſs-men; and yet even to them, and in their moſt ordinary operations, there happen now and then little accidents, which, though they know not well to what to aſcribe, are not yet capable of hindering them from doing ſometimes what they have done a thouſand times. And I remember, that among the laſt times I have been at a glaſs-houſe, an eminently-ſkilful workman, whom I had purpoſely engaged to make ſome veſſels for me, that required more than ordinary dexterity, was not able, when I came thither, to make metal (as they call that colliquated mixture of ſand and fixt ſalt, whereof they blow their glaſſes) tolerably fit to be employed: wherefore he deſired me to take the pains to come again another day, and he would try to repair his unluckineſs. But the next time I came, though it were upon appointment, his metal proved again unſerviceable, and inſtead of being colourleſs, when it was cold, looked as if it had been ſtained with blue and yellow, and was beſides brittler than it ought to have been. So that it need be no ſuch wonder, if philoſophers and chymiſts do ſometimes miſs of the expected event of an experiment but once, or at leaſt but ſeldom tried, ſince we ſee tradeſmen themſelves cannot do *always*, what, if they were not able to do *ordinarily*, they could not earn their bread.

IT is affirmed by *Helmont* and others, that treat of the *Lapides Cancrorum*, that they grow within the ſkulls of thoſe craw-fiſhes, from whence they have their name: but I have known good anatomiſts complain, that they have ſought them in vain in the heads of thoſe fiſhes, which may well make them diſtruſt the veracity of thoſe, that aſcribe them to that ſort of animals; yet we have often taken thoſe ſtony concretions out of the heads of craw-fiſhes. But paſſing lately through *Hungerford*, a town famous for the plenty of ſuch kind of fiſh, we made diligent enquiry concerning their nature, and were there informed by thoſe, that looked to them, that the concretions above-mentioned are to be found in their heads but about that ſeaſon of the year, wherein they ſhift their ſhells, and that at other times of the year, ſeveral perſons had in vain endeavoured to ſtore themſelves with crabs-eyes at *Hungerford*. And indeed, having at the laſt time of my being there (which was about the latter end of *June*) cauſed divers large ones to be taken out of the water, we found theſe little ſtones in the head but of one of them; whereas about a fortnight before, which was near the ſummer ſolſtice, paſſing by that place, we found in the wonted parts of the heads ſeveral ſuch concretions, as to bigneſs and ſhape, but ſo ſoft, that we could eaſily cruſh and diſcind them betwixt our fingers. And certainly the miſtake of the circumſtance of time has much prejudiced the reputation of many truths: and I remember, that *Aſellius*, to whoſe anatomical fortune the world is ſo much beholden, ingenuouſly acknowledges, that he had like to have loſt the diſcovery of the milky veins, becauſe having at firſt ſuſpected thoſe unlooked-for white veſſels, which he took notice of in the meſentery of a dog diſſected alive, to be ſome irregular ramifications of nerves, he was much confirmed in his conjecture by the next dog he opened; for having diſſected him at an inconvenient diſtance of time from the dog's repaſt, the ſlender veſſels he looked for being deſtitute of the chyle, which is it, that makes them conſpicuous, did not appear. So that he had loſt the benefit of his firſt lucky obſervation, had not his ſagacity inclined him to ſuſpect, that if a dog was plentifully fed at a convenient diſtance of time before his being diſſected, the veſſel ſwelled with alimental juices would be the better diſcernible: whereupon, having feaſted another dog ſome hours before he opened him, he manifeſtly detected thoſe milky veſſels, whoſe diſcovery has ſince ſet anatomiſts ſo uſefully on work.

BUT, *Pyrophilus*, not to exceed the limits of an eſſay, I muſt not multiply inſtances of the contingencies of experiments, but content my ſelf to tell you in general, that in divers caſes ſuch circumſtances as are very difficult to be obſerved, or ſeem to be of no concernment to an experiment, may yet have a great influence on the event of it. If on either of the extremes or poles of a good armed load-ſtone, you leiſurely enough, or divers times, draw the back of a knife, which has not before received any magick influence, you may obſerve, that if the point of the blade have in this affriction been drawn from the middle of the æquator of the load-ſtone towards the pole of it, it will attract one of the extremes of an equilibrated magnetick needle; but if you take another knife, that has not been invigorated, and upon the ſelf-ſame extremity or pole of the load-ſtone thruſt the back of the knife from the pole towards the æquator, or middle of the load-ſtone, you ſhall find, that the point of the knife has, by this bare difference of poſition in the blade, whilſt it paſt upon the extreme of the load-ſtone, acquired ſo different a magnetick property, or polarity, from that, which was given to the former knife by the ſame pole of the load-ſtone, that it will not attract, but rather ſeem to repel or drive away that end of the magnetick needle, which was drawn by the point of the other knife. And this improbable experiment not only we have made

made trial of, by paſſing ſlender irons upon the extremities of armed load-ſtones, the breadth of whoſe ſteel-caps may make the experiment ſomewhat leſs ſtrange; but we have likewiſe tried it by affrictions of ſuch irons upon the pole of a naked terella, and we found it to ſucceed there likewiſe: how ſtrange ſoever it may ſeem, that the ſame point or part of the load-ſtone ſhould imbue iron with contrary properties, barely as they are, during their paſſing over it, drawn from the æquator of the load-ſtone, or thruſt towards it. But whether, or how far this obſervation inſinuates the operation of the load-ſtone to be chiefly performed by ſtreams of ſmall particles, which perpetually iſſuing out of one of its poles do wheel about and re-enter at the other; we ſhall not now examine, (though this ſeem one of the moſt likely phænomena we have met with, to hint a probable magnetical hypotheſis) contenting ourſelves to have manifeſted by what plainly appears, how much influence a circumſtance, which none but a magnetick philoſopher would take notice of, may have on an experiment. We have alſo, with pleaſure, obſerved, how artificers in the tempering of ſteel, by holding it but a minute or two longer or leſſer in the flame, (or other competent heat) do give it very differing tempers, as to brittleneſs or toughneſs, hardneſs or ſoftneſs: for as when it is taken out of the flame to be extinguiſhed, it looks either red, yellow or blue: ſo they eſteem and find it fit to make knives, engraving tools, or ſprings for watches, *&c.* and yet it paſſes from one colour to another ſo ſwiftly, that none but an artiſt expert in tempering of iron would ſuſpect, that ſo ſmall a difference of time of its ſtay in the flame could produce ſo great a difference in its tempers. On which occaſion, *Pyrophilus*, I call to mind, that making a while ſince ſome trials concerning gravers in the ſhop of a famous artificer, he preſented me, as a great rarity, a graver (which I yet keep) that would make the uſual experiments about tempering of gravers appear falſe to him, that ſhould never try them but upon it; for with all the care, wherewith I tried upon it the known ways of ſoftening gravers, I could not ſoften this: which men eminently ſkilled in theſe matters (together with the perſon, that made it) affirmed to have been made of *Damaſco*-ſteel, the ſtrength whereof in cutting iron I have (not without ſome wonder) made trial of. But whether this ſingularity, which we have mentioned in this graver, proceeded from the nature of the ſteel, or from the temper, that it had afterward given it, is not yet agreed upon by thoſe ſkilful men, to whom I have ſhewed it: but one of them, who by making inſtruments for navigators, has had the opportunity of making more than ordinary inquiry into matters of this nature, aſſures me, that he can eaſily ſoften this kind of ſteel, by only taking it off the fire at a certain nick of time, differing from that, which is wont to be obſerved in order to the ſoftening of common gravers. And who knows, but that in many other experiments, ſeemingly deſpicable and unheeded circumſtances may be of great concernment, though by reaſon of the want of ſuch particular obſervations, as the frequent dealing with the ſame body has given magnetick philoſophers and artificers occaſion to make, men have not yet taken notice of their importance?

To give you one inſtance to this purpoſe, *Pyrophilus*, let me take notice to you, that divers planters of fruit-trees have with wonder obſerved, that ſome grafts of cherry-trees, for example, have borne fruit the ſame year, that they were grafted, (nay, I have obſerved ſome plants to bear fruit the ſame quarter of the year) and others not till the year after their inſition, though neither in the goodneſs of the graft, nor in that of the ſtock, they had obſerved any diſparity, to which the difference above mentioned could be aſcribed; and therefore the bearing or not bearing of the cions of a cherry-tree the firſt year of its inſition is by many gardeners looked upon as a thing meerly contingent. And yet indeed it ſcarce deſerves to be reckoned among ſuch contingent experiments, as we have been hitherto treating of; for I am informed by the trials of more than one of the moſt ſkilful and experienced grafters of theſe parts, that a man ſhall ſeldom fail of having cherries borne by his graft the ſame year, in which the inſition is made, if he take care, that his graft, which muſt be of a good kind, have bloſſom-buds, as they are wont to be called, upon it: whereas if it were only leaf-buds, as they may be termed, it will not bear fruit till the ſecond ſeaſon. And this not being taken notice of by vulgar gardeners, makes them, as we have ſaid, impute a needleſs contingency to the fruitfulneſs of ſuch kind of grafts. Now to diſcern ſuch buds as are fit to produce bloſſoms, from ſuch as will diſplay themſelves but in leaves, is no difficult matter, the former ſort being more full, and big, and round than the latter, which are wont alſo to lie more flat and cloſe to the graft. And it was, *Pyrophilus*, ſuch obſervations as this, that induced us, after the beginning of the former eſſays, to diſcriminate from ſuch contingent experiments as thoſe, wherein the cauſe of the contingency is very abſtruſe and difficult to be diſcerned, ſuch other experiments, whoſe ſeeming contingency proceeds from more eaſily diſcoverable cauſes; for ſuch, by diligent obſervation of circumſtances, may be reduced to a greater certainty than the others ſeem capable of. Though I dare not deny, that even divers of thoſe contingent experiments, which to us yet ſeem to belong to the firſt ſort, by men's future ſkill and diligence in obſervation, may be made fit to be reduced to the ſecond ſort.

BEFORE I leave this ſubject, *Pyrophilus*, I dare not omit to ſay ſomething to you of the *Virgula Divina*, or rather *Divinatoria*, by which many mineraliſts pretend to diſcover the latent veins of metals. Some uſe a forked hazel, whoſe horns they hold by the ends one in each hand; and others content themſelves to chuſe a hazel rod (which ſome will have to be all of the ſame year's ſhoot) and this they bind on to another ſtreight ſtick of any other wood, and walking ſoftly with it over thoſe places, where they ſuſpect the bowels of the earth to be enriched

riched with metals, they ſay, that if they paſs over a metalline vein, the wand will, by bowing towards it, diſcover it. And ſome dealers in metals I know, who affirm, that by holding the metals ſucceſſively in that hand, wherein a man holds the rod, he may diſcover what determinate metal is predominant in the vein: for when he puts into his hand that metal, wherewith the mine chiefly abounds, the wand will manifeſtly bow more ſtrongly, than when it is held in the hand with any other metal. What to determine concerning the truth of this perplexing experiment, I confeſs I know not. For *Agricola* himſelf, after a long debate concerning it, gives us this account of his ſenſe; *Metallicus igitur* (ſays he) *quia eum virum bonum & gravem eſſe volumus, virgulâ incantatâ non utetur, quia rerum naturæ peritum & prudentem, furcatam ſibi uſui non eſſe, ſed, ut ſupra dixi, habet naturalia venarum ſigna, quæ obſervat.* The diligent *Kircherus* informs us in his *Arte Magneticâ*, that having exactly tried the experiment with metals, (for he mentions not his having tried it with mines,) he could not find it in any meaſure ſucceed; and we our ſelves having ſeveral times made trial of it in the preſence of the confidenteſt aſſertors of the truth of it, could not ſatisfy our ſelves, that the wand did really ſtand either to the metals, when placed under it, or to the metalline veins, when we carried it over mines, whence metalline ore was at that very time digging out. But on the other ſide, divers good authors, and even our diligent country-man *Gabriel Plat*, though wont to be ſomewhat too ſevere to chymiſts, does aſcribe very much to this detecting wand; and divers perſons, in other things very far from credulous, have as eye-witneſſes with great aſſeverations aſſerted the truth of the experiment before us: and one gentleman, who lives near the lead-mines in *Somerſetſhire*, leading me over thoſe parts of the mines, where we knew that metalline veins did run, made me take notice of the ſtooping of the wand, when he paſſed over a vein of ore, and proteſted, that the motion of his hand did not at all contribute to the inclination of the rod, but that ſometimes, when he held it very faſt, it would bend ſo ſtrongly as to break in his hand. And to convince me, that he believed himſelf, he did, upon the promiſes made him by his ſtooping wand, put himſelf to the great charge of digging in untried places for mines, (but with what ſucceſs he has not yet informed me.) Among the miners themſelves I found ſome made uſe of this wand, and others laughed at it. And this I muſt take notice of, as peculiar to this experiment, that the moſt knowing patrons of it confeſs, that in ſome men's hands it will not at all ſucceed, ſome hidden property in him that uſes the wand being able, as they ſay, to overpower and hinder its inclinatory virtue. To which I muſt add what a very famous chymiſt, who affirms himſelf to have tried many other things with it beſides thoſe that are commonly known, very ſolemnly profeſſed to me upon his own knowledge; namely, that in the hands of thoſe very perſons, in whoſe hands the rod will (as they ſpeak) work, there are certain unlucky hours, governed by ſuch planets and conſtellations, (which I confeſs I believed not enough to remember their names) during which it will not work, even in thoſe hands, wherein at other times it manifeſtly will. But of this experiment I muſt content my ſelf to ſay, what I am wont to do, when my opinion is aſked of thoſe things, which I dare not peremptorily reject, and yet am not convinced of; namely, that they that have ſeen them can much more reaſonably believe them, than they that have not.

De re metallica, lib. 20. p. 28.

Lib. 3. part 5. cap. 3.

NOR is it only in experiments, *Pyrophilus*, but in obſervations alſo, that much of contingency may be: witneſs the great variety in the number, magnitude, poſition, figure, *&c.* of the parts taken notice of by anatomical writers in their diſſections of that one ſubject the human body, about which many errors would have been delivered by anatomiſts, if the frequency of diſſections had not enabled them to diſcern betwixt thoſe things, that are generally and uniformly found in diſſected bodies, and thoſe which are but rarely, and (if I may ſo ſpeak) through ſome wantonneſs, or other deviation of nature, to be met with. I remember, that a while ſince being preſent at the diſſection of a luſty young thief, we had opportunity to obſerve, among other things, that the interval betwixt two of his ribs was near the back bone filled up with a thick bony ſubſtance, which ſeemed to be but an expanſion of the ribs, and appeared not to have grown there upon occaſion of any fracture, or other miſchance. About the ſame time being at a private diſſection of a large and young human body with ſome learned men, an ingenious perſon, profeſſor of anatomy, there preſent, chancing to cut a great nerve, ſpied in the ſubſtance of it a little of a very red liquor, which he immediately ſhewed me, as wondering what it might be: but I concluding it to be blood, preſently ſuſpected, that it might have proceeded from ſome ſmall unheeded drop of blood wiped off by the bruſhy ſubſtance of the nerve from the knife, wherewith it was cut. Wherefore carefully wiping a diſſected knife, I did in another place cut the nerve aſunder, and found another very little drop of pure blood in the ſubſtance of it as before. This I did again elſewhere with like ſucceſs, ſhewing it to the by-ſtanders, who admired to ſee a veſſel carrying blood (for ſuch they concluded it to be) in the body of a nerve, in regard they remembered not to have ever met with ſuch an accident; though I the leſs admire it, becauſe I have in an ox's eye or two obſerved in that coat, which the moderns commonly call the retina, and which ſeems to be but an expanſion of the pith of the optick nerve, little turgent veins manifeſtly full of blood.

WE further obſerved in that lately-mentioned body, in which we took notice of the irregular conjunction of two ribs, that the lungs, which were very ſound, had a ſupernumerary lobe on one ſide, which did ſo little differ from its companions, that we did not, till we had diſplayed the lungs, take notice of

it. And I remember, that a while before, being invited by a company of phyſicians to a private diſſection, and the lungs, which otherwiſe ſeemed not unſound, appearing in divers places faſtened to the ribs, two ingenious anatomiſts, that were there preſent, did ſo little agree in their obſervations concerning ſuch caſes, that the one affirmed, that he had never ſeen any lungs (which had not been exceſſively morbid) tied to the thorax; and the other proteſted, that he had ſcarce ever opened a diſeaſed body, wherein the lungs did not ſo adhere. But if it were not improper to mind a young gentleman of venereal obſervations, I could eaſily give you an eminent proof of the diſagreement of anatomical obſervators, by inſiſting on the controverſy betwixt the famous writers on that ſubject, concerning the anatomical notes or tokens of virginity; many eminent authors affirming, that they have ſeldom failed of finding them in one amongſt very many diſſected maids; and many other artiſts, both conſpicuous and experienced, preremptorily profeſſing, that they have ſeldom or never met with the pretended marks in perſons even of the moſt undoubted virginity. And certainly it is very ſtrange, that about a matter, which ſeems ſo eaſily determinable by ſenſe, accurate and ſober men ſhould ſo widely diſagree; as that the one ſhould profeſs he has very rarely, if ever, met with in a human body, what another affirmeth himſelf to have as ſeldom, if ever, miſſed. But becauſe, *Pyrophilus*, this ſubject is, perhaps, ſomewhat improper to be inſiſted on either to, or by, a young man, I ſhall paſs on to tell you, that amongſt the accurateſt of our modern writers, I ſuppoſe you will readily allow me to reckon Dr. *Harvey* and Dr. *Highmore*; and that though in their excellent treatiſes of generation they both inſiſt on the production and changes obſervable in hens eggs, as the patterns, whereunto the generation of other animals may be referred; yet have we divers, times, in the progreſs of nature in her formation of a chick, obſerved conſiderable variations in point of time and other circumſtances (though in the main our obſervations commonly agreed) from what is by them delivered: which diverſity may eaſily proceed from the differing conſtitution of hens, their differing aſſiduity in ſitting on their eggs, the differing qualifications of the eggs themſelves, and ſeveral other particulars of like nature. And I remember, that the other day taking notice of this to my learned friend Dr. *Highmore*, he readily acknowledged to me, that he himſelf had likewiſe obſerved divers circumſtances in eggs whilſt they were hatching, which varied from thoſe ſet down by him in his book; though he had there accurately expreſſed the changes he diſcerned in thoſe eggs, which at the ſame time afforded him his obſervations. And indeed there are certain things of ſuch a nature, that ſcarce any ſingle man's accurateneſs in making a ſingle obſervation about them can ſecure him from appearing unſkilful or unfaithful in his obſervations, unleſs thoſe, that ſhall afterwards examine them, chance to be endowed with a ſomewhat more than ordinary either equity, or ſagacity, or both. For inſtance, he that firſt affirmed, that a needle animated by a loadſtone did conſtantly convert its extremes to the oppoſite poles of the earth, could ſcarce ſuſpect himſelf of having delivered any thing, which he had not carefully tried. And yet of thoſe pilots, *Gonzales Oviedo* and *Sebaſtian Cabot*, (who are ſaid to have in *America* firſt taken notice of the declination of the mariner's needle) he that did firſt in thoſe far diſtant parts of the world compare the meridian line afforded by magnetical needles with one mathematically drawn, (which may be readily found by accurate ſun-dials,) and thereby obſerve the variation of the needle, or its declination from the true meridian line, might eaſily conclude the obſerver formerly mentioned to have been faulty, by reaſon of his finding the needle's variation differing (perhaps by divers degrees) from that delivered by the firſt obſerver. And this ſecond man's obſervation might appear to have been as careleſly made to a hundred other obſervers, if the obſervations of navigators had not made it apparent, that the declination of the needle is far from being the ſame in all places: for though *Cardan* (as *Kircher* and *Fracaſtorius*, as another informs us) be pleaſed to affirm, that the loadſtone declines as many degrees, as the pole-ſtar is diſtant from the pole of the world; yet beſides divers reaſons, common experience ſufficiently manifeſts the inconſiderableneſs (not to ſpeak more harſhly) of that aſſertion. For about the iſlands of the *Azores*, eſpecially that of *Corvo*, over which the firſt meridian is by many ſuppoſed to paſs, the magnetick needle hath been obſerved directly to reſpect the poles, without any ſenſible declination from them; but in other places it is wont to vary ſometimes eaſtward, ſometimes weſtward, more or leſs. Inſomuch that not only our venturous countryman Captain *Thomas James* obſerved it in 63 degrees north-latitude to be no leſs than 27 degrees, 48 minutes; but a learned mathematical writer, that is lately come forth, makes the declination at the *Fretum Davis* to amount to, what is almoſt incredible, 50 degrees. And this deflexion of the needle ſometimes to one ſide of the meridian, ſometimes to the other, happens with ſo much ſeeming irregularity, as has made both the diligent *Kircher* himſelf, and divers other magnetick writers, almoſt deſpair of reducing theſe kind of obſervations to any general hypotheſis.

Fourn'er Hydr. l. 11. *c.* 11.

In the Table annexed to his voyage.

To which we may add, that perhaps very few even of the exacteſt obſervations of this nature made an age ſince, would now appear accurate to them, that ſhould try them in the ſelf-ſame places wherein, and the ſelf ſame manner after which they were formerly made. So that the diligenteſt of thoſe obſervers would appear to us to have been negligent, if the ſagacity of ſome of their ſucceeders had not prompted them to ſuſpect, that even in the ſame place the needle's variation may vary. And I remember, that having not long ſince inquired of an Engliſh contriver of mathematical inſtruments for the uſe of ſeamen, what he had obſerved concerning this alteration of the needle's

variation, he told me, that by comparing of ancient and modern obſervations made by himſelf and other accurate mathematicians at *London*, he had found the declination conſtantly to decreaſe, and, as he conjectured, about 12 or 13 minutes (though that methinks be much) in a year. And it will be yet more difficult to ſet down any obſervation of this nature, which will appear exact to poſterity, if that ſtrange thing be true (as it may well be) which was related to *Kircher* by a friend of his, who affirms himſelf to have obſerved a notable change of the needle's variation at *Naples*, after a great *incendium* of the neighbouring mountain *Veſuvius*; which alteration he not abſurdly ſuſpects to have proceeded from the very great change made in the neighbouring ſubterraneal parts by that great conflagration. And it ſeems the ſame obſervation has been taken notice of by mathematicians elſewhere. For the learned Jeſuit *Fournier* in his French hydrography tells us in more general terms, that ſince the *incendiums* of *Veſuvius* the declination (of the needle) has notably changed in the kingdom of *Naples*. The ſame author ſomewhere delivers what (if it be true) is remarkable to our preſent purpoſe, in theſe words: 'There are perſons, who have obſerved, that the 'ſame needle, that declined 5 degrees upon the 'ſurface of the earth, being carried down very 'low into certain caves, declined quite other-'wiſe.' I added thoſe words, *if it be true*, not to queſtion the veracity of the author, but becauſe it is very poſſible the makers of the obſervation (though learned men) may have been miſtaken in it, without ſuſpecting themſelves in danger of being ſo. For I ſhould ſcarce have imagined, unleſs my own particular obſervation had informed me, in how great a variety of ſtones and other foſſiles the ore of iron may lurk diſguiſed: ſo that it is no way incredible, that knowing chymiſts themſelves, and much more mathematicians and others, not being aware of the obſervation of what I have newly delivered, may preſume, becauſe they ſaw not in the deep caves above mentioned any minerals like the vulgar iron ore, that there is nothing of that metal there, when indeed there may be enough to occaſion that deflexion of the needle; which (eſpecially if it be ſtrongly excited) may be often drawn aſide by iron or other magnetick bodies, at a greater diſtance than thoſe, that have not tried, will be apt to ſuſpect. Which may perhaps be the reaſon, why in the little iſland of *Ilva* (upon the coaſt of *Italy*) where they dig up iron and ſtore of loadſtones, of which I have ſeen in *Tuſcany* of a prodigious bigneſs, there is in different, but neighbouring places, ſuch a ſtrange diſparity of the needle's variation as curious men have recorded.

Book II. *chap.* 10.

NOR are magnetical and anatomical obſervations the only ones, which are ſubject to diſagree now and then, without the negligence of thoſe that make them: but I want time, and I fear you would want patience, to conſider at preſent as many of them, as might be eaſily enumerated to you.

I SUPPOSE, *Pyrophilus*, you may have obſerved, how I in the paſt diſcourſe have forborn to inſiſt on medicinal experiments; which I have purpoſely done, becauſe they are ſo many, and almoſt all of them ſubject to ſuch uncertainties, that to inſiſt on them would require much more time, than my occaſions will allow me to ſpend upon this eſſay. And indeed in phyſick it is much more difficult than moſt men can imagine, to make an accurate experiment: for oftentimes the ſame diſeaſe proceeding in ſeveral perſons from quite differing cauſes, will be increaſed in one by the ſame remedy by which it has been cured in another. And not only the conſtitutions of patients may as much alter the effects of remedies, as the cauſes of diſeaſes; but even in the ſame patient, and the ſame diſeaſe, the ſingle circumſtance of time may have almoſt as great an operation upon the ſucceſs of a medicine, as either of the two former particulars; as we may elſewhere have occaſion by ſundry inſtances to manifeſt. But beſides the general uncertainty, to which moſt remedies are ſubject, there are ſome few, that ſeem obnoxious to contingencies of a peculiar nature: ſuch is the ſympathetick powder, of which not only divers phyſicians and other ſober perſons have aſſured me they had ſucceſsfully made trial, but we our ſelves have thought, that we were eye-witneſſes of the operation of it; and yet not only many, that have tried it, have not found it anſwer expectation, but we our ſelves trying ſome of our own preparing on our ſelves, have found it ineffectual, and unable to ſtop ſo much as a bleeding at the noſe; though upon application of it a little before, we had ſeen ſuch a bleeding, though violent, ſuddenly ſtopped in a perſon, who was ſo far from contributing by his imagination to the effect of the powder, that he derided thoſe, that he ſaw apply it to ſome of the drops of his blood. Wherefore that the ſympathetick powder and the weapon-ſalve are never of any efficacy at all, I dare not affirm; but that they conſtantly perform what is promiſed of them, I muſt leave others to believe. But making mention of remedies of this nature, though I am willing, *Pyrophilus*, to put a period both to your trouble and my own, yet I muſt not omit to tell you, that whereas the pæony-root has been much commended both by ancient and modern phyſicians of no mean account, as an amulet againſt the falling-ſickneſs, and yet has been by many found ineffectual; we have been apt to ſuſpect, that its inefficacy, if it be but infrequent, might poſſibly proceed from its having been unſeaſonably gathered: and when I was laſt in the weſt of *Ireland*, acquainting the eminenteſt of the Galeniſts there with my conjecture, he confirmed me in it, by aſſuring me, that he had often tried the pæony-root unſeaſonably gathered without ſucceſs; but having lately gathered it under its proper conſtellation, as they ſpeak, (which is when the decreaſing moon paſſes under *Aries*) and tied the ſlit root about the necks and arms of his patients, he had freed more than one, whom he named to me, from epileptical fits. Agreeable whereunto I find, that a famous phyſician of *Grenoble*, Monſieur *des Grands Prez*, in the laſt of his obſervations

communicated to the famous practical phyſician *Riverius*, ſolemnly profeſſes his having divers times freed his patients from the falling-ſickneſs by the ſingle outward application of pæony-roots, collected and applied as is above-mentioned. But though he thence infers the uſefulneſs of obſerving ſtars in the practice of phyſick, yet before much weight be laid upon ſuch improbable notions, as moſt of thoſe of judiciary aſtrologers, the influence of conſtellations upon ſimples, *&c.* ought by ſevere and competent experiments to be better made out than hitherto it has been.

But to ſay no more of the contingent obſervations to be taken notice of in trials medical, I could tell you, that I have obſerved even mathematical writers themſelves to deliver ſuch obſervations as do not regularly hold true. For though it hath been looked upon as their privilege and glory to affirm nothing, but what they can prove by no leſs than demonſtration; and though they uſed to be more attentive and exact, than moſt other men in making almoſt any kind of philoſophical obſervation: yet the certainty and accurateneſs, which is attributed to what they deliver, muſt be reſtrained to what they teach concerning thoſe purely-mathematical diſciplines, arithmetick and geometry, where the affections of quantity are abſtractedly conſidered: but we muſt not expect from mathematicians the ſame accurateneſs, when they deliver obſervations concerning ſuch things, wherein it is not only quantity and figure, but matter, and its other affections, that muſt be conſidered. And yet leſs muſt this be expected, when they deliver ſuch obſervations, as, being made by the help of material inſtruments framed by the hands and tools of men, cannot but in divers caſes be ſubject to ſome, if not many, imperfections upon their account. Divers of the modern aſtronomers have ſo written of the ſpots and more ſhining parts or (as they call them) *Faculæ*, that appear upon or about the ſurface of the ſun, as to make their readers preſume, that at leaſt ſome of them are almoſt always to be ſeen there. And I am willing to think, that it was their having ſo often met with ſuch phænomena in the ſun, that made them write as they did. And yet when I firſt applied my ſelf to the contemplation of theſe late diſcoveries, though I wanted neither good teleſcopes, nor a dark room to bring the ſpecies of the ſun into, yet it was not till after a great while, and a multitude of fruitleſs obſervations made at ſeveral times, that I could detect any of theſe ſolary ſpots, which having during many months at leaſt appeared ſo much ſeldomer than it ſeems they did before, that I remember a moſt ingenious profeſſor of aſtronomy, excellently well furniſhed with dioptrical glaſſes, did about that time complain to me, that for I know not how long he had not been able to ſee the ſun ſpotted. And as for the *Faculæ*, that are written of, as ſuch ordinary phænomena, I muſt profeſs to you, *Pyrophilus*, that a multitude of obſervations made with good teleſcopes, at ſeveral places and times whilſt the ſun was ſpotted, has ſcarce made me ſee above once any of the looked for brightneſſes.

And as the nature of the material objects, wherewith the mathematician is converſant, may thus deceive the expectations grounded on what he delivers; ſo may the like happen by reaſon of the imperfection of the inſtruments, which he muſt make uſe of in the ſenſible obſervations, whereon the mixed mathematicks (as aſtronomy, geography, opticks, *&c.*) are in great part built. This is but too manifeſt in the diſagreeing ſupputations, that famous writers, as well modern as ancient, have given us of the circuit of the terreſtrial globe, of the diſtance and bigneſs of the fixed ſtars and ſome of the planets, nay, and of the height of mountains: which diſagreement, as it may oftentimes proceed from the differing method and unequal ſkill of the ſeveral obſervers, ſo it may in divers caſes be imputed to the greater or leſs exactneſs and manageableneſs of the inſtruments employed by them. And on this occaſion I cannot omit that ſober confeſſion and advertiſement, that I met with in the noble *Tycho*, who having laid out, beſides his time and induſtry, much greater ſums of money on inſtruments than, any man we have heard of in latter times, deſerves to be liſtened to on this theme, concerning which he has (among other things) the following paſſage: *Facilè* (ſays he) *lapſus aliquis penè inſenſibilis in inſtrumentis etiam majoribus conficiendis ſubrepit, qui inter obſervandum aliquot ſcrupulorum primorum jacturam faciat; inſuper ſi ipſe ſitus & tractandi modus non tam abſoluta norma perficiatur, ut nihil prorſus deſideretur, intolerabilis nec facilè animadvertenda deviatio ſeſe inſinuat. Adde quod inſtrumenta uſu & ætate à prima perfectione degenerent. Nihil enim, quod hominum manibus paratur, ab omni mutatione undiquaque exiſtit. Organa enim ejuſcemodi, niſi è ſolido metallo affabre elaborentur, mutationi aëreæ obnoxia ſunt; & ſi id quoque detur, ut è metallica materia conſtent, niſi ingentia fuerint, diviſiones minutiſſimas graduum non ſufficienter exhibent; dumque hoc præſtant, ſua magnitudine & pondere ſe ipſa ita aggravant, ut facile tum extra planum debitum aut figuram competentem, dum circumducuntur, declinent, tum etiam ſua mole intractabilia redduntur. Quare magis requiritur in inſtrumentis aſtronomicis, quæ omni vitio careant conſtruendis, artificium pari judicio conjunctum, quam hactenus à quamplurimis animadverſum eſt. Id quod nos ipſe uſus longaque docuit experientia, non parvo labore nec mediocribus ſumptibus comparata.*

Tycho Brahe, *l.* 2. *de Cometâ An.* 1577. *p.* 133.

Hitherto our noble author. And as for the obſervations made at ſea, the diligent *Fournier* advertiſes, that however many ſea-captains and others may brag of their mathematical obſervations made on ſhip-board, yet he, upon trial of many inſtruments both at ſea and aſhore, makes bold to affirm, that no aſtronomer in the world can be ſure to make his obſervation at ſea within ten minutes of the preciſe truth, no not (ſays he) upon the ſand it ſelf, within one minute of it.

But inſtead of acquainting you with what may be drawn from the writings of our hydrographer,

grapher, to prove, that his aſſertion is rather modeſt than too bold, I ſhall obſerve, that the obſervations even of ſkilful mathematicians may hold ſo little, or diſagree ſo much, when they pretend to give us the determinate meaſures of things, that I remember of three very eminent modern mathematicians, who have taken upon them, by their experiments, to determine the proportion betwixt air and water, the one makes not the weight of water to exceed above 150 times that of air; the other reckons water to be between 13 and 14 hundred times; and the third no leſs than 10,000 times the heavier. Not to mention a modern and famous writer or two, who have been ſo miſtaken as to think, that the weight of the water in compariſon of the air is I know not how much under-reckoned, even by this laſt (overbold) eſtimate. And, if I had leiſure, I could annex an experiment partly ſtatical, and relating to the weight of the air, which though we made divers times in an hour, yet we miſſed of the like ſucceſs twice as often in the ſame hour, without being able to know before-hand, whether the experiment would ſucceed within ſome pounds weight. But of this more perhaps elſewhere.

THE ends, *Pyrophilus*, which we have propoſed to our ſelves in ſetting down the things by us delivered in this and the former eſſay, are principally two.

AND firſt, we deſire, that the inſtances we have given you of the contingency of experiments, may make you think your ſelf obliged to try thoſe experiments very carefully, and more than once, upon which you mean to build conſiderable ſuperſtructures either theorical or practical; and to think it unſafe to rely too much upon ſingle experiments, eſpecially when you have to deal in minerals: for many to their ruin have found, that what they at firſt looked upon as a happy mineral experiment, has proved in the iſſue the moſt unfortunate they ever made. And I remember, that the moſt experienced mineraliſt I have hitherto been acquainted with, though his ſkill has been rather gainful then prejudicial to him, has very ſeriouſly told me, that he could quickly grow an extraordinary rich man, if he could but do conſtantly whatſoever he has done, not only two or three, but many times.

THE other end, *Pyrophilus*, to which I had an eye in writing the paſt diſcourſes, was, that they may ſerve for a kind of apology for ſober and experimental writers, in caſe you ſhould not always upon trial find the experiments or obſervations by them delivered anſwer your expectations. And indeed it would prove a great diſcouragement to wary and conſiderate naturaliſts from enriching the world with their obſervations, if they ſhould find, that their faithfulneſs in ſetting down what they obſerved is not able to protect them from blaſting imputations of falſhood, but that by publiſhing any thing for the good of others, they muſt expoſe their reputation to all the uncertainties, to which any of their experiments may chance to prove obnoxious. It is true indeed, that if a writer be wont to be fabulous or tranſcriptive, and to deliver things confidently by hear-ſay, without telling his readers when he does ſo; if his experiments upon trial ſucceed not, we may be allowed to impute their unſucceſsfulneſs rather to him, than to our ſelves, or to chance, and need not think our ſelves obliged to have ſo much a greater care of his reputation, than he had of his own, as for his ſake to try more than once, what he for our ſakes never tried ſo much as once. But if an author, that is wont to deliver things upon his own knowledge, and ſhews himſelf careful not to be deceived, and unwilling to deceive his readers, ſhall deliver any thing, as having tried or ſeen it, which yet agrees not with our trials of it; I think it but a piece of equity, becoming both a Chriſtian and a philoſopher, to think (unleſs we have ſome manifeſt reaſon to the contrary) that he ſet down his experiment or obſervation as he made it, though for ſome latent reaſon it does not conſtantly hold; and that therefore though his experiment be not to be relied upon, yet his ſincerity is not to be rejected. Nay, if the author be ſuch an one, as has intentionally and really deſerved well of mankind, for my part I can be ſo grateful to him, as not only to forbear to diſtruſt his veracity, as if he had not done or ſeen what he ſays he did or ſaw, but to forbear to reject his experiments, till I have tried, whether or no by ſome change of circumſtances they may not be brought to ſucceed. Thus a while ſince finding in Sir *Francis Bacon*, that he delivers as a ſomewhat unlikely truth, that ſpirit of wine will ſwim upon oil (of almonds) we forthwith made trial of it, but found the oil ſwim upon the ſpirit of wine, and this upon ſeveral trials before witneſſes: but our tenderneſs of the reputation of ſo great and ſo candid a philoſopher made us to bethink our ſelves, that (though he mentions it not, nor perhaps thought of any ſuch thing, yet) poſſibly he may have uſed ſpirit of wine more pure than ordinary; and thereupon having provided ſome that was well rectified, we found, that the oil, that was wont to ſwim upon ſpirit of wine, not freed from its aqueous parts, did readily ſink, and quietly lie in the bottom of that, which was carefully dephlegmed. And ſo having been informed, that the learned Dr. *Brown* ſomewhere delivers, that aqua fortis will quickly coagulate common oil, we poured ſome of thoſe liquors together, and let them ſtand for a conſiderable ſpace of time in an open veſſel, without finding in the oil the change by him promiſed, (though we have more than once with another liquor preſently thickened common oil.) Whereupon being unwilling, that ſo faithful and candid a naturaliſt ſhould appear fit to be diſtruſted, we did again make the trial with freſh oil and aqua fortis in a long-necked phial left open at the top, which we kept both in a cool place, and after in a digeſting furnace; but after ſome weeks we found no other alteration in the oil, than that it had acquired a high and lovely tincture: notwithſtanding which, being ſtill concerned for the reputation of a perſon, that ſo well deſerves a good one, the like contingencies we have

formerly

formerly met with in other experiments, made us willing to try, whether or no the unſucceſsfulneſs we have related might not proceed from ſome peculiar though latent quality, either in the aqua fortis or the oil by us formerly employed: whereupon changing thoſe liquors, and repeating the experiment, we found after ſome hours the oil coagulated almoſt into the form of a whitiſh butter. Nor dare I allow my ſelf to be confident, that I ſhall not need to be dealt with by you upon ſome occaſions, with the like equity, that I have been careful to expreſs towards others. And ſince the writing of thus much of this very eſſay, having deſired a very ſkilful and candid chymiſt to do me the favour to provide me ſome of the pureſt and ſtrongeſt ſpirit of ſalt, that could be made; he kept ſome ſalt in a vehement fire for divers days and nights together, and freed the extracted liquor ſo carefully and ſo ſkilfully both from its phlegm and its terreſtrial fæces, that after all I have written in the former eſſay concerning that menſtruum, I muſt freely confeſs to you, that I am now ſatisfied, that a ſpirit of ſea-ſalt may without any unſincerity be ſo prepared, as to diſſolve the body of crude gold, though I could not find, that the ſolutions I made of that metal were red, but rather of a yellow or golden colour, much like thoſe made with common aqua regis. But neither this artiſt nor I have been ſince able to make another ſpirit of ſalt capable of diſſolving gold, notwithſtanding all the induſtry we have employed about it; which makes me refer this to contingent experiments; unleſs the proſperous event of our former trial may be aſcribed to the quality of the ſalt, that was diſtilled, which was brought from the iſland of *Mayo*, where the ſcorching ſun makes out of the ſea-water a ſalt, that is accounted much ſtronger and more ſpirituous than that, which is wont to be made in *France* and other more temperate climates. And let me, *Pyrophilus*, take this opportunity to add, that if I had not very cautiouſly ſet down the obſervation I related in another eſſay * concerning the little fiſhes or worms I there teach you to diſcover in vinegar, I ſhould perhaps need much of your equity, to keep me from being thought to have impoſed upon you in what I there delivered. For I have ſince met with divers parcels of vinegar, wherein the obſervation could not be made, for one wherein it held; ſo that I am glad to keep by me ſome vinegar ſtocked with thoſe ſcarce viſible animals, to ſatisfy ingenious men, among whom ſome have been fain, after their own fruitleſs trials, to come to me to ſhow them the things delivered in that obſervation. What I mentioned a little above to have been tried upon ſallet-oil, puts me in mind of telling you, that among our experiments concerning the changes of colours, we were about to acquaint you with one, which we had formerly made upon common oil-olive, it ſeeming to us a not inconſiderable one; ſince it was a way, that we deviſed, of inſtantly changing the colour of the oil from a pale yellow to a deep red, with a few drops of a liquor, that was not red, but almoſt colourleſs. This experiment, as we were ſaying, *Pyrophilus*, we were about to ſet down among others concerning colours: but becauſe we do not willingly rely on a ſingle trial of ſuch things, as we know not to have been ever tried before, we thought it not amiſs for greater ſecurity to make the experiment the ſecond time, but could not then find it to ſucceed, nor even ſince upon a new trial (probably by reaſon of ſome peculiar quality in that particular parcel of liquor we firſt made uſe of) which made us think fit to omit the intended mention of it: but if I had upon my firſt trial acquainted you with it without any further ſcruple, you might upon trial have ſuſpected, if not concluded, that I had miſ-informed you, though I had really delivered nothing but what I had tried. And indeed, *Pyrophilus*, though I have not the vanity to pretend to have deſerved ſo much of you, as ſuch naturaliſts as Sir *Francis Bacon* have deſerved from every ingenious reader of their books; yet perhaps you will do me but right to believe, that though ſome of the experiments I have delivered may prove contingent, yet I have not delivered them unfaithfully, in reference to what I thought I obſerved in them, and remembered of them. And though I deſire you ſhould ſo read my writings, as to give no farther aſſent to my opinions, than the reaſons or experiments produced on their behalf require; yet in matters of fact, which I deliver as having tried or ſeen them, I am very willing you ſhould think, that I may have had the weakneſs to be miſtaken, but not an intention to deceive you.

THERE is yet one thing more, that I ſhall venture to acquaint you with before I conclude this eſſay, though you may think it reliſhes of a paradox, and it is this: that when I am ſatisfied of the abilities and circumſpection of a writer, delivering a matter of fact as upon his own knowledge; I do not preſently reject his obſervation as untrue, much leſs condemn the perſon himſelf as a lyar, whenſoever I find, that it ſeems to be contradicted by a contrary and more undoubted obſervation, or to contradict a received and plauſible either hypotheſis or tradition; but rather try, if by fit diſtinction or limitation I can reconcile them; unleſs I can imagine ſomething or other, which might probably lead him to miſtake. And of this indulgence to an intelligent writer I have this reaſon to give, that ſometimes there happen irregularities contrary to the uſual courſe of things, as is evident in monſters; and ſometimes the received hypotheſis, though perhaps not to be rejected as to the main, will not hold ſo univerſally as men preſume; and ſometimes too the contradiction betwixt the obſervations may be but ſeeming, (by reaſon of the want of ſome unheeded circumſtance neceſſary to make them inconſiſtent) and ſo they may both be true.

WE might dilucidate and confirm what we have newly delivered by ſeveral inſtances, were it not, that this eſſay is already but too prolix. Wherefore we ſhall only recommend to your conſideration theſe few particulars.

THAT the Iriſh ſpiders (of which, what-

* This is one of thoſe, that make up the book of the uſefulneſs of *Experimental Philoſophy*.

ever is vulgarly believed to the contrary, my ſelf have in *Ireland* ſeen divers) are not poiſonous, is not doubted by the inhabitants, who have had many ages experience of their harmleſſneſs: and yet I dare not deny what the learned *Scaliger* ſomewhere affirms, that in (his country, if I miſ-remember not) *Gaſcony* their venom is ſo pernicious, that they ſometimes poiſon thoſe that tread upon them through the very ſoles of their ſhoes. And that even here in *England* (though a country ſo near to *Ireland*) ſome ſpiders (at leaſt) are venomous even without biting, I may elſewhere have occaſion to give you an experimental proof.

IT is ſo much taken for granted by divers authors, who pretend likewiſe to give reaſons of it, and by the generality of their readers, that under the ſame meridian the magnetick needle keeps every where the ſame variation, without changing it by being carried northwards or ſouthwards, that it is like, if many perſons better acquainted with magnetick ſpeculations than trials ſhould read in the relations of the Hollanders, that under the meridian, that paſſes by the iſland of *Corvo*, where the needle points directly at the poles, and which is therefore wont to be reckoned the firſt meridian, they found at two places, the one about 46, the other about 55 degrees of northern latitude, a declination in the former of thoſe elevations of no leſs than 7 or 8 degrees, and in the latter of a far greater number; and alſo that they found under the twentieth parallel of ſouthern latitude under the ſame meridian of the *Azores* 10 or 11 degrees of declination; many, I ſay, if they ſhould meet with theſe particulars, probably would ſuppoſe the Dutch to have been very bad obſervers, becauſe theſe obſervations do not (as we intimated above) agree with the theory of the needle's declination. And yet if we confer theſe obſervations with others of the like nature, made by good navigators and other ſkilful men along other meridians, we may, I ſuppoſe, find cauſe rather to rectify the general opinion, than reject the Dutch obſervations for their diſagreeing with it; eſpecially if we take into conſideration what is affirmed by the Jeſuit *Jules Alenis* (whom *Fournier*, amply treating of longitudes, extols for the accurateſt obſerver of the needle's variation that ever was) ſailing into *China* in a great Portugal carraque, and accompanied by the famous pilot *Vincent Rodrique*, who had then made twenty-eight voyages to the *Indies*. For out of one of this father's letters *Fournier* has preſerved this memorable paſſage; 'You muſt (ſays he) take 'notice of one thing very conſiderable, name- 'ly, that the further you go from the æquator 'in the ſame meridian, the greater you will 'find the magnetical variation.' There are ſome eminent modern naturaliſts, who affirm, that they have aſſuredly tried by weather-glaſſes, that cellars and other ſubterraneal places are colder in winter than in ſummer: and yet not to oppoſe to this experiment the common tradition to the contrary, I remember, that the bold and induſtrious Capt. *James* (formerly mentioned) in the relation of his ſtrange voyage publiſhed by his late Majeſty's command, has this notable obſervation, where he relates the exceſſive coldneſs of the water they met with in ſummer in that icy region, where they were forced to winter in the year 1632. 'Moreover 'our well (ſays he) out of which we had wa- 'ter in *December*, had none in *July*.'

De la Longitude, c. 34.

LASTLY, Though in the weſtern parts it have been obſerved, that generally the inſide, or heart, as they call it, of trees, is harder than the outward parts; yet an author, very well verſed in ſuch matters, treating of the building of ſhips, gives it us for a very important advertiſement touching that matter, that they have obſerved at *Marſeilles*, and all along the Levantine ſhores, that that part of the wood, that is next the bark, is ſtronger than that, which makes the heart of the tree. But to draw at length to a concluſion of this already too tedious eſſay; the ends above mentioned, *Pyrophilus*, being thoſe, which I propoſed to my ſelf in writing the paſt diſcourſe, you will make an uſe of it, which I was very far from intending you ſhould, if you ſuffer it to diſcourage you from the vigorous proſecution of your inquiries into experimental knowledge. Nor indeed is any thing, that hath been ſaid, fit to perſuade you to other than watchfulneſs in obſerving experiments, and warineſs in relying on them; but not at all to ſuch a deſpondency of mind, as may make you forbear the proſecution of them: for neither doth the phyſician renounce his profeſſion, becauſe divers of the patients he ſtrives to cure are not freed from their diſeaſes by his medicines, but by death; nor doth the painful huſbandman forſake his cultivating of the ground, though ſometimes an unſeaſonable ſtorm or flood ſpoils his harveſt, and deprives him of the expected fruit of his long toils. For as in phyſick and huſbandry, thoſe, that exerciſe them, are kept from deſerting their profeſſions, by finding, that though they ſometimes miſs of their ends, yet they oftentimes attain them, and are by their ſucceſſes requited not only for thoſe endeavours that ſucceed, but for thoſe that were loſt; ſo ought we not by the contingencies incident to experimental attempts, to be deterred from making them, becauſe not only there are many experiments ſcarce ever obnoxious to caſualties, but even among thoſe, whoſe event is not ſo certain, you may very probably make an experiment very often, without meeting with any of thoſe unlucky accidents, which have the power to make ſuch experiments miſcarry. And ſure the proſperous ſucceſs of many ſucceeding attempts is well able to make amends for the fruitleſs pains employed on thoſe few, that ſucceed not; eſpecially ſince in experiments it not unfrequently happens, that even when we find not what we ſeek, we find ſomething as well worth ſeeking as what we miſſed. Of this laſt mentioned truth we may elſewhere have occaſion to diſcourſe more largely; and therefore ſhall now conclude with barely minding you, that even merchants themſelves are not wont to quit their profeſſion, becauſe now and then they loſe a veſſel at ſea, and oft-times their ſhips are by contrary winds and other accidents forced to put in at other ports than thoſe they were bound for. Which

Fourn. Architecture Navale, c. 22.

example

example I the rather make uſe of, becauſe that as the American navigators employed by the European merchants, having been by ſtorms forced from their intended courſe, have been ſometimes thereby driven upon unknown coaſts, and have made diſcovery of new regions much more advantageous to them, than the faireſt and conſtanteſt winds and weather could have been; ſo in philoſophical trials, thoſe unexpected accidents, that defeat our endeavours, do ſometimes caſt us upon new diſcoveries of much greater advantage, than the wonted and expected ſucceſs of the attempted experiment would have proved to us.

SOME

SPECIMENS of an Attempt

To make CHYMICAL EXPERIMENTS uſeful to illuſtrate the notions of the CORPUSCULAR PHILOSOPHY.

THE PREFACE,

Giving an account of the two following treatiſes, and propoſing the deſirableneſs of a good intelligence betwixt the Corpuſcularian Philoſophers and the Chymiſts.

THERE are many learned men, who being acquainted with chymiſtry but by report, have from the illiterateneſs, the arrogance and the impoſtures of too many of thoſe, that pretend ſkill in it, taken occaſion to entertain ſo ill an opinion, as well of the art, as of thoſe that profeſs it, that they are apt to repine, when they ſee any perſon, capable of ſucceeding in the ſtudy of ſolid philoſophy, addict himſelf to an art they judge ſo much below a philoſopher, and ſo unſerviceable to him: nay, there are ſome, that are troubled when they ſee a man, acquainted with other learning, countenance by his example ſooty empiricks, and a ſtudy, which they ſcarce think fit for any but ſuch, as are unfit for the rational and uſeful parts of phyſiology. I now take notice of theſe things, becauſe they gave occaſion to the two following treatiſes. For perceiving divers years ago, that ſome learned men of the temper above deſcribed thought it ſtrange (if not amiſs alſo) that one, of whoſe ſtudies they were pleaſed to have too favourable an expectation, ſhould ſpend upon chymical trials (to which I then happened to be invited by the opportunity of ſome furnaces and leiſure) much of thoſe endeavours, which they ſeemed to think might be far more uſefully employed, than upon ſuch an empty and deceitful ſtudy: perceiving this, I ſay, I thought it not amiſs to endeavour to manifeſt, that without ſeeking after the elixir, that alchymiſts generally hope and toil for, (but which they, that knew me, knew to be not at all in my aim) I did not in the proſecution of chymical trials do any thing either without an end, or unſuitable to the deſign I had of attempting to promote men's knowledge of the works of nature, as well as their power over them. In order to this, I did not think it enough to ſhew, that by an inſight into chymiſtry one may be enabled to make ſome meliorations (I ſpeak not of * tranſmutations) of mineral and metalline bodies, and many excellent medicines for the health of men, beſides divers other preparations of good uſe in particular trades, and in ſeveral occurrences of human life; I did not, I ſay, think it enough to do this, becauſe, that though this might ſuffice to evince that a rational man might without loſing his time employ ſome of it to underſtand and promote chymiſtry; yet this would ſcarce ſuffice to manifeſt it to be uſeful to philoſophy. And therefore there ſeemed requiſite ſome ſpecimens, which might ſhew that chymical experiments might be very aſſiſtant even to the ſpeculative naturaliſt in his contemplations and inquiries.

BUT againſt my attempting any thing of this nature, three difficulties oppoſed themſelves. The firſt was the want of leiſure, in regard I was already pre-engaged to write of other ſubjects, and to proſecute ſome experiments, whoſe event I was concerned to know. Another impediment was, that for other reaſons elſewhere mentioned, and chiefly to keep my judgment as unprepoſſeſſed as might be with any of the modern theories of philoſophy, till I were provided of experiments to help me to judge of them; I had purpoſely refrained from acquainting myſelf thoroughly with the intire ſyſtem of either the Atomical, or the Carteſian, or any other whether new or revived philoſophy; and therefore I could ſcarce be fit to ſhew, how chymical experiments might illuſtrate their doctrines. And thirdly, ſome of thoſe learned men, for whom I was to write, more favouring the Epicurean, and others (though but a few) being

* See the *Eſſay of the Uſefulneſs of Chymiſtry* in Sect. II. Part I. *Of the Uſefulneſs of E. P.*

being more inclinable to the Carteſian opinions, it ſeemed very difficult to gratify by the ſame compoſures perſons of differing perſuaſions.

But as to the firſt of theſe diſcouragements, ſince my pre-engagements to other themes were not unknown to thoſe, for whom I was to write, it might reaſonably be preſumed they would over-look ſuch unaccurateneſs as ſhould appear imputable to haſte: and beſides, ſome ſuch ſubject might be choſen to write of, as would conveniently admit enlargements and additions, according as my leiſure ſhould afterwards ſerve me to annex them.

On occaſion of the ſecond impediment, I remembered, that having divers years before read the lives of the Atomical, among other philoſophers, in *Diogenes Laertius*; and having ſometimes occaſionally heard mention made of divers Epicurean and Carteſian notions, and having hence framed to my ſelf ſome general, though but imperfect, idea of the way of philoſophizing my friends eſteemed; I thought I might, without a more particular explicit inquiry into it, ſay ſomething to illuſtrate ſome notions of it, by making choice of ſuch, as, being of the more ſimple and obvious, did not require ſkill in the more myſterious points of the hypotheſis they belonged to.

And as for the laſt of the three diſcouragements abovementioned, I conſidered, that the Atomical and Carteſian hypotheſes, though they differed in ſome material points from one another, yet in oppoſition to the Peripatetick and other vulgar doctrines they might be looked upon as one philoſophy: for they agree with one another, and differ from the ſchools in this grand and fundamental point, that not only they take care to explicate things intelligibly; but that whereas thoſe other philoſophers give only a general and ſuperficial account of the phænomena of nature from certain ſubſtantial forms, which the moſt ingenious among themſelves confeſs to be incomprehenſible, and certain real qualities, which knowing men of other perſuaſions think to be likewiſe unintelligible; both the Carteſians and the Atomiſts explicate the ſame phænomena by little bodies variouſly figured and moved. I know, that theſe two ſects of modern naturaliſts diſagree about the notion of body in general, and conſequently about the poſſibility of a true vacuum; as alſo about the origin of motion, the indefinite diviſibleneſs of matter, and ſome other points of leſs importance than theſe: but in regard that ſome of them ſeem to be rather metaphyſical than phyſiological notions, and that ſome others ſeem rather to be requiſite to the explication of the firſt origin of the univerſe, than of the phænomena of it, in the ſtate wherein we now find it; in regard of theſe, I ſay, and ſome other conſiderations, and eſpecially for this reaſon, that both parties agree in deducing all the phænomena of nature from matter and local motion; I eſteemed that, notwithſtanding theſe things, wherein the Atomiſts and the Carteſians differed, they might be thought to agree in the main, and their hypotheſes might by a perſon of a reconciling diſpoſition be looked on as, upon the matter, one philoſophy. Which becauſe it explicates things by corpuſcles, or minute bodies, may (not very unfitly) be called corpuſcular; though I ſometimes ſtyle it the Phenician philoſophy, becauſe ſome antient writers inform us, that not only before *Epicurus* and *Democritus*, but even before *Leucippus* taught in *Greece*, a Phenician naturaliſt was wont to give an account of the phænomena of nature by the motion and other affections of the minute particles of matter. Which becauſe they are obvious and very powerful in mechanical engines, I ſometimes alſo term it the mechanical hypotheſis or philoſophy.

By ſuch conſiderations then, and by this occaſion, I was invited to try, whether, without pretending to determine the abovementioned controverted points, I could, by the help of the corpuſcular philoſophy, in the ſenſe newly given of that appellation, aſſociated with chymical experiments, explicate ſome particular ſubjects more intelligibly, than they are wont to be accounted for, either by the ſchools or the chymiſts. And however ſince the vulgar philoſophy is yet ſo vulgar, that it is ſtill in great requeſt with the generality of ſcholars; and ſince the mechanical philoſophers have brought ſo few experiments to verify their aſſertions; and the chymiſts are thought to have brought ſo many on the behalf of theirs, that of thoſe, that have quitted the unſatisfactory philoſophy of the ſchools, the greater number, dazzled as it were by the experiments of Spagyriſts, have imbraced their doctrines inſtead of thoſe they deſerted: for theſe reaſons, I ſay, I hoped I might at leaſt do no unſeaſonable piece of ſervice to the corpuſcular philoſophers, by illuſtrating ſome of their notions with ſenſible experiments, and manifeſting, that the things by me treated of may be at leaſt plauſibly explicated without having recourſe to inexplicable forms, real qualities, the four peripatetick elements, or ſo much as the three chymical principles.

Being once reſolved to write ſome ſuch *ſpecimina* as I formerly judged requiſite, I ſoon bethought my ſelf of the experiment hereafter delivered concerning ſalt-petre, divers of whoſe phænomena I did alſo, as time would permit, caſt into one of the eſſays I was then engaged to write to a friend. And having diſpatched that little treatiſe, it found ſo favourable a reception among thoſe learned men, into whoſe hands it came, that I was much encouraged to illuſtrate ſome more of the doctrines of the corpuſcular philoſophy, by ſome of the experiments, wherewith my furnaces had ſupplied me; which alſo, as occaſion ſerved, I did, partly by writing ſome phyſico-chymical treatiſes, and partly by making ſuch large notes on the eſſay concerning ſalt-petre, as might plentifully contribute to the hiſtory of qualities, of which I had ſometimes thoughts. And this continued, till in the year before the laſt the publick confuſions in this (then unhappy) kingdom reducing me to quit my former deſign, together with the place, where my furnaces, my books, and my other accommodations were; I fell afterwards upon the making of pneumatical trials, whereof I lately ventured to give Viz. *A. D.* 1659.

the publick an account in a book of new experiments phyſico-mechanical about the air.

I SHOULD not trouble the reader with ſo prolix a preface to ſuch ſmall treatiſes as thoſe whereto this is prefixed, but for theſe two reaſons: The one, that I hope the foregoing narrative will make me be the more favourably judged by the philoſophers I deſire to ſerve, if ſometimes I write leſs ſkilfully of their opinions, than perhaps I ſhould have done, had I allowed my ſelf to ſearch into them: and the other, that I am earneſtly ſollicited to publiſh ſome other tracts, tending to the ſame purpoſe that theſe do; to which alſo ſhould I ever be induced, by the reception theſe may meet with, to trouble the world with them, the ſame preface, as it is now penned, may ſerve for an introduction. I had almoſt forgot to take notice, that whereas at the end of the eſſay concerning ſalt-petre I mentioned a then newly publiſhed treatiſe of the laborious *Glauber*'s, which I had not then peruſed, I found it to contain ſome obſervations concerning the hiſtory of ſalt-petre, which, if they be true, are conſiderable enough; I muſt again recommend the examination of them to the reader's curioſity, having been hindered by divers avocations from ſaving him that labour my ſelf. And whereas alſo ſome years after I was informed of another little book he had put out ſince the former, wherein he teaches us a way of purifying ſalt-petre, to make a conjunction of the ſpirituous and fixter parts of it, and then to ſuffer the mixture to evaporate and ſo cryſtallize into nitre; this would, I confeſs, have made me apprehenſive of paſſing for a plagiary with thoſe, that did not know me, but that it was eaſy for me to clear my ſelf by the teſtimony of very learned men, who had ſome years before peruſed my treatiſe, and eſpecially of one perſon, (well known by his writings) who was pleaſed to like it ſo well, as to deſire he might tranſlate it, and had accordingly long before turned it into very elegant Latin. I might perhaps venture to add, that though I could not juſtify my ſelf by ſo convincing a proof of my innocence, yet he, that ſhall take the pains to conſider, that I could not borrow of *Glauber* the various phænomena I have particularly ſet down, and much leſs the reflections on them, and ſhall compare in what differing manners, and to what differing purpoſes, we two propoſe the making of ſalt-petre out of its own ſpirit, and fixed ſalt, (he but preſcribing as a bare chymical purification of nitre, what I teach as a philoſophical redintegration of it;) he, I ſay, who ſhall compare theſe things together, will, perchance, think, that I was as likely to find this laſt named experiment as another. Which things I ſay not, as if I ſcrupled to make uſe of the induſtrious *Glauber*'s, or any other man's experiments, eſpecially, when I borrow not with them any of the doctrines I build on them; but becauſe ſince I neither did nor could take any notice of *Glauber*'s book in mine, I judged it requiſite to ſay ſomething, to prevent my being thought to have unthankfully taken one of the chief paſſages of my diſcourſe from a book, to which I was utterly a ſtranger.

THE reaſons of my thus conſenting to publiſh the following *Hiſtory of fluidity and firmneſs*, without the reſt of thoſe annotations, which I writ upon the ſame eſſay touching ſalt-petre, are partly, that theſe are my recenteſt compoſures of this nature, (having been written but the laſt year ſave one) and were ſet down, when I allowed my ſelf to be leſs unacquainted with writers addicted to the modern philoſophy; partly alſo, becauſe the conſiderableneſs of the ſubject invited me to make theſe annotations much more copious, and ſomewhat leſs unaccurate, than my notes upon almoſt any other part of the eſſay; and partly (and indeed principally) becauſe mention being ſometimes made of this hiſtory in my freſhly publiſhed phyſico-mechanical experiments, both the printer, and ſome learned gentlemen, who were pleaſed to think that book not unworthy the tranſlating, have ſollicited me to let this treatiſe be annexed to the ſeveral verſions they are about of that pneumatical piece, and to the Engliſh edition of the three fore-going diſcourſes, which the printer fears would, without the company of theſe or ſome others, make but too thin a book.

AND I thought fit to premiſe to this hiſtory the eſſay concerning ſalt-petre, not only becauſe it might appear very improper to publiſh annotations without the text it ſelf, whereunto they relate; but indeed becauſe I find, that there are ſtill many learned men, of the ſame diſpoſition with thoſe I have mentioned in the beginning of this preface; whence I am invited to divulge this eſſay by the ſame conſiderations, that at firſt induced me to write it. Eſpecially ſince I remember not, that among the new philoſophers, I have met with any one experiment, that does ſo fairly and ſenſibly accommodate ſo many of their opinions. And indeed I freely confeſs, that I ſhall think my ſelf to have done no uſeleſs ſervice to the common-wealth of learning, if I prove ſo fortunate, as by theſe, or any other writings of mine to the like purpoſe, to beget a good underſtanding betwixt the chymiſts and the mechanical philoſophers, who have hitherto been too little acquainted with one another's learning; there being to this very day a great and almoſt general miſunderſtanding betwixt the corpuſcular phyloſophers and the chimiſts; moſt of thoſe (on the one hand) looking upon the Spagyriſts as a company of mere and irrational operators, whoſe experiments may indeed be ſerviceable to apothecaries, and perhaps to phyſicians, but are uſeleſs to a philoſopher, that aims at curing no diſeaſe but that of ignorance; and moſt of the Spagyriſts (on the other hand) looking upon the Corpuſcularians (if I may ſo call them) as a ſort of empty and extravagant ſpeculators, who pretend to explicate the great book of nature, without having ſo much as looked upon the chiefeſt and the difficulteſt part of it; namely, the phænomena, that their art has added to the former edition of this vaſt and obſcure volume. But that ſome of the principal of the hermetick opinions may be more handſomely accommodated by the notions of the Phœnician hypotheſes, than by the com-

mon philoſophy of elements and ſubſtantial forms, (which yet their writers ſo frequently allude to and otherwiſe employ) may appear from hence, that whereas the ſchools generally declare the tranſmutation of one ſpecies into another, and particularly that of baſer metals into gold, to be againſt nature, and phyſically impoſſible; the corpuſcular doctrine rejecting the ſubſtantial forms of the ſchools, and making bodies to differ but in the magnitude, figure, motion or reſt, and ſituation of their component particles, which may be always infinitely varied, ſeems much more favourable to the chymical doctrine of the poſſibility of working wonderful changes, and even tranſmutations in mixt bodies. And on the other ſide, there are ſcarce any experiments, that may better accommodate the Phenician principle, than thoſe, that may be borrowed from the laboratories of chymiſts. For firſt, chymiſtry enabling us to depurate bodies, and in ſome meaſure to analyze them, and take aſunder their heterogeneous parts, in many chymical experiments we may better than in others know what manner of bodies we employ, art having made them more ſimple or uncompounded, than nature alone is wont to preſent them us. And next, many chymical operations being performed in cloſe, and yet in tranſparent veſſels, we may better know what concurs to the effects produced, becauſe adventitious bodies (or at eaſt all groſſer ones) are kept from intruding upon thoſe, whoſe operations we have a mind to conſider. And laſtly, the bodies employed by the chymiſts being for the moſt part active ones, the progreſs of nature in an experiment, and the ſeries of ſucceſſive alterations, through which the matter paſſes from firſt to laſt, is wont to be made more nimbly, and conſequently becomes the more eaſy to be taken notice of and comprehended. So that all this conſidered, I hope it may conduce to the advancement of natural philoſophy, if, as I ſaid, I be ſo happy, as, by any endeavours of mine, to poſſeſs both chymiſts and corpuſcularians of the advantages, that may redound to each party by the confederacy I am mediating between them, and excite them both to inquire more into one another's philoſophy, by manifeſting, that as many chymical experiments may be happily explicated by corpuſcularian notions, ſo many of the corpuſcularian notions may be commodiouſly either illuſtrated, or confirmed by chymical experiments.

A

PHYSICO-CHYMICAL ESSAY,

Containing an EXPERIMENT, with ſome Conſiderations touching the differing parts and redintegration of SALT-PETRE.

SECTION I.

SALT-PETRE, *Pyrophilus*, though in that form, wherein it is ſold in ſhops, it be no very obvious concrete; yet either in its rudiments, or under ſeveral diſguiſes, it is to be found in ſo great a number of compound bodies, vegetable, animal, and even mineral, that it ſeems to us to be not only one of the moſt catholick of ſalts, but ſo conſiderable an ingredient of many ſublunary concretes, that we may juſtly ſuppoſe it may well deſerve our ſerious inquiries, ſince the knowledge of it may be very conducive to the diſcovery of the nature of ſeveral other bodies, and to the improvement of divers parts of natural philoſophy.

SECT. II.

BUT not having at preſent much leiſure allowed me by ſeveral avocations, to make accurate inquiries into the nature of ſalt-petre in general; and, which is more conſiderable, being not yet furniſhed with a competent number of experiments requiſite to ſuch a purpoſe; I muſt content my ſelf for this time to tender you ſome aſſiſtance, towards the diſcovery of how differing ſubſtances may be obtained from nitre, and compound it again, by preſenting you ſome reflections on an experiment, which my deſire to haſten to another ſubject obliges me to ſet down nakedly, as I firſt tried it, by way of narrative.

SECT. III.

WE took then common nitre (as we bought it at the druggiſt's) and having by the uſual way of ſolution, filtration, and coagulation, reduced it into cryſtals, we put four ounces of this purified nitre into a ſtrong new crucible, * in which (the veſſel being firſt well nealed to

* If it be here demanded, Why the experiment was not made with a greater quantity of ſalt-petre? we may anſwer, that the mentioned quantity was moſt proportionate to the beſt crucible we then had. And if it be further asked, Whether it were not the better way of obtaining the ſeveral ſubſtances ſeparable from nitre, to diſtil it in cloſe veſſels without addition of any foreign body? we ſhall reply only by repreſenting, that the propoſed way is not ſo practicable as one would imagine: for not acquieſcing in the common practice of chymiſts, who are wont to mingle with the ſalt-petre they diſtil three or four times its weight of brick, earth, or ſome other additament, which

to prevent cracking, and covered to prevent the falling in of any thing, that might unſeaſonably kindle the petre) we melted it into a limpid liquor, and whilſt it was in fuſion, caſt into it a ſmall live coal, which preſently kindled it, and made it boil and hiſs, and flaſh for a pretty while. After which, we caſt in another glowing coal, which made it fulminate afreſh; and after that we caſt in a third and a fourth, and ſo continued the operation, till the nitre would neither fulminate nor be kindled any more. After which we continued to keep it in a ſtrong fire for above a quarter of an hour, that if any volatile part ſhould yet remain, it might be forced off.

SECT. IV.

THEN taking out the crucible, and breaking it whilſt it was hot, we took out, as carefully as we could, the remaining fixed nitre, before it had imbibed much of the moiſture of the air; and dividing it into two equal parts, we diſſolved one of thoſe portions in as much fair water, as would juſt ſuffice for the ſolution of it, and then dropped on it ſpirit of ſalt-petre, till the ebullition occaſioned by the mutual action of thoſe contrary liquors did perfectly ceaſe; and forthwith filtrating this mixure, we expoſed it in a new open phial to the air in a window; and returning to the other portion of fixed nitre, which we had ſet apart and not diſſolved, we dropped on that likewiſe of the ſame ſpirit, till the hiſſing and ebullition were altogether ceaſed, and then we expoſed this mixture alſo in an open glaſs-jar to the air in the ſame window with the former.

SECT. V.

THE event of theſe trials was, that the mixture, wherein fair water was employed, did in a few hours faſten to the lower part of the ſides of the glaſs, wherein it was put, ſome ſaline particles, which ſeemed by their form (and partly too by their ſhooting about the lower parts of the veſſel) to be ſalt-petre; amongſt whoſe little cryſtals nevertheleſs there appeared to ſwim very little grains (much ſmaller than muſtard-ſeeds) of ſome other kind of ſalt, environed with a downy matter, not unlike that, which is oftentimes to be obſerved in roſe-water, and ſeveral other diſtilled waters, when they begin to decay. The cryſtals were the next day taken out, being by that time grown ſomewhat greater, and more numerous; and diſcloſed themſelves, upon trial, to be indeed nitrous, as well by their manner of burning, as their ſhape. Concerning the latter of which, ſince learned modern writers have miſ-repreſented it, ſome making nitre to be cylindrical, and others of a figure leſs approaching to the true one; I think my ſelf obliged in this place to obſerve to you by the way, that having purpoſely conſidered ſome large cryſtals of refined and unanalyzed nitre, the figure being in ſuch beſt diſcerned, they appeared to have each of them ſix flat ſides (not always of equal breadth in reſpect of one another) whereof any two that were oppoſite were commonly parallel. But to return to our augmented cryſtals of nitre; what the other matter, that adhered to them, was, there was ſo very little of it, that we could not well diſcern, though we then ſuſpected it to proceed from the want of a juſt or exact proportion betwixt the volatile and fixed parts of the nitre, that were to be reunited.

SECT. VI.

THE remaining liquor being poured into an open glaſs-jar, and left in the ſame window, continued five or ſix days without manifeſting any conſiderable alteration; but at the end of that time there began to appear in it very fine cryſtalline ſtriæ of petre, which grew more and more numerous during a fortnight longer: at which time, being wearied with attending the ſo ſlow conſumption of the liquor, we poured it from the cryſtals, and ſet it in a digeſting furnace to evaporate more nimbly.

SECT. VII.

THE other mixture, wherein no water was employed, did preſently, for a great part of it, ſubſide in the form of ſalt; over which there ſwam a little liquor, which alſo ſeemed to keep the ſubſiding particles of ſalt from congealing into one coherent maſs, or ſo much as greater lumps: and a part of this drenched ſalt being taken out, and permitted to dry in the air, did not appear very regularly figured, but yet ſeemed here and there to recede very little from the ſhape of ſalt-petre; and being caſt on a quick coal, it burned partly after a manner not peculiar (that we have obſerved) to any diſtinct kind of ſalt; and yet it partly ſeemed to imitate the flaſhing way of deflagration proper to nitre. The remaining part of this ſalt, together with the liquor ſwimming upon it, we kept for about a month in the open air, without diſcerning any obſervable change in the liquor, till towards the latter end of that time, and then we found it partly coagulated into ſmall ſaline maſſes, whoſe figure we were not able to diſcern. And therefore diſſolving the whole mixture in a little fair water, and filtrating it, we found (after evaporation in a digeſting-furnace) about one half of the ſalt ſhot into fine ſmall icicles of the ſhape of cryſtals of petre, but ſomewhat differing from them in taſte upon their firſt being put upon the tongue; but upon a live-coal they burned not unlike petre. And the remaining half of this diſſolution, being ſomewhat haſtily preſſed to exhale, let fall its ſalt in a figure, which we could not reduce either to that of ſalt-petre, or of any other determinate kind of ſalt.

FOR

which (eſpecially in ſo great a proportion) may much alter the nature of the fixed ſalt remaining behind with it; we have had the curioſity to try more than once, whether we could diſtil ſalt-petre *per ſe* in glaſs-retorts, and found, that though to avoid giving too ſtrong a fire, we once (at leaſt) placed the retort only in a pan-full of ſand; yet when the heat was grown ſtrong enough to melt the ſalt, it cracked the retort, and did partly run out at the crack: only we obtained ſome ſmall quantity of a liquor, which by its ſourneſs and operation taught us what we might have expected of the reſt of the volatile part of the nitre, in caſe the veſſel would have held till it had paſſed over into the receiver.

FOR the clear comprehending of this experiment, you may be pleaſed, *Pyrophilus*, to take notice,

SECT. VIII.

1. THAT a new coal is not to be caſt on the nitre, till the detonation occaſioned by the former be either quite or almoſt altogether ended; unleſs it chance, that the puffing matter do blow the coal too ſoon out of the crucible, (which often enough happens towards the end of the operation:) which ſeems to happen chiefly, becauſe the firſtpart of the nitre growing to be predominant, the inflammable and halituous particles cannot break through the matter, now grown more ſtiff, but by ſuch impetuous eruptions, as make them oftentimes toſs back the coals as ſoon as ever they are caſt into the crucible: and in this way of proceeding we have been forced to ſpend much more time, than the opinion of the ready deflagrability (if I may ſo ſpeak) of ſalt-petre did beforehand permit us to imagine.

SECT. IX.

2. THAT we diſcerned by our ſcales, that the weight of the ſpirit of nitre requiſite to be dropped on, till all the ebullition made betwixt that liquor and the ſolution of fixed nitre were ceaſed, did not amount to ſo great a weight, as the ſalt-petre loſt in its detonation, and yet fell not much ſhort of it.

SECT. X.

3. THAT the fixed nitre this way made differed but very little from vulgar ſalt of tartar in its lixiviate taſte, in its aptneſs to attract the air, or to relent by the moiſture of it, and in its other more obvious qualities; only whereas ſalt of tartar is wont to be white (which nevertheleſs being fluxed has been by others, as us, obſerved to become of a kind of ſky-colour) this fixed nitre was of a deep colour betwixt blue and green: which colour, upon the affuſion of the ſpirit of nitre, vaniſhed; whereas otherwiſe (to obſerve that to you upon the by) ſome ſort of calcined nitre will ſo obſtinately retain that colour, that I keep by me a bluiſh-green liquor made of fixed-petre, I know not how oftentimes ſucceſſively reſolved *per deliquium* and coagulated again, till it would no longer be reduced to a dry ſalt, but to an unctuous body eaſily flowing in heat like wax: my deſign in which trial it were here ſomewhat improper to inſiſt on *.

SECT. XI.

AND becauſe, *Pyrophilus*, it may be ſuſpected, that the ſalt-petre mentioned to have been produced by the re-union of the volatile and fixed part of that concrete, may have been only ſome aſſociated particles of ſalt-petre, that by lurking undiſcernedly in the fixed nitre had eſcaped the analizing violence of the fire, and by the affuſion of fair water were ſet at liberty to aſſemble together, and thereby diſcloſe themſelves in their true ſhape:

To remove this ſcruple, and to let you ſee that much of the enſuing diſcourſe will not need your ſuppoſing, that the experiment of the redintegration of petre was accurately made, and did accordingly ſucceed; I muſt here annex, that though by divers other chymical experiments, which I have had occaſion to make with ſalt-petre, I ſometimes diſcovered, that now and then ſome undiſcerned particles of the ſalt-petre may poſſibly eſcape our diligence when we make fixed nitre; yet thoſe particles are too few to amount to ſuch cryſtals of petre, as the affuſion of the acid ſpirit upon the lixiviate ſalt are capable of affording. And that we have, to ſatisfy our ſelves farther in this particular, purpoſely ſatiated, according to the former manner, a ſolution of common pot-aſhes, bought of them, that are wont to ſell it in ſhops, (who are not ſo fooliſhly knaviſh, as to adulterate them with ſalt-petre, which is much dearer than pot-aſhes) and filtrating the ſolution from its copious *fæces*, found after evaporation, in the remaining liquor, within about two or three days, and ſometimes much ſooner, pretty ſtore of cryſtalline ſalt in a nitrous figure, which though at firſt it taſted ſomewhat corroſively, (perhaps becauſe the proportion betwixt the nitrous ſpirit and the pot-aſhes was not duly obſerved) yet after it had a while remained upon the tongue, the taſte of it much emulated that of ſalt-petre; and part

* That our friends might not be obliged to wait ſo long for the redintegration of nitre, but might ſee the experiment made in as little time as is poſſible, we deviſed a more expeditious way of uniting the divorced parts of our ſalt, and it was only by ſuffering ſuch fixed nitre, as is mentioned by our author, to run *per deliquium* into a liquor, which being ſeparated from its *fæces* by filtration through cap-paper was very clear and limpid: for, when we had a mind to ſhew the experiment, we did only upon this liquor drop ſome ſpirit of nitre, and that, after ſuch a noiſe, ſparkling and efferveſcence, as our author ſpeaks of, (all which haſtily vaniſhed) did immediately aſſociate it ſelf with a competent proportion of the fixed ſalt ſwimming in the ſolution, and therewith fall down in little icicles of a nitrous ſhape and nature; and when we pleaſed to continue the affuſion of the acid ſpirit, this emergency of ſalt-petre would be obſervable from time to time, till either all, or almoſt all the fixed ſalt had united it ſelf with the other. And theſe little icicles being dried in lumps, did as well upon the tongue and upon a quick coal, as they had done to the eye, diſcloſe themſelves to be ſo truly nitrous, that our friends were not wont without ſome wonder, as well as much pleaſure, to behold ſalt-petre thus ſuddenly generated in leſs than a minute of an hour. Theſe ſmall icicles being in ſufficient plenty diſſolved in fair water, we did for trial's ſake reduce by congelation to fairer cryſtals.

But though this be the perfecteſt and readieſt way of re-producing nitre, yet becauſe it often requires, eſpecially in dry weather, a long time to reduce fixed nitre *per deliquium* into a liquor, we have ſometimes ſubſtituted the following way. We diſſolved in fair water as much fixed nitre as we could, and filtrating the ſolution through cap-paper, we ſatiated it with ſpirit of nitre, after the manner above deſcribed; and then ſetting it to evaporate very ſlowly, and afterwards ſuffering it to cool, we obtained, within ſome hours after the firſt mixture of the liquors, ſtore of fine little cryſtals of petre, which ſhot in the liquor; the remaining part of which being evaporated afforded more of them. And though the evaporation and cryſtallization coſt us divers hours, yet it ſeemed, that the ſalt-petre was produced preſently upon the ceaſing of the conflict betwixt the two liquors. For the mixture, before evaporation, taſted very like a ſolution of common nitre, and the little drops, that upon the efferveſcence skipped out of the glaſs, and fell back upon the ſides of it, did there many of them preſently coagulate into little grains of nitrous ſalt.

part of it being caſt upon a live coal, did by its blue and halituous flame diſcover it ſelf to be of the nature of that ſalt. To which we may add, that we likewiſe tried the experiment with aqua fortis and ſalt of tartar, and thereby produced ſalt-petre, though but in ſmall quantity, and a long time. And thoſe two additional experiments I the rather mention, becauſe many of the enſuing reflections may be juſtified by them, although the main experiment made on ſalt-petre alone ſhould in divers particulars be ſuppoſed (for we have uſed our endeavours that it may not be found;) to have been miſtaken.

SECT. XII.

THE reflections, which may be made on this experiment, are more than I have either the ſkill or leiſure to proſecute; and therefore I ſhall content myſelf to preſent you very ſuccinctly with a few of thoſe, that do the moſt readily occur to my preſent thoughts.

AND firſt, this experiment ſeems to afford us an inſtance, by which we may diſcern, that motion, figure, and diſpoſition of parts, and ſuch like primary and mechanical affections (if I may ſo call them) of matter, may ſuffice to produce thoſe more ſecondary affections of bodies, which are wont to be called ſenſible qualities.

SECT. XIII.

AND to begin with the tangible qualities, as heat and cold; it is commonly held, that ſalt-petre is in operation a cold body, if not one of the coldeſt in the world; and accordingly phyſicians and chymiſts are wont to give it in fevers, to allay the inward exæſtuations of the blood and humours: and that profound naturaliſt the Lord *Verulam* highly commends a little of it, and did for many years himſelf make uſe of it, to condenſe the ſpirits. But wherever it be in inward operation, certainly to the outward ſenſe it appears very cold: and yet the parts of this ſo cold body (its ſpirit and alkali, by the latter of which chymiſts are wont to mean any fixed ſalt produced by burning) put together, do immediately agitate each other with great vehemency; and did in our experiment produce ſuch an heat, that I could ſcarcely endure to hold in my hand the phial, wherein much leſs than an ounce of each was mixed, though but leiſurely and almoſt by drops; as if heat were nothing but a various and nimble motion of the minute particles of bodies. For in our experiment, as long as that confuſed agitation laſted, ſo long the heat endured, and with that agitation it increaſed and abated; and at length, when the motion ceaſed, the heat alſo vaniſhed.

SECT. XIV.

UPON the mixture of the two fore-mentioned liquors, there was alſo produced a very audible ſound, not unlike the hiſſing produced by the quenching of a live coal in water; and this hiſſing was, as that other is wont to be, accompanied with an efferveſcence and boiling up of the liquor, with ſtore of bubbles, till it was ready to run over the veſſel. This ſound ſeemed to proceed from the nimble and ſmart percuſſions of the ambient air, made by the ſwift and irregular motions of the particles of the liquors: and ſuch a kind of ſound, but much louder, was produced by the impetuous eruptions of the halituous flames of the ſalt-petre upon the caſting of a live coal upon it. What intereſt ſuch a ſmartneſs in ſtriking the air hath in the production of ſound, may in ſome meaſure appear by the motion of a bullet, and that of a ſwitch or other wand, which produce no ſound, if they do but ſlowly paſs through the air; whereas if the one do ſmartly ſtrike the air, and the other be ſhot out of a gun, the celerity of their percuſſions on the air puts it into an undulating motion, which reaching the ear, produces an audible noiſe, even at a good diſtance from the body, whoſe ſwift paſſage cauſes thoſe nimble vibrations in the air, as we may elſewhere have occaſion to declare. And that in the ſound obſervable in our experiment, the contiguous air receives many ſtrokes from the particles of the liquor, ſeems probable, by the ſudden and eager tumultuation of the parts of the liquors; and by this, that the noiſe increaſed and decayed proportionably to the ebullition of the liquors, and ceaſed altogether as ſoon as the ſaline particles floating in them had by their conflict tired themſelves in to quietneſs. And it is to be obſerved, that the noiſe ended long before the heat. To the latter of which ſuch an inteſtine tumult of the parts of many bodies is ſufficient, as is yet uncapable to produce a ſound. As we ſee in amber or good hard wax heated by rubbing; and in many liquors, which retain a conſiderable degree of heat a good while after the expiration of the noiſe they made in boiling.

SECT. XV.

WE mentioned alſo, that our fixed petre was of a bluiſh green colour, which upon the affuſion of the acid ſpirit ſuddenly vaniſhed; that diſpoſition of parts, whereby the light reflected to the eye, was ſo modified as to produce that colour, being now altered. And the like change we have ſometimes obſerved to be producible in fixed nitre, by the bare leaving it a while in the moiſt air. To which I muſt add, that in ſome ſuch kind of experiments I have obſerved the copious fumes, ariſing from the mixture, to make the unfilled part of the glaſs look of a reddiſh colour; which is not moreodd than that, which we have lately had opportunity to obſerve in ſoot, which though it be ſo black itſelf, and reſult from the coalition of dark exhalations, yet preſſed with a ſtrong fire, has filled our receivers with fumes white enough to make them look, as if they were repleniſhed with milk. And we have ſometimes alſo taken great pleaſure to behold the variety of colours, which may be now and then diſcerned in the ſublimate, made by gradually ſubliming in an urinal a mixture of equal parts of only white ſal-armoniac and black antimony. But to wander no longer far from our preſent experiment, give me leave to inform you, that a while ſince attempting

to make ſalt of tartar, I diſſolved in a little fair water an ingredient of ſalt-petre; by the addition of good aqua fortis, the union of theſe two liquors produced a deep green colour, which not only was diffuſed quite through the mixture, but alſo appeared to reſide peculiarly in certain particles of it. For having for trial-ſake filtred it through cap-paper, there remained in the filtre a powder of a very deep and lovely colour, but in ſo little quantity, that we could not attempt any experiment upon it to make it confeſs its nature. But this circumſtance is not to be omitted, that the ſalt of tartar, that was then employed, was extraordinay pure, having been by a peculiar art (elſewhere to be taught you) brought, without any addition, into fair-figured cryſtals almoſt like lumps of white ſugar-candy. To which I muſt add, that the ſame aqua fortis, with a ſolution of other pure ſalt of tartar, did likewiſe produce a colour much reſembling the former, but much fainter. And it is farther to be taken notice of on this ſubject, partly, that nitre it ſelf, although it ſeem to have nothing of kin to redneſs, doth in diſtillation yield blood-red fumes (fondly called by ſome chymiſts the blood of the ſalamander) which fall again into a liquor that has nothing of red in it; and partly, that the fixed nitre, that did before appear opacous, by a new diſpoſition of its parts conjoined with thoſe of its re-imbibed ſpirit, becomes again ſomewhat diaphanous and cryſtalline, as it was at firſt.

SECT. XVI.

UPON the mixture of theſe two liquors there alſo obtrudes it ſelf upon the ſenſe a very ſtrong and offenſive ſmell, proceeding from the ſpirit of petre; which perhaps occaſioned ſome chymiſts to call a menſtruum (wherein that nitrous ſpirit and ſmell is predominant) the Stygian water. But though the nitrous ſpirit have a very ſtrong and unwelcome odour of it ſelf, yet is it made much more offenſive by being poured on its own fixed ſalt; for upon their conflict, the matter, being vehemently agitated, doth more copiouſly emit ſuch ſtinking exhalations than before, and ſendeth forth fumes manifeſtly diſcernible as well to the eye as noſtrils. The odour of the fixed nitre is very languid; but that, which it diſcovers, being diſſolved in a little hot water, is altogether differing from the ſtink of the other, being of kin to that of other alkalizate ſalts. And yet the ſalt-petre, from which ſuch differingly-ſcented bodies ſpring, and which may again emerge from the coalition of them, has not been obſerved, as I remember, to have any ſmell at all.

SECT. XVII.

THE taſtes of theſe two bodies are as differing as any of their other qualities: for the ſpirit is exceedingly acid, and may be called a ſtrong and ſour *Acetum Minerale*; whereas the fixt nitre has as ſtrong a taſte of ſalt of tartar as the ſpirit has of diſtilled vinegar: and yet theſe two bodies, whoſe ſapours are ſo pungent, and ſo differing, do both ſpring from and unite into ſalt-petre, which betrays upon the tongue no heat nor corroſiveneſs at all, but coldneſs mixt with a ſomewhat languid reliſh retaining to bitterneſs. And though we muſt not conceal from you, that in our trial the redintegrated ſalt-petre had upon its firſt impreſſion upon the tongue a taſte more ſharp and perforating (if I may ſo ſpeak) than ordinary nitre; yet that pungency may not improbably be ſuppoſed to have proceeded from ſome acid particles of the ſpirit, that were not yet duly incorporated with, but only looſely adherent to, the more perfectly nitrous parts, which afterwards diſcovered it ſelf upon the tongue. And however, the difference betwixt the taſte of this new ſalt, and thoſe of the acid and alkalizate ſalts whereof it conſiſted, and (unqueſtionably) the taſte of theſe compared with that of the crude petre, which was diſſipated into them, were ſufficient to warrant this reflection.

SECT. XVIII.

OF the other obſervables preſented us by our experiment, we muſt, *Pyrophilus*, content our ſelves to mention but a few; our haſte being ſuch, that it will not permit us either to enumerate them all, or to inſiſt long on any of them.

SECT. XIX.

SECONDLY then, the propoſed experiment ſeems to make it ſomewhat queſtionable, whether or no inflammability doth ſtrictly in all mixt bodies require a diſtinct ſulphureous ingredient; and whether or no in ſome concretes it may not reſult from ſuch a contrivance of parts, as that thereby the particles of the concrete are diſpoſed to be ſet a moving by the adventitious, whether fiery or calorifick, corpuſcles of another body, in ſuch numbers, and with ſuch celerity, as may put them into that ſcheme of matter, which we call flame. How violent an heat may be produced upon ſuch an account as this, may in ſome meaſure appear by an experiment, wherein our preſent theme ſalt-petre is the main agent. For if into a phial filled with good ſpirit of nitre you caſt a piece of iron, you may perceive, that the liquor, whoſe parts moved placidly and uniformly before, manifeſted no heat to the touch, meeting with pores and particles in the iron capable of very much altering the motion of its parts, (and perhaps alſo that of ſome very ſubtile intercurrent matter,) thoſe active parts do preſently begin to penetrate, ſever, and ſcatter abroad the particles of the iron, (almoſt as gunpowder doth the pieces of breaking granadoes) with ſuch rapidity, and in ſuch plenty and throngs, that being themſelves alſo put into a very ſwift and irregular motion (whence ſoever it proceeds) there is hereby produced a heat capable (if the quantity of the liquor and metal be great enough) to burn his hand, that holds the veſſel, and perhaps break the veſſel (if it be not very open) all to pieces: whereas by caſting into the ſame ſpirit of nitre little lumps of camphire, whoſe particles were indiſpoſed to occaſion the like diſturbance and agitation in the nitrous ſpirit, we obſerved the

agitation made of the particles of the white gum to change it only into a yellowiſh and fluid ſeeming oil.

SECT. XX.

BUT not to wander any further, our own experiment informs us, that ſalt-petre (which not only is inflammable, but burns very fiercely and violently) may be produced by the coalition of two bodies, which are neither of them inflammable; the one being a fixed ſalt, that to become ſuch has already ſuffered the loſs of all that the fire could deprive it of, and the other being a ſpirit abounding with acid particles, which kind of ſalts have been obſerved to be more apt to quench than foment fire.

SECT. XXI.

AND becauſe we may elſewhere, God aſſiſting, treat more particularly of the inflammableneſs of bodies, we will now add but a few lines concerning that of nitre, that this circumſtance of it might not eſcape our obſervation; namely, that upon caſting ſalt-petre on a glowing coal, or upon the caſting of a glowing coal into melted ſalt-petre, the nitre will immediately take fire, and flaſh out into bluiſh and halituous flames; whereas if the ſame nitre be placed in a crucible, though that crucible be by degrees made glowing hot, and do immediately with its concave ſurface in innumerable places touch the particles of nitre, yet the ſtrange ſalt will be thereby melted, but not kindled. The reaſon of which phænomenon I muſt not now (but may on another occaſion) ſpend time to inquire after.

SECT. XXII.

It may alſo, *Pyrophilus*, deſerve the inquiry, whence it proceeds, that whereas the body of ſalt-petre, when committed to diſtillation, is oftentimes very well dried, and conſiſts of ſaline parts, which are generally accounted to be of a very dry nature, yet the ſpirits of petre forced by the fire into the receiver ſhould not, like ſal-armoniac, and ſome other bodies diſtilled with the like heat and veſſels, adhere in the form of ſublimate to the receiver, but fall into a liquor, which does not, for aught we have ſeen or heard of, either totally or in part coagulate again in the cold, as we have ſeen ſpirit of urine and other volatile liquors (afforded by animal ſubſtances) often do; and as we have obſerved, though rarely, even in the corroſive liquor, that is wont to be called butter of antimony. And the like inquiry may be made concerning the liquidneſs of the diſtilled ſpirits of decrepitated ſalt, calcined vitriol, and divers other bodies, which ſeem to have been deſtitute of moiſture, when committed to diſtillation.

SECT. XXIII.

BUT this not being preciſely a phænomenon of our experiment, we ſhall not here proſecute it, (though perhaps we elſewhere may) but rather obſerve to you, *Pyrophilus*, that whereas good ſpirit of nitre being left in an open veſſel, is wont to ſmoak and waſte it ſelf in an exhalation ſenſible, eſpecially if it be excited by a little heat, not only in the noſe but to the eye; this fugitive ſpirit, when it is once re-united to its own fixed ſalt, emits no ſuch ſteam, though kept a good while near a conſiderable fire: which inſtance may ſomewhat aſſiſt us to make out, that the moſt fugitive parts of concretes may in ſpight of their natural mobility be detained in bodies by their union and texture with the more ſluggiſh parts of them, among which thoſe lighter and more active ingredients may be ſo entangled, as to be reſtrained from avolation.

SECT. XXIV.

ANOTHER thing worth conſidering in our experiment is this, that upon the dropping of the acid ſpirit into the alkalizate liquor, if you place the open-mouthed glaſs, wherein the experiment is performed, betwixt the light and your eye, you may plainly diſcern, that the ſaline particles of theſe liquors toſs one another (or are toſſed by ſome briſk inviſible ſubſtance) to the height of divers fingers breadth up into the air, whence moſt of them fall back into the veſſel like a thick ſhower of little drops of rain. And it were worth inquiring, whence this ſparkling of the parts of theſe mixed liquors ariſes; and whether the ſaline corpuſcles may be conceived rapidly to move differing ways, and ſo, thwarting each other in their courſes, and rudely joſtling at their occurſions, ſome of them are forced to bound or fly upwards, (almoſt like ivory balls meeting each other on a billiard-table,) And to aſſiſt you in this inquiry, give me leave to inform you, that the particles thus thrown into the air appear to be moſt of them ſaline by this obſervation; that ſoon after the fall of the fore-mentioned ſhowers, you ſhall find the ſides of the glaſs, wherein the affuſion of the nitrous ſpirit has been made, all embroidered with little grains of ſalt, left there by thoſe wandering drops, that fell beſides the liquor.

SECT. XXV.

AND let me farther obſerve to you, that there ſeems to be a very nimble agitation in the particles of the ſpirit of nitre, by this, that upon the pouring of aqua fortis (whoſe active part is little elſe than ſpirit of nitre) upon a ſolution of ſalt of tartar in fair water, in which divers ſmall lumps of the ſalt remained yet undiſſolved, we have obſerved the acid ſpirit to ſever the particles of the ſalt with ſuch impetuoſity, that the numberleſs little bubbles produced upon their conflict, and haſtily aſcending in ſwarms from ſome of the little lumps, made them emulate ſo many little, but rapidly riſing, ſprings. And to make it yet appear more probable, that there may be ſuch croſſing motions in the parts of theſe liquors, we obſerved, that after the two contrary ſalts had by their mutual conflict tired each other, (or rather had been upon their occurſions faſtened to one another) there would follow no farther ebullition or ſkipping up and down of little drops of the liquors, upon the putting in of more ſpirit of nitre, unleſs there were added likewiſe more of the alkalizate liquor.

SECT.

SECT. XXVI.

AND, before we paſs on from this reflection, it may not be uſeleſs to take notice of the difference, that there may be betwixt thoſe active parts of a body, which are of differing natures, when they are as it were ſheathed up, or wedged in amongſt others in the texture of a concrete; and the ſame particles, (when extricated from theſe impediments) they are ſet at liberty to flock together, and by the exerciſe of their nimble motions diſplay their proper, but formerly clogged activity, or acquire a diſpoſition to be briſkly agitated by ſome fine interfluent matter. For though in the intire body of ſalt-petre the ingredients it conſiſts of, or the differing ſubſtances, into which the fire diſſipates it, do ſo mutually implicate and hinder each other, that the concrete, whilſt ſuch, acts but very languidly; yet when the parts come to be diſlocated, and the halituous and alkalizate particles are enabled or made to diſband from the concrete, and aſſociate themſelves with thoſe of their own nature, we ſee with how great an activity both the acid ſpirit and the fixed ſalt are endowed.

SECT. XXVII.

AND we may yet farther obſerve, that it is not barely an indefinite nimbleneſs of motion, and activity of the particles of ſaline liquors, that enables them to perform each of their particular effects: for to the production of ſome of theſe there ſeems requiſite, beſides perhaps a modification of their motion, a determinate figure of the corpuſcles, anſwerable to that of the pores of the body by them to be diſſolved; as ſpirit of nitre corrodes ſilver, but not gold; which nevertheleſs its particles aſſociated with thoſe of ſal-armoniac, and thereby acquiring a new figure, and perhaps a differing motion, will readily diſſolve: and the liquor of fixed nitre will, for the ſame reaſon, diſſolve ſuch ſulphureous and unctuous bodies as the acid ſpirit will not corrode: nay, and I have carefully obſerved, that there may be liquors, that will not diſſolve ſome bodies, unleſs the motion or activity of their particles be allayed or modified by the mixture of fair water, or ſuch unactive vehicles.

SECT. XXVIII.

ANOTHER particular, which in our experiment we may take notice of, is, the unwarineſs of thoſe vulgar chymiſts, who preſume confidently (and indiſcriminately enough) to aſcribe to each of the heterogeneous ingredients, or (in their language) principles of a concrete analyſis by the fire, the virtues and properties (perhaps too in an exalted degree) of the entire body. But though this be an error of very ill conſequence in reference to divers chymical preparations of medicines; yet having elſewhere diſcourſed purpoſely of it, we ſhall here content our ſelves to alledge againſt it the inſtances afforded us by the experiment under conſideration: for in that we may obſerve, that when ſalt-petre is diſtilled, the volatile liquor and fixed ſalt, into which it is reduced by the fire, are endowed with properties exceeding different both from each other, and from thoſe of the undiſſipated concrete. For the ſpirit of nitre is (as we formerly have obſerved) a kind of *Acetum Minerale*, and poſſeſſes the common qualities to be met with in acid ſpirits as ſuch; whereas the fixed nitre is of an alkalizate nature, and participates the qualities belonging generally to lixiviate ſalts; and ſalt-petre it ſelf is a peculiar ſort of ſalt, diſcriminated by diſtinct properties both from thoſe ſalts, that are eminently acid, as allum, vitriol, ſal-gemmæ, *&c.* and from thoſe, that are properly alkalizate, as ſalt of tartar and pot-aſhes; and accordingly, we may eaſily obſerve a vaſt diſparity in the effects and operations of theſe three bodies. For ſeveral, if not all of thoſe mineral ones, which aqua fortis will by corroding diſſolve, the ſolution of fixed nitre will precipitate; and divers, if not all of thoſe ſulphureous and unctuous bodies, which the ſolution of fixed nitre will diſſolve, the acid ſpirit of petre will precipitate. And we have in a trice re-diſſolved with the ſpirit a ſolution of ſublimate precipitated with the other liquor: thus, if into a ſcarlet tincture made by an infuſion of Braſil in fair water, we pour a little ſpirit of nitre, the ſhaken liquor will in a moment change its redneſs for a kind of yellow, which by pouring on it a little of the ſolution of fixed nitre, may be again graduated into a ſomewhat ſanguine colour, ſometimes paler, and ſometimes perhaps deeper than the firſt; whereas a ſolution of ſalt-petre it ſelf poured on either of the former tinctures, the red or the yellow, has not been by us diſcerned to have produced any ſenſible alteration. And whereas ſalt-petre it ſelf is partly fixed, and partly volatile, the acid ingredients of it are altogether volatile, the alkalizate fixed. But having elſewhere occaſion to ſpeak to this ſubject, we ſhall now proceed to tell you, that

SECT. XXIX.

IT may paſs to another obſervable preſented us by our experiment, that it gives us occaſion to inquire, whether the air doth not contribute ſomething to the artificial production of ſalt-petre, or at leaſt to the figuration of it according to the perfecter ſhape belonging to that kind of ſalt: for we formerly obſerved, that the ſalt, which was leiſurely permitted to ſhoot of it ſelf in the liquor expoſed to the open air, did ſhoot into more fair and large cryſtalline ſtriæ, than thoſe, that were gained out of the remaining part of the ſame liquor by a more haſty evaporation, though made but in a digeſting furnace. And we have alſo obſerved, that when once we poured aqua fortis on a ſtrong ſolution of ſalt of tartar, till no further effervеſcence was diſcernable betwixt them, though the mixture by a ſomewhat quick heat afforded a ſalt, that ſeemed to be very nitrous, yet it would not be brought to ſhoot in ſo fair and conſpicuouſly figured cryſtals of petre, till it had been a good while expoſed to the open air: but whether the air it ſelf impregnated with the promiſcuous ſteams of moſt of the bodies of the terreſtrial globe, (and perhaps with ſeminal effluvia from ſome of them) do

really

really contribute any thing either to the production or figuration of ſalt-petre in our experiment, I dare not yet determine, for two chief reaſons.

SECT. XXX.

WHEREOF the firſt is, becauſe the figuration ſeems not improbably aſcribable, not ſo much to the proper efficiency of the air, as to the conveniency, which by quietneſs, and a competent vehicle to move in, was afforded to the ſaline particles, to conform themſelves (or be conformed by a concourſe of agents and circumſtances) to that figure, which is moſt natural to them. For we have obſerved already, that the fixed nitre, which was not diſſolved in water, before the affuſion of the acid ſpirit, did not ſhoot into the wonted form of cryſtals of petre, but remained a kind of nitrous powder, the acid and alkalizate ſaline particles not having a convenient vehicle to expand themſelves in; but being neceſſitated, for want of room, to make an unſeaſonable and over-haſty coalition, upon which their own weight made them ſubſide in the figures reſulting from their caſual concourſe, and therefore probably differing from thoſe, into which the ſaline corpuſcles would have been diſpoſed, had they been allowed a competency of vehicle and time.

SECT. XXXI.

THE other reaſon of my heſitancy about the uſe of the air in our experiment, is, that I inconſiderately forgot to try, whether part of that liquor, which ſhot into cryſtals in an open-mouthed glaſs expoſed to the air, would not have done the like, if it had been left quiet as long as the other was, though in a veſſel accurately ſtopped *: but whatever the air hath to do in this experiment, I dare invite you to believe, that it is ſo enriched with variety of ſteams from terreſtrial (not here to determine whether it receive not ſome alſo from celeſtial) bodies, that the inquiring into the further uſes of it, (for I mean not its known uſes in reſpiration, ſailing, pneumatical engines, *&c.*) may very well deſerve your curioſity. To encourage which, I dare at preſent only tell you, that though I cannot yet pretend to much experience in this particular, yet we have known ſuch changes (ſeemingly chymical) made in ſome ſaline concretes, by the help chiefly of the volatilizing operations of the open air, as very few, ſave thoſe, that have attentively conſidered what *Helmont*, and one or two other artiſts, have hinted on that ſubject, or have made trials of that nature themſelves, will be apt to imagine.

SECT. XXXII.

AND if upon further and exacter trial it appears, that the whole body of the ſalt-petre, after its having been ſever'd into very differing parts, by diſtillation, may be adequately re-united into ſalt-petre equiponderant to its firſt ſelf; this experiment will afford us a noble and (for aught we have hitherto met with) ſingle inſtance to make it probable, that that, which is commonly called the form of a concrete, which gives it its being and denomination, and from whence all its qualities are in the vulgar philoſophy, by I know not what inexplicable ways, ſuppoſed to flow, may be in ſome bodies but a modification of the matter they conſiſt of; whoſe parts, by being ſo and ſo diſpoſed in relation to each other, conſtitute ſuch a determinate kind of body, endowed with ſuch and ſuch properties. Whereas if the ſame parts were otherwiſe diſpoſed, they would conſtitute other bodies of very differing natures from that of the concrete, whoſe parts they formerly were, and which may again reſult or be produced after its diſſipation and ſeeming deſtruction, by the re-union of the ſame component particles, aſſociated according to their former diſpoſition.

SECT. XXXIII.

THE redintegration (or re-production) of an analyzed body, if it can be accurately and really performed, may give much light to many particulars in philoſophy, and would certainly be very welcome both to the embracers of the atomical hypotheſis, and generally to thoſe other modern naturaliſts, who aſpire to ſuch explications of nature's phænomena as may at leaſt be underſtood: all whom I wiſh, that though men cannot perhaps in all things, yet at leaſt as far as they can, they would accuſtom themſelves to ſpeak and think, as nature does really and ſenſibly appear to work; and not to acquieſce in notions and explications of things, which, ſtrictly examined, are not intelligible.

WHEREFORE I am about to attempt a reproduction in vitriol, turpentine, and ſome other concretes, in which it ſeems not unlikely to be performable: and perhaps you may ſee cauſe to think, that the experiment of ſalt-petre, even as we have already made and propoſed it, though it be not an exact and adequate redintegration, is yet not far from being a real one; the diſſipated parts of the concrete truly re-uniting into a body of the ſame nature with the former, though not altogether of the ſame bulk.

SECT. XXXIV.

AND yet I think it requiſite to repreſent to you, *Pyrophilus*, that ſalt-petre is a body, whoſe parts are not organical, and which is not ſo much as very compounded; and that therefore bodies, that conſiſt of more numerous ingredients, and much more thoſe, whoſe organical parts require a much more artificial and elaborate diſpoſition or contrivance of their component particles, cannot be ſafely judged of, by what is poſſible to be performed on a body of ſo ſimple and ſlight a contexture as is ſalt-petre: for we ſee, that even wine, though no organical body, nor ſo much as the moſt compounded

* Whether the air have any great intereſt in the figuration or in the re-production of nitre, the author hath ſince examined by particular trials; but in veſſels and by ways not to be eaſily deſcribed in few words, and therefore the further mention of them is reſerved for another diſcourſe.

of inanimate concretes, when its ſpirit is, though by the gentleſt diſtillation, drawn from it, will not, by the re-union of its conſtituent liquors, be reduced to its priſtine nature; becauſe the workmanſhip of nature in the diſpoſition of the parts was too elaborate to be imitable, or repairable by the bare and inartificial appoſition of thoſe divided parts to each other: beſides that in the diſſociating action, even of the gentleſt fire, upon a concrete, there does perhaps vaniſh, though undiſcernedly, ſome active and fugitive particles, whoſe preſence was requiſite to contain the concrete under ſuch a determinate form; as we ſee in wine degenerating into vinegar, where the change ſeems to proceed from this, that upon the avolation, or (if I may ſo ſpeak) depreſſion, of ſome ſubtile ſulphureous ſpirits, whoſe receſs or degeneration is not to be perceived by any ſenſible diminution of bulk in the liquor, the remaining parts fall into new leagues or diſpoſitions, and conſtitute an acid liquor ſomewhat fixed and corroſive, and conſequently of qualities very differing from thoſe of the wine, whoſe ſouring produced it: as we more fully declare in our experiments relating to fermentation.

SECT. XXXV.

AND certainly there is, as we formerly ſaid, ſo artificial a contrivance of particles requiſite to the conſtitution of the organical parts of living bodies, that it will be ſcarce poſſible for human art or induſtry to imitate, ſo as to equal thoſe exquiſite productions of nature. And therefore I wonder not, that the ſtory of the phœnix's reſurrection out of her own aſhes ſhould, by the beſt naturaliſts, be thought a meer fiction. And if that relation, mentioned by the inquiſitive *Kircherus* as an eye-witneſs of the re-production (if I may ſo call it) of ſhell-fiſhes near the brink of a lake in the Sicilian promontory *Peloro*, by the watering of their broken bodies with ſalt-water in the ſpring, be ſtrictly true, it ſeems much more improbable, that ſuch changes and viciſſitudes ſhould be bare redintegration of the diſſociated parts of ſuch reſtored bodies; than that, (according to what we * elſewhere teach,) they ſhould be new productions made by ſome ſeminal particles undiſcernedly lurking in ſome part of the deſtroyed body, and afterwards excited and aſſiſted by a genial and cheriſhing heat ſo to act upon the fit and obſequious matter, wherein it was harboured, as to organize and faſhion that diſpoſed matter according to the exigencies of its own nature. For that in ſome bodies the ſeminal particles may a while ſurvive the ſeeming deſtruction of life, is not altogether without example, as we elſewhere profeſſedly manifeſt. And in *Kircher*'s ſtory it is to obſerved, that the reſtored animals were but ſhell-fiſh; in whoſe ſlimy and viſcous ſubſtance the ſpirits and prolifick parts are probably both more diffuſed and kept from being eaſily diſſipable; to which I know not whether it will be worth while to ſubjoin, that in ſuch fiſhes the mechanical contrivance is but very plain, and, as it were, ſlight and obvious, in compariſon of the exquiſitely elaborated parts of more perfect animals.

Lib. 3. de Arte Magnet. Par. 5. cap. 3.

SECT. XXXVI.

THE laſt obſervable, *Pyrophilus*, that we ſhall at preſent take notice of in our experiment, ſhall be this, that it may thereby ſeem probable, that ſome chymical remedies may be too raſhly rejected by phyſicians, becauſe oil or ſpirit of vitriol, aqua regis, or other corroſive liquors, have been employed in their preparation: for it is confidently affirmed by many phyſicians, and but faintly denied by ſome chymiſts, that the corroſive menſtruums made uſe of in the preparation of remedies, can never be ſo exquiſitely waſhed off from them, but that ſome of the ſalts will adhere to the medicines, and perniciouſly diſplay their corroſive nature in the body of him, that takes them. And it is not to be denied, but that many ignorant and venturous chymiſts do unſkilfully (and therefore dangerouſly enough) imploy corroſives ſometimes without any neceſſity or real advantage to invite them to it, and ſometimes without ſufficiently freeing their medicines from the corroding ſalts, by whoſe aſſiſtance they were prepared. For it is not always the frequency of ablution, though with warm water, that will ſuffice to carry off the ſalts from ſome bodies; and therefore thoſe great artiſts *Helmont* and *Paracelſus* preſcribe ſome things to be dulcified by the abſtraction of the water of whites of eggs, (which, though it ſeemed inſipid, hath been found a great diſarmer of corroſive ſalts) and others by the frequent diſtillation of ſpirit of wine, which indeed (not to mention the balſamick parts it may leave behind) we have obſerved to have a faculty of carrying up with it the ſaline particles of ſpirit of vinegar adhering to ſome chymical remedies. But all this notwithſtanding, *Pyrophilus*, there may be ſeveral bodies (and perhaps more than are commonly taken notice of) which quite alter the nature of the acid ſalts employed to prepare them, by occaſioning thoſe ſalts to degenerate into another nature, upon the very act of corroding, or elſe by ſo aſſociating their own ſalts with one of thoſe of the diſſolving menſtruum, that from the coalition of both, there emerges a third body differing in qualities from either. As in our experiment we find, that the ſpirit of petre, which is much more ſharp and corroſive than the ſtrongeſt diſtilled vinegar, and the fixed nitre, which is cauſtick like ſalt of tartar, and may, I ſuppoſe, well ſerve for a potential cautery, (as ſurgeons ſpeak) do by their mutual action work themſelves into ſalt-petre, which is far enough from having any eminently fretting quality, and may be ſafely taken inwardly in a much greater doſe than either of its ingredients.

SECT. XXXVII.

How much corroſive ſalts may dulcify themſelves by corroding ſome bodies, you may eaſily try, by pouring diſtilled vinegar, or moderate ſpirit of vitriol, upon a competent proportion

* In ſome papers about the origin of living creatures ſuppoſed to ſpring of themſelves.

portion of corals, or crabs eyes, or pearls, (or, as I ſuppoſe, almoſt any teſtaceous body.) And for my part, though I am very ſhy of imploying corroſive liquors in the preparation of medicines; yet I have lately given a preparation of refined ſilver made with aqua fortis it ſelf, or ſpirit of nitre, not only innocently, but with ſuch ſucceſs, that a couple of experienced phyſicians themſelves, that were troubled with a ſuperfluity of ſerous humours, ſent to requeſt it of me for their own uſe.

SECT. XXXVIII.

IT were therefore worth while, in every preparation, where corroſive liquors are wont to be imployed, or may ſeem requiſite to be ſo, to conſider the diſtinct nature of the particular bodies to be wrought upon, or conſult experience, whether or no the acid menſtruum do communicate to the concrete any particles capable of retaining their fretting quality after the end of the operation; or whether or no the ſalts do not ſo ſpend and tire themſelves in the act of corroding, that being as it were ſheathed, they become unable to corrode any further; or whether or no the menſtruum do not in the body to be corroded meet with ſome ſuch ſaline particles, as may with it conſtitute a new and inoffenſive ſubſtance, as when ſpirit of vinegar, by corroding calcined lead, is turned with it into a ſalt, not of an acid, but a ſaccharine taſte, ſuch as invited chymiſts to give it the name of ſugar of *Saturn*. In the former of theſe caſes the medicine may be dangerous, unleſs it be after the ſolution or corroſion ended exquiſitely dulcified from all remainder of the corroſive ſalts. But in the two latter caſes the remedies may, in ſpite of the corroſiveneſs of the menſtruums employed about them, be ſafe and innocent enough; for it matters not much, how ſharp and fretting the ſever'd ingredients of a remedy were, provided the remedy it ſelf reſulting from them be not ſo. And whereas it is objected, that in divers of theſe remedies the corroſive ſalts are not really deſtroyed, but only diſguiſed, becauſe by diſtillation it is poſſible to ſeparate from them the liquors uſed about them as corroſive as ever; it may eaſily be replied, that beſides that, in ſeveral medicines, the matter of fact will not hold in divers others, the objection built on it is much more ſpecious than ſolid: for it very little concerns us to be ſure, that out of the medicines we take or give, the violence of fire cannot ſeparate corroſive ſalts; provided we be duly ſatisfied, that no ſuch ſeparation can be made by the heat or juices of a human body. And therefore, though it have been affirmed, that tartarum vitriolatum would upon the urgent ſollicitation of a ſtrong fire, part with much of (that moſt fretting liquor upon animal ſubſtances) the oil of vitriol, that concurred to its production; yet our beſt and warieſt phyſicians, not only chymiſts but methodiſts, ſcruple not to give it inwardly in ſeveral conſtitutions and diſtempers. And to end this diſcourſe with the experiment, that began it, we clearly ſee, that ſalt-petre is frequently and innoxiouſly given inwardly, though the ſalt, that makes even aqua fortis ſo corroſive, be the principal ingredient of it, and may by diſtillation be driven from it.

SECT. XXXIX.

IT would not have been very uneaſy for me, *Pyrophilus*, to have added to divers particulars of the paſt diſcourſe, experiments and conſiderations tending to countenance or illuſtrate the reflections therein ſet down: but in the firſt place, I wanted leiſure to expatiate; in the ſecond place, I was unwilling to anticipate what I have to ſay to you in other eſſays, eſpecially expecting to have elſewhere occaſion to make mention of ſalt-petre. And beſides all this, I am (to tell you the truth) deſirous to impoſe on you a kind of neceſſity of proſecuting this experiment, further than, when I made it, I had opportunity to do. For as I am apt to think it may prove a noble one, ſo I am ſufficiently ſenſible of my having not yet been able to look into the bottom of it; and that very ſenſe of my own ignorance helped to keep me from lengthening your trouble in this eſſay, leſt by ſolemnly endeavouring to countenance my conjectures, I might be thought dogmatical in a haſty ſcribble, wherein it is much more my deſign to awaken and engage your curioſity, than acquaint you with my opinions. And yet I thought it not amiſs to mention the paſt conſiderations, ſuch as they are, partly becauſe this one inſtance ſeems ſo fairly to accommodate more than one notion of the intelligible philoſophy, which ſeems hitherto not to have ſo much as employed, much leſs produced, any ſtore of experiments; and partly, becauſe I would have you take notice, that more obſervables than one may ſometimes be very reaſonably ſought for in a ſingle experiment. And perhaps too, I was willing by my ſpending a whole eſſay upon one experiment, without allowing my ſelf to wander often from it, to invite you to think with me, that experiments ought to be eſtimated by their value, not their number; and that a ſingle experiment, I ſay not ſuch as that the laſt eſſay treats of, but in general, ſuch as, it may be, may as well deſerve an entire treatiſe, as a great many leſs conſiderable ones. As one of thoſe large and orient pearls, that are fit to adorn a monarch's crown, may out-value a very great number of thoſe little (though true) pearls, that are to be bought by the ounce in goldſmiths and apothecaries ſhops.

SECT. XL.

HAVING newly met, *Pyrophilus*, with ſome ſmall treatiſes freſhly publiſhed by *Glauberus*, and not having now the leiſure to conſider, or indeed ſo much as to peruſe; much leſs the opportunity to make trial of divers particulars, which by turning over the leaves of the book, I find mentioned by him in relation to ſalt-petre, I muſt recommend to you the care of examining the particulars he delivers; and trying how far ſome of them may ſerve to correct, or to confirm, and how far others may be

be corrected by what has been in the paſt diſcourſe ſet down concerning ſalt-petre upon experiments; ſome of whoſe fruits I can yet ſhew you, which were made upon the account of the diviſibleneſs of nitre into fixed and volatile parts, long before the publication of *Glauber*'s treatiſes.

THE

HISTORY

OF

FLUIDITY and FIRMNESS.

Advertiſements concerning the following Treatiſe.

THAT the author in thoſe animadverſions upon the *Eſſay touching Salt-petre*, whereof the enſuing treatiſe makes a part, might with the more freedom and conveniency add, alter, and even retract as he ſhould ſee cauſe, he thought fit to write them, as if they were made on the work of another.

THE author hopes, that the equitable reader, conſidering that the following particulars touching fluidity and firmneſs were firſt written but by way of annotations upon the beginning of the above-mentioned eſſay, will excuſe the unaccurateneſs of the method, as a fault ſcarce evitable on that occaſion. It is alſo hoped, that if the reader will remember, that he was told in the preface to the newly-mentioned eſſay, that moſt of thoſe, whom to gratify that treatiſe and the enſuing notes on it were written, were addicted to the Epicurean philoſophy; the author's explicating things chiefly according to the atomical principles will not be thought ſtrange, nor be looked upon as a ſure argument of his being wedded to the particular opinions, wherein the Atomiſts differ from other modern Naturaliſts: eſpecially, ſince he has on ſome occaſions plainly enough intimated the contrary, by propoſing, together with the atomical ways of reſolving a thing, another explication more agreeable to the Carteſian, or ſome other modern hypotheſis.

THE following tract was entitled, *A Hiſtory of Fluidity and Firmneſs*, becauſe indeed the having ſet down experiments and other matters of fact relating to the ſubjects treated of is the main, though not the only thing the author dares pretend to have done in it. And he ſtyles the hiſtory, as it now comes abroad, *Begun*; partly, becauſe he would invite abler pens to contribute their obſervations towards the compleating of what he is ſenſible he has but begun; and partly becauſe he may hereafter, if God permit, do ſomething of that kind himſelf.

AND laſtly, the author, though troubled that he can do it, dares not but advertiſe the reader, that ſome pages, partly a little after the beginning, and partly about the middle of the following treatiſe, having been loſt through the negligence or miſtake of him, to whoſe care the ſheets, whereon it was written, were committed; he fears he has not been able, otherwiſe than very lamely and imperfectly, to repair that loſs out of his memory.

THE

Hiſtory of FLUIDITY and FIRMNESS.

The Firſt Part.

Of FLUIDITY.

SECT. I.

WHETHER philoſophers might not have done better in making fluidity and firmneſs rather ſtates than qualities of bodies, we will not now examine. But under which ſoever of the two notions we look upon them, it is manifeſt enough, that they are to be reckoned amongſt the moſt general affections of the conventions or aſſociations of ſeveral particles of matter into bodies of any certain denomination, there being ſcarce any diſtinct portion of matter in the world, that is not either fluid, or elſe ſtable or conſiſtent. And therefore, I preſume, it may be well worth while to conſider, what may be the general cauſes of theſe two ſtates, qualities, or affections of matter; and to try, whether by aſſociating chymical experiments to philoſophical

notions, there may not be given at leaſt a more intelligible and more practical of both theſe ſubjects, than has been hitherto afforded us by the doctrine of the ſchools, which is wont to appear very unſatisfactory to diſcerning men; many of whom look upon what is wont to be taught by the Peripateticks, concerning fluidity and firmneſs, as well as other qualities, to be partly too general to teach us much, and partly too obſcure to be underſtood. And that which at preſent invites us to this inquiry is, chiefly, that ſome circumſtances of our author's experiment, touching ſalt-petre, may afford us ſome uſeful aſſiſtance in our deſigned ſearch. For though the chief phænomena and circumſtances of the experiment may be thought principally to reſpect fluidity; yet ſince that and firmneſs are contrary qualities, and ſince it is truly, as well as commonly, ſaid, that contraries ſurveyed together ſerve to illuſtrate each other, it may reaſonably be hoped, that the circumſtances juſt now related may give to the nature of fluidity, may facilitate the knowledge of that of compactneſs: nevertheleſs, we ſhall often be obliged to treat of theſe two qualities together, becauſe the experiments we are to produce do many of them relate to both.

SECT. II.

A BODY then ſeems to be fluid, chiefly upon this account, that it conſiſts of corpuſcles, that touching one another in ſome parts only of their ſurfaces (and ſo being incontiguous in the reſt) and ſeparately agitated to and fro, can by reaſon of the numerous pores or ſpaces neceſſarily left betwixt their incontiguous parts, eaſily glide along each other's ſuperficies, and by reaſon of their motion diffuſe themſelves, till they meet with ſome hard or reſiſting body; to whoſe internal ſurface, by virtue of that motion, their ſmallneſs, and either their gravity, or ſomething analogous or equivalent to it, they exquiſitely, as to ſenſe, accommodate themſelves.

SECT. III.

WHAT notion *Epicurus*, and the ancient Atomiſts his followers, had of fluid bodies, may be learned from theſe verſes of his paraphraſt *Lucretius:*

Illa autem debent ex lævibus atque rotundis
Eſſe magis, fluido quæ corpore liquida conſtant.
Nec retinentur enim inter ſe glomeramina quæque,
Et procurſus item in proclive volubilis extat.

And indeed, it is probable enough, that in divers liquors the little ſurfaces of the component particles are ſmooth and ſlippery, and that their being ſo does much facilitate the gliding of the corpuſcles among themſelves; and conſequently, the fluidity of the body they compoſe. Nor is it to be denied, that the ſpherical figure of ſuch corpuſcles may alſo conduce to their eaſy rolling upon one another: but there are divers other figures, which may make the little bodies endowed with them voluble enough to conſtitute a fluid ſubſtance. And the other qualities to be met with in divers liquid ſubſtances, and even in water itſelf; and oil, ſeem to argue their parts to be otherwiſe ſhaped; and thoſe fluid bodies, which are not liquors, as air and fire, ſeem to be compoſed of particles not all or moſt of them round, but of very various, and ſometimes of very irregular figures; and yet that ſuch bodies deſerve to be called fluid ones, will be manifeſt anon. And that they make a much more conſiderable part of the univerſe, than thoſe that are wont to be called liquors, may be argued from hence, that except the earth, the planets, and perhaps too the fixt ſtars, the reſt of the world, as vaſt as it is, ſeems to conſiſt chiefly, if not only, of an ætherial, thin, and fluid ſubſtance, as may appear (to omit other arguments) by what later aſtronomers have obſerved concerning the free and unreſiſted motion of ſuch comets as have by a trajection through the æther, for a long time wandered through the celeſtial or interſtellar part of the univerſe.

SECT. IV.

AND here let us obſerve, that it is not neceſſary to the fluidity of a body, nay, nor to its appearing fluid to the eye it ſelf, that the corpuſcles it conſiſts of be crouded as cloſe together as they are wont to be in water, and other bodies, that are commonly looked upon as the only liquors. For though a parcel of matter no bigger than a grain of corn, being rarified into ſmoke, will poſſeſs an incomparably greater ſpace than it did before; and though, if a body be further rarified into flame, its expanſion will be yet much greater: yet both ſmoke and flame may be ſo ordered, as to appear like liquors. We have practiſed divers ways, to make the fumes of bodies acquire a viſibly-level ſuperficies like water; but the eaſieſt, though not perhaps the beſt, is this, (part of which I remember I have ſeen performed as a kind of trick by a very ingenious perſon:) The mouth being filled with the ſmoke of roſemary (that happening to be at hand when I made the experiment) if this ſmoke be plentifully blown into a glaſs pipe of an indifferent ſize, and open at both ends; and if when it is well filled with ſmoke, the lower end be preſently ſtopt, and the glaſs be kept ſtill a while in an erected poſture, the fumes will ſettle by degrees to a level ſuperficies like water: ſo that, though you gently incline the pipe any way, the upper ſurface of the ſmoke will nevertheleſs quickly grow parallel to the horizon. And if the glaſs be further (but ſlowly) made to ſtoop, the ſmoke will ſeem to run down in a body like water, whilſt it continues in the pipe; though when it is come to the lower end of it, inſtead of dropping down like water, it will commonly rather fly upwards, and diſperſe it ſelf into the air. And as for flame, I foreſee I ſhall ere long have occaſion to mention an experiment, whereby I have ſometimes endeavoured to ſhew, that even two contiguous flames, as expanded bodies as they are, and as open as their texture is, may like viſible fluids of a differing kind retain diſtinct ſurfaces.

SECT. V.

BUT inſtead of examining any further, how many bodies are or may be made viſibly to appear fluid ones; let us now reſume the conſideration of what it is that makes bodies fluid: eſpecially, ſince having intimated ſome of the reaſons, why we are unwilling to confine our ſelves to the Epicurean notion, we hope it will the leſs be diſliked, that we thought fit to make ſuch a deſcription of a fluid ſubſtance, as may intimate, that we conceive the conditions of it to be chiefly theſe three.

THE firſt is the littleneſs of the bodies that compoſe it: for in big parcels of matter, beſides the greater inequalities or roughneſſes, that are uſual upon their ſurfaces, and may hinder the eaſy ſliding of thoſe bodies along one another; and beſides that divers other affections of a fluid body cannot well belong to an aggregate of groſs lumps of matter; beſides theſe things, I ſay, the bulk it ſelf is apt to make them ſo heavy, that they cannot be agitated by the power of thoſe cauſes (whatever they be) that make the minute parts of fluid bodies move ſo freely up and down among themſelves: whereas it would ſcarce be believed, how much the ſmallneſs of parts may facilitate their being eaſily put into motion, and kept in it, if we were not able to confirm it by chymical experiments. But we ſee that lead, quick-ſilver, and even gold it ſelf, though whilſt they are of a ſenſible bulk, they will readily ſink to the bottom of aqua regis, or any other ſuch liquor; yet when the menſtruum has corroded them, or fretted them aſunder into very minute parts, thoſe minute corpuſcles grow then ſo much more capable of agitation than before, that quitting the bottom of the liquor, they are carried freely every way, and to the top, with the aſſociated parts of the liquor, without falling back again to the bottom. Nay, we ſee, that ponderous and mineral bodies divided into corpuſcles ſmall enough may be made ſo light and voluble, as to become ingredients even of diſtilled liquors; as we may learn by what ſome chymiſts call the butter, others (ſimply) the oil, and others the *oleum glaciale* of antimony; which, though it be after rectification a very limpid liquor, yet does in great part conſiſt of the very body of the antimony, as may appear (not to mention its weight) by this, that it is moſt eaſy to precipitate out of it with fair water ſtore of a ponderous white calx, reducible by art to an antimonial glaſs. Nay, we make a menſtruum, with which we can eaſily at the firſt or ſecond diſtillation bring over gold enough, to make the diſtilled liquor appear and continue enobled with a golden colour.

AND to ſhow yet more particularly, that great bodies are too unwieldy to conſtitute fluid ones; we may further obſerve, how as well nature as art, when either of them makes bodies of conſiderable bulk fluid, is wont, in order thereunto, to make a comminution of them, as we may obſerve in divers examples.

SECT. VI.

THUS we ſee, that in the ſtomachs of dogs, nature, to reduce bones into thoſe fluid bodies, chyle and blood, does by ſome powerful and appropriated juice, (whether belonging to the ſtomach it ſelf, or thrown out of the arteries in the paſſage of the circulating blood) diſſolve them into parts ſo minute, that the acuteſt eye would not tempt a man to ſuſpect, that ſuch a liquor had ever been a bone. And that it may not be objected, that this diſſolution is chiefly performed, or at leaſt muſt always be aſſiſted by the liquor, which animals take into their ſtomachs by drinking; I ſhall repreſent not only, that we find by experience, how little common water, the only uſual drink of dogs, wolves, *&c.* is able to diſſolve bones, though they be very long not macerated, but boiled in it; but that (if we may believe natural hiſtorians and credible travellers) there are ſome ſorts of animals, as particularly camels, that may be brought not to drink once in many days, even when they travel in hot climates. And to make you think this the leſs improbable, I ſhall add, that I am familiarly acquainted with an ingenious gentleman, who, as himſelf and an ancient virtuoſo, in whoſe houſe he lives, have informed me, does uſually drink but once in ſeveral days, and then no exceſſive draught neither. And when I aſked him, how long he had actually abſtained not barely from drink, but from thirſting after it? he anſwered, that he had once (ſome few years before) continued about nine days without either taking or needing any drink; and he doubted not, but that he might have continued much longer in that ſtate, if by diſtempering himſelf one night with long and hard ſtudy he had not had ſome light inclination to take a ſmall draught, which ſerved him for about four days longer. And when I aſked him, whether in that hot ſummer's-day, that preceded the evening, wherein he happened to tell me this, he had not drunk at all? he anſwered negatively. And it adds to the ſtrangeneſs of this peculiarity, that this gentleman is in the flower of his youth, being but about twenty two years of age, and of a ſanguine and florid complexion. And (to annex that alſo upon the by) I learned by inquiry from him, that he ſweats freely enough, as I remember I ſaw him do; that his diet is the ſame with other men's, without reſtraining him from the free uſe of ſalt meats; and that his urine is in quantity much like that of ordinary men of his age and temperament. But to return to what I was ſaying more generally of the ſtomachical menſtruum of animals; I ſhall add on this occaſion, that to make ſome kind of imitation of it, I prepared, and do elſewhere mention and teach a certain liquor, that I uſe, whereby I have in a ſhort time, and without fire, diſſociated the parts of roaſted or boiled fleſh, bread, fruit, *&c.* and pulled them aſunder into very minute bodies, whereby I have reduced ſometimes one, ſometimes another of them, together with the menſtruum, (which needs not much exceed them in bulk) to the conſiſtence of a fluid body.

WE ſee likewiſe, that fuſion makes metals fluid, and in fuſion there is manifeſtly a comminution of the melted body; the heat alone of gold, ſilver, or iron, though increaſed even

to

to ignition, being not able to make thoſe metals become fluid, whilſt they continue in maſſes of any ſenſible bulk. To which I ſhall add anon, that even melted metals may have their fluidity increaſed by a yet further comminution of their parts.

SECT. VII.

AND to reſume here the conſideration of that very difficult queſtion, which we have elſewhere mentioned, it ſeems well worth inquiry, whence it happens, that in the diſtillation of common ſalt and other ſaline bodies, which not only are not fluid, but are hard even to brittleneſs, there will yet be obtained a perfect and permanent liquor, and from ſome of them a very conſiderable proportion of it. In anſwer to this queſtion it may indeed be ſaid, that in divers dry bodies, ſuch as harts-horn, wood and bones, committed to diſtillation, the fire does no more than ſeparate the aqueous or other liquid parts from the others, wherewith they were blended in the concrete, and bring them together into the receiver, where they convene into a liquor. But beſides that this it ſelf is perhaps more eaſily ſaid than proved, it does not reach the propounded difficulty: for with what probability can it be affirmed of bodies, that have been already calcined or melted? ſuch as are the red calx of vitriol, and fluxed ſea-ſalt, *&c.* which yet afford liquors, though their aqueous and other looſer parts have been already driven away by a ſtrong fire before their being expoſed to diſtillation. I have ſometimes then conſidered, whether it may not ſeem leſs improbable to conjecture, that the vehement agitation produced in ſuch bodies by the violence of heat does both divide them into minute corpuſcles, and drive over ſwarms of them into the cold receiver, where loſing their former vehemence of agitation, they are reduced into a liquor, chiefly, (for I would not exclude concurrent cauſes) by reaſon that the fire happened to rend the concrete into parts, by their extreme littleneſs, or their ſhape, or both, ſo eaſy to be tumbled up and down, that the wonted agitation of the air, propagated by the interpoſed bodies or medium, or elſe that the ſame cauſe, whatever it be, that gives the air its wonted agitation, is able to give ſuch minute corpuſcles enough of it to keep them fluid.

SECT. VIII.

THAT there is conſtantly in the air a various motion of the ſmall parts, will be anon declared. That alſo ſome bodies will be kept fluid by a much leſs meaſure of agitation than is requiſite to others, ſeems probable from hence, that wine will continue a liquor in ſuch a languid warmth of the air, as will not keep the parts of water moving, but permit them to reſt in the form of ice. And in cold countries, where wine it ſelf would congeal, (as I have by art made it do here in *England*) it is obſerved, that though the more aqueous parts will by the loſs of their motion be turned into ice, yet the more ſubtile and ſpirituous parts remain unfrozen; and ſo do divers other liquors, (eſpecially chymical) of very ſubtile and voluble parts. And the corpuſcles, that chiefly compoſe that body, which is properly called the air, though it appears by weather-glaſſes, that cold may very much contribute to condenſe it, (that is, to occaſion the approach of its parts to one another, or, reduce them to a cloſer order) have not been obſerved to be frozen by any degree of cold whatſoever; which ſeems to proceed from hence, that by reaſon of their extreme littleneſs, (not excluding their figure) there cannot be ſo little of agitation about the earth, as not to be ſufficient to continue a various motion in ſuch very minute bodies, and conſequently to keep them fluid.

Now, that likewiſe it is poſſible, that a ſaline ſpirit ſhould conſiſt at leaſt in great part of very minute grains of ſalt, we elſewhere declare; where it is taught, that a ſal-armoniac may be made by ſpirit of urine and ſpirit of ſalt, as the common ſal-armoniac is made with crude ſalt: and there a way is alſo ſhewn, how theſe two ſalts, (the urinous and the other) as ſtrictly as they are united in the compound, may be readily divorced. And agreeably to this I obſerve, that as (according to what I elſewhere note) a common aqua fortis may be enabled to diſſolve gold, (on which of it ſelf it will not faſten) by the addition of ſpirit of ſalt; ſo I find, that common crude ſalt barely diſſolved in it will give it the like power of working upon gold. Nay, I have tried, that crude nitre, diſſolved in good ſpirit of ſalt, may make it ſerve for an aqua regis. And I remember on this occaſion, that having inquired of the moſt noted perſon in *Holland* for the diſtilling of corroſive waters, what was the greateſt proportion of diſtilled liquors, that ever he was able to obtain from ſea-ſalt; he (though a man not given ſo much as to boaſting) affirmed to me, that by uſing inſtead of the ordinary *Caput mortuum*, as brick-duſt, ſand, *&c.* (that chymiſts are wont to mingle with ſalt before they diſtil it) a certain whitiſh clay, he had ſometimes brought over almoſt the whole body of ſalt into a liquor; inſomuch that from a pound of ſalt he could draw, and that without any extraordinary trouble or degree of fire, fourteen ounces of liquor. And when, becauſe I ſuſpected, that much of this might be water forced from the clay mingled with the ſalt, I inquired, whether he had ever dephlegmed this liquor; he anſwered me, that he had purpoſely done it; and ſometimes found no leſs than about twelve ounces of it to be ſtrong rectified ſpirit: which brought into my mind that almoſt incredible paſſage of *Beguinus*, who ſomewhere teaching the diſtillation of another ſalt, adds to the end of his directions, that if you have wrought well, you ſhall get from a pound of the matter a pound of ſpirit. But becauſe from all theſe liquors, diſtilled from ſuch kind of ſalts, it is poſſible either by rectification, or ſome more philoſophical way, to obtain a portion of phlegm or water, I leave it to further inquiry, whether or no the fluidity of theſe diſtilled liquors may not in divers caſes be in part furthered by the mixture of ſome particles of an aqueous nature, (ſuch being fit to make diſſolvers and vehicles for ſalts) which may not abſurdly

abſurdly be ſuſpected to have been produced by the action of the fire, upon the concrete committed to diſtillation; if we allow, with that famous chymiſt *Helmont*, that by the alkaheſt all groſs bodies may be totally, and that, without it, even oil and ſalt may in great part, (and that without additaments) be reduced into inſipid water.

SECT. IX.

WE ſhall anon, (when we come to treat of firmneſs) mention our having made a certain ſubſtance ſo diſpoſed to fluidity, that it may be made to change the ſtable conſiſtence for a liquid one, by ſo ſmall an agitation, as only the ſurpluſage of that, which the ambient air is wont to have about the middle even of a winter's-day, above what it hath in the firſt or latter part of it. Nay, we have made even a metalline ſalt or vitriol capable of this proclivity to liquefaction, of which we have unqueſtionable witneſſes. And therefore, it need not appear incredible, that other heaps or aggregates of corpuſcles much lighter than theſe, though heavier than thoſe of the air, may have all their parts ſo minute and fitted for motion, that the wonted agitation of the air may not only about noon, but at all other times of the day, keep them in motion, and thereby in the ſtate of fluidity.

SECT. X.

AND here I muſt add, that it was not altogether without cauſe, that I lately took notice of the ſhapes as well as the ſizes of bodies, in reference to their fitneſs to conſtitute fluid ones. For though I be not ſure, but that in thoſe bodies, as ſal-armoniac, antimony, *&c.* which are by the fire ſublimed into flowers rather than diſtilled into liquors, the magnitude of the component corpuſcles may not be a hinderance to the fluidity of the body they conſtitute; yet this ſeems as probably referable to their figure, unapt for the requiſite motion, as to their bulk. And I have ſometimes made to this purpoſe this experiment; that by ſlowly diſtilling oil-olive *per ſe* in a glaſs-retort, (placed in ſand) I found, as I expected, that about the third part of the oil, which was driven over into the receiver, did there coagulate into a whitiſh body almoſt like butter. So that although it ſeemed manifeſt by the ſtrong ſmell and very piercing taſte of this white ſubſtance, that the oil, which afforded it, had its particles, as it were, torn in pieces; and though diſtillation be wont to obtain liquors even from conſiſtent bodies; yet in our experiment of a concrete, that is naturally fluid, the diſtilled liquor it ſelf proves not to be ſo: of which no cauſe ſeems more obvious, than that the newly-acquired ſhape of the diſſipated parts of the oily corpuſcles makes them unfit for motion; either abſolutely ſpeaking, or at leaſt in reſpect of one another, by making them leſs pliant than formerly, or giving them a figure more eaſy to be entangled with the neighbouring corpuſcles, or elſe by making their ſurfaces leſs ſmooth and ſlippery than before.

SECT. XI.

BUT to return thither, whence we have digreſſed, and mention ſome more familiar examples of the conduciveneſs of the ſmallneſs of a body's disjoined parts to its fluidity, we may take notice, that of bodies, that conſiſt of incoherent parts, and are made up, as it were, by aggregation, thoſe *de cæteris partibus*, in their being poured out, moſt reſemble liquors, that are the ſmalleſt; as would appear upon the emptying of ſeveral ſacks, the one of apples, the other of walnuts, the third of filberts, the fourth of corn, the fifth of ſand, and the ſixth of flour.

CONFECTIONERS alſo, cooks, and others, that make much uſe of whites of eggs, will eaſily reduce thoſe clammy and viſcous bodies into a thin and fluid ſubſtance, to which, for its affinity with water, many give the ſame name: and yet this difference of fluidity being effected only by long and ſkilfully beating the maſs with a whiſk, or even with a ſpoon, ſeems to be produced but by pulling aſunder the parts, (which, perhaps, before were long and ſomewhat twined) and breaking them into ſhorter or leſſer, and conſequently more voluble ones. And I remember, I have ſeen a good quantity of that jelly, that is ſometimes found on the ground, and by the vulgar called a ſtar-ſhoot, as if it remained upon the extinction of a falling ſtar, which being brought to an eminent phyſician of my acquaintance, he lightly digeſted it in a well-ſtopt glaſs for a long time, and by that alone reſolved it into a permanent liquor, which he extols as a ſpecifick to be outwardly applied againſt wens.

SECT. XII.

AND here we will ſubjoin an obſervation afforded us by the art of caſting, which has ſometimes yielded us a not unpleaſant diverſion. It is obſerved then by goldſmiths well verſed in that art, (and has been recommended to me by an artificer eminently ſkilful in it) as one of the chief remarks belonging to it; that when any ſuch curious work of ſilver is to be caſt, as requires, that the impreſſion of hairs or very ſlender lines be taken off by the metal, it is not enough, that the ſilver be barely melted; but it muſt be kept a conſiderable while in a ſtrong fuſion: for if it be too ſoon poured out, the figure it will make will be but blunt; whereas if it be kept a competent time in fuſion, the matter becoming thereby more liquid as well as hotter, will be thin enough to run into the ſmalleſt cavities of the mould, and ſo receive a figuration even from the delicateſt of them. Whence it may probably be deduced, that ſome bodies already fluid may, by a further comminution of their parts, be made yet more fluid. The like increaſe of fluidity may be obſerved in ſome other fluid bodies, eſpecially unctuous ones, as turpentine, oil, *&c.* when heat begins to break as well as agitate their parts.

I MAY elſewhere have occaſion to mention, how, by the operation of the fire, the cryſtalline, ſalt of urine may be reduced without additaments.

ments to a ſtrong and ponderous liquor: though in this, as perhaps alſo in ſome of the former inſtances, it is not unlikely, that (as we may hereafter more particularly declare) there may concur to the produced change of conſiſtence ſome alteration in the figure of the corpuſcles, whereof the firm body conſiſted.

AND if that be true, which *Helmont* in ſeveral places affirms of his prodigious liquor, alkaheſt, it is poſſible to turn plants, animals, ſtones, minerals, metals, or whatever kind you pleaſe of conſiſtent body here below, into a liquor equiponderant to the reſolved concrete: which (if granted) ſeems to argue, that the moſt ſolid body, by being divided into parts ſmall enough to be put into motion by the cauſes, that keep thoſe of water and other liquors in agitation, may become fluid bodies. And this intimation I ſhall add for the ſake of philoſophers, that barely by long digeſtions, (and much more if they be helped by ſeaſonably-repeated diſtillations) in exactly ſtopt veſſels, and a due degree of heat, there may be made in the parts of many bodies, both vegetable and animal, ſo great a change from the ſtate of conſiſtence to that of fluidity, as thoſe, that contenting themſelves with ordinary courſes of chymiſtry, have not had a peculiar curioſity for trials of this nature, will not be forward to expect.

SECT. XIII.

THE ſecond of the above-mentioned three conditions is, that there be ſtore of vacant ſpaces intercepted betwixt the component particles of the fluid body, or at leaſt about thoſe of them, that are ſuperficial: for without this there will not be room for each of the corpuſcles to continue its agitation upon the ſurfaces of the neighbouring ones; and there would be no ceſſion of any, becauſe there would be no place unpoſſeſſed for the impelled corpuſcle to be received in. But when I ſpeak of vacant ſpaces, ordinarily, (if not always) requiſite to be intercepted betwixt the particles of fluid bodies; I intend not to determine, whether or no ſuch ſpaces ſhould or may be vacuities properly ſo called; it being commonly ſufficient to this ſecond condition of a fluid body, that in the little ſpaces intercepted between thoſe that either are, or at leaſt are conſidered as ſolid parts, there be none but ſuch as will eaſily yield to them, and cannot conſiderably reſiſt the freedom of their motions.

WHICH being premiſed to keep this condition from being miſtaken, we may in confirmation of it take notice, how ſnow, which at its firſt falling is of a looſe and open texture, does eaſily yield to the impreſſions of the hand: but when by being ſtrongly compreſſed and formed into balls, the little icy bodies it conſiſts of are brought into a cloſer order, and many of them thruſt into the little ſpaces formerly poſſeſſed only by the yielding air, they become unable to give way to the motions of our hand as before, but compoſe a hard and reſiſting body. We ſee alſo, that when water is ſtrongly forced into and kept compreſſed in a bladder, ſo that its exteriour particles have not about them as before the yielding air to give way to them, when they ſhould, according to their wont, ſwell about the ſides of the bodies that endeavour to preſs it inwards, it emulates a hard body, and reſiſts ſuch motions as otherwiſe it would readily yield to; unleſs a more eaſy ceſſion be occaſioned by the retching of the moiſtened bladder it ſelf.

AND I chuſe to inſtance in a bladder diſtended with water, rather than in one full of air, becauſe, though this latter will alſo emulate a hard body, yet in this caſe the tenſion of the bladder would perhaps be aſcribed to a kind of ſpring, which divers experiments have taught us to belong to the air: whence it might be ſaid, that ſince the incloſed air will ſuffer it ſelf to be thruſt inward a good way, though it will quickly when permitted fly out again; the hardneſs of a well-blown bladder proceeds not from want of the rooms requiſite to the ceſſion of the aërial corpuſcles, but to the motion of reſtitution natural to them; when like an innumerable company of little bows or ſprings, being bent by the force, that compreſſes the ſides of the bladder, they do, as ſoon as it is taken off, ſtretch themſelves out again (ſome one way, ſome another) as far as is permitted them by the impriſoning bladder, which they thus every way keep ſtrongly diſtended.

BUT this having of vacant ſpaces, or ſome yielding matter about the corpuſcles of a fluid body, ſeems requiſite to its being ſo, but as what in a ſchool-term one may call a *Removens prohibens*; I mean, only as it obviates that impediment to their motion, which exquiſite fulneſs may be conceived to give to the various glidings amongſt themſelves of the parts of a body ſuppoſed to be perfectly of the ſame hardneſs or ſoftneſs, or, if you pleaſe, altogether equally diſpoſed or indiſpoſed to yield to one another. And although in ſuch bodies, as water, wine, oil, quickſilver, and the like, that are generally agreed upon to be fluid liquors, it will I preſume be granted, that this ſecond condition we have been ſpeaking of may take place; yet I will not ſay, that it were altogether abſurd to queſtion, whether there may not be a portion of matter conſiſting of parts ſo minute, and ſo agitated, and conſequently ſo eaſy to be either crumbled into yet ſmaller parts, or ſqueezed into any figure as occaſion requires, that they may inceſſantly change places among themſelves, and thereby conſtitute a moſt fluid body, without any vacuities, receptacles, or yielding matter about them, unleſs perhaps it be about the exteriour parts of thoſe of them, that from time to time happen to be the ſuperficial corpuſcles of this thinneſt liquor. But though we have ſaid, that this may be queſtioned without abſurdity, yet it will not ſo much concern us in this place to examine, whether the affirmative may be rationally maintained, as to proceed to conſider what is farther requiſite to that ſtate of matter we are now treating of, eſpecially the qualification yet unmentioned ſeeming to be the principal of all.

SECT. XIV.

FOR the third and chief condition of a fluid

body is, that the particles it conſiſts of be agitated variouſly and apart, whether by their own innate and inherent motion, or by ſome thinner ſubſtance, that tumbles them about in its paſſage through them. For this ſeems to be the main difference betwixt ſolid ice and fluid water, that in the one the parts (whether by any newly acquired texture, or for want of ſufficient heat to keep them in motion) being at reſt againſt one another, reſiſt thoſe endeavours of our fingers to diſplace them, to which in the other, the parts being already in motion, eaſily give way. For whereas in the ice, every part actually at reſt muſt by the law of nature continue ſo, till it be put out of it by an external force capable to ſurmount its reſiſtance to a change of its preſent ſtate; in water each corpuſcle being actually (though but ſlowly) moved, we need not begin or produce a new motion in it, but only byaſs or direct that, which it has already, which many familiar inſtances manifeſt to be a much eaſier taſk. From this agitation of the ſmall parts of liquors it comes to paſs, that theſe little bodies, to continue their motion, do almoſt inceſſantly change places, and glide ſometimes over, ſometimes under, and ſometimes by the ſides of one another. Hence alſo may be rendered a reaſon of the ſoftneſs of fluid bodies, that is, their yielding to the touch: for the particles that compoſe them being ſmall, incoherent, and variouſly moved, it can be no difficult matter (as we lately intimated) to thruſt them out of thoſe places, which being already in motion they were diſpoſed to quit, eſpecially there being vacant rooms at hand, ready to admit them as ſoon as they are diſplaced. And hence it likewiſe happens, that theſe little bodies muſt be very eaſily moveable any way upon the motion of the maſs or liquor, which they compoſe; and that being very ſmall, and moving ſo many ways, they cannot but (according to *Ariſtotle*'s definition of things fluid) be very unfit to bound themſelves, but very eaſy to be bounded by any other firm body; for that hinders them from ſpreading any further: and yet to continue their various and diffuſive motion as much as they can, (eſpecially their gravity, at leaſt here about the earth, equally depreſſing and thereby levelling as to ſenſe their uppermoſt ſuperficies) they muſt neceſſarily move to and fro, till their progreſs be ſtopped by the internal ſurface of the veſſel, which by terminating their progreſs (or motion toward the ſame part) does conſequently neceſſitate the liquor thoſe little bodies compoſe, to accommodate it ſelf exactly (for aught the eye is able to diſcern to the contrary) to its own figure.

SECT. XV.

THIS ſhort and general account of fluidity may, we hope, be as well further explicated and illuſtrated, as confirmed, by the following inſtances and experiments; and therefore we ſhall forthwith proceed to them.

AND it will be fit to mention in the firſt place thoſe, that are affordedus by the body our author treats of, ſalt-petre; they having occaſioned our writing about this ſubject.

SALT-PETRE then may be made fluid two ſeveral ways, either by, or without a liquor.

BY the intervention of a liquor it puts on the form of a fluid body, when being diſſolved in water or aqueous juices, it is not by the eye diſtinguiſhable from the ſolvent body, and appears as fluid as it; which ſeems to proceed from hence, that the agitated particles of the water piercing into the joints or commiſſures of the corpuſcles of the ſalt, do disjoin them, and thereby divide the nitre into parts ſo ſmall, that it is eaſy for thoſe of the water, wherewith they are aſſociated, not only to ſupport them, but move them to and fro: whence it comes to paſs, that theſe particles be ſo ſmall, and ſwimming ſome one way, ſome another in the yielding body of water, make no ſuch reſiſtance againſt the motion either of a man's hand, or other external body, that ſtrives to diſplace them, as they did in their ſaline form.

BUT that with much leſs liquor a nitrous body may be rendered fluid, may appear to him, that ſhall expoſe ſuch fixed nitre, as our author teaches to make, to the moiſt air of a cellar: for there it will run *per deliquium*, (as chymiſts ſpeak) into a liquor, which conſiſts of no more aqueous particles, than are neceſſary to keep the ſaline ones (which ſeem to be much ſmaller than thoſe of unanalyzed nitre) in the agitation requiſite to fluidity.

SECT. XVI.

AND hence we may proceed to conſider, what fluidity ſalt-petre is capable of without the intercurrence of a liquor: and this may be two-fold. For firſt, if it be beaten into an impalpable powder, this powder, when it is poured out, will emulate a liquor, by reaſon that the ſmallneſs and incoherence of the parts do both make them eaſy to be put into motion, and make the pores they intercept ſo ſmall, that they ſeem not at a diſtance to interrupt the unity or continuity of the maſs or body. But this is but an imperfect fluidity, both becauſe the little grains or corpuſcles of ſalt, though eaſily enough moveable, are not always in actual motion; and becauſe they continue yet ſo big, that both they and the ſpaces intercepted betwixt them are, near at hand, perceivable by ſenſe. But if with a ſtrong fire you melt this powdered nitre, then each of the ſaline corpuſcles being ſub-divided into I know not how many others, and theſe inſenſible parts being variouſly agitated by the ſame heat, (both which may appear by their oftentimes piercing the crucible after fuſion, wherein they lay very quietly before it) the whole body will appear a perfect liquor, and be thought ſuch by any beholder, that ſhall judge of it but by the eye: and ſuch alſo is the fluidity of melted metals, in which, when they are brought to fuſion in vaſt quantities, I have ſeen the ſurface waved like that of boiling water, and ſometimes parcels of liquor thrown up a pretty way into the air. And not only fire, and other actually and manifeſtly hot bodies,

dies; are able to make ſome hard ones fluid, but it ſeems alſo, that ſome bodies may be brought to fluidity by others, which to the touch appear cold, if they be but fitted to change the texture of the hard body, and put its inflected parts into a convenient motion; as may be ſeen in the chymical experiment of turning the brittle body of camphire into an oil for the time, by letting it lie upon aqua fortis, which perhaps bends and complicates the formerly rigid particles, and puts them into ſuch a motion, that they do as well glide along as ſomewhat twine about each other. And I further tried, (not having found it mentioned by the chymiſts) that camphire may by a dexterous application of heat be brought in cloſe glaſſes, both to flow, and to boil almoſt like oil. It is true, that theſe liquors taken from the fire quickly loſe that name, and grow ſolid again. But the durationof a thing is not always neceſſary to denominate it ſuch; for the leaf of a tree, for inſtance, whilſt it flouriſhes, may be as truly green as an emerald, though the leaf will after a while wither and turn yellow, which the ſtone will never do: and in cold climates, where lakes, *&c.* at other times navigable, are ſometimes frozen ſo hard, that carts and even great ordnance may ſafely be drawn over them, ice and water are the one a ſtable, and the other a liquid body, notwithſtanding that the ſame portion of matter, which at one time is frozen into a hard and ſolid ſubſtance, was a little before a fluid body, and (now and then in a very ſhort time) will be thawed into a liquor again.

SECT. XVII.

I KNOW not whether it be requiſite to take notice, that the fluidity, which ſalt-petre acquires upon fuſion by fire, ſeems very much of kin to that, which is acquired by ſolution in water. But if fuſion be made rather by the ingreſs and tranſcurſions of the atoms of fire themſelves, than by the bare propagation of that motion, with which the agitated particles that compoſe fire beat upon the out-ſide of the veſſels, that contain the matter to be melted; in ſuch caſe, I ſay, both thoſe kinds or manners of fluidity newly aſcribed to ſalt-petre will appear to be cauſed by the pervaſion of a foreign body: only in diſſolution the fluid body is a viſible and palpable liquor, and conſequently more groſs, whereas in fuſion the fluid ſubſtance that permeates it is more thin and ſubtil, and divides it into much ſmaller parts, and ſo adds very little to its bulk.

SECT. XVIII.

But becauſe ſome ſcruple may poſſibly ariſe about this matter from hence, that the powder of nitre, how fine ſoever, ſeems fluid but juſt whilſt it is pouring out, and even then is but very imperfectly ſo; and that as for fuſion, that is wont to reduce the melted body to a new and permanent ſtate, as the formerly-mentioned powder of ſalt-petre, which before fuſion was but a heap of incoherent particles, is by it made a ſolid and conſiderably hard body: to prevent, I ſay, or remove ſuch ſcruples, we will ſet down one experiment that we long ſince met with, as to the main, in the ſhops of ſtone-cutters, which, though unregarded by them, will excellently ſerve to make out what we mention it for. Take then good alabaſter, or in defect of this, of that white ſtone, which is well known to our maſons by the name of plaſter of *Paris*, beat it very ſmall, and put as many pounds as you pleaſe of the finely-fearced powder into any flat-bottomed (and firſt well heated) veſſel of braſs or iron, (bigger or leſſer according to the quantity you intend to burn.) Increaſe the fire by degrees, till it grow to be ſtrong, and when the calorifick atoms ſhall have in ſufficient numbers pervaded the heap of powder, or, if you pleaſe, when the igneous corpuſcles have by their numerous and briſk ſtrokes upon the veſſel communicated by its means their agitation to the incloſed powder, and when by either of theſe ways, or both, the fire (which may alſo reſolve ſome of the more ſpirituous and exhalable parts, whereof diſtillation has ſhewn me, that alabaſter is not deſtitute, into vapours) ſhall have put the little bodies it conſiſts of into actual motion, (which will be quickly done) you ſhall ſee it aſſume the form of a liquor, and boil with numerous great and confuſed waves juſt like a ſeething-pot. And if, whilſt it continues in this ſtate, you ſtir it with a ſtick, it will not like a heap of ſand, or, as itſelf would do at another time, reſiſt the motion thereof, but yield thereto like a liquor, and, like it, will ſeem to have ſomething of the nature of a coherent body: for by ſtirring it any thing ſtrongly near one ſide of the veſſel, you may make the waves beat very manifeſtly againſt the oppoſite part of it. And beſides all this, you may obſerve this further reſemblance betwixt this boiling matter and a liquor, that there will fly up out of the pot great ſtore of ſteams like ſmoke, but that they are white, which will ſometimes like ſmoke aſcend, for aught can be diſcerned, to the very top of the chimney, and leave its colour upon the places by which plenty of it hath paſt. Beſides, thoſe, that make this experiment often, as we have taken pleaſure to do, may have the opportunity to obſerve, that when the veſſel has continued ſo long over the fire, that the contained alabaſter relapſes into the form of a heavy moveleſs powder, by keeping it a while longer in the heat, it will for once at leaſt reſume the form of a fluid body, and boil again as before; the ſpirituous ſteams, whoſe avolation promoted the ebullition, being not yet quite ſpent. And laſtly, if when it ſeems moſt a liquor, you take up a little of it, and, as nimbly as you can, caſt it upon a ſheet of white paper, it will not at all wet it, but immediately diſcover itſelf to be a moveleſs incoherent powder, as it was before its being ſet over the fire. Whereby it (I hope) appears, that a heap or aggregate of ſuch little bodies as are neither ſpherical nor otherwiſe regularly ſhaped, nor ſmall enough to be below the diſcernment of the eye, may, without either fuſion or being poured out, be made fluid barely by a ſufficiently ſtrong and various agitation (from what cauſe ſoever that proceed)

of the particles that make it up, and loſe its fluidity immediately upon the ceaſing of it.

THUS have we ſeen, how very much it conduces to the making of a body fluid, that its ſmall parts be actually moved. But whence this motion proceeds, we ſhall not at preſent venture to determine. For though in the examples newly mentioned, and ſome others, moſt men will be forward to aſcribe the motion produced in the parts of the fluid bodies there mentioned, to the action of the fire, whereunto they were expoſed; yet what it is, that puts the parts of fluid bodies in general into the motion requiſite to make them ſuch, is a queſtion, of which the true reſolution indeed were very deſirable. But the full debate of it will not, I hope, be here expected from me, whilſt I am writing but notes, ſince it would engage me to diſcuſs two or three of the difficulteſt as well as the importanteſt controverſies belonging to natural philoſophy. For firſt, I ſhould be obliged to conſider whether motion, or a propenſity to it, be an inherent quality belonging to atoms in general, and not loſable by them; or whether all motion is communicated by impulſe from one body to another. And ſince thoſe, that of late have taught, that all viſible liquors, as water, oil, quick-ſilver, *&c.* owe their fluidity chiefly to the agitation of ſome thin and reſtleſs matter, which inceſſantly permeates them, do deduce the neceſſity of ſuch an ethereal ſubſtance principally from the impoſſibility, that there can be any vacuum properly ſo called in the univerſe, wherein yet are very many ſpaces unpoſſeſſed by either air or groſſer bodies than it: the examination of this ſubtile matter would draw on the conſideration of the nice controverſies, that perplex philoſophers concerning emptineſs, which it were more difficult for us to examine in few words, than it is neceſſary for us to meddle with them in this place; ſince not writing of the firſt principles of phyſiology, but of fluidity, which is but a ſecondary or derivative quality (if I may ſo call it) it ſeems ſufficient to give a notion of it, that we deduce it not from the unintelligible ſubſtantial form of the fluid bodies, but from thoſe ſimple and general affections of matter, the figure, ſituation, and motion of its ſmall parts.

SECT. XIX.

WHEREFORE declining to add any thing in this place to what we have otherwhere diſcourſed concerning the origin of motion, and the poſſibility or impoſſibility of a vacuum; we will proceed to take notice, that there is one thing more, which we may learn from ſalt-petre touching the nature of fluidity, and that is the diſtinction betwixt a fluid body and a wetting liquor, which are wont, becauſe they agree in many things, to be confounded, but inconſiderately enough: for though every wetting liquor be fluid, yet every fluid body does not wet. The air, the æther, and even flame it ſelf may be properly called fluid bodies, according to the notion of fluidity hitherto made out, and yet will ſcarce by any man be called moiſt liquors; and ſalt-petre, whilſt in fuſion, is really a liquor, and ſo is every melted metal; and yet theſe wet not the bodies they touch, as do water and other wetting liquors, which are fluid bodies with this peculiar qualification, that they ſtick to and moiſten the dry bodies, which they touch (or at leaſt abound with ſome parts, which being ſeparated from the reſt and reduced to a liquor, will do ſo.) And, according to this notion, methinks, it may be conceived, that the humidity of a body is but a relative thing, and depends chiefly upon the congruity or incongruence of the component particles of the liquor in reference to the pores of thoſe particular bodies, that it touches: for, ſometimes the little eminencies and pores of the ſurface of the dry body, on or againſt which the liquor flows, are of ſuch magnitudes and figure, that the particles of the liquor find admittance into thoſe pores, and are detained there (by which means they uſually ſoften it;) and ſometimes the pores and aſperities of the dry bodies ſurface are ſo incommenſurate in bigneſs and figure to the particles of the liquor, that they glide over the ſurface, without ſticking or adhering firmly to any part of it. This may be exemplified in quickſilver; which cannot be ſaid to be a humid body in reſpect of our hands or clothes, or of almoſt all other bodies of the world, upon whoſe ſurfaces it will roll without leaving any of its particles lodged in their pores, or faſtened to their little eminencies, whence it is called by vulgar chymiſts, the water, that wets not the hands: but in reference to divers metals, eſpecially gold and tin, quickſilver may be ſaid to be a humid liquor, for it inſinuates it ſelf into their pores, and thereby mollifies their bodies, as other liquors do thoſe, that are moiſtened by them. And even water, that wets almoſt all other animal and vegetable, and many mineral bodies, beſides that it is commonly enough obſerved to ſtand in almoſt globular drops upon cabbage-leaves, ſeems not a humid liquor in relation to the feathers of ducks, ſwans, and other water-fowl; whom nature having deſigned to fly ſometimes in the air, and live ſometimes in the water, ſhe providently makes their feathers of ſuch a texture, that they do not, like the feathers of divers other birds, admit the water, which imbibed would make them unfit for the uſe of flying. And it is obſervable, that upon the change of texture in a liquor, it may be brought to ſtick to the ſurface of a body, to which before it would not adhere; as may appear by this, that though quickſilver alone will not ſtick to glaſs, yet if there be mixt with it a due proportion of lead, tin, and tin-glaſs, though neither of them will adhere to glaſs, yet their liquid mixture (as we have often tried and elſewhere * taught) readily will, even without the aſſiſtance of heat.

SECT. XX.

IF it be objected, that this various agitation of the inſenſible parts of water and reſembling bodies,

* The writing here referred to, is the ſecond tome of *The Uſefulneſs of Experimental Philoſophy*, which ſhould have appeared before theſe ſpecimens.

bodies, wherein we make the nature of fluidity chiefly to consist, is but an imaginary thing, and but precariously asserted, since by our own confession they are so small, that the particles themselves, and more, the diversity of their motions are imperceptible by sense, which represents water, for example, to us as one continued body, whose parts are at perfect rest:

If this, I say, be urged against our doctrine, we shall not deny the objection to be plausible, but must not acknowledge it to be unanswerable.

For of the seeming continuity of water and other liquors this may be the reason, that the particles, whereof the liquor consists, being too small to be visible, and being not only voluble, but in actual motion, the pores or vacant spaces intercepted between them must also be too little to be discerned by the eye, and consequently the body must appear an uninterrupted or continued one: not to mention, that, were the parts of the liquor less minute, their shifting of places would hardly be perceived by the eye, each displaced corpuscle being immediately succeeded by another like it. It is true, that a heap of grains of nitre, though upon its effusion out of the vessel it somewhat emulates a fluid body, does yet, when it rests in the vessel, appear to be but an aggregate of many little incoherent bodies heaped up together; because the intervals or holes left between them are great enough to affect the sense: but if the same salt be reduced into an alcohol (as the chymists speak) or impalpable powder, the particles and intercepted spaces being then extremely lessened, the body they make up will much more resemble an intire mass, though it be looked upon from a nearer distance; and so when this powder is by the fire further broken into parts incomparably smaller than those of the powder, and which consequently intercept such extremely little pores, that not only salt-petre, but some metals, and even gold it self, (from which it will not be supposed that any thing exhales to lessen it) are by some affirmed (for I have not my self diligently enough observed it, and do yet doubt it) to take up rather less than more room melted than cold, why should we not grant, that these pores may be little enough, not any where to discontinue the body as to sense?

SECT. XXI.

And that the incoherent parts of fluid bodies are also diversly agitated, some this way, and some that way, though the sense cannot discern it, may be proved by their sensible operations*. For without such local motion, how could the particles of water pierce into the recesses of bodies, and occasion those putrefactive alterations that are wont to be imputed to superfluous moisture? and how comes it else to pass, that aqueous liquors so readily diffuse themselves into, and so exquisitely mingle with one another? as we see when red and white wine are in a trice confounded into claret: and without this various agitation of the parts of water, how could it be, that lumps of sugar or salt cast into it should quickly be so perfectly dissolved in it, that the lumps themselves totally disappear, and the dissociated parts are carried about every way by those of the water, even from the bottom to the very top? As is evident particularly in sea-salt, which when the superfluous liquor is sufficiently exhaled, begins visibly to coagulate, not at the bottom, but upon the surface of the water; and not only salt, but even gold it self, though the heaviest of bodies, may have its parts so scattered by the agitation of those waters, as experience has taught us, and as you may easily try by putting a little of the solution of gold, made in aqua regis, into fifteen or twenty times as much fair water, which will all thereby be immediately ennobled with a golden colour. That the little bodies, whereof flame consists, are fiercely agitated, appears oftentimes even to the eye, and will scarce be denied by him, that considers the operations of it, and the vivid beams it darts round about it against the neighbouring bodies. And that the particles, that compose our common air, are also very diversly agitated, we may be induced to believe by sundry particulars. As first, by those little moats, that from a shady place we see swimming up and down in the sun-beams, and by the tremulous motion, which that of swarms of little bodies in the air seems to impart to distant objects looked on after sun-rise through a good telescope, (and which by the bare eye in hot weather may be often discovered by certain very dilute shades, which seem to tremble upon the walls of high-roofed halls and churches, and other spacious buildings.) Next, (and more easily) by this, that if you take salt of tartar, first brought to fusion, and place it in a cellar, or even in an ordinary room, it will in a short time (now and then in a few minutes) begin to relent, and have its surface softened by the imbibed moisture of the air, wherein if it be left long enough, it will totally be dissolved into clear liquor; which would not be, if the moist vapours that help to constitute the air, did not move to and fro every way, and were not thereby brought to the salt, and enabled to insinuate themselves into its pores, and by that means dissolve it, and reduce it with themselves into a liquor.

And even in summer, when the air is wont to be much dryer than at other seasons of the year, one may quickly discover, that there are in the air store of aqueous corpuscles, moved some one way and some another, by the experiment of putting into a drinking-glass, for want of ice and snow, some beer or wine actually very cold: for thereby, after a while, the outside will appear all bedewed with little drops of liquor; which seems plainly to be no other than the aqueous steams, that swimming up and down in great multitudes in the air, are by its agitation towards all parts carried, as every other way, so to the sides of the glass, and be-

* The author now finding, that something concerning the various motion of the parts of fluid bodies, which he has but touched upon, has been, though but briefly and without experiments, yet excellently explained in a mathematical way by Monsieur *des Cartes* in the 56th and 57th articles of the second part of his principles, thinks fit to refer the inquisitive reader thither for fuller satisfaction about that particular.

ing there condenſed by the coldneſs of that ſmooth body, turn into viſible and palpable water. And, if I much miſ-remember not, it was one of the circumſtances of the laſt experiment of this kind we have had occaſion to take notice of, that the drops, that faſtened themſelves to the outſide of the glaſs, purpoſely left in part unfilled, reached either not at all, or very little further than the ſurface of the liquor within the glaſs, whoſe coldneſs as it ſeems did not infrigidate thoſe upper parts of the glaſs, to whoſe level the liquor it ſelf did not reach. To which I could eaſily add arguments to prove, that the drops we have been ſpeaking of proceeded not from the tranſudation of the liquor within the glaſs, if I thought it worth while to diſprove ſo unlikely a conjecture. But inſtead of that I ſhall only intimate, that from this experiment uſeful hints may be taken both theorical and practical, and particularly, that a reaſon may, perchance, be given of a ſtrange way of catching a ſalt and liquor out of air, barely by glaſs-veſſels of a peculiar and ſkilful contrivance. Much of what we have lately ſaid will, I preſume, be the leſs wondered at, if we ſubjoin what experience has taught us, that it is not difficult by the help of a convenient furnace and fit veſſels to make that ponderous metal, lead, aſcend to a good height in the open air, in the form of a copious ſmoke: ſuch a ſmoke we diſcerned after a while to be carried ſo many ways by the aërial corpuſcles, that it met with in actual motion, that it was ſoon diſperſed ſo far as to diſappear; which perhaps will be thought ſome confirmation of what we formerly delivered, when we taught, how much the being divided into very minute parts may conduce to the fluidity even of ponderous bodies.

SECT XXII.

AND though quickſilver be, excepting gold, the heavieſt known body in the world, yet when it is reduced into vapour, it ſeems to be carried to and fro like the other terreſtrial particles, that ſwim up and down in our air: for I remember, that an expert gilder not long ſince complained to me, that if when he evaporated quickſilver, he forgot to take off his rings from his hand, though they touched not the quickſilver whilſt it was in a body, the roving fumes would oftentimes faſten upon the gold in ſuch plenty, as would put him to much trouble to get them off from his rings; one of which he ſhewed me, that he had lately thus whitened, and as it were ſilvered over with mercurial fumes, and was then to reſtore to its native yellow.

SECT. XXIII.

BUT let us return to viſible liquors, and endeavour to prove almoſt *ad oculum*, as they ſpeak, that their inſenſible parts may be every way agitated, though their motion be but ſeldom viſible to us. Take then what quantity you pleaſe of aqua fortis, and diſſolve in it as much as you pleaſe of ordinary coined ſilver, (it not being neceſſary for this experiment that it be refined) and pour the coloured ſolution into twelve or fifteen times as much fair water, and then decant or filtrate the mixture, that it may be very clear. If you look upon this liquor, the parts of it will ſeem to be all of them as perfectly at reſt as thoſe of common water; nor will your eye be able to diſtinguiſh any corpuſcles of ſilver ſwimming in the liquor: and yet that there are ſuch metalline corpuſcles agitated to and fro with and by thoſe of the water, will quickly appear, if you immerſe into it a flatted piece of clean copper, for by that time you have held it two or three minutes of an hour (perhaps not ſo long) in the liquor, you ſhall ſee the particles of ſilver, that were roving up and down the liquor, faſten themſelves in ſuch ſwarms to the copper-plate, that they will appear in their native hue, and cover it, as it were, with a looſe caſe of ſilver, which may be eaſily ſhaken off in the form of a metalline powder: and if ſeveral ſuch plates be left all night, or for a competent number of hours, in the bottom of the veſſel, you may the next day find all the particles of ſilver, that were diſperſed through the whole body of the liquor, ſettled upon or about them; the deep bluiſh green tincture you will diſcover in the water proceeding only from ſome little parts of the copper-plates, and of the alloy of the coin, diſſolved by the ſaline particles of the aqua fortis. And I remember, that, to compleat the experiment, I have ſometimes made even theſe fall to the bottom of the veſſel, by leaving a lump or two of ſpelter there for two or three days: for, not only thoſe metalline corpuſcles, that were juſt over or near to the determinate place, where I put the ſpelter, but alſo all the reſt, into how remote parts ſoever of the liquor they were diffuſed, did ſettle upon the ſpelter, as appeared both by its increaſe of bulk, and by their leaving the water clear and colourleſs; which plainly ſeems to have proceeded from hence, that the particles of the water were reſtleſly and every way agitated, and ſo by frequently gliding along the ſurface of the ſpelter they muſt carry thither of the corpuſcles of copper mingled with them, ſome at one time and ſome at another, till at length all were brought to it and detained there.

SECT. XXIV.

THAT of the particles of ſpirit of wine, and ſuch like inflammable liquors drawn from fermented juices, though they ſeem to the eye to be at reſt, a good many do yet move confuſedly and very nimbly, I remember I have long ſince manifeſted by an eaſy and ocular proof, which I deviſed about ten or twelve years ago, when (being yet ſcarce more than a boy) I firſt began to conſider what fluidity might be. The experiment, as I writ it down, with all the circumſtances and obſervations relating to it, I have not now by me; but having divers times been deſired to ſhew it to learned men (phyſicians, mathematicians, and others) I cannot have forgotten thoſe phænomena of it, that are the moſt pertinent to our preſent ſubject. Suppoſing then, that in pure ſpirit of wine, beſide the aqueous parts that glide ſoftly along each other, there are ſtore of volatile and ſpirituous

corpuſcles, whoſe agitation is ſtronger, I let fall (from a pretty height, that it might be broken into ſmall drops by its fall) into any wide-mouthed glaſs filled with this liquor, (which muſt not be over dephlegmed, leſt the oil ſink in it) a little common oil or ſpirit of turpentine, which I therefore made choice of, becauſe its tenacity, greater than that of the chymical oils of ſpices, makes it, that it will neither mingle with ſpirit of wine, nor ſpread it ſelf, as divers other diſtilled oils will, upon the ſurface of it, but keep it ſelf in the form of round drops, whoſe ſhape facilitates their motion. The oily drops then ſwimming at the top of the ſpirit of wine, will be, by the diſorderly rovings of the agile parts of it (which hit againſt them little globes, as the vinous ſpirits aſcend to exhale) made to move reſtleſly to and fro in an irregular manner, the drops ſometimes bearing up to one another, as if all or moſt of them were preſently to unite into one body, and then ſuddenly falling off, and continuing to ſhift places with one another, after a manner pleaſant and ſtrange enough to them, that never before ſaw the experiment: and this dance will continue for half an hour or an hour, (or a ſhorter or much longer time, according to the quantity and ſtrength of the liquor) till the ſpirituous parts being flown away, the drops being no longer impelled lie at reſt upon the diſpirited liquor, as they would upon common water. And whereas the nimble motion of the drops might be ſuſpected to proceed from ſome ſecret contrariety in nature betwixt the oil of turpentine and ſpirit of wine; beſides, that I could eaſily ſhew, that thoſe two liquors have no antipathy, I not only tried the experiment with another inflammable liquor than ſpirit of wine, but (if I much miſremember not) found, as I expected, that little pieces of chopped ſtraw (ſuch both being light and not eaſily imbibing moiſture) being gently let fall upon the ſpirit of wine, were in a tumultuous manner carried to and fro upon the ſurface of it; though I am not ſure, but that the motion of the oily drops may be in part due to ſome partial ſolution made of them by the vinous ſpirit, which during that action may tumble them to and fro; not to add, that I have, by ſome trials, been tempted to ſuſpect the air may have ſome intereſt in the motion of the drops. However, I have mentioned the recited experiment, not as if I thought that either it or fugitive ſpirit of wine were fit to teach us the nature of fluid bodies in general, but to ſhew by an ocular example, that there may be a quick and inteſtine motion in ſome parts of a liquor, notwithſtanding that the unaſſiſted eye can diſcern no ſuch matter. I ſhall not here relate, how having cauſed to be hermetically ſealed up ſome of theſe liquors in a glaſs, to try how long the extravagant dance of the drops would laſt, when the more ſpirituous parts of the vinous liquor could not exhale, my veſſel was ſoon broken without any diſcernible violence. Nor ſhall I now take notice of any of the other phænomena of our experiment, partly, becauſe I have elſewhere mentioned moſt of them; and partly, becauſe I think it more pertinent to our preſent theme, to obſerve, that this unſeen agitation of the minute parts will not only hold in light and ſpirituous liquors: for, that the inſenſible parts even of the heavieſt liquors themſelves are alſo in actual motion, though many may think it unfit to be believed, will follow from what has been already delivered concerning the nature of fluid bodies, as ſuch; and may be confirmed by this, that whereas three of the heavieſt liquors, we yet know of, are quickſilver, oil of tartar *per deliquium*, and oil of vitriol; that firſt-named will even in the cold penetrate into the pores of foliated gold, and deſtroy the texture of that cloſeſt of metals: the liquor alſo of ſalt of tartar will in the cold draw tinctures from ſeveral bodies, and we have endeavoured to evince the agitation of the parts of oil of vitriol, not only by ſhewing, how in the cold it would corrode divers metals, but by caſting little pieces of camphire into it, which without the aſſiſtance of the fire were made liquid by it, and appeared like ſo many drops of oil. And he, that yet doubts, whether the parts of theſe two oils (as chymiſts abuſively call them) how ponderous ſoever they be, are fiercely agitated or no, may probably be ſoon ſatisfied by ſhaking an ounce or two of each of them together, and obſerving the heat, hiſſing, ebullition, and ſparkling, that will ſuddenly enſue upon their being blended.

SECT. XXV.

BUT here we muſt take notice, that though it belong to the nature of fluid bodies, that their parts do eaſily ſhift places; yet that is to be underſtood only as to the parts of the ſame fluid bodies, as water, or of ſuch differing fluid bodies as are diſpoſed readily to admit each other's particles, and mingle together, as we ſee in water and wine. For otherwiſe fluid bodies may be of ſuch differing natures, that when two or more of them are put together, they will not mix, but each retain its own diſtinct ſurface; ſo that in regard of one another, the contiguous bodies do in ſome degree emulate each of them the nature of a conſiſtent body: for though it cannot be looked upon as a hard body but a ſoft, becauſe of the eaſy ceſſion of its ſuperficies, yet it does like a compact or conſiſtent body deny to mingle permanently with the contiguous liquor or other fluid ſubſtance. And I ſomewhat wonder, that *Lucretius* and other Atomiſts ſhould (at leaſt for aught I remember) over-ſee this obſervation, ſince it is obvious enough in oil, which will not mix with water, but float upon its ſurface: not to mention, that quickſilver will not incorporate with any of the familiar liquors known to the ancients. I had almoſt forgot, that I promiſed at the beginning of this diſcourſe an inſtance concerning flame, which I will therefore now recite. And it is, that having by an eaſy preparation of copper, by the intervention of a little ſal-armoniac, (which I have already taught in another treatiſe*) ſo opened the body of that metal, as to make it inflammable; I took ſome ſmall grains of this prepared

* An Hiſtorical Dialogue about Flame.

prepared mineral, and put them under the wick of a ſtrong and actually burning candle, whereby (as I expected) they were with the melted tallow ſoon carried up to the bottom of the flame, and by it ſo kindled, that the green (not blue) flame of the cupreous body did (ſomewhat to the wonder of the ſpectators) burn for a good while (this combuſtible matter being marvellouſly laſting) diſtinct from the yellow flame of the candle, as if there had been ſome inviſible partition between them. But to return to the unmingleable liquors we were formerly ſpeaking of; the cauſe, why theſe retain their diſtinct ſurfaces, my preſent taſk does not oblige me to inquire into: but this I ſhall obſerve in general, that it ſeems to depend very much upon the texture of the particular liquors, and perhaps too upon the peculiar motions of their minute parts. For I have obſerved, that though pure ſpirit of wine and ſalt of tartar, reſolved into a liquor by the moiſture of the air, will, when put together, retain diſtinct ſurfaces, or preſently regain them if you ſhake the liquors never ſo ſtrongly together; yet by adding a little fair water to either of them, the texture being thereby altered, it will eaſily incorporate with the other. And thus although that (as I noted already) common ſpirit or oil of turpentine will not mingle with ſpirit of wine, yet having had the curioſity to make a trial with oil of turpentine abſtracted ſkilfully, and with a very gentle fire, (for otherwiſe the experiment may eaſily miſcarry) from melted or at leaſt well decrepitated ſea-ſalt, we found, according to expectation, that though there appeared no viſible alteration in the oil, yet we could eaſily by ſhaking confound it with pure ſpirit of wine. Moreover, though lixiviate liquors and oils will not by an ordinary agitation be permanently joined, yet I have tried, that by digeſting a good while a ſolution of ſalt of tartar with oil of almonds, I could reduce them to a ſoft ſaponary ſubſtance: which experiment makes ſomewhat more to my preſent purpoſe, than the common practice of ſoap-boilers, becauſe I did not, as they, boil away the water wherein the lixiviate ſalt is diſſolved. I might add alſo, that if you put one part of quickſilver into about four parts of oil of vitriol, you will find (at leaſt if the experiment proceed always after the ſame manner as it has done with me) that the two liquors will remain diſtinct whilſt you keep them in the cold, but if by degrees of heat you bring the oil of vitriol to boil, it will pierce the ſurface of the quickſilver, and by partly incorporating with it, reduce it to a ſubſtance very differing from what it was. But becauſe theſe two laſt experiments may be, with leſs improbability than the two that preceded them, referred to other cauſes, I ſhall no farther inſiſt on them, but take notice of one thing more concerning the difference of fluid bodies. And it is this.

SECT. XXVI.

I OBSERVED, that ſome of them do not only not mingle with others, that are contiguous to them, but faſhion the ſurfaces of thoſe others, and reduce them to determinate ſhapes. This I have taken pleaſure to conſider in ſome chymical liquors, which I have purpoſely put together; for inſtance, having poured ſpirit of wine upon oil of tartar *per deliquium*, (as chymiſts call it) I found, that the ſuperficies, wherein they touched each other, was flat, or (as to ſenſe) parallel to the horizon. But if this were done in a very ſlender or narrow glaſs, with the mouth unſtopped, though the lower ſurface of the ſpirit of wine which touched the other liquor appeared very level; yet the upper ſuperficies, which was contiguous to the air, was manifeſtly very concave. And if to theſe two liquors I did in a broader glaſs pour oil of almonds, that oil would ſink to the bottom of the ſpirit of wine, (that being well rectified) and floating upon the oil of tartar, would ſeparate the two liquors, and both above and below retain a flat or level ſurface. But if inſtead of oil of almonds, or another expreſſed oil, I dropped into pure ſpirit of wine, ſwimming upon oil of tartar, ſome common oil of turpentine; the oil would gather into parcels, (ſome of the bigneſs of hail-ſhot, ſome as big as ſmall piſtol-bullets, and ſome of other ſizes) which in caſe they did ſwim in the ſpirit of wine, and touched neither of its ſurfaces, ſeemed globulous, and continued ſo (the glaſſes being ſtopped) for many hours: but in caſe they emerged to the upper part of the ſpirit of wine, as much of them as lay immerſed in the ſpirit (which was by far the greateſt part of them) appeared round, and continued ſo long as I pleaſed; the upper parts only of thoſe little globes appearing to have the ſame ſurface with the ſpirit of wine. And I further obſerved, that ſome ſmall drops would, as it were, reſt conſtantly upon the ſuperficies of the oil of tartar, touching it but as it were in a point, and continuing to the eye ſpherical; though the ſurface of the liquor were purpoſely now and then ſomewhat ſhaken. But that, which I took ſpecial notice of, was, that having (upon deſign) into pure ſpirit of wine (for upon common ſpirit oil will ſwim) let fall ſome great drops of oil of turpentine, they did at firſt ſink to the bottom of it, and lie upon the ſurface of the oil of tartar almoſt like hemiſpheres, whoſe convex part was all above the oil of tartar; but after a while they were, as I expected, preſſed on all ſides and faſhioned into round bodies (yet a little more protuberant at the ſides than the top) which ſeemed ſcarce to touch the ſurface of the oil of tartar on which they leaned. Divers other obſervations of this kind were afforded me by ſome peculiar mixtures, that I made of chymical liquors: but not having the leiſure to ſet them down, much leſs to inquire into their cauſes, I ſhould ſcarce have mentioned what I have already delivered (eſpecially ſince we found that a light variation of circumſtances would often alter the event of ſuch trials, which we have therefore ſet down barely hiſtorically) but that finding that drops of water, quickſilver, and other fluid bodies, ſeemed to be faſhioned into a round figure by that every way almoſt equal preſſure of the ambient air; and having likewiſe tried, that quickſilver ſuſpended

in

in the air (as it may eaſily be, if the Torricellian experiment being made in a tube exceeding ſlender, ſome air be afterwards dexterouſly let in to divide the long mercurial cylinder into diverſe ſhort ones) has both at the top and bottom, where it is expoſed to the action of the air, a very protuberant ſurface; finding, I ſay, theſe effects of fluid bodies upon one another, I thought it not amiſs to intimate, how ſome experiments might be made, that may poſſibly facilitate the giving an account of the figuration of ſome of the more conſiderable fluid bodies, which, as we noted already, make up much the greater part of the univerſe: eſpecially, ſince I could eaſily enough make it probable, that ſuch ſteams of the terreſtrial globe, as may well be ſuppoſed to be the chief ingredients of our atmoſphere, may like a liquor retain a ſuperficies diſtinct from that of the ambient and contiguous body. And ſince we are ſpeaking of the diſtinct ſurface of fluids, the occaſion invites me to add an experiment, which, though apt to miſcarry upon the account of unheeded circumſtances, has yet, when all things were rightly ordered, ſucceeded very well: I will, I ſay, ſubjoin it here, becauſe it ſhews a way of dividing in a trice a liquor tranſparent, and, as to ſenſe, homogeneous, into two very differing liquors, the one diaphanous, and the other opacous, which will not mingle. The experiment is this. Diſſolve one ounce of clean common quickſilver in about two ounces of pure aqua fortis, ſo that the ſolution be clear and total; then whilſt it is yet warm, pour into it by degrees, leſt they boil over, half an ounce or one ounce of filings of lead, and if no error, nor ill accident have intervened, the lead will be in a trice precipitated into a white powder, and the mercury reduced into a maſs (if I may ſo ſpeak) of running quickſilver, over which the remaining part of the aqua fortis will ſwim, whereby we may ſee, that liquors being reduced into very minute parts, may mingle very well, the corpuſcles of the one ſupporting in that ſtate thoſe of the other, though in greater bulk; eſpecially, the texture of one being ſomewhat varied, they will retain diſtinct ſurfaces. *N.B.* Note, that when the operation ſucceeds not well, the mercury need not, for all that, be loſt, but may (in great part at leaſt) be recovered by freeing the precipitated matter from the reſt by filtration, and then diligently grinding the white precipitate with water, by which means, the mercury will little by little be gathered into drops. And though this be far from being the true mercury of lead, as I may elſewhere ſhew you; yet ſome inducements, not here to be named, incline me to look upon it, as ſomewhat differing from common mercury, and fitter than it for certain chymical uſes.

SECT. XXVII.

AND here I ſhould paſs on to the conſideration of firmneſs, but that, when a while ago I diſcourſed of the agitation of the corpuſcles that compoſe oil of tartar and oil of vitriol, I forgot to add, that not only in fluid bodies, but in ſome alſo of thoſe that are conſiſtent, there may perhaps be more motion in the inſenſible parts than our ſenſes diſcern, or we are wont to imagine; eſpecially in thoſe bodies, which having been once endowed with life, are, though not fluid, yet either ſoft, or at leaſt not perfectly hard. I have more than once taken pleaſure to look upon an heap of ſwarming bees, for though they make not up a liquid but coherent body, which may be turned upſide down without loſing its coherence, and which being beheld at a diſtance, ſeems to be one entire maſs or body; yet it is evident to him, that looks at them near enough, that the particular bees, that ſwarm, have moſt of them their diſtinct and peculiar motions, and that yet theſe motions of the particular bees deſtroy not the coherency of the heap; becauſe that when one of the more innermoſt bees removes, as ſhe lets go her hold from thoſe, that ſhe reſted on before, and goes away from thoſe that reſted on her, ſo ſhe meets with others, on which ſhe may ſet her feet, and comes under others, that in like manner ſet their feet on her; and ſo by this viciſſitude of mutual ſupports their coherence and their removes are made compatible. And if inſtead of bees, the ſwarm conſiſted of extremely little flies, their particular motions would perhaps be inconſpicuous. And that ſome ſuch thing may happen in the conſiſtent bodies we have been ſpeaking of, ſeems probable from hence, that in wainſcot and other hard wood, we often ſee little heaps of duſt produced in them by putrefaction; and not only in cheeſe we many times ſee multitudes of mites ſtart up, but in apples and other fruits we oftentimes find maggots, though the ſkin be whole, (which could not be unleſs the parts of the matter were variouſly tranſpoſed, that is, put into a local motion, and connected after a manner ſuitable to the nature of the inſect to be produced.) And by the growth of bones in the bodies of perfecter animals, as well in reſpect of the internal cavity, where the marrow lodges, as of the external ſurface, as alſo by the growth of the ſhells of oyſters and ſnails, (though cold animals) from a ſize inconſiderable at firſt, in regard of what is afterwards attained to, and by ſome other reſembling particulars, it ſeems, that the ſmall particles, that conſtitute even the ſolid parts of animals, are not, whilſt the creature lives, (or at leaſt whilſt it grows) altogether exempt from ſome (though ſlow and inſenſible) local motion. And I remember, that it has by a very diligent obſerver been affirmed to me, that he ſaw ſeveral pieces of gum ſweat out of an old wainſcot of above twenty years ſtanding. Which I the leſs wonder at, becauſe I have ſeveral times ſeen viſcous exſudations diſcloſe themſelves like drops of turpentine upon deal-boards, which had been made uſe of about building. (But of this ſubject more, perhaps, elſewhere.)

SECT. XXVIII.

AFTER we have hitherto diſcourſed of fluidity, as conſidered in diſtinct bodies, we might properly enough ſay here ſomething of what furtherance or hinderance, in reſpect of fluidity, one body may receive by being mingled with another.

another. But the conſideration of thoſe changes of conſiſtence, which may be produced by mixture, is a ſubject; that we ſhall have ſuch frequent occaſions to treat of in what we are to deliver about firmneſs, that we ſhall now only give this general admonition, that it is not ſo ſafe as one would think, to foretel the conſiſtence of a mixture of two or more bodies, from the bare conſideration of the conſiſtence of thoſe bodies, whereof it is to be compounded. And that we might at once both manifeſt this, and inſinuate what judgment ſhould be made of what is ſaid by ſo many chymiſts and others, who without limitation teach, that the addition of ſalts to metalline and mineral bodies does much facilitate their fuſion, I remember I purpoſely made and employed this experiment.

WE diſſolved crude copper in a due quantity of ſpirit of nitre, and by evaporation reduced the ſolution to a kind of vitriol of a lovely colour. We alſo corroded with two parts of ſpirit of nitre one of good tin, and ſuffered the mixture to reduce itſelf (as it eaſily did) to a ſubſtance almoſt like meal. Of this mixture we put a parcel into a crucible, and ſuffered it to grow (and for a pretty while to continue) red hot: nay, we put ſome of it upon a quick coal, and excited the heat by frequently blowing the fire, without finding, that this metalline meal did at all melt, though ſalt-petre be a fuſible ſalt, and tin it ſelf be of exceeding eaſy fuſion. Whereas, although copper be a metal, which is much harder to melt, not only than tin and lead, but even than ſilver, (as thoſe well know, that mix ſilver with copper to make a fuſible mixture to ſolder upon copper and braſs) yet was this metal, that will endure a long and ſtrong ignition by being joined *per minima* with the ſame kind of nitrous corpuſcles, that had ſo contrary an effect upon the tin, ſo ſtrangely diſpoſed to fuſion, that the vitriol would melt with as ſmall a heat as that of one's hand. Nay, we have made ſuch a vitriol either with ſpirit of nitre or with (what differed little from it) a certain aqua fortis, as would even in winter be made to ſtand melted for divers hours together, by the languid warmth of the ſun, though ſhining on it but through a window, where it alſo ſtood but in an unſtopped glaſs. So fit it is, that we conſider as well the new texture, that mingled bodies obtain by the aſſociation of their particles, (whoſe ſize and ſhape, and perhaps motion may be thereby much altered) as the conſiſtence of the particular bodies before their being mixed.

THE

Hiſtory of FLUIDITY and FIRMNESS.

The Second Part.

Of FIRMNESS.

IT is ſufficiently known, that the chymiſts aſcribe the firmneſs and hardneſs of bodies to ſalt, and teach, that the ſaline ingredient of them is the principle of coagulation in them, and the cauſe of their compactneſs and ſolidity. But though this opinion of the chymiſts be embraced by ſo many modern philoſophers and phyſicians, that ſome may think it ſuperfluous to make enquiry after other cauſes; yet others (to whom the explications of chymiſts ſeem not always ſo much as intelligible) will, upon the very account of the receivedneſs of the propoſed opinion, think it rather worthy to be examined, than to be acquieſced in. However, without making it our buſineſs, either to ſide with, or oppoſe any ſect of naturaliſts, we will apply our ſelves a while to conſider the thing it ſelf in proſecution of the deſign already begun. And having in the fore-going part of our little hiſtory taken a general view of fluidity; we will now proceed to try, what light it will afford us to diſcover the nature of firmneſs or compactneſs.

AND ſince fluidneſs and ſtability being contrary qualities, are to be apprehended under contrary notions, we may conceive, that the firmneſs or ſtability of a body conſiſts principally in this, that the particles, that compoſe it, beſides that they are moſt commonly ſomewhat groſs, either do ſo reſt, or are ſo intangled between themſelves, that there is among them a mutual coheſion, whereby they are rendered unapt to flow or diffuſe themſelves every way, and conſequently to be, without violence, bounded and figured by other ſurfaces than thoſe, which their connection makes themſelves conſtitute.

IN this rude deſcription of firmneſs we have intimated three principal cauſes of it, namely the groſſneſs, the quiet contact, and the implication of the component parts.

THE firſt is groſſneſs of parts, of which we have in effect almoſt ſufficiently diſcourſed already: for ſince treating of fluidity, we manifeſted at large, how conducive ſmallneſs of parts was to that quality; it is eaſy to deduce, that groſſneſs of parts in a body muſt commonly be a great diſpoſition to its being firm. And bigger corpuſcles being *cæteris paribus* more difficult than leſſer to be put into motion, when they are once at reſt, it is obvious, that a body conſiſting of ſuch particles is leſs diſpoſed to become fluid, and conſequently more apt to continue firm, than if its component parts were ſmaller, and thereby more eaſy to be diſplaced. But when I ſpeak of the groſſneſs of corpuſcles, I pretend not to determine, whether or no body or matter be ſo perpetually diviſible,

ſible, that there is no aſſignable portion of matter ſo minute, that it may not at leaſt mentally (to borrow a ſchool-term) be further divided into ſtill leſſer and leſſer parts: for allowing this indefinite diviſibility of corporeal ſubſtance, it is plain, that it may in ſome ſenſe be averred, that there are no firm bodies, whoſe parts are not extremely minute. But I underſtand by the groſs parts I here ſpeak of, ſuch corpuſcles, as actually convening to conſtitute a body, are ſcarce diſſipable or diviſible into leſſer by the agitation of the ambient air or æther, or by the other cauſes of the fluidity of bodies.

IT is alſo to be noted, that when I ſpake of the fitneſs of groſſer corpuſcles to make a firm body, I added, *cæteris paribus*, becauſe it may happen, that the breaking of the ſmall parts of a body into minute particles may make them but the fitter to contribute to the firmneſs of the body they belong to: for the parts of the divided corpuſcles may by their comminution acquire a new, and perhaps a more irregular ſhape than before, upon whoſe account they may be more diſpoſed to be entangled among the neighbouring particles, or may be better fitted to get into and fill the pores of ſome kind of bodies. And in ſuch little particles, not only the minuteneſs may make them lie cloſer together, and conſequently the better exclude the air; but the greatneſs of the ſurface in proportion to the bulk of the matter may perhaps in ſome caſes occaſion a fuller contact, and ſo facilitate the conſtitution of a very firm body, in caſe theſe minute parts (whoſe intervals, if they intercept any, need not be other than very ſmall) ſhall be placed and diſpoſed to the beſt advantage for a full contact of one another. But as I ſaid a while before, from what we have already delivered (concerning the ſize of parts, when we treated of fluidity) it may eaſily be underſtood, how much the magnitude of them may conduce to firmneſs; and therefore we will preſently paſs on to the mention of the two other things to be conſidered, in reference to conſiſtent bodies. Whereof the one is the bare reſt of the ſmall and contiguous parts, that make up the firm body; and the other the intricate texture of ſuch parts in the body they make up. And either of theſe two ſeems alone ſufficient to render a body ſtable; though nature do perhaps oftentimes make ſome (though not equal) uſe of both, to faſten the parts of the ſame body more firmly together.

OF the former of theſe cauſes, I am informed, that the juſtly famous Monſieur *Des Cartes* has alſo taken notice, but without adding proof from experiments, or obſervations. But it ſeems to have been either over-looked, or, (as incongruous to their hypotheſis of the innate motion of atoms) rejected by the old atomiſts, and by *Lucretius*, who takes notice (that I remember) only of the latter: for though they did of old make mention of the ſudden divulſion of two flat and ſolid bodies, yet they employ that obſervation but to prove a vacuum, (without otherwiſe taking notice, that I have met with, of thoſe things, that are moſt material in ſuch obſervations to our preſent purpoſe, and without deducing thence what we ſhall endeavour to do in order to the explication of the cauſes of firmneſs.) Upon what account then ſoever the atomiſts have omitted to reckon for a cauſe of firmneſs that, which we have newly been ſpeaking of; yet (as we obſerved above) if two bodies be once at reſt againſt one another, it ſeems conſonant to the catholick laws of nature, that they ſhould continue in that ſtate of reſt, till, ſome force capable to over-power their reſiſtance puts them out of it. And whatever may be ſaid of the unloſable mobility of atoms ſtrictly ſo taken, yet that divers parts of matter may compoſe bodies, that need no other cement to unite them, than the juxta-poſition which we here pre-ſuppoſe, and the reſting together of their parts, whereby the air and other fluid bodies, that might diſſociate them are excluded, I have been inclined to think by what I have obſerved in grinding of glaſſes: for ſometimes the convex ſurface of one body being ground upon the concave ſurface of another, the two ſurfaces will happen to be ſo cloſely and exactly fitted to one another, (their immediate contact in all their parts, or at leaſt in innumerable of them, hindering the intercurrence of the air) that a man is not able without breaking one or both of them to pull them directly aſunder; but if you will ſever them, you muſt be fain to make one of them to ſlip along the ſurface of the other: which makes the glaſs-grinders often complain of the trouble they meet with in ſeparating ſuch bodies. Nay, if you lay two flat glaſſes ground very true and well poliſhed upon one another, ſo that their ſurfaces may almoſt every where touch each other, (to which it will be requiſite to rub them a little one upon another, for the better excluſion of the air) you may by lifting up the uppermoſt, lift up the lowermoſt (though perhaps, as we have often tried, two or three times bigger) with it, as if the two plates of glaſs made but one body. Nay, we have divers times taken up four or five pieces of glaſs at once, laid and preſſed thus one upon another, and might, perchance, have taken up a greater number, if we had had more of them at hand. And trial has alſo informed us, that if you hold a looking-glaſs very level with the unfoliated ſide downward, and rub a little againſt it a piece of other very flat and very ſmooth glaſs, you may eaſily, by that way only, faſten them to one another; ſo that the lowermoſt glaſs, though large, will hang between the uppermoſt and the ground, to the wonder of thoſe, that behold it, and can diſcern nor imagine nothing capable to keep it from falling: and by the ſame way (as we ſhall recite anon) we have often made one conſiderably thick piece of marble take and hold up another, having purpoſely cauſed their flat ſurfaces to be carefully ground and poliſhed, without which the experiment will not ſucceed. Nor is it requiſite, that the glaſſes be flat to make them adhere very cloſely together, provided their immediate contact be made according to a large ſurface: for to what we have already mentioned concerning the cohering of convex and concave bodies, we may add, that having purpoſely

poſely applied a long glaſs-ſtopple of an almoſt conical figure, and well ground, to the mouth of a thick quart bottle, whoſe neck was made long, and of a figure convenient to receive the ſtopple, and ground within fit for it, we found, that theſe two glaſs bodies touching one another in a multitude of parts, did adhere together ſo cloſely, that when the ſtopple was carefully put in, we could eaſily, and divers times one after another, lift up the bottle, though there was by our gueſs above a pound of liquor in it. Unleſs we ſuppoſe, without much probability, that becauſe it is found, that moving them to and fro upon one another, and preſſing down the ſtopple, promotes their ſticking, their adheſion may be in part aſcribed, either to ſome elaſtical motion in the parts of the preſſed glaſs, or to the exquiſite adaptation of the almoſt numberleſs, though very ſmall, aſperities of the one, to the as numerous little cavities of the other; whereby the ſurfaces do lock in with one another, or are as it were claſped together. For as poliſhed as the ſurfaces may appear to ſenſe, we muſt not deny, that there may be ſuch inequalities in them, ſince being wont to be poliſhed with putty or ſome ſuch powder, or heap of grating and irregularly ſhaped corpuſcles, they muſt needs make ſtore of little furrows, and ridges, and other aſperities on them. But to inſiſt on theſe conjectures, were to digreſs.

YET here we muſt not decline taking notice, that, at leaſt here below, the ſticking together of ſuch bodies, as are of ſenſible bulk, and whoſe ſmooth ſurfaces immediately touch one another, may poſſibly not ſo much proceed from this, that their parts, as we formerly obſerved, are at reſt among themſelves, and by their immediate contact do make up as it were but one body; as from the preſſure of the atmoſphere, proceeding partly from the weight of the ambient air, (mixed with the effluviums of the terreſtrial globe) and partly from a kind of ſpring, by virtue of which the air continually preſſes upon the bodies contiguous to it, though through accuſtomance and negligence, and perhaps ſome other cauſes not here to be inſiſted on, we neither feel it in our own bodies, nor take notice of it in others. Now this preſſure of the air every way being ſuppoſed, I think the adhering of the ſmooth bodies we ſpeak of (for we ſuppoſe them far greater than the particles of the air) to one another may probably enough be aſcribed to this, that when, for inſtance, the ſmooth ſurfaces of two pieces of glaſs do ſo exquiſitely touch one another, that none of the ambient air is either intercepted or admitted between them, then the undermoſt glaſs will ſuffer no preſſure on that ſide, which touches the uppermoſt; the parts of the uppermoſt glaſs having no ſenſible ſpring in them (ſo that they can only reſiſt, but not repel the other:) but that ſide of the undermoſt glaſs, which is expoſed to the air, will be preſſed upon thereby; and there being, as we ſaid, no elaſtical preſſure on the other ſide of the glaſs to balance this, it is not to be wondered at, that the inferiour glaſs ſhould not fall off from the other, in regard the weight, that would carry it downwards, is much too ſmall to overcome that force of the air, that thruſts it againſt the uppermoſt glaſs: as if one ſhould with his hand thruſt a plate of iron broad-wiſe againſt the flat cieling of his chamber, the iron would not fall as long as the force of the hand perſeveres to preſs againſt it. Nor is it material, that in our caſe the preſſure of the atmoſphere is ſuppoſed to force the lowermoſt glaſs upwards; for if we ſuppoſe the air to conſiſt of innumerable little ſprings (as it were) bearing upon and ſupporting one another, and whereof the lowermoſt are bent by the weight of all that are incumbent on them, it will be eaſy to conceive, that near the ſurface of the earth, (about which the air muſt diffuſe it ſelf by reaſon of the gravity of its ſmall parts, and the reſiſtance of the earth againſt their deſcent) it may preſs almoſt equally every way, and by a kind of recoil (though not properly ſo called) from the terreſtrial globe upwards, may ſtrongly preſs any body, upon which it can bear, againſt any other, which has no ſuch elaſtical power to repel from it a body ſo preſſed againſt it.

THIS difficulty being thus diſpatched, we ſhall proceed by two or three particulars, to confirm our conjecture at the cauſe, why ſmooth bodies ſtick together upon bare juxta-poſition or contact. And firſt I obſerve, that if a piece of flat glaſs be, as we formerly mentioned, appended to a looking-glaſs held with the unfoliated ſide downwards, parallel to the horizon, though the adhering glaſs will not drop down, yet it will very eaſily be moved any way along the level ſurface; and if by inclining the looking-glaſs any way, you deprive it of its former level, the ſmaller glaſs will eaſily ſlide downwards upon the ſurface of the greater. Of which the reaſon ſeems to be, partly that the gravity as ſuch of the lower glaſs does not conſiderably reſiſt the horizontal motion of it, but only the motion upwards, whereby it muſt recede from the centre of heavy bodies, as might, if need were, be probably deduced from divers inſtances obvious enough; and partly, or rather chiefly, that to the edges of the glaſs the ambient air is contiguous as well on the one ſide as on the other, and ſo the preſſure of the air being equal on every part of the edges, the gravity of the ſmaller glaſs is not hindered by the air (which can as faſt ſucceed on one ſide, as it is diſplaced on the other) from making it ſlide down the ſhelving ſurface of the greater glaſs; whereas of the broad and flat ſides of the lowermoſt glaſs the one is, as we ſaid, preſſed by the ſpring of the air, whilſt the other ſuffers no ſuch preſſure from the looking-glaſs, to which it was applied. And ſo, if you take a ſmall open-mouthed glaſs, and plunge it into a veſſel full of quickſilver with the mouth upward, that the quickſilver may fill it without leaving any air in it, and if then, whilſt it is under the quickſilver, you turn the mouth downwards, and ſo keeping it upright, lift it up till the mouth be almoſt come to the top of the mercury you ſhall perceive, that the glaſs will remain almoſt full of

quickſilver in the veſſel: and this will continue ſo, though you incline the glaſs this way or that way, provided you keep the mouth of it within the mercury. And this experiment, though more noble when tried with quickſilver, will ſucceed alſo when tried, as it may more eaſily be, with water. Of which the reaſon ſeems to be, that the glaſs hinders the quickſilver in it from the preſſure of the incumbent air, whereas the quickſilver in the veſſel being expoſed to it, muſt by it neceſſarily be forced up againſt the ſurface of the inverted bottom of the glaſs, where it meets no elaſtical power to repel it downwards. For, that it is not nature's abhorrency of a vacuum, that keeps the quickſilver from deſcending till ſome air can come to ſucceed in its room, the famous experiment invented by *Torricellius*, and found true by many others, and our ſelves, touching the deſcent of quickſilver in any tube of above two foot and a half long, ſeems clearly to evince. And to confirm what we have ſaid, and ſhew withall, that it is not ſo much the contact of bodies according to a large ſurface, as that contact is conſidered in it ſelf, as by reaſon of its being ordinarily requiſite to the excluſion of air, that at leaſt here below keeps bodies from falling aſunder; I ſhall relate, that having by a certain artifice out of a large glaſs (with a narrow mouth) cauſed a certain quantity of air to be ſucked, we found, that by immediately applying a book (which then chanced to lie at hand) to the orifice of the veſſel, the book was readily lifted up and ſuſtained in the air as long as we pleaſed, though the ſurface of the ſuſpended body could be touched, as is evident, but by the ring, which incircled the orifice of the veſſel, and though the weight taken up (beſides that it was inconveniently ſhaped for ſuch a trial, which would probably have ſucceeded as well with a much greater weight, if we had had one fitly ſhaped at hand) exceeded twenty ounces *. Of which event the cauſe ſeems plainly to be this, that by reaſon of the exſuction of ſome air out of the glaſs, the elaſtical power of the remaining air was very much debilitated in compariſon of the unweakened preſſure of the external air, which being able to preſs the book againſt the orifice of the veſſel with greater ſtrength than the internal air can reſiſt, thereby it comes to paſs, that the whole orifice of the veſſel, though there be but part of it of ſolid body, does yet on this occaſion perform in ſome meaſure the part of an entire ſurface exactly ſmooth.

IT may be conſidered alſo (to add that upon the bye) whether upon the principle lately explicated may not in ſome meaſure depend the ſolidity of glaſs. For though its parts ſeem very little or not at all branched or interwoven one within another, and appear very ſmooth and ſlippery, yet ſince the fire, that brought them to fuſion, and conſequently to be fluid, may well be ſuppoſed to have ſub-divided and reduced them into very ſmall particles, and to have thereby aſſiſted them to exclude the air from betwixt them, it may ſeem, that it needs not much be wondered at, if the immediate contact of ſuch ſmall and ſmooth corpuſcles ſuffice to make them hold together; for that their union is ſtrict enough to keep out the air, may appear from this, that thoſe that blow glaſſes, and thoſe that diſtil in them, find not the air can traverſe the pores even of heated glaſs: and as for any more ſubtil matter, we ſee by the free paſſage of light and heat, or, to ſpeak more warily, of magnetical effluvia through glaſs, without injuring its texture, that ſuch matter, but moderately moved, will not hinder the little ſolid parts from cleaving together. And on this occaſion it might be conſidered, how much the juxta-poſition of their corpuſcles crouded together by fuſion may contribute to the conſiſtence and brittleneſs of ſalt-petre, and divers other bodies, which may from an incoherent powder be readily turned into one maſs; as alſo how far the ſticking together (for I ſpeak not of the figures compoſed by them) of the ſmall parts of hanging drops of water, and ſuch other liquors, as are not thought to conſiſt of corpuſcles hooked or branched, may be aſcribed to the contact of their ſmall parts, and the excluſion of air. Theſe, I ſay, and ſome other ſuch things might be here conſidered, but that we are forbidden to examine them particularly, and eſpecially what has been repreſented touching the ſolidity of glaſs, (which we ſuſpect another cauſe may have a great intereſt in) by our haſte, which calls us to the remaining part of our diſcourſe.

THOUGH then it be hence (to omit other proofs elſewhere mentioned) ſufficiently manifeſt, that the air has a ſpring, and that a ſtrong one, yet there appears no great neceſſity of having recourſe to it for the giving an account why the two ſmooth glaſſes above mentioned were able to adhere ſo cloſely to each other: for a probable reaſon of the ſame phænomenon may be rendered by the preſſure of the air conſidered as a weight. And firſt, we muſt recall to mind what we (a little above) ſaid of the recoiling (or rebounding of the preſſure) of a cylinder of air from the earth, to the ſuſpended piece of glaſs, proceeding from this, that the fluid air, which is not without ſome gravity, being hindered by the reſiſting ſurface of the terreſtrial globe to fall lower, muſt diffuſe it ſelf, and conſequently preſs as well upwards as any other way. Next, we may conſider, that when the ſurfaces of two flat bodies of any notable (and, for example, of equal) breadth do immediately touch each other, and lie both of them level with the horizon, and one of them directly over the other; in this caſe, I ſay, ſince the air cannot move in an inſtant from the edges to the middle of the two ſurfaces that lie upon each other, the lowermoſt cannot be drawn away downwards in a perpendicular line from the uppermoſt, but that by reaſon of the ſtiffneſs and contact of the two bodies, it muſt neceſſarily happen, that at the inſtant of their ſeparation, ſhould it be effected, the lowermoſt glaſs

* Much more conſiderable inſtances of this nature may be met with in the author's *New Phyſico-Mechanical Experiments*.

will be preſſed upon by the whole (crooked) pillar of air, ſuppoſed to reach from the top of the atmoſphere, and to have for baſis the ſuperficies of the undermoſt glaſs. For at that inſtant, the air having not time to get in between the two glaſſes, there is nothing between them during that inſtant to reſiſt the preſſure of that air, which bears againſt the lower ſuperficies of that undermoſt glaſs, and conſequently ſuch a revulſion of the lower glaſs cannot be effected, but by a weight or force capable to ſurmount the power of the weight of the above-mentioned cylinder of the atmoſphere; and this, as I ſaid, becauſe that by reaſon of the ſudden ſeparation, the upper ſurface of the glaſs has not any air contiguous to it, which, were it there, would (according to the nature of fluid and ſpringy bodies) preſs as much againſt the upper ſurface of the glaſs, as the pillar of the atmoſphere againſt the lower, and conſequently ſuſtain that endeavour of the air againſt the lower ſide of the glaſs, which in our propoſed caſe muſt be ſurmounted by the weight or force employed to draw down the lower glaſs. And hence we may underſtand (to add that upon the bye,) that it is not neceſſary, that the contiguous ſurfaces of the two flat glaſſes, we have been treating of, be paralleled to the horizon: for if you ſhould hold them perpendicular to it, their divulſion would not ceaſe to be difficult, provided it were attempted to be made by ſuddenly pulling one of the broad ſurfaces from the other in a level line, and not by making one of the ſurfaces ſlide upon the other; for in the former caſe, the ſeparation of the contiguous bodies will be hindered by the weight or preſſure of the lateral air (if I may ſo ſpeak) that bears againſt the broad ſides of the glaſſes contiguous to it. But whereas in theſe caſes we ſuppoſe the ſuperficies of the two glaſſes to be ſo exactly flat and ſmooth, that no air at all can come between them; experience has informed us, that it is extremely difficult, if at all poſſible, to procure from our ordinary tradeſmen either glaſſes or marbles, ſo much as approaching ſuch an exquiſiteneſs: for we could very hardly get either experienced ſtone-cutters, or perſons ſkilled at grinding of glaſſes, to make us a pair of round marbles, though of an inch or two only in diameter, that would for ſo much as two or three minutes hold up one another in the air by contact, though they would eaſily enough take up each other, if the uppermoſt were drawn up nimbly, before the air could have leiſure to inſinuate it ſelf betwixt them.

BUT this notwithſtanding, we endeavoured by the following expedient, not only to manifeſt, that the power or preſſure of the air is in theſe experiments very great, but alſo to make ſome eſtimate (though but an imperfect one) how great that power is.

HAVING then provided a pair of marbles of an inch and half in diameter, and as flat and ſmooth as we could get, and having conſidered, that as it was the getting in of the air between them, that (for the reaſon above declared) hindered them from ſticking ſtrongly together; ſo the acceſs afforded to the air was for the moſt part due to that ſcarcely evitable roughneſs or inequality of their ſurfaces that remained in ſpite of the poliſh: conſidering theſe things, I ſay, we ſuppoſed, that the intruſion of the air might be for ſome while prevented by wetting the ſurfaces to be joined with pure ſpirit of wine; and that yet this liquor, that ſeems the freeſt that we know of from tenacity, would not otherwiſe than by keeping out the air prove a cement to faſten the ſtones together. But becauſe the eaſy ſeparation of ſuch ſmooth bodies, as adhere but by contact does in great part (as we formerly noted) proceeds from this, that whereas it is very difficult to hold ſuch bodies exactly level for any conſiderable ſpace of time, and yet the leaſt inclination any way gives the lower body opportunity to ſlide off; becauſe of this, I ſay, we reſolved in the firſt place to ſee what could be done by faſtening to the upper marble certain wires and a button, in ſuch manner, as that the lower marble, when it was joined, might freely fall directly down, but not ſlip much aſide, being hindered by the wire. And in purſuit of this we found, that not only the dry marbles could be made to take up and hold up one another, but that once by drawing up the upper marble nimbly, we could take up (but not keep up for any time) together with the lower marble, a ſcale, and in it a pound weight of 16 ounces Troy.

AFTER this we moiſtened the ſurfaces of the marbles with ſuch pure alkalizate ſpirit of wine, as we elſewhere teach to make, which was ſo thin and ſubtile, that not only we burned ſome of it, before we would employ it about this experiment, in a ſilver ſpoon, without leaving ſo much as any ſign of phlegm behind; but it would (in the open air) almoſt in a moment fly away from the ſurface of the marble anointed with it, and leave it dry and gloſſy. The marbles being ſkilfully wetted, and kept by the above-mentioned wires from ſlipping aſide, we caſt into the ſcale faſtened to the lower of them divers weights at ſeveral times, and by nimbly pulling up the higher ſtone, tried many times, how much we could draw up with the lower, and did ſometimes take up above an hundred ounces, and once an hundred thirty-two ounces Troy, beſides the ſcale, that contained them, and the marble it ſelf, the diameter of whoſe ſmooth ſurface was by meaſure but about an inch and two thirds.

BUT here I muſt take notice, both in relation to this and the following experiments to be ſet down concerning ſmooth marbles, that we never yet found any ſort of experiments, wherein ſuch ſlight variations of circumſtances could ſo much defeat our endeavours; which we therefore mention, that in caſe ſuch experiments be tried again, it may be thought the leſs ſtrange, if others be not able to do as much at the firſt and ſecond, or perhaps the tenth or twentieth trial, as we did after much practice had made us expert in this nice experiment, and ſuggeſted to us divers facilitating circumſtances, which could not here in few words be particularly ſet down.

AND now, becauſe we perceived, that the

ſpirit

ſpirit of wine was too fugitive and ſubtile a liquor for our purpoſe, we ſuppoſed, that oil, as it would better fill up the little cavities of the ſtones, ſo it would more exactly keep out the air, and leſs eaſily vaniſh into it. And accordingly, having moiſtened the ſurfaces with a due proportion of good expreſſed oil of ſweet almonds, and having carefully obſerved the other requiſite circumſtances, we took up ſome drams above four hundred ounces Troy hanging at the lower marble.

AND that you may not ſuſpect, that it was by gluing the marbles together, that the oil did enable them to make ſo much greater reſiſtance againſt ſeparation than the ſpirit of wine did; I ſhall add, that in caſe the flat ſurfaces of the joined ſtones were held not parallel, but perpendicular to the horizon, that ſo the air might (as we formerly alſo obſerved) immediately ſucceed, as the looſer marble ſhould ſlide off, the weight of ſome ounces was now and then requiſite to draw down the marbles, when they had nothing but ſpirit of wine between them; whereas they would eaſily enough ſlide off from one another, when they were cemented together with oil: perhaps becauſe that the ſpirit of wine, by reaſon of the ſmallneſs and penetrancy of its parts, and becauſe of its fugitive nature, did not ſo well fill up the little pores and furrows of the ſurfaces of the marbles; whereby the little protuberances getting into thoſe little cavities, might more reſiſt the ſliding of the marbles upon one another's ſurfaces, whoſe texture is better fitted to make their ſurfaces ſmooth and ſlippery.

AND to ſhew, that the reſiſtance of ſuch contiguous marbles to a violent ſeparation is greater in thoſe, which being broader are preſſed againſt or reſiſted by a proportionably bigger (though not a longer) pillar of the atmoſphere; we cauſed two marbles to be made, whoſe diameter was three inches, or a very little more: and having after the above-mentioned manner employed ſpirit of wine to keep out the air from between them, we did after ſome trials, with the uppermoſt of them take up the lowermoſt, and with it four hundred ſixty eight, or four hundred and ſeventy ounces. But making uſe of oil of almonds inſtead of ſpirit of wine, we did with our own hands draw up twice, one time after another, with the undermoſt ſtone, a much greater weight, namely, eighty-four pound or 1344 ounces (Troy weight) notwithſtanding which weight we manifeſtly perceived the marble, at which it hung, to ſtick ſtrongly to the other.

AND here again we will take notice, that the interpoſed oil was ſo far from being able as a cement, rather than by keeping out the air, to make theſe marbles ſtick ſo cloſe together, that, whereas bodies glued or cemented together are wont to make an almoſt equal reſiſtance to their being ſeparated, in what poſture ſoever you place them, I made our marbles, even when we tried this laſt experiment, very freely ſlide upon one another, by impelling the uppermoſt to the right hand or to the left, with my finger or my thumb (whereof the reaſon is intimated above, where we mentioned almoſt the like caſe in glaſſes) and having ſometime before taken up a weight, which we conjectured to be not much inferiour to that laſt named, we preſently for trial-ſake held the marbles with their edges downwards; and found, that thoſe, that in an horizontal poſition could not be drawn aſunder by ſo great a weight, did in another poſture preſently fall aſunder by their own weight, which made one readily ſlide off from the other to the ground. Now although we have confeſſed, that this way of meaſuring the force of the air is not accurate; yet we hope it will not be thought uſeleſs, ſince (not to mention, that by thus breaking the ice, we may make way for the happier inquiries of others) it not only ſhows us, that this preſſing or ſuſtaining force of the air, as unheeded as it is wont to be, is very great, but it may alſo aſſiſt us to conjecture, how great it is, which though we cannot hereby determine preciſely and with certainty, yet we may eſtimate it with much leſs uncertainty than otherwiſe we could.

I KNOW, that the Peripateticks, and the generality of the ſchool-philoſophers, will confidently aſcribe the ſticking of the marbles, not to the cauſe we have aſſigned, but to nature's abhorrency and fear of a vacuum. But not to engage our ſelves now in a diſquiſition, that, when we diſcourſed of fluidity, we did (for the reaſons there expreſſed) decline to meddle with; we will, without diſputing whether or no nature either can at all admit, or do abhor a vacuum, content our ſelves to confirm the explication given of this phænomenon by theſe two conſiderations. The one, that if nature did ſo violently oppoſe a vacuum as is pretended, it is not likely, that any force whatſoever, that we could employ, would be capable to produce one; whereas in our caſe we find, that a little more weight added to the lower of the marbles is able to ſurmount their reluctancy to ſeparation, notwithſtanding the ſuppoſed danger of thereby introducing a vacuum. And my next conſideration is, that (according to what we have hitherto delivered) without having recourſe to any ſuch diſputable principle, a fair account may be given of the propoſed phænomenon, by the preſſure or weight of the air. And that what we have ſaid concerning the latter of theſe may be entertained with the leſs difficulty, let us ſuppoſe, that when the marbles ſtick well together, the lowermoſt of them, or the appendant weight were faſtened to the ground: for in this caſe there appears no reaſon to believe that their power to reſiſt ſeparation would be leſs than it was before. And yet it ſeems evident, that the uppermoſt marble would not be perpendicularly pulled up but by ſuch a force as were at leaſt (I ſay at leaſt) able to lift up a weight equal to that of the laſt mentioned marble, and of a pillar of air having the ſtone for its baſe, and reaching to the top of the atmoſphere; ſince at the inſtance of revulſion, before the air can get in, and ſpread it ſelf between the ſtones, there is not, for aught appears, any ſuch body under the upper marble, as can help the hand to ſuſtain the weight both of that marble and the incumbent cylinder of the atmoſphere, which

which then gravitates upon it, and conſequently upon the hand; becauſe there is no air, nor other equivalent body underneath it, to ſuſtain its part of the weight, as the lower air is wont to do in reference to the heavy bodies that lean on it, and to the weight of the incumbent air. And therefore we need not much marvel, if when only a leſs weight than that of the forementioned pillar of the atmoſphere hangs at the lower marble, it ſhould be capable of being drawn up by the uppermoſt, rather than ſuffer a divulſion from it. As we ſee, that when two bodies being faſtened together, are endeavoured to be drawn aſunder by forces or weights not able to ſeparate them, they will uſually both of them move that way, towards which either of them is the moſt ſtrongly drawn. On which occaſion, I remember what I have ſometimes obſerved in one of the ways of trying the ſtrength of load-ſtones; for if the load-ſtone be able to take up more than its own weight, you may as well lift up the load-ſtone by a knife, as a knife by the load-ſtone. And though one accuſtomed to judge only by his eyes, would have imagined, that when I held the great weights formerly mentioned ſuſpended in the air, there was no ſtrong endeavour to pull up the upper marble from the lower, becauſe my hand being for a while held ſteady, ſeemed to be at reſt; yet he will eaſily be invited to ſuſpect, that in ſuch a thought there may be a great miſtake, who ſhall conſider, that neither did the weight ſenſibly appear to pull the lower marble downwards, though my hand aſſured me that the weight had not loſt its gravitation. And if I ſhall add, that once, when the weight after having been lifted up into the air, was caſually ſo looſened from the upper marble, as ſuddenly to drop down, my hand, unawares to me, was by the force of that endeavour, it juſt before employed to ſuſtain the fallen weight, carried up with ſuch violence, that I very ſenſibly bruiſed it by the ſtroke it gave againſt the face of a by-ſtander, who chanced out of curioſity to hold his head over the marbles.

AND here it will not be impertinent to bring in an experiment that I once deviſed, not only for other uſes, but to illuſtrate the ſubject we have been hitherto treating of. The trial I lately found regiſtered among my *Adverſaria*, in theſe terms. A braſs valve of about an inch diameter was with cement well faſtened to the ſhorter leg (which was but of very few inches in length) of a long glaſs ſiphon left open at the end of the other leg. This valve being let down to the bottom of a tall glaſs body full of water, ſo that it was (if I much miſ-remember not) between a foot and half a yard beneath the ſurface of the water, when there was let in as much water into the pipe, as reached in that as high as the ſurface of the external water in the tall cucurbite: then about an ounce weight was put into the oppoſite ſcale of a ballance, to the neighbouring ſcale, whereof one end of a ſtring was tied, whoſe other end was faſtened to the ſaid valve, whoſe parts would be thereby drawn aſunder. But when the water was emptied out of the pipe, and the valve was let down to the former depth, there was requiſite about 5 ounces, that is 4 ounces more than formerly, to disjoin the parts of the valve, and let the water get in between. And when (the ſiphon being freed from water) the valve was lifted higher and higher, together with the pipe, there needed leſs and leſs weight to make a disjunction; two ounces of additional weight (to the one ounce requiſite to counterpoize the cover of the valve it ſelf) on the water ſufficing to lift up the cover, when the valve was held about half way, between its lower ſtation, and the top of the water; a ſingle ounce ſufficing afterwards, and half an ounce of additional weight proving enough to disjoin the parts, when the valve was held but a little beneath the ſurface of the liquor.

THIS relation of an experiment, which I afterwards ſhowed to many vertuoſi, will perhaps ſeem ſomewhat dark to you without a ſcheme; but if you conſider it attentively enough to apprehend it thoroughly, I preſume it will ſhow you, that whether or no there be, upon any other ſcore, a repugnancy to the ſeparation of ſmooth bodies joined by immediate contact; yet certainly there may be a great repugnancy upon the bare account of the gravity of the medium, wherein the divulſion is attempted. For in our caſe the fuga vacui, if there be any, ought to reſiſt the ſeparation of the parts of a valve ſtill kept under water, as much near the top of the water, as at the bottom. And therefore the great difference found in that reſiſtance at thoſe different places may be attributed to the preſſure of the ambient water, that thruſt them together. And though it be true, that air is an exceeding light body in compariſon of water; yet in divers trials I have found the diſproportion in gravity of thoſe two fluids not to exceed that of 1000 to 1. So that conſidering how many miles, not to ſay ſcores of miles, the air may reach upwards, there ſeems no abſurdity at all to ſuppoſe that the bare preſſure of it againſt the marbles formerly mentioned may keep them as coherent as we found them to be*.

BUT it is now high time to look back to that part of our diſcourſe, which the conſideration of our marbles has ſo long inticed us from directly proſecuting. Although then it may from the paſt diſcourſe be conceived, that in bodies of ſenſible bulk, whoſe ſmooth ſurfaces touch one another, the force of the air does mainly make them cohere; yet it ſeems, that generally in bodies (whether greater or ſmaller)

* But ſince this I have been able to make an experiment, that does ſufficiently confirm the former doctrine. For having ſuſpended the two coherent marbles in a capacious glaſs, whence by a certain contrivance, the air could little by little be drawn out, we found, as we expected, that whilſt there remained any conſiderable quantity of air, in the glaſs, the lower marble continued to ſtick to the other, the preſſure of the remaining air, though but weak, being yet ſufficient for the ſuſtentation of the lower marble, which it was not after the air was further withdrawn. And if when the disjunction was made, the upper marble were by another contrivance let down upon the lower, ſo as to touch it as before; though whilſt the external air was kept out of the glaſs, the upper marble might eaſily be raiſed without taking up the lower with it; yet when the outward air was let in, the marbles were preſſed together, and became again ſtrongly coherent.

ſmaller) it is a ſufficient cauſe of coheſion, that the parts of the body are at reſt by one another, though perhaps the entire concretion be removed from place to place. For bodies of ſenſible bulk being either fluid or conſiſtent, and it being (as above we have taught) the chief requiſite of a fluid body, that its ſmall parts be in motion, there ſeems not any thing neceſſary to keep a body from being fluid, and conſequently to keep it a firm body, but that its contiguous parts be in a ſtate of reſt.

I KNOW, that almoſt all philoſophers both ancient and modern require ſomething elſe than the reſt of the parts (of which ſcarce any of them takes the leaſt notice, as of a thing conducive to firmneſs) to the keeping together the parts of a dry and ſtable body. But although to engage very far in ſuch a metaphyſical and nice ſpeculation were unfit for me, (at leaſt at preſent, when I am but to endeavour to explicate fluidity and firmneſs in the ſenſible bodies we converſe with;) yet we dare not quite ſkip it over, leſt we be accuſed of overſeeing it. The greater number of contemplators aſcribe the effect under conſideration to a certain ſubſtantial form, to which they aſſign, among other offices, that of keeping all the parts united into one body. But what this form is, and by what means it unites the parts ſo ſtrongly in a diamond or a ruby, *&c.* and ſo looſely in tallow, camphire, or the like ſlight concretions; and how the ſubſtantial form continuing the ſame in water and ice, the ſame matter may eaſily and frequently become by turns a hard and a fluid body; how theſe, I ſay, and divers other things are effected by the forms of ſolid bodies, is to me, I confeſs, at leaſt as difficult to conceive, as to imagine without it a cauſe of coheſion in the parts of a dry body.

OTHER learned men there are among the modern naturaliſts, who have recourſe ſome of them to a ſpirit, which penetrating and faſtening to each other all ſubſtances corporeal, unites them into one world; but others fancy rather a certain cement or glue, whereby they conceive the parts of bodies to be made as it were to ſtick to each other. But as for this laſt hypotheſis, it would be conſidered, that though glue is made uſe of to join together bodies of ſenſible bulk, yet glue it ſelf being a body, that is ſo too, it muſt alſo it ſelf conſiſt of leſſer parts ſticking to one another; which allows me to demand the cauſe of the mutual coherence of thoſe parts. And if it be anſwered, that they likewiſe ſtick together by the intervention of ſome more ſubtile glue, I ſhall again repreſent, that this glue alſo muſt conſiſt of corporeal parts; and therefore I ſhall further demand how theſe alſo ſtick together: and if the like anſwer be again made me, I ſhall ſtill renew the like demand, till at length the anſwerer be reduced to confeſs, that parts of matter ſo very ſmall cannot be reaſonably ſuppoſed to be kept together by a cement. And if the corpuſcles, that make up the fineſt glue imaginable, are not kept together by a cement, we may be allowed to aſcribe their adheſion to the immediate contact and reſt of the component parts, (which is a cauſe intelligible, and at leaſt probable) till ſome other ſufficient cauſe be aſſigned, which I do not take that to be, which is taught by the patrons of the firſt hypotheſis lately mentioned, concerning a ſpirit diffuſed through the maſs of matter. For not to mention, that the agility of a ſpirit ſeems not ſo proper a qualification for that, which is to faſten bodies together, we may conſider, that this ſubſtance which is called a ſpirit, is indeed but a ſubtile body. And why therefore may not the minute parts of other bodies, if they be conveniently ſhaped for adheſion, ſtick to one another, as well as ſtick to this ſpirit? And I ſhould here alſo demand, how the parts of this ſpirit are kept faſt to one another. If any ſhould anſwer, that this ſpirit conſiſts of parts, which are inſeparable, and yet perhaps of a hooked ſhape, which fits them to faſten themſelves to the bodies they take hold of, and thereby thoſe to one another; this would be to propoſe ſuch a new notion of the diffuſed ſpirit, as I know not whether thoſe, whoſe opinion I have been examining, did ever dream of, or would be content to adopt: and ſure, according to this hypotheſis, there muſt be a wonderful plenty of theſe little ſpirits in the groſſeſt bodies; and ice for example, which is thought ſo deſtitute of ſpirits, muſt be well nigh half made up of them: for theſe little ſpirituous parts can faſten no parts of other bodies together but thoſe they touch, ſince otherwiſe the parts of other ſorts of matter, if but contiguous, might cohere without theſe, which is againſt the hypotheſis. And ſince each of theſe ſmall ſpirituous corpuſcles, if I may ſo call them, being really a natural body, and by conſequence neceſſarily diviſible, at leaſt by thought, into parts, I ſhall aſk the propoſers of this new notion of ſpirit, upon what account this corpuſcle can be indiviſible; I mean, what it is, if it be not reſt and immediate contact, that hinders, but that the parts (or deſignable parcel of corporeal ſubſtance) which are diviſible by thought, ſhould be always kept together, and never be actually divided. I am not averſe indeed from granting, that they may almoſt always eſcape diſſolution: but I am apt to ſuſpect, that may be, becauſe that by reaſon of the extreme ſmallneſs, and the reſt and ſtrict contact of their parts, they can ſcarce ever meet with an agent minute and ſwiftly enough moved, to be able to ſhatter them, or diſſociate the combined parts. For to ſay, that it is the nature of every ſuch corpuſcle to be indiviſible, is but to give me cauſe to demand how that appears; for ſo important an aſſertion needs more than a bare affirmation for proof.

AND if two of theſe corpuſcles, that are preſumed to be indiviſible, ſhould, being ſmooth and of the ſame figure, (as for example cubical) happen to lie upon one another, and a third ſhould likewiſe chance to be fitly placed upon the uppermoſt of the two, what ſhould hinder, but that this aggregate may by the violent knock of ſome other corpuſcles be broken in the midſt of the whole concretion, and conſequently in the middlemoſt body? For ſuppoſe them as adamantine as you pleaſe, yet ſince corpuſcles as hard as they are, can be made

very violently to knock againſt them; why may not theſe grate or break the middlemoſt corpuſcles, or any of the others? as we ſee that diamonds themſelves may be reduced to powder by other diamonds, though not (as artificers verſed in the trade inform me) by attrition with any other ſtone. To prove, that the coheſion of the middlemoſt of the three lately-mentioned ſmall deyes with the other two, the one above it, the other below, is not ſo ſtrong as that of the parts of that middlemoſt corpuſcle, notwithſtanding that the contact between each two adjoining bodies is ſuppoſed to be full, (for ſo it muſt be in ſuch bodies, though not always in others viſibly greater, in which ſome ſubtiler ſubſtance may be ſuppoſed to come in part between them;) to prove this, I ſay, there muſt be aſſigned ſome better cauſe of the coheſion of the matter in one part of the propoſed body than in the other. And it cannot with probability be pretended, that a corpuſcle preſumed uncapable to be divided ſhould conſiſt of hooked parts: and if that ſhould be pretended, yet even theſe hooks alſo being true bodies, the queſtion would recur concerning them, and be ſtill renewable *in infinitum*. If it ſhould be ſaid, that theſe minute bodies are indiſſoluble, becauſe it is their nature to be ſo; that would not be to render a reaſon of the thing propoſed, but in effect to decline rendering any. And though I know, that in every hypotheſis about the principles of things, ſomething is allowed to be aſſumed, as not being to be explained or proved by any thing more primary than it ſelf; yet I know not whether this excuſe be proper in our caſe, wherein it ſeems, that the entireneſs and permanency of any parcel of matter, how minute ſoever, may be probably enough deduced from the immediate contact, the reſt and the extreme littleneſs of its deſignable parts. And if for a laſt refuge it ſhould be ſaid, that the deſignable parts of theſe corpuſcles are therefore unſeparable, becauſe there is no vacuity at all intercepted between them; beſides that this is contrary to the ſuppoſition formerly made; for ſuch extremely minute deyes as we imagined to be one upon another, having their ſurfaces, according to our poſtulatum, flat, ſmooth, and exquiſitely congruous, could no more than the parts of either of the three corpuſcles have any vacuity intercepted between them: beſides this, I ſay, this is both to ſuppoſe a vacuum in all diviſible bodies, and that too as the cauſe of their being ſuch, and to decline the former hypotheſis touching the uſe of this ſpirit, and take ſanctuary among the atomiſts, to whoſe opinion about the account, upon which thoſe bodies they call atoms are not diſſipated, although ſome of the conſiderations we have alledged againſt the newly-examined opinion may in part be applied; yet divers of their other opinions do ſo fairly comport with the generality of our experiments in theſe notes touching *Fluidity and Firmneſs*, that I am willing to decline claſhing with them, by not purſuing now any further a diſquiſition, which, as I ſaid a while ago, is not neceſſary to my preſent deſign: eſpecially, ſince the dim and bounded intellect of man ſeldom proſperouſly adventures to be dogmatical about things, that approach to infinite, whether in vaſtneſs or littleneſs. Nor indeed would I have that looked upon as a reſolute declaration of what I think of ſo abſtruſe a ſubject, which I have rather propoſed to avoid ſaying nothing, where I ſuppoſed it expected I ſhould ſay ſomething.

THE other thing then, which in our deſcription of a firm body we mentioned as capable to make it ſo, is the texture of the parts (whether homogeneous or not) that conſtitute it; and though the juxta-poſition and reſt of theſe parts may poſſibly alone ſuffice to make the body ſtable; yet this texture ſeems to be the moſt uſual cauſe of ſtability, and ſometimes alſo it may ſuper-add a degree of that quality to that, which bodies may have upon the former account only. For, though whilſt the parts of the body are actually at reſt, it cannot be fluid, yet thoſe parts, if they cohere to one another but by reſt only, may *cæteris paribus* be much more eaſily diſſociated and put into motion by any external body actually moved, than they could be, if they were by little hooks and eyes, or other kind of faſtenings intangled in one another; it being often neceſſary in this caſe violently to break off theſe faſtenings, before the little bodies faſtened together by them can be disjoined, and put into ſuch a ſeparate motion, as is requiſite to the conſtituting of a fluid body.

WE formerly made uſe of that familiar ſubſtance, the white of an egg, to illuſtrate the nature of fluidity: let us now try, whether it will alſo aſſiſt us in our inquiry after the cauſes of ſtability. When an egg is made hard by boiling, ſince whether we ſuppoſe this induration to be effected by bare motion or impulſe, or elſe by the inſinuation of fiery corpuſcles; ſince I ſay there is nothing, that appears to get in at the ſhell, unleſs perhaps ſome calorific atoms, and, perchance too, ſome little particles of the fluid water it is boiled in, it is not eaſy to diſcover, from whence elſe this change of conſiſtency proceeds, than from a change made in the texture of the parts, whereby they are connected and diſpoſed after a new manner, fit to make them reciprocally hinder the freedom of each other's motions. But if inſtead of hardening the whites of eggs by the heat of the fire, you beat them very well into froth, you may perceive that froth to emulate the nature of a ſtable body: for not only you may raiſe it up to a pretty height, and make it retain a ſharp top almoſt like a pyramid; but I remember I have, for curioſity-ſake, made with a little care a long and proportionably thick body of theſe bubbles hang down from my finger without falling, like an icicle from one of the reeds of a thatched houſe; and yet in this there appears not any alteration to be made in the fluid body, ſave a meer mechanical change of the diſpoſition of its parts: which may be confirmed by water beaten into froth, for there the heaped bubbles will quickly ſubſide and fall back into water of the very ſame conſiſtence it was of before.

Now there may be ſeveral things, whereby

a body may be put into ſuch a texture, as is convenient to make it firm or ſtable. And of theſe, before we conſider of them particularly, it will be fit to take notice in general, that for the moſt part it is not from any of them ſingle, but from two or more of them concurring, that the ſtability of concretions proceeds.

THE firſt and chiefeſt of theſe ſeems to be the fitneſs of the ſhapes of the component particles to faſten to each other; as if ſome were figured like the handles of buckets, and others like the hooks, that are wont to be employed to draw them up out of the well, or ſome like buttons, others like loops, ſome like male, others like female ſcrews (as mechanicians ſpeak) or as if many together were ſo variouſly branched, that their parts may be ſo interwoven one within another, as not to be eaſily ſeparable (as we often ſee in a well-made dry hedge, of which if a man go to pull away one bough, he ſhall often be unable to do it without pulling away with it divers others, whoſe ſlender twigs will be intangled with it.) An eminent example of the power of the bare texture of many ſmall bodies (even ſuch as each of them apart is not, perhaps, extraordinarily ſhaped for ſuch a purpoſe) to make a ſtable one, is afforded us by ropes and cables; where only by twiſting together and wreathing the ſlender and flexible threads the cable is made up of, they are ſo well, as it were, wedged in between and faſtened to one another, that they conſtitute a body not to be broken by the weight of an iron anchor, nor, perhaps, by the force of a ſhip violently driven on by the fury of the winds and waves. This figuration of the corpuſcles, that make up conſiſtent bodies, ſeems to have been the chief, if not only, cauſe of their conſiſtence, in the judgment of the antient Atomiſts, this being the account, that is given of it by *Lucretius:*

Denique quæ nobis durata ac ſpiſſa videntur,
Hæc magis hamatis inter ſeſe eſſe neceſs' eſt,
Et quaſi ramoſis alte compacta teneri.
In quo jam genere imprimis adamantina ſaxa
Prima acie conſtant, ictus contemnere ſueta,
Et validi ſalices, ac duri robora ferri,
Æraque quæ clauſtris reſtantia vociferantur.

AND indeed, ſo innumerable may be the correſpondent figures, which are fit to faſten bodies to one another, that it is very poſſible, that two bodies, whereof each apart is fluid, may upon their conjunction immediately intangle their parts in one another, and thereupon acquire ſuch a new texture, that their parts cannot as formerly diſſociate themſelves at pleaſure, and move along one another's ſurfaces, nor conſequently flow after the manner of liquors, but are ſo connected or intangled, that the motion of one of them will be reſiſted by many, and ſo the whole body will become firm or ſtable. Something like this may be ſeen in the experiment mentioned by our author, where he teaches, that the diſtilled liquor of nitre, and that made *per deliquium* out of fixed nitre, will preſently, upon their mixture, in part concoagulate into ſaline, and conſequently ſtable, bodies; but this ſeeming only a re-union of the ſaline particles, that did, though inviſibly, ſwim up and down in the aqueous parts of the mingled liquor, which after this ſeparation remains both more copious than the ſaline parts, and as fluid as before, we will add a noble inſtance (mentioned to another purpoſe by *Lully* and *Hartman*) to declare, how much the firmneſs of bodies depends upon their texture. If you take then the alcohol or highly-rectified ſpirit of wine, and exquiſitely dephlegmed ſpirit of urine, and mix them in a due proportion, (as I remember the laſt time I made the experiment I took about equal parts by gueſs, though two of the former to but one of the latter, if this be excellent, be a better proportion;) you may in and about a minute of an hour turn theſe two fluid liquors into a conſtant body; and I confeſs it was not without pleaſure, that I have immediately upon the ſhaking of theſe two liquors ſeen them ſhoot into the likeneſs of ſnow, and acquire ſuch a conſiſtence, that I could without ſpilling the mixture turn the veſſel, that contained it, upſide down.

BUT I dare not expect to have this experiment believed, even by moſt of them that ſhall try it, experience having taught me, that it will not ſucceed, unleſs the ſpirits of urine and of wine be both of them more exactly dephlegmed, than is uſual even among chymiſts. Yet ſo much more does this coagulation ſeem to depend upon the ſalt of urine as of ſuch a texture, than barely as urinous, that we will add that, as the ſpirit of fermented urine is not (whatſoever ſome eminent chymiſts may think or ſay) ſo indiſpenſably requiſite, but that my curioſity leading me to try, whether other liquors, which I ſuppoſed to be of a reſembling nature, might not ſerve the turn, I found, that ſufficiently-rectified ſpirit of hartſhorn (to mention that alone here) may be made to ſupply its place: ſo I endeavoured to make it probable by this *, that having tried a certain method (though that may ſeem ſtrange to moſt chymiſts) of ſo ordering urine, that without ſtaying at all to ferment or putrefy it either forty days, or half ſo many hours, I can make the volatile or ſaline ſpirit aſcend firſt in diſtillation, though I uſe but ſome ſuch gentle heat as that of a bath: having, I ſay, by this means diſtilled a very ſtrong ſpirit of unfermented urine, and rectified it too, I found, as I expected, that I could not by any means make it coagulate with ſpirit of wine, which ſeemed to proceed from the differing texture of this ſpirit from that of fermented, or rather putrefied, urine; ſince I had added nothing to the freſh urine I diſtilled, but what was extremely fixed, and belonging (as chymiſts ſpeak) to the mineral kingdom. Whereupon having had the curioſity to inquire of ſome of my chymical acquaintances, I found, that, they complained, that they had not been able to coagulate ſpirit of wine with the ſaline ſpirit made of meer urine, without any addition at all, when they diſtilled that urine without a previous putrefaction

* This way the author afterwards publiſhed in another book.

faction (which is not wont to be perfected under ſix weeks or thereabouts.) But to return to our coagulum, we will annex, that this is further remarkable in this experiment, that this white coagulated ſubſtance, being put into a glaſs veſſel exactly ſtopt and kept in a gentle heat (which yet it ſelf is not, perhaps, neceſſary, though expedient) for ſome weeks or months, will at leaſt for the greateſt part by much (for I have not yet totally ſeen it do ſo) reſume the form of a limpid liquor; as if either all the crooked particles, that connected the ſmall coalitions of the vinous and urinous corpuſcles to one another, were, by the motion they were put into by the external heat one after another, broken off, or elſe the ſame little concretions (for the menſtruum ſeems to conſiſt chiefly of them, being able to perform other matters than either of the ſingle liquors whereof it is conſtituted) either aſſiſted by outward warmth, or enabled thereto by ſome other cauſe of mobility, did, after many and various attempts to clear themſelves of each other, little by little ſo unbend or break off the crooked particles, that intangled them, as at length to extricate themſelves, and become capable of freely ſhifting places among themſelves, and ſo of the form of a liquor.

AND here I ſhall add a couple of experiments, for the ſake of their affinity with ſome parts of the newly-recited experiments about the vino-urinous coagulate.

AND firſt it ſeemed to me worth trying, whether ſome acid ſalts, being duly ordered, would not concoagulate with ſpirit of wine, as well as with urinous ſalts; and having for a while digeſted together in a convenient proportion pure *ſaccharum Saturni*, made with ſpirit of vinegar, and rectified ſpirit of wine, I found the mixtures ſo changed in point of conſiſtence, that upon inclining the glaſs, which contained it, none of it would run down the ſides. But this experiment did not afterwards ſeem to me either eaſy or conſiſtent, nor is it more than one of the ways, and I doubt none of the beſt, of attempting what we have propoſed.

THE other experiment I promiſed you, relates to the reſolution of the coagulum of ſpirit of wine, (which to be performed by digeſtion requires a very long time.) And I wiſh I had not ſome reaſons to hinder me from communicating to you the way of making of it at preſent; it being an experiment, that ſeems ſomewhat ſtrange in its kind; but that part of it, which is directly pertinent to our preſent argument, you will, I truſt, believe upon my relation, which is, that by the addition of nothing but of a very fixed and very dry body (inſomuch that it will not yield any thing by the common way of diſtillation, even in a naked fire) by the ſole addition, I ſay, of this dry body, the newly-mentioned coagulum, which is alſo a conſiſtent body, may in a few hours be brought into a permanent liquor (quite diſtinct from the dry body) which, when experience firſt recommended this way to me, was of too ſubtile and penetrating a nature, not to make me expect from it conſiderable effects, both in chymiſtry and phyſick, of which imitation you may be pleaſed to take notice.

BUT to return to what I was about to ſubjoin after the mention of our coagulum, as that is an example of firmneſs produced by texture; I will here, becauſe it is not eaſy to procure ſpirits pure enough to make ſuch a concretion as that; I will here, I ſay, ſet down another way of ſpeedily hardening one fluid body by another: for if you take the white of an egg, and beat it till it become thin, and then ſhake well into it about half its quantity (perhaps much leſs might ſerve the turn) of right ſpirit of ſalt, you ſhall have in a few minutes the mixture ſo coagulated, that I remember when we turned the glaſs, wherein we made it, upſide down, not a drop of liquor did run out, though ſome hours after we obtained a little by breaking the curdled matter. And another experiment much of the nature of this is ſaid to be delivered by Sir *Francis Bacon*, who teaches to coagulate whites of eggs with ſpirit of wine: and indeed, if you obſerve a circumſtance (unmentioned, that I hear of, by him) which is the ſhaking of the two bodies well together, and if your ſpirit of wine be good, the experiment will ſucceed very well; inſomuch that I remember I have made this way a coagulum, from which no liquor would drop down in about a minute of an hour. But whereas this great naturaliſt conceives this hardening of the egg's white to be performed by the heat of the ſpirit of wine, I ſhall willingly confeſs he has aſſigned the cauſe ingeniouſly, but muſt doubt, whether he have done it truly: for there are divers things, that ſeem to argue ſpirit of wine, as inflammable as it is, to abound with a piercing ſalt, and that ſuch ſaline corpuſcles may ſuffice to curdle whites of eggs, our freſhly-mentioned experiment of curdling the white of an egg with ſpirit of ſalt does ſufficiently declare; and not only we have performed the like effect with ſome other acid ſpirits, and particularly that called oil of vitriol, but it may be produced, though more ſlowly, even by a crude ſalt; for by long beating the white of an egg with a lump of allom, you may bring it for the moſt part into white curds. So that if we will allow the coagulation we treat of to be performed by the ſpirit of wine as hot, it ſeems, that that heat muſt be only ſuch, as may be aſcribed to the active particles of ſaline bodies, which yet are commonly accounted rather cold than hot. But becauſe I ſomewhat doubt, how juſtly they are reputed ſo, I will add, that I did purpoſely for trial-ſake, take the ſerum or whey, that is wont to ſwim upon men's blood after it is cold and ſettled, and indeavoured in vain to coagulate it with ſuch ſpirit of wine as would coagulate eggs; and yet this whey will at leaſt as ſoon, as (if not much ſooner than) whites of eggs, coagulate over a gentle heat of embers: which makes it doubtful, whether the effect proceed not from the greater correſpondency in texture of the ſpirit of wine with one of the liquors than with the other, rather than from the heat aſcribed to it, which did not at all coagulate the whey.

BUT

BUT although we have mentioned ſome examples to ſhew, that two fluid bodies may be aſſociated into a conſiſtent one; yet we want not an experiment to make it appear, that likewiſe by the change of texture a fluid body may be divided into two conſiſtent ones. This experiment, which we have partly taken notice of before (treating of fluidity) is, that having for trial-ſake by convenient degrees of fire diſtilled over a due proportion of the more volatile parts of ſallet oil, neither the liquor, that came over, nor the ſubſtance, that remained behind in the retort, was fluid, though the oil that yielded them had been ſo.

BUT when I put to the oil before diſtillation a convenient quantity of common ſalt, and one or two other things, that were fit to change the texture of the branched or hookt corpuſcles whereof it conſiſted; I could then obtain an oil of common oil, that both dropt into the receiver in the form of a liquor, and continued a fluid body; which may probably be of good uſe to ſurgeons, varniſhers, and men of ſome other profeſſions.

AND to make it the more likely, that by additaments of ſome ſuch nature as that newly-mentioned, ſome groſſer and cloggy parts are retained, or elſe much ſubtilized and otherwiſe altered; I ſhall add, that proſecuting a hint I happened to meet with in the diſcourſe of a wandering chymiſt, I practiſed a way ſo to defecate the dark and muddy oil of amber drawn *per ſe*, that a pretty proportion of it would come over ſo tranſparent and finely coloured, that the experiment did not a little pleaſe thoſe I ſhewed it to. And if it do not appear upon trial, that this way of preparing oil of amber does by detaining ſome parts, which, though more groſs than the reſt, may yet be no uſeleſs one, impair the remedy; and that it does not, upon ſome other ſcore, infringe the medicinal virtue of the oil, the experiment will not be unuſeful. For the liquor, that is thus prepared, is not only very diaphanous and well coloured, but ſo pure and ſubtile, that it will ſwim, not only upon water, but upon ſpirit of wine it ſelf. And it will be no deſpicable thing, if by extending or further applying this experiment to other indiſpoſed bodies, many empyreumatical oils diſtilled by ſtrong fires in retorts can be brought to emulate eſſential oils (as chymiſts call them) drawn in limbicks, as to clearneſs and lightneſs.

THE additament I laſt thought fit to make uſe of for purifying oil of amber was briefly this. ℞. two pound or ſomewhat leſs of good brandy, one pound of good ſea-ſalt, and half a pound of the oil to be ſubtilized, mix, and diſtil them together.

UPON the mention I made above of the white coagulum of the ſpirits of wine and urine, I remember what I have ſometimes obſerved in the eſſential oil of anniſeeds (as chymiſts ſpeak) diſtilled with ſtore of water in a limbick and refrigeratory; namely, that in the heat of ſummer it would remain a perfect liquor like other chymical oils; but during the cold of the winter, though they, notwithſtanding that ſeaſon, continued fluid as before, the oil of anniſeeds would coagulate into a body, though not of an uniform texture to the eye like butter (but rather almoſt like camphire) yet like it white and conſiſtent, not without ſome kind or degree of brittleneſs.

AND on this occaſion I will here inſert an experiment, which ſhould have been ſet down in that part of the former hiſtory of fluidity, where I mention, that the ſmall parts of a body may be ſufficiently agitated to conſtitute a liquor by the air or other agents not ſenſibly hot themſelves. The experiment take thus. Caſting by chance my eyes in the winter-time upon a glaſs of oil of anniſeeds, which ſtood coagulated by the cold of the ſeaſon, I preſently bethought my ſelf of making a liquor (whoſe proceſs belongs to another treatiſe) of which, as ſoon as I had prepared it, I made this trial. I melted with a gentle heat the congealed oil of anniſeeds to make it flow, and then covered part of it in another glaſs with a mixture I had provided: and having let them both reſt in the window, I found, that the meer oil being fully refrigerated again, coagulated as before; but that, which was covered with the other liquor, continued fluid both day and night, and in ſeveral changes of weather, and does ſtill remain at the bottom of the menſtruum a clear oil diſtinct from it, though I have purpoſely ſhaken them together to confound them.

AND becauſe, *Pyrophilus*, I have not diſcovered to you the menſtruum I made uſe of, I will here preſent you with a ſuccedaneous experiment made with a common liquor. I took then good clear Venetian turpentine, and having ſlowly evaporated about a fourth or fifth part of it, till the remaining ſubſtance being ſuffered to cool would afford me a coherent body, (or a fine colophony) I cauſed ſome of this tranſparent and very brittle gum (of which I have elſewhere taught you ſome uſes) to be reduced to fine powder: of which I put into pure ſpirit of wine a greater proportion, than I judged the liquor was capable of diſſolving, to the end, that when the ſpirit had taken up as much of the powder as it could, there might remain at the bottom a pretty quantity of our colophony. On which, though the menſtruum (being already glutted) could not act powerfully enough to diſſolve it, yet it might give the matter (which it had already ſo far ſoftened, as to reduce it into a coherent maſs) agitation enough to emulate a fluid (though ſomewhat viſcous) body. And accordingly I obtained a ſluggiſh liquor, which continued fluid, as long as I pleaſed to continue the menſtruum upon it. The like experiment I tried with clarified roſin, and with fine colophony, though but bought at the ſhops; and although the trial ſometimes ſucceeded not ill, yet I found not the ſucceſs conſtant and uniform, whether becauſe the bodies to be diſſolved were not defecated and pure enough, or that I did not hit upon the beſt proportion between the ſolvent and them. But this circumſtance I ſhall not omit, that when the glutinous liquor was ſeparated from the menſtruum, it would by degrees, though but ſlowly, harden

in the air. The application of which property, for the preſervation of ſmall and very tender bodies, I ſhall not here more expreſly hint than by having barely named it. I had forgot to add, that whilſt the ſubſtance continued fluid, I could ſhake it, (as I lately told you I could the oil of anniſeeds) with the ſupernatant menſtruum, without making between them any true or laſting union.

WHICH laſt circumſtance brings into my mind another experiment, that I likewiſe forgot to add to that part of the former hiſtory of fluidity, where I take notice, that the particular textures of fluid bodies may be reckoned among the chief cauſes of their being diſpoſed, or indiſpoſed to mingle with one another. For partly to confirm this conjecture, and partly to manifeſt, that it is not univerſally true, which chymiſts are wont to think, that acid ſalts and oils will not incorporate or mingle; I took an arbitrary quantity (and, as I remember equal weight) of common oil of vitriol and common oil of turpentine, as I bought them at the druggiſts: theſe I put together very ſlowly, (for that circumſtance ſhould not be omitted) and obtained, according to my deſire, an opacous and very deep-coloured mixture, whoſe almoſt balſam-like conſiſtence was much thicker than either of the liquors that compoſed it. (The like experiment alſo ſucceſsfully tried with ſome other chymical oils, but found none preferable for this purpoſe to oil of turpentine.) And to make it probable, that the diſpoſition of theſe liquors to mingle thus preſently together depended much on their texture, we made the mixture be warily diſtilled over, (for elſe the experiment will ſcarce ſucceed) and thereby obtained, (as we elſewhere mention to another purpoſe) a certain groſs ſubſtance, which was that, which ſeemed to mediate the former union betwixt the two liquors. For this ſubſtance being ſeparated, and thereby the texture of one of the liquors (or perhaps both) being changed, the liquors (which came over very clear into the receiver) ſwam upon one another; nor have I ſince been able by ſhaking them together to confound them for any conſiderable time, but they preſently part again, and do to this day remain diſtinct as well as tranſparent. But after having forgot to ſet down theſe things in their proper place, I muſt not forget alſo, that to employ here more words about them were to digreſs.

To this then annex we, that the liquor we elſewhere mention ourſelves to have diſtilled from benzoin, has been, and is ſtill, ſubject to much more frequent viciſſitudes of fluidity and firmneſs: for part of it all the year long continues in the form of a blackiſh oil, and the reſt, according as the ſeaſon of the year or of the day makes the weather cold or hot, frequently changes its texture, ſometimes appearing perfectly the ſame with the newly-mentioned oil, and ſometimes ſhooting into clear and variouſly-ſhaped cryſtals, which faſten themſelves to the bottom and ſides of the veſſel, till a warmer part of the day or of the ſeaſon reſolves them again into a liquor. And theſe two laſt obſervations may alſo ſerve to confirm what we formerly taught, that the fluidity of ſome bodies depended almoſt wholly upon the various agitation of their parts: for in theſe inſtances the parts of the anniſeeds and thoſe of the benzoin, upon the operation or abſence of the languid heat of the ambient air, ſometimes agitating them, and ſometimes ſuffering them to reſt, did conſtitute a fluid or a conſiſtent body. And having thus taken notice of this upon the by, we will add to the other examples mentioned under this ſecond head that, which it afforded us to our preſent purpoſe by ſalt-petre, which being diſſolved in a ſufficient quantity of common water, will ſeem to be loſt in it, and to conſtitute with it one uniform fluid ſubſtance; but if a competent quantity of that water be boiled (or permitted to exhale) away, and the remaining liquor be ſuffered to reſt a while, eſpecially in a cool place, the ſaline particles will be re-uniting themſelves, and by the excluſion of the aqueous parts, conſtitute ſtable and determinately-figured icicles or cryſtals.

THE conſideration of this may ſuggeſt to us another way, that ſeems quite contrary to the former, whereby ſome bodies may become firm and ſolid; and that is by the intermingling of a due proportion of water or ſome other liquor. For, though the ſmall parts of ſuch fluid bodies, being themſelves in motion, are apt to give thoſe of others ſuch an agitation as we have formerly taught, that fluidity principally depends on; it ſeems, that the admiſſion of any liquor muſt rather conduce to the making of a body fluid than conſiſtent: yet if we conſult experience, it will inſtruct us otherwiſe; for when I have taken either an equal or a double weight of oil of vitriol and diſtilled it warily from running mercury, very much the greater part of the liquor would come over, and leave behind it a very white powder conſiderably fixed. And if we examine that familiar production of chymiſtry *mercurius dulcis*, (which they now uſe to make, by ſubliming together of two parts of crude mercury, with but one of ſublimate, which conſiſts chiefly of mercury already) we may find that in that, which is counted the beſt, the fluid body of quickſilver is ſo contexed with the ſalts it carries up in ſublimation, that the dry and brittle body they compoſe may contain far more (perhaps twice more) quickſilver than ſalt. And other experiments may perſuade us, that the mixture of a convenient liquor may cement bodies into one hard concretion, which would ſcarce be compacted together otherwiſe. Nor is it againſt reaſon, that it ſhould be ſo; for there may be differing qualifications required to a body, whilſt it is conſtituting, and when it is conſtituted; and though the motion of the parts, that make it up, oppoſe the firmneſs of a formed body, yet it may conduce to the making of a firm body. For when a great many hard corpuſcles lie together looſe and incoherent, they do, as we formerly noted, emulate a fluid body; whereas by the mixture of a liquor, thoſe looſe corpuſcles being for a while diſſociated and put into motion, they may after many evolutions apply themſelves to one another

ther after that manner, that is moſt requiſite to make them touch one another cloſely, and according to a greater ſurface. Whereupon it often follows, that the liquor, in which they did formerly ſwim, is either ſqueezed out upon their cloſing, or elſe ſo diſperſed in ſmall particles, and diſpoſed of among thoſe of the harder corpuſcles, that they are unable to agitate them, or prejudice their mutual coheſion.

AND here to dilucidate the ſubject under conſideration by an inſtance, that ſeems very pertinent to it, we will make a further uſe of the experiment formerly mentioned touching the burning of alabaſter. For if the powder, after it has done boiling, and has been ſufficiently burnt, and kept ſome hours (the moſt experienced artificers obſerving, that it is not ſo convenient to employ it preſently after it is taken off the fire) be well beaten and tempered up with fair water almoſt to the conſiſtence of thin pap, if the powder have been rightly prepared and ſkilfully tempered, you ſhall ſee that fluid ſubſtance in a few minutes of an hour begin to ſet (as the tradeſmen ſpeak) that is, to exchange its fluidity for firmneſs; ſo that if it were before caſt into a mould, it will perfectly retain the figure of the internal ſurface thereof.

Now that in our mixture there is for a while ſuch an agitation of the hard parts produced upon the affuſion of the water, and afterwards an excluſion of the ſuperfluous water, we may confirm partly by this, that when any conſiderable quantity of burnt alabaſter is tempered up with water, the mixture after a little time grows ſenſibly hot, and ſometimes continues ſo for a pretty while; and partly alſo by this, that having purpoſely for trial's ſake filled a new and good glaſs-phial, containing about half a pint, or pound, with the mixture we ſpeak of, and when it was top full, ſtopped it up very cloſe, the liquid mixture within leſs than half an hour cracked the phial (though ſtanding in a window) in ſeveral places, and at thoſe crevices diſcharged it ſelf of about a ſpoonful of clear water; the remaining mixture retaining perfectly the figure and dimenſions of the phial, and growing as hard as chalk, or ſomewhat harder, inſomuch that we were fain to imploy ſeveral ſtrokes with a ſtrong iron to divide the maſs.

AND let me here add, that ſome other ſubſtances may this way afford much ſolider bodies than burnt alabaſter does; and therefore it may be a thing of good uſe to inquire out and try what other bodies, eaſily to be procured, may be thus brought to a new and laſting ſolidity. For the learned hydrographer, *Fournier*, ſpeaking of thoſe dams or digues (as he calls them in his language) which are ſometimes made in the ſea to ſecure ſhipping, (as I have ſeen at the port of *Genoa* and elſewhere) after having told us, that the Romans made the faireſt harbours in the world by the help of a certain ſand to be met with at *Cuma* and *Puteoli* in the kingdom of *Naples*, which ſand mingled with a third part of quick-lime acquires in the water a flint-like hardneſs; ſubjoins this obſervation of his own, * *J'ay veu, &c.* that is, I have ſeen (ſays he) in *Flanders* near *Tournay* a certain ſort of aſhes of lime made of marble, which was excellent for any kind of work made in the water. For having made a bed of great ſtones, they caſt upon them whole bags full of ſuch aſhes inſtead of mortar, and the water betwixt the ſtones having tempered up theſe aſhes, petrified them to that degree, that in a ſhort time they became as hard as marble. Thus far he. But to purſue our former diſcourſe.

THAT alſo, which we intimated of the conduciveneſs of the various tumblings to and fro of the hard particles to their uniting into one firm concretion, ſeems confirmable by what we have obſerved in ſome ſaline liquors, eſpecially certain parcels of ſpirit of hartſhorn, which whatever were the conſtitution of the ambient air, remained fluid ſome of them for many months, after which the ſaline corpuſcles began to ſhoot at the bottom of the remaining liquor into exquiſitely-figured cryſtals, which at length grew copious enough. For this ſpontaneous coagulation of the little ſaline bodies happening ſo late, it ſeemed, that it was preceded by almoſt innumerable evolutions, which were ſo many and ſo various, that at length the little bodies came to obvert to each other thoſe parts of themſelves, by which they might be beſt faſtened together and conſtitute a firm body. Which conjecture ſeemed the leſs improbable, becauſe we could not well imagine, that this coagulation proceeded (as that of diſſolved alum and other ſalts is wont to do) from the evaporation of the ſuperfluous liquor; for the glaſſes, wherein what we have mentioned happened, being carefully ſtopped, there was no danger of ſuch an avolation; and if any thing could get away, it muſt have been the ſubtile, peircing and fugitive ſpirit, (which indeed, as my noſe had informed me, does oftentimes penetrate ordinary ſtopples) for the flying away of thoſe volatile parts would only have left the remaining liquor more aqueous. And it is well known to thoſe, that deal with ſuch kind of liquors, that the more aqueous they are, the leſs apt they are to cryſtallize. And however it will ſerve our turn, that there was but an inſenſible diminution of the liquor upon the receſs of whatever it was that got through the cork.

To the ſame purpoſe I remember alſo, that having in a cryſtal phial carefully kept a pretty quantity of well-coloured tincture of amber, made with pure ſpirit of wine, it remained fluid for a year or two, and during that time preſented us with a ſtrange phænomenon, that belongs to other papers †. But having been abſent for two or three years from the place where we locked it up, we found, when we came again to look upon it, that though it had formerly remained fluid ſo long, yet ſeveral yellow lumps of amber, almoſt like beads, with one ſide flat, had here and there faſtened themſelves partly to the bottom, and partly to the

* *Hydrograph. du P. G. Fournier*, Lib. II. Cap. 6.

† This phænomenon is partly deſcribed at large in one of the author's *Phyſico-Mechanical Experiments*.

the ſides of the glaſs; the reſt of whoſe internal ſurface continues yet tranſparent.

ANOTHER thing, whereby bodies become ſtable, is, the admiſſion of adventitious corpuſcles into their pores and receſſes. And of the ways, by which theſe foreign corpuſcles may bring the ſubſtance they invade to be compact, theſe four appear the chief.

FIRST then, the adventitious corpuſcles we ſpeak of may produce ſtability in the matter they pervade, by expelling thence thoſe voluble particles, which, whilſt they continued in it, did by their ſhape unfit for coheſion, or by their motion oppoſe the coalition, or diſturb the reſt of the other particles whereof the body conſiſted. But of this having already diſcourſed, proceed we to what is to follow.

IN the next place then, foreign bodies may contribute to the ſtability of a ſubſtance they get into, by hindering the motion of the little bodies, that conſtitute it.

AND thirdly, ſuch advenient bodies, eſpecially if they be not of the ſmalleſt ſize, may produce a firmneſs in the ſubſtance, which they get into, by conſtituting with the particles it conſiſts of corpuſcles more unapt for motion, and fitted for mutual coheſion.

THESE two we mention together, becauſe that very often nature imploys them together, for the introducing of ſtability into matter.

TO theſe ſeems to be reducible the way of turning the fluid body of milk into curds by the mixture of a little runnet; whoſe ſaline particles pervading the body of the milk, do not only make a commotion in the parts of it, but faſten the branched particles of it to one another, and with them conſtitute a body of another texture than was the milk; and the weight of theſe curdled bodies reducing them by degrees into a cloſer order, does, whilſt it preſſes them together, ſqueeze out the thinner and more ſerous liquor, which the runnet was unable to coagulate, and which being thus ſever'd from the groſſer parts of the milk, may well be more fluid than milk it ſelf is wont to be. And that there is ſome coalition of the particles of the runnet with the coagulated ones of the milk, may appear by the complaints, that houſewives ſometimes make of their dairy-maids, that the cheeſes taſte too ſtrong of the runnet, when too great a proportion of it has been mingled with the milk. And though we aſcribed the curdling of the milk to the ſaline particles of the runnet, we ignore not, that, not only common runnet, but alſo divers juices of herbs will curdle milk, as is well known in thoſe parts of *Italy*, where cheeſe is made without runnet. But we made eſpecial mention of the ſaline corpuſcles of the runnet, becauſe really houſewives are wont to ſalt it, and becauſe ſaline liquors do manifeſtly and powerfully operate in the coagulation of milk, which may be curdled by juice of lemons, and I know not how many other acid ſalts. And to manifeſt yet further the coagulative power of them, we have ſometimes in about a minute of an hour arreſted the fluidity of new milk, and turned it into a curdled ſubſtance, only by dexterouſly mingling with it a few drops of good oil of vitriol. But of the effects of various ſalts upon milk we elſewhere may, and therefore ſhall not now, diſcourſe.

BETWEEN this laſt recited experiment, and the two following ones, it will not be improper to inſert the immediately enſuing one, for the affinity, which it ſeems (in different reſpects) to have with both.

I REMEMBER then, that I divers years ago prepared a ſalt, which either was, or at leaſt anſwered well to the qualities aſcribed to that which is now called *Glauberus*'s *ſal mirabilis*, which ſeemed to have in it a coagulative power, in reference to common water. For whereas ſalt of tartar, common ſalt, nitre, *&c.* being diſſolved in water, do upon evaporation of a ſufficient quantity of that water, recover indeed their priſtine ſaline forms, yet they do but coagulate themſelves without concoagulating with them, either any water, or at leaſt ſo much, as chymiſts have thought worth the taking notice of. Whereas this ſalt we ſpeak of, being prepared for the purpoſe, and diſſolved in a convenient quantity of water, does upon its re-coagulation ſo diſpoſe of the aqueous particles, among its own ſaline ones, that if the experiment be well and carefully made, almoſt the whole mixture will ſhoot together into fine cryſtals, that ſeem to be of an uniform ſubſtance, and are conſiſtent enough to be even brittle, and to endure to be pulverized, ſifted, *&c.* though the concretion may have ſuch a proportion of water in it, that (as I remember) when the experiment ſucceeded well, from three parts of water, and but one of ſalt, I had about four parts of cryſtals.

I NEED not tell you, that this ſalt ſeems to have a ſomewhat more than ordinary reſemblance of a true coagulum, ſince it reduces ſo much water into a ſtable conſiſtence; yet it does in no contemptible proportion materially concur to the body produced. But I may hereafter (which I muſt not do now) entertain you about a ſalt of a differing kind from *this*; and which put me upon conſidering, whether there may not be a coagulum more properly ſo called of common water, which may in a very ſmall proportion operate upon a great quantity of that liquor, as runnet does on milk.

I HAVE not yet examined, whether it will be ſufficient to refer merely to the ſecond and third ways lately mentioned of making bodies become ſtable in the phænomena I am about to ſpeak of, or whether it may be reaſonably ſuppoſed (and added as a fifth way) that the bodies to be coagulated may (in great part) be brought to be ſo; by ſo acting upon the bodies to which they are put, that the agent liquor (if I may ſo ſpeak) does by its action communicate to the ſubject it works on, or loſe upon ſome other account ſome ſubtile parts whoſe abſence fits the diſpoſed remaining fluid for ſuch a coheſion, as may ſuffice to make a body be (though very ſoft, yet) conſiſtent. But however, it will not be amiſs to take ſome notice of effects, which, what e'er the cauſe be, belong to the *Hiſtory of Fluidity and Firmneſs*.

I SOME years ſince prepared a ſubſtance of a whitiſh colour, which would not only de-

ſtroy the fluidity of ſome other liquors, but would give a conſiſtency to a notable proportion of oil of vitriol it ſelf, though the parts of this liquor be preſumed, upon the ſcore of its corroſiveneſs, and its aptneſs to grow very hot with many other bodies, and make them ſmoke, to be very vehemently agitated.

AND I remember, that I ſometimes ſhewed the curious a glaſs phial well ſtopped, upon the bottom of which lay a little of this newly-mentioned whitiſh powder, over which there was a conſiderable proportion of oil of vitriol in a conſiſtent form, without ſeeming to have any thing to do with the powder, as indeed it had been only poured upon it, and ſuffered to ſtand in the cold for ſome time (which if I miſtake not was a day or two) at the end of which the above mentioned change was wrought on the liquor by the powder, which did not appear to be diſſolved thereby. Which phænomenon ſeemed indeed to argue, that there happened in this experiment (that was not the only one of the kind I then made) ſomething like the coagulation formerly mentioned of quickſilver by the vapour of lead; ſome ſubtile parts of the coagulator, if I may ſo call it, inviſibly pervading the liquor, whoſe fluidity was to be ſuſpended, though it ſeem not improbable to me, that the effect produced might depend upon both cauſes, this newly expreſſed, and the other a little above mentioned; where I gueſſed, that a change of texture, and thereby of conſiſtence in the menſtruum, might be the reſult of the operation of the menſtruum, and the body it acts upon. And becauſe this powder is not ſo eaſy to be prepared, I ſhall add, that you may (though not ſo well as by the newly-mentioned way) ſee the coagulation of a menſtruum upon a firm body, which it does not ſeem to diſſolve, by the enſuing experiment: Take cryſtals of ſaltpetre very well dried, but not powdered; and gently pouring on it in a glaſs phial ſome good oil of vitriol till it ſwim about half an inch, or perhaps more, above the ſalt; leave the phial cloſed with a cover of paper in a cool quiet place, where it may not be ſhaken: and if the trial ſucceed with you as did it with me, the liquor will, though ſlowly, ſo ſettle it ſelf about the nitre, that though you incline the phial to any ſide (or perhaps turn it upſide down) it will not run out: and I have ſometimes taken notice of little ſaline bodies, and as it were fibres, that ſeemed to keep the parts of the mixture united together. I made alſo ſome other trials to coagulate unflegmatick A. F. upon nitre and ſome other bodies, the phænomena of which trials did not oblige me to renounce the lately-mentioned conjectures about the cauſes of ſuch changes of conſiſtency in liquors, as I have been ſpeaking of: for I ſtill think it highly probable, that the beſt coagulator I have met with acts but as a finer ſort of runnet, which in an inconſiderable quantity really diſperſes material parts of it ſelf through the liquor to be wrought on, though theſe, when the coagulator is a conſiſtent body, be, perchance, ſo few or ſubtile, as not to make any viſible diminution of the body it parts with.

A MORE eminent example to our preſent purpoſe may be afforded us ſometimes, (for I am ſure the experiment will not always ſucceed) by the notable way of coagulating quickſilver, and thereby turning it from a fluid into a firm body, by the vapour of melted lead, in which when it is taken off the fire (but before it be quite grown hard again), a little cavity muſt be made with a pebble or a ſtick, that the quickſilver tied up in a rag may be nimbly put into that hole, and be congealed by the permeating ſteam of the cooling lead. Which effect may be leſs hopefully expected by the way wont to be preſcribed by authors (moſt of whom I doubt never made trial of it) than by another that I have practiſed, and may on another occaſion ſhew you. And that ſome metalline ſteam does really invade the quickſilver, ſeems probable by the waſting of lead by fuſion, and by the operations aſcribed by chymiſts to the fume of lead upon gold, about which I may elſewhere tell you what is come to my knowledge.

AND I remember, that not long ſince, an ingenious phyſician of my acquaintance keeping ſome lead long in fuſion to reduce it *per ſe* into a calx, and holding his head often over the melting pot to obſerve the alterations of the metal, was ſuddenly purged divers times both upwards and downwards, which both he and I aſcribed to the ſaturnine exhalations. And though I ſuſpected the congelation formerly mentioned might proceed from the egreſs of ſome ſubtile ſubſtance, that formerly agitated, but after deſerted, the mercurial corpuſcles; yet that the concretion of the quickſilver might be effected by ſome benumbing vapour of the lead, ſeems confirmable by a notable accident, that befel that famous geometrician Doctor *Wallis*, who related it to me as a phænomenon he knew not well what to make of; namely, that he and other learned men at *Oxford* being minded to make the experiment under conſideration, they found that, upon the firſt fuſion of the lead, the immerſed quickſilver was very well coagulated by it; but when they came to melt it the ſecond time, and put new quickſilver into it, the experiment would not ſucceed; at which they wondered, finding by trials, that the lead might be ſo eaſily deprived of its power of hardening quickſilver. That this obſervation will always hold true, I am not apt to believe; but that ſuch learned and candid naturaliſts ſhould either be miſtaken in making it, or miſrelate it, it were injurious to ſuſpect: wherefore ſuppoſing that to have then at leaſt happened, which one of them regiſtered in writing, and more than one of them told me; it ſeems to countenance what we have delivered, and looks as if, according to our doctrine, there were in lead a coagulative ſteam or ſpirit, and yet (at leaſt in that parcel of metal) in ſo ſmall a proportion, as that it almoſt totally diſlodges or ſpends it ſelf upon the firſt opportunity it meets with of paſſing into quickſilver.

WE have elſewhere, to another purpoſe, mentioned our having ſometimes (for, as we there advertiſe, it will not always ſucceed) made an experiment, which ſeems of kin to the former, and may give much light to the matter under con-

conſideration, and it was this; we poured upon aqua fortis common ſallet oil, which floated together at the top of it, but after ſome hours had its texture ſo changed by the aſcending ſteams or other ſubtile inſinuating particles of the ſaline liquor, that it was turned into a white conſiſtent (and ſometimes a brittle) body like butter, remaining all in one cake on the top of the menſtruum. And the like experiment (but in a longer time) we have performed with expreſs oil of ſweet almonds inſtead of common oil.

AND to ſhew further, how much the operation of the ſame viſible agent may be diverſified as to the production of fluidity or firmneſs, according to the differing diſpoſitions of the bodies it acts on; I have ſometimes (I remember) taken the ſame aqua fortis, or ſpirit of nitre, wherewith I had coagulated expreſſed oil of olives, and having poured it off from the butter-like ſubſtance; I caſt into it ſome good camphire, which, without heat, was thereby reduced into an oil, that retained a diſtinct ſuperficies from the menſtruum, which it ſwam upon, and would not incorporate with; ſo that the ſame numerical menſtruum, without the help of any degree of fire, turned a brittle body into a liquor, and the liquor into a brittle body, (for ſuch is the ſubſtance, that may be made of common oil, if it be ſuffered to float long enough upon the coagulating liquor;) which brittle ſubſtance (to add that upon the bye) ſeemed to have received a more durable alteration from the ſteams of the menſtruum than was expected. For not only when melted with fire, it would upon refrigeration recover its conſiſtence without becoming again fluid, as when it was in the form of oil; but I made a trial or two, without ſucceſs, to reduce it to a liquor, by mixing it with oil of tartar *per deliquium*, which, you know, has a great faculty to find out and mortify acid ſpirits, ſuch as thoſe of the nitre or aqua fortis, that had (whether as mere acids I now examine not) coagulated our oil.

THE fourth and laſt way, whereby corpuſcles entering from without into a body may give it a ſtable conſiſtence, is by making ſuch a commotion in the parts of it, as may make them apply themſelves one to another according to a greater ſurface, or otherwiſe complicate and diſpoſe them after the manner requiſite to make them ſtick together.

THIS way of making bodies become conſiſtent, is ſeldom or never employed by nature without the concurrence of ſome of the other ways already mentioned: but we have diſtinguiſhed it from the two laſt recited, becauſe in them we ſuppoſe, that ſome of the adventitious corpuſcles are ſtopped in the body, to whoſe firmneſs they conduce, and (though perhaps but in a very conſiderable proportion) do concur to make it up; whereas here we ſuppoſe, that without materially concurring to conſtitute the body they work upon, they do only agitate and variouſly move the particles it conſiſts of, perhaps breaking ſome, bending and twiſting others, and in a word ſo altering the texture, that the parts, that did formerly either move ſeparately, or adhere together but looſely, are now reduced to a cloſer order, or a more implicated texture, and thereby more firmly connected to one another. That the bare diſpoſition of the parts of a body in reference to each other, without any addition of foreign matter, may do much towards ſtability, we may ſee both in ſome examples formerly mentioned, and in oſier wands, which, when lying looſely in an heap together, may each of them very eaſily be diſſociated from the reſt; but when they are breeded into a baſket, they cohere ſo ſtrongly, that when you take up any one of them, you ſhall take up all the reſt. To which may be added thoſe many obvious, though perhaps unheeded, inſtances, wherein by the bare texture of the ſlender hair or filaments, whereof wool or ſilk conſiſts, cloth, ſilk-ſtockings, and many other durable garments are made by illiterate tradeſmen.

WE may alſo obſerve the force of bare motion in altering the texture, and thereby the conſiſtence of bodies by the common way of churning, for there the external impulſe of the churn makes a great commotion in the parts of the cream, and tumbles and ſhuffles them perpetually to and fro among themſelves; whereupon it happens, that the more branched corpuſcles meeting with one another, are intangled, and thereby ſeparated from the reſt, and after many occurſions all theſe parts are at length faſtened to one another, and excluding thoſe of the butter-milk, which ſeem not ſo conveniently ſhaped for mutual coheſion, do conſtitute butter: which is wont to be made yet more conſiſtent, or rather more compact, by being beaten or otherwiſe compreſſed, as the parts thereby reduced into a cloſer order ſqueeze out the fluid butter-milk, that was intercepted among them.

IT will perhaps be thought more ſtrange, that a fluid body, nay a diſtilled liquor, which is very volatile, and paſſes for ſimple and homogeneous, and is at leaſt far leſs compounded than milk, ſhould by motion, without the mixture of any new matter, be made coherent: and therefore I hope, that it will not only ſecond the example newly alledged, but likewiſe confirm ſome main points of our doctrine touching firmneſs, if we obſerve, that even the chymical oil of turpentine, which paſſes for one of the principles or elements of that body, may be in great part, if not wholly, coagulated without addition. And yet (not to anticipate what I may have occaſion to deliver elſewhere concerning this experiment) I ſhall now only relate, that inquiring a while ſince of a very expert chymiſt, whether he had not ſometimes obſerved (which I have often done, as I elſewhere declare) oil of turpentine to begin to coagulate, if it were often diſtilled; he went with me to his laboratory, and there let me ſee in a receiver ſome oil of turpentine, which he had often diſtilled over *per ſe*, in good part coagulated into a whitiſh and conſiſtent body: affirming alſo to me, that he had ſometimes, by frequent diſtillations, without addition, obtained from clear oil of turpentine a far greater proportion of ſuch a ſtable ſubſtance. Whoſe

con-

conſiſtence, whether it ſhould be aſcribed to the fire's breaking the oily corpuſcles into parts more fit for mutual coheſion, or whether it proceed from a new texture of the ſame corpuſcles, only chancing by thoſe various evolutions to be diſpoſed after ſuch another manner, as to complicate or otherwiſe connect them, I need not now ſpend time to inquire; ſince it is enough for my preſent purpoſe, that in this example we have one, that declares, how much even motion, without the addition of any ſenſible ſubſtance, may in ſome caſes conduce to firmneſs.

AND here to illuſtrate our doctrine about this quality and fluidity, by ſhewing what the inteſtine motion of the parts, even without the aſſiſtance of adventitious heat, may do, to make a body change its conſiſtence, according to the previous diſpoſition of the matter, and become of firm, fluid; as we lately ſaw oil of turpentine made of fluid, firm: I will add on this occaſion, what I obſerved of oil of wax diſtilled in a retort with an additament of the like nature with that I formerly mentioned, when I ſpoke of the fluid oil drawn from oil of olives. For this oil of wax, though at firſt it came over for the moſt part, if not totally, in the form of a butter; yet by ſtanding on a ſhelf (and that not in a hot place, as a ſtove or laboratory) I obſerved it little by little to reſolve into a tranſparent oil; and purpoſely inquiring of him, that looked after it, whether or no this effect might not be aſcribed to the increaſed warmth of the weather, he aſſured me of the contrary, having taken notice what effects the changes of weather had upon it.

BUT what if we ſhould ſay, that fluidneſs and ſtability depends ſo much upon the texture of the parts, that by the change of that texture the ſame parts may be made to conſtitute either a fluid or a dry body, and that permanently too? Theſe laſt words I add, becauſe of what may be ſaid to this purpoſe concerning the change of water into ice, and ice into water, and of metals into fluid or hard bodies, by fuſion and refrigeration: for in theſe examples the acquired hardneſs of water and fluidity of metals may be preſently loſt upon the bare removal of thoſe bodies into a temperate air; whereas in the inſtance we are to give, the acquired texture is ſo durable, that without an extreme external violence, ſuch as would deſtroy moſt other ſtable bodies, it is not to be deſtroyed. And this inſtance is afforded us by that admirable repoſitory of nature's wonders, quickſilver: for if ſome ounces of this fluid mineral be put into a convenient glaſs-veſſel, and that veſſel be firſt exactly ſtopped, and kept for ſix, eight, or ten weeks (or longer, if need be) in a ſand-furnace, whoſe heat may be ſtrong and conſtant, the corpuſcles, that conſtitute the quickſilver, will, after innumerable revolutions, and perhaps bendings, twiſtings, and other changes, be ſo connected to one another, that inſtead of a fluid body, they will appear in the form of a red powder, that chymiſts precipitate *per ſe*: which change is ſo unexampled, that though among the more curious Spagyriſts it be very well known, yet many Naturaliſts cannot eaſily be brought to believe it; whom to convince of the poſſibility of it by a much leſs tedious preparation, I take half a pound or a pound of quickſilver, and with a ſtrong fire diſtil it out of a glaſs-retort, and for the moſt part there will remain in the bottom and about the ſides of the veſſel a little red powder, which ſeems to be nothing but part of the fluid body (moſt expoſed to the action of the fire) turned into a dry one in eight or ten hours ſpace.

AFTER what manner the fire produces ſo odd a change in the quickſilver, I do not preſume to know. It is true, that though the parts of liquors do, as we have formerly taught, touch one another but in part of their ſuperficies, yet they all of them ſeem to have ſome degree of viſcoſity, or ſome ſlight and looſe complication or other kind of adheſion of parts, as appears by their being ſo eaſily contexed into thoſe thin membranes or films we call bubbles, inſomuch that not only ſpirit of wine, that ſeems the moſt light, and moſt fluid of liquors, will afford bubbles, but (what may ſeem ſtrange) we have divers times purpoſely obſerved, that quickſilver itſelf, as ponderous as it is, eſpecially being ſuffered to fall in a ſlender ſtream into a veſſel almoſt full of the ſame mineral, will afford bubbles numerous and large enough, although (as thoſe alſo of the ſpirit of wine) quickly vaniſhing.

AND hence it might be imagined, that in the operation we are treating of, ſome ſuch change is made in the quickſilver, as we formerly obſerved to be made in the white of an egg, when by a new diſpoſition of its parts, either heat or beating it makes it a kind of ſtable body, or elſe it might be pretended, that there is a variety of parts argued to be in quickſilver by the great variety of its effects upon other bodies, and that by the frequent evolutions, which the fire makes of thoſe parts among themſelves, they come at length to be ſo applied to one another, that either they lock into each other, as it were, or ſlip upon one another's ſurface in ſuch a manner, as that as much of their ſurfaces immediately touch one another, as is requiſite to make them cohere, as we formerly mentioned of ſeveral very ſmooth pieces of glaſs mutually adhering without any other cement, than the congruity and immediate contact of their ſurfaces. But though theſe conjectures and divers others might be propoſed, yet I fear all of them would prove but meer conjectures. Nor were we much aſſiſted to make better by looking upon our mercurial precipitate in one of the beſt magnifying glaſſes in the world; for what we there diſcovered was only, that the red powder had in it many corpuſcles of ſundry other colours, and that the little grains of powder ſeemed to be of no determinate ſhape, but looked like ſlender fragments of red-coral. And having put ſome ſmall duſt of a ſhining precipitate of gold and mercury into the ſame augmenting glaſs, all we could diſcern was, that the little grains of this precipitate differed from thoſe of that made of mercury alone, in that theſe (which a chymiſt would take notice of) were ſo tranſ-

parent throughout, that one would verily think he beheld the beſt ſort of thoſe precious ſtones goldſmiths call granats. But though we pretend not to make out, how the new texture is produced in the quickſilver, yet to make it ſtill more evident, that its change of conſiſtence proceeds from its change of texture, we will add, that having a great curioſity to try whether our powder could not be made fluid again, I procured ſome precipitate *per ſe* of a perſon, who formerly lived with me, and was expert in many mercurial operations, and preſented me ſome of his own making: this being weighed, and put into a convenient glaſs, was carefully preſſed with a naked fire (which ſhould be ſtronger than that wherewith it was precipitated) and at length it roſe by degrees in fumes, which ſettled in the neck of the glaſs in many drops of revived running mercury; all which being collected into one, we found, that there wanted but about a ſixth or ſeventh part of what we had put in, and we ſuppoſed we ſhould not have wanted that neither, but that the vehemence of the fire had melted the glaſs, which ſwallowed up a part of the powder, that made a great ſhew through it, after what was colliquated had been removed from the fire.

THIS experiment brings into my mind another, that was judged uncommon enough, and it was this: Being not long ſince maſter of about half an ounce of a certain mercury, which ſome ways of examining it, that I had employed, induced me to think mercury of Saturn; I imagined (for ſome reaſons) that it might be made very ſerviceable to confirm our doctrine touching fluidity and firmneſs. And accordingly I found upon trial, that I could, barely by ſhaking it long, reduce it to a black powder: in which form it would continue as long as I pleaſe to let it do ſo. And when to the byſtanders there appeared nothing in it, that gave ſuſpicion of a fluid body, I could in a trice, only by dexterouſly rubbing it in a ſmall marble mortar, reduce it little by little into running mercury, as it had been before. Which quick paſſage, from one quality to another, being made, not only without the help of fire, but without adding or taking away any viſible ſubſtance, proved no ignoble inſtance, how much motion and reſt, and the thence eaſily reſulting texture of the component corpuſcles of a portion of matter, may contribute to its fluidity or firmneſs.

FROM the experiment of precipitating quickſilver *per ſe*, and from ſome other things, partly delivered already, and partly to be delivered by and by, we may learn what to think of the opinion of ſome eminent modern philoſophers, who teach, that a fluid body is always diviſible into bodies equally fluid, as quantity into quantities, as if the particles of fluid bodies muſt alſo be fluid themſelves: for by them it ſeems to appear, that quickſilver, and ſome other actually fluid bodies conſiſt very much of hard corpuſcles, ſince by the change of their texture they may be deprived of their fluidity and become ſtable. We ſee alſo, that the ſtiff and ſolid particles of ſalts diſſolved in common water, and of ſilver diſſolved in aqua fortis, being by thoſe liquors ſufficiently diſſociated and ſeparately agitated, do with them conſtitute fluid bodies. And we have elſewhere mentioned to another purpoſe an experiment, which may not impertinently be repeated here; namely, that by putting together into a glaſs retort one part of quickſilver and four of common oil of vitriol, and diſtilling them in a ſand furnace with a ſtrong fire, there remain'd in the bottom of the veſſel a ponderous calx or powder, ſo far from being fluid, that it was but in part diſſoluble in water: and that, which ſeems to prove, that in the very liquid oil of vitriol, though a diſtilled liquor, the ſaline corpuſcles, that chiefly compoſe it, do retain their ſtiffneſs (generally to be found in undiſtilled ſalts) is, that by ſteeping our calx in fair water, we could ſeparate from it a conſiderable quantity of particles, which upon the evaporation of the water coagulated into ſtore of ſaline and brittle bodies. And that theſe proceeded rather from the menſtruum than the metal, we were induced to think, by obſerving the dry calx, before any water was poured on it: for though the ſaline part of the mixture did not weigh (perhaps any thing near) ſo much as the mercurial diſtinctly did, yet the aggregate or mixture did weigh a great deal more than the quickſilver did when it was put in; and the oil of vitriol, that was abſtracted, a great deal leſs, than it did before it was committed to diſtillation. Nay, I once or twice obſerved in a glaſs, where I kept a quantity of oil of vitriol, that there did ſpontaneouſly faſten themſelves to the ſides little ſaline cryſtals, which, when I took out, I found hard and brittle; but when I had, for trial-ſake, expoſed them to the air, they preſently reſumed a fluid form, and appeared to be oil of vitriol. In the obſervation alſo lately mentioned concerning the ſpontaneous coagulation of ſpirit of hartſhorn, it ſeems evident, that bodies, which are all or moſt of them hard, and appear ſo when they are commodiouſly connected to each other, may yet conſtitute a fluid body when they are reduced to ſufficient ſmallneſs, and put into a convenient motion. And indeed, if the leaſt particles of fluid bodies were not (many of them at leaſt) indowed with their determinate bigneſs and ſhapes, but that ſuch fluid bodies could be always divided into particles fluid alſo, how comes it to paſs, that ſome liquors cannot pierce into or moiſten ſome bodies, which are eaſily pervious to other liquors? For if the particles of the excluded liquor were of neceſſity always diviſible into fluid ones, there ſeems no reaſon, why they ſhould not be ſub-divided into ſo very ſmall ones, as that no pores can be ſuppoſed little or oddly figured enough to keep them out.

IT is true indeed, that as it is hard to demonſtrate, ſo it is not eaſy to diſprove, that the matter, whereof fluid bodies conſiſts, is capable of being indefinitely divided: and it may be granted too, that by how much the ſmaller parts a body is divided into, by ſo much the more eaſily, *cæteris paribus*, are the parts of that body to be put into motion. But this diviſibility

viſibility of a fluid body into perpetually leſſer and leſſer parts, belongs not to it properly as it is fluid, but as it is a body; ſuch diviſibility, if ſuppoſed true, being a primary affection of matter it ſelf, and belonging as well to thoſe portions of it that are hard, as to thoſe that are fluid. And though it were admitted, that ſuch an endleſs diviſion, as is preſumed might be made mentally, (as they ſpeak in the ſchools) that is, by the thought or operation of the mind, yet it would remain a great queſtion, whether or no nature does actually ſo far mince and ſubdivide bodies; as may appear by what has been freſhly noted. And however, it is not only requiſite to the conſtitution of a fluid body, that the parts of it be ſmall enough, but that they be alſo actually moved. For we obſerved, not long ſince, that the duſt of alabaſter put into motion did (though its corpuſcles were not inſenſible) emulate a fluid body, and immediately ceaſed to be fluid, when they ceaſed to be agitated: whereas the particles of water, as minute and apt as they are to conſtitute a fluid ſubſtance, do yet make that hard and brittle body we call ice, when thoſe little particles, upon what account ſoever, are reduced to be at reſt.

BY what has been hitherto diſcourſed, we may alſo be aſſiſted to judge of the doctrine of the chymiſts, who teach, that in all bodies, coagulation, ſtability, hardneſs, and brittleneſs depend upon ſalt: for though what above has been ſaid of curdling of milk by ſaline liquors, and the hardneſs and brittleneſs obvious in ſalts themſelves, may keep us from denying, that the ſaline principle is very powerful in the coagulation of ſome bodies, and does produce much firmneſs or even brittleneſs in many or moſt of the concretes wherein it is predominant; yet this hardening power of ſalt ſeems not to proceed from any peculiar and inexplicable property it has to coagulate other bodies, or make them compact, but from the ſhape and motion of its corpuſcles, which it ſeems are more fitted by nature, than thoſe of many other concretes, to inſinuate themſelves into the pores of other bodies, and faſten their particles to themſelves, and to one another, either by wedging their corpuſcles together, or by their ſtiff and ſlender parts, or their ſharp angles or edges piercing divers of them together; as when many pieces of paper are kept from ſcattering by a wire, that runs through them, or as when a knife takes up at once divers pieces of bread and meat, by being ſtuck into them all. But whenſoever there is in the conſtituent parts of the body a ſufficient fitneſs and diſpoſition to adhere firmly to one another, nature may of thoſe parts compoſe a ſtable body, whether they abound in ſalt or no; it not being ſo much upon chymical principles, or even upon the predominancy or plenty of any one ingredient, as upon the ſhape and motion of the component parts of bodies, that their fluidity and firmneſs depend. I will not here urge, that ſalts are generally reducible by an eaſy mixture with water into the form of liquors; nor that ſea-ſalt, ſalt of tartar, and divers other ſorts of ſalts, will of themſelves, even in the air, if not very dry, aſſume the form of fluid bodies; nor yet will I preſs the ſhortly to be mentioned example of coral, which is confidently affirmed to be ſoft, whilſt it remains in the ſalt water, and to grow hard when taken out of it: I will not here, I ſay, preſs theſe and the like arguments, but content my ſelf to have hinted them, becauſe they are ſuch, as I cannot well in few words make out and vindicate. Wherefore I ſhall rather demand, what ſalt can be made appear to paſs out of the body of melted lead into that of quickſilver, to perform in it the coagulation above mentioned? What acceſſion of ſalt is there to be obſerved, when running mercury is precipitated *per ſe* into a powder? And how will it be proved, that when in a well-ſtopped glaſs the whole body of water is, in froſty nights, turned into firm ice by the cold of the ambient air, that coagulation is performed by ſalt, it having not yet been made appear by chymiſts, that either ſalts or even the diſtilled ſpirits of them can penetrate, without a kind of prodigy, the narrow pores of unheated glaſs? It is uſually obſerved in eggs, that though at their firſt coming out of the hen's belly, the ſhells are ſoft, yet ſoon after they grow hard and brittle; and yet it appears not, how the ſaline ingredient is increaſed to effect this ſpeedy induration: and (to ſubjoin that by the by) albeit I am not averſe from thinking, that the coldneſs of the outward air, and its imbibing ſome of the looſeſt of the moiſt parts of the ſoft egg-ſhell, may concur to this effect; yet there are many obſervations of egg-ſhells, that have been found hard in the womb of the hen. And I well remember I have taken notice, that divers eggs not yet laid, but found at one time in the body of the ſame hen, were each of them furniſhed with a compleat and brittle ſhell. But I think I can draw a much ſtronger argument againſt the chymical opinion from the conſideration of an egg; for I demand, what plenty of ſalt can be made appear to pierce the hard ſhell, and more cloſe-wrought membrane, that both lines it and involves the egg, eſpecially ſince it is certain, that in *Egypt*, and divers other places, eggs may be hatched by a temperate external heat without the hen. And yet we may here obſerve, that the ſame internal ſubſtance of the egg, which at firſt was fluid, the yolk and white, that compoſed it, being ſo, is upon the excluſion of the chick turned almoſt all of it into conſiſtent bodies, ſome of them tough, as the membranes and griſtles of the bird, and ſome of them harder and almoſt brittle, as his bones and beak; and all this, as we ſaid, without acceſſion of new ſalt. It would be hard for chymiſts to prove, that diamonds and rubies, which are counted the hardeſt bodies we know, (and at particular trials of whoſe hardneſs I have ſometimes wondered) do abound in ſalt; at leaſt it will not be unreaſonable for us to think ſo, till chymiſts have taught us intelligible and practicable ways of ſeparating (at leaſt ſome) true ſalt from either of thoſe jewels. And it may be alſo doubted, whether the blood of animals, when it is freeſt from ſerum, do not (though a liquor)

as much abound with ſalt as their ſkins or their fleſh.

AND ſince it is with chymiſts that I am now reaſoning, I preſume I may be allowed to preſs them with arguments drawn from ſome of the eminenteſt writers of their ſect. For the generality of chymiſts, and even thoſe, that are by the reſt, and themſelves too, called philoſophers, not only granting, but aſſerting and maintaining the tranſmutation of great quantities of quickſilver and the other ignobler metals into ſilver or gold by means of the white or red elixir, I ſhall demand of them, whence it happens, that one grain of the powder of projection can turn a whole pound of mercury into true gold or ſilver, and conſequently change a very fluid body into a very firm one; though the proportion of ſalt employed to coagulate the whole maſs of quickſilver would not amount to the ſix thouſandth or ſeven thouſandth part of the liquor; though we ſhould grant, that the powder employed to work this marvellous change were all of it ſalt, to which yet chymical writers aſcribe much more of the ſulphurous nature. And to this I ſhall add, what the famous and acute *Helmont* does to another purpoſe relate upon the experience of *Raymund Lully* and his own, concerning his prodigious liquor, alkaheſt; namely, that being abſtracted from common quickſilver, it does in a quarter of an hour coagulate it: and yet in this coagulation he points at this as a ſingular phænomenon, that this liquor, which is as well immortal as exceeding ſaline, leaves nothing of itſelf with the mercury, on which it works, and yet ſo coagulates it, that he preſcribes the making it into a ſubtile powder.

Helmont de Febr. cap. 14.

I REMEMBER alſo to our preſent purpoſe, that a phyſician of much veracity in what he relates, diſcourſing with me the other day about an odd preparation, that he ſaw at the preſent Duke of *Holſtein*'s, (that learned prince and great chymiſt) aſſured me, that among other things he there took notice of a glaſs of ſpirit of urine, which in warm weather remained in the form of a liquor, but in cold weather did totally coagulate into cryſtalline ſalt. And being aſked by me, if he knew how this urinous body had been prepared? he anſwered me, that the Duke cauſed ſpirit of urine exceeding rich in volatile ſalt to be diſtilled very many times; after every diſtillation re-conjoining all, that came over in a liquid with that, which remained in a ſaline form, till by very frequent cohobations all the parts of the urinous ſubſtance were brought to the union or coalition abovementioned. What we may propoſe concerning the various conſiſtence of the ſaline part of urine upon our own knowledge, we ſhall for certain reaſons reſerve for another place.

AND on this occaſion we will annex a few particulars, which may tend not only to the making of the chymical hypotheſis about the coagulation of bodies doubtful, but to the confirmation of much of the doctrine by us propoſed. The firſt ſhall be an obſervation afforded us by the art of making ſugar, wherein very great care is taken, that nothing acid (and eſpecially juice of lemons) fall into the chaldrons or other veſſels, wherein the juice of the ſugar-cane is to coagulate into ſugar: for though acidity be generally by the chymiſts aſcribed to ſalt, yet here the ſaline bodies are ſo far from promoting the coagulation of the ſaccharine ſyrup, that they would quite hinder it. And becauſe that through the want of ſugar-canes in theſe parts, we are reduced to take this obſervation upon the credit of others, and becauſe alſo in itſelf it ſeem ſomewhat ſtrange, we will vouch for it two eminent authors, in whoſe writings we met with it. The one is the ingenious French publiſher of the natural and moral hiſtory of thoſe American iſlands, commonly called by the French *les Iſles Antilles*, and by us the Caribbee iſlands; who deſcribing particularly how his country-men make ſugar in thoſe parts, gives this caution towards the latter end, *Sur tout*, &c. that is, above all, great heed muſt be taken, to let no juice of citrons (or lemons) fall into the caldrons, for that would abſolutely hinder the formation of the ſugar. The other is the diligent *Gulielmus Piſo*, who having given us a particular account, both by words and pictures, of the way of making ſugar, tells us that, *ſi momentum ſucci limonis vel acidi quid injiciatur, ſacchari conſiſtentiam nunquam acquiret, ſed in totum perditur.* To which I ſhall add, that having purpoſely inquired concerning this obſervation, it has been confirmed unto me by perſons, that pretend more than ordinary knowledge of the art of ordering ſugar: which likewiſe affords us another obſervation not impertinent to the theme we treat of; for the beſt authors, that write hereof, inform us, that the juice ſqueezed out of the ſugar-canes is wont firſt to be boiled and depurated in vaſt veſſels of copper or braſs, whence it afterwards is conveyed to be further purified and coagulated into ſmaller ones; and that whilſt it is in the former, they uſe to pour upon it ſome very ſtrong lee to facilitate the ſeparation of its feculencies, as in the ſmaller ones it is uſual to pour a little oil or butter upon the boiling juice, to keep the ſyrup from boiling over. Now that, which they further obſerve to our purpoſe, is related almoſt after the ſame manner both by our French author and by *Piſo*, and by the latter of them in theſe words: *obſervatu dignum* (ſays he) *ſi oleum majoribus inderetur ahenis in quibus liquor primus, caldo dictus, purificatur, ſaccharo conficiendo plane foret ineptus: viciſſim ſi minoribus lixivium ſicut majoribus infundatur, æquè impoſſibile ſaccharum conficere.* So much the fluidity and firmneſs of bodies depend upon their texture, how much ſoever chymiſts would have them depend upon ſalt.

Hiſt. Moral. Cap. 5.

Hiſto. Nat. & Med. Braſil. l. 4. c. 1.

Gulielm. Piſo, & Author Gallic. ubi ſupra.

BUT to this borrowed obſervation, though borrowed of authors not to be diſtruſted, we will add two or three experiments of our own, which we hope may the more confirm the doctrine by us propoſed touching ſtability in bodies, becauſe it was our aim in them to bring light by them to the matters we treat of.

FIRST then, we prepared a liquor, elſewhere to be deſcribed, which is almoſt, if not altogether, as ſaline as *aqua fortis* itſelf, or any other

acid ſpirit, that is commonly known: and yet when in this liquor we laid fragments of ſolid harts-horn of ſeveral ſizes to ſteep, even in a cold place, the menſtruum was ſo far from hardening them, that it would (without diſſolving them as corroſive liquors do metals) gently pierce into them and ſoften them; ſo that in about two or three days it would reduce them to a kind of white ſlime, or mucilaginous ſubſtance, at the bottom of the liquor. We took alſo good ſalt of tartar, and on it poured good ſpirit of vinegar, as long as the affuſion of it would produce any ebullition: then we diſtilled off the liquor, which came over almoſt inſipid, the ſaline parts, that make ſpirit of vinegar ſo ſharp, being retained by the ſalt of tartar. Upon the remaining dry mixture we poured freſh ſpirit of vinegar, as long as any hiſſing enſued thereupon, and afterwards abſtracted the aqueous parts of this parcell of liquor alſo; and ſo we proceeded, till having ſufficiently impregnated the fixed ſalt with the ſaline parts of the diſtilled vinegar, we obtained, according to our deſire, a mixture, which (though it were all made up of ſalts, and ſuch ſalts too as being made by the chymical analyſis of the bodies whence they were drawn, may according to the chymical doctrine be looked upon as pure and elementary) was yet ſo near fluidity, that it required not the heat of the fire to turn it preſently into a liquor, which ſhape it aſſumed with a gentler warmth, than one would expect from a ſaline body. Laſtly, we took common oil of vitriol, and caſt into it divers little pieces of camphire, which floating upon it were by degrees and after ſome hours wholly reduced into a reddiſh oil, that was to be ſeen altogether upon the top of the other liquor. Then having formerly tried that oil of vitriol would eaſily mix with common oil, we tried alſo, by ſhaking the ſaline and camphorate liquors together, to unite them, and eaſily confounded them into one high-coloured liquor, which ſeemed very uniform, and continued ſo (at leaſt as to ſenſe) for many hours. Then we added to this mixture three or four times as much fair water, and (as we expected) the camphire immediately recovered a white conſiſtent body, and by degrees ſettled at the top of the liquor: where we may obſerve, that the camphire is not made hard but fluid by its mixture with the ſaline corpuſcles of oil of vitriol, and exchanges its fluidity for firmneſs upon the affuſion of ſaltleſs water. And thus much it may ſuffice to have ſaid touching the chymiſts deriving the ſtability of bodies from their abounding in ſalt.

AND as for the hardneſs and brittleneſs they aſcribe to the ſame principle, how much they may be increaſed or diminiſhed in a body, without the acceſſion or decrement of the ſaline principle or ingredient, may appear by that experiment mentioned by us to ſeveral purpoſes, of tempering a ſlender piece of ſteel: for when it has been ſufficiently heated, by plunging it red-hot into fair water, which is more likely to diſſolve than increaſe its ſalt, you may make it not very hard alone, but very brittle; whereas by only ſuffering it to cool leiſurely in the air, it will be both much leſs hard and more tough. And if after having quenched it in cold water, you again heat it till it have attained a deep blue, it will become (comparatively) ſoft and very flexible, and that not from any waſting of the ſaline ingredient by the fire; for if this ſoftened ſteel be again heated red hot, and ſuddenly refrigerated, whether in water or otherwiſe, as before, it will re-acquire both hardneſs and brittleneſs.

NOW that by theſe operations a real change is made in the diſpoſition of the ſmall parts of the ſteel, we have elſewhere evinced even by a ſenſible proof. And that by procuring a cloſer order and more immediate contact of the parts of a body, a man may without increaſing the ſalt increaſe the hardneſs of it, is, as we formerly alſo noted, obvious in ſnow, which whilſt it lies in flakes as it falls upon the ground, compoſes but a ſoft and yielding body; but when the ſame ſnow is, by being ſtrongly preſſed every way betwixt the hands, formed into balls, the little whether icicles or frozen bubbles it conſiſts of, are ſo approached to one another, and forced into an order, which allows ſo little waſte of room, that the formerly-intercepted ſpaces being moſt of them filled up with little bodies, the icicles can no longer yield, as they did before, to the preſſure of a man's fingers, but conſtitute a maſs conſiderably hard, which yet may be made harder being melted into water, and afterwards frozen into ice: for this having been a fluid body, (and in ſuch, room is wont to be better huſbanded than in others) the bubbles intercepted in it cannot keep it from being of ſo cloſe a texture, as to be conſiderably hard.

I KNOW, that not only profeſt chymiſts, but other perſons, who are deſervedly ranked amongſt the modern philoſophers, do with much confidence entirely aſcribe the induration, and eſpecially the lapideſcence of bodies, to a certain ſecret internal principle, by ſome of them called a form, and by others a petrifying ſpirit, lurking for the moſt part in ſome liquid vehicle. And for my part, having had the opportunity to be in a place, where I could in a dry mould and a very elevated piece of ground cauſe to be digged out ſeveral cryſtalline bodies, whoſe ſmooth ſides and angles were as exquiſitely figured, as if they had been wrought by a ſkilful artiſt at cutting of precious ſtones, and having alſo had the opportunity to conſider divers other exactly or regularly ſhaped ſtones and other minerals, ſome digged out of the earth by my friends, and ſome yet growing upon ſtones newly torn from the rock; I am very forward to grant, that (as I elſewhere intimate) it is a plaſtick principle implanted by the moſt wiſe creator in certain parcels of matter, that does produce in ſuch concretions as well the hard conſiſtence as the determinate figure. We deny not then, that theſe effects depend moſt commonly upon an internal principle; but the difficulty conſiſts in conceiving, how that internal principle produces its effects, which theſe writers not pretending to explicate intelligibly, we thought it not amiſs briefly to ſurvey ſome of the principal ways, by which

which it ſeems, that nature makes bodies firm and ſtable, whereby we may be aſſiſted to judge, whether it be as neceſſary to have recourſe to a plaſtick principle or a Gorgonick ſpirit in all other quick and notable indurations of bodies in the cold, as in the hardening ſuch bodies, whoſe curious and determinate either internal textures or outward ſhapes (common to ſeveral concretions of one kind) argue their having been framed by ſome one formative power, or by divers ſeminal principles convened together. But this we will do without affirming, either that ſhe cannot by ſome other yet unobſerved way make conſiſtent bodies, or that of the ways by us diſcourſed of, ſhe is wont ſo to confine her ſelf to any one, that ſhe does not frequently make uſe of two or more of them, to produce the ſame effect.

AND becauſe hardneſs is a high degree of firmneſs, I ſuppoſe it will not be impertinent to ſhew by ſome examples, how ſmall an external operation may, without any appearing adventitious ſalt, make a ſoft body hard, and even brittle, when there appears not any other change to be made, than that of the texture or diſpoſition of its component particles.

IT is a tradition amongſt naturaliſts, that coral grows ſoft at the bottom of the ſea, but when it is brought up into the open air, though it retains its bulk and figure, it hardens into a ſtony concretion, according to that of *Ovid*:

Ovid. 15. *Metamor.*

Sic & coralium, quo primum contigit auras
Tempore dureſcit, mollis fuit herba ſub undis.

WHETHER or no this tradition is ſtrictly true, we had not opportunity, when we ſtaid at *Marſeilles* (whoſe neighbouring ſea is the chiefeſt in *Europe* where coral is wont to be fiſhed) to give our ſelves an ocular ſatisfaction. But whatever ſome ſay to diſcredit the tradition, nay, how confidently ſoever *Beguinus* (who ſeems to have the moſt ſtrongly argued againſt it,) hath rejected it, it muſt not be denied to be, ſometimes at leaſt, true, (and that is enough to ſerve our preſent turn.) For the learned *Gaſſendus* in the life of *Pereſkius*, relating how that incomparable gentleman had the curioſity to fiſh for coral near *Toulon*, (a noble port not far from *Marſeilles*) has among other things this paſſage: (*viz.*) The plants, which were plucked up and drawn out were neither red nor handſome till their bark was pulled off; in ſome parts they were ſoft, and would give way to the hand, as towards the tops, which being broken and ſqueezed, they ſent forth milk, like that of figs. I remember likewiſe, that the learned Jeſuit *Fournier*, who being alſo a French hydrographer, and one that writes of *Marſeilles* and *Toulon* as places very well known unto him, may be ſafely credited on this occaſion; after he has particularly deſcribed the way of fiſhing corals near *Toulon*, he adds; Theſe plants are neither red nor poliſhed, when they are drawn out of the water, till their rind have been taken off; nay, they are ſoft, and being broken or elſe ſqueezed betwixt the fingers, they throw out a kind of milk reſembling that of figs; and when one leaves off preſſing them, he may ſee the ſmall holes or pores, that harboured the milk, that was ſqueezed out. Thus far he. The credibleneſs of a good part of theſe narratives has been confirmed to me by a practiſer of phyſick in the *Eaſt-Indies*, who having made ſome ſtay at his return on the iſland of *Mehila* (near that of *Madagaſcar*) where ſtore of white coral is reported to grow, I inquired of him, whether he had gathered any, and whether he found it ſoft whilſt it was growing? and he anſwered me, that he had of late years divers times gathered coral upon the ſands of that iſland; and found it, when he gathered it, exceeding white, and (to uſe his expreſſion) as ſoft as an onion: adding, that though it would in a very ſhort time grow hard in the air, (which he aſcribed, how juſtly I know not, to the external heat of the ſun) yet it is very well known to the ſea-men, that deal in that ware, that if it be not gathered at a ſeaſonable time of the year, it will not keep long, but either crumble away or otherwiſe decay: which diſagrees not with the experienced *Piſo*, who in his natural hiſtory of *Braſil*, ſpeaking of ſome places of the *Braſilian* coaſt, where divers ſtony plants, ſome like little trees, ſome otherwiſe framed, may be ſeen in clear weather growing in the bottom of the ſea, tells us, that, *è fundo erutæ mox duriſſimæ, ſi inſolentur in littore, ſiccæ niveique coloris fiunt.* As remarkable a change is that I meet with in *Scaliger*, who tells us, as upon his own knowledge, of ſome, who at the urinary paſſages voided a ſlimy matter, which in the air coagulated into a firm ſubſtance. The ſtory being memorable, take it in his own words thus: *Ex bovillis oppidanus noſtris adjutus medicamentis eminxit vitrum ſane ex illa nobili Paxagoræ pituita, dum mingeretur albuminis mollitie emiſſum vitri duritie ac ſplendore, ſenatoris filius ejecit, puttis modo multos, & maximos: qui aëris contactu poſtea in gypſeam tum ſpeciem tum firmitatem concrevere; hic quoque nunc rectè valet.* Having likewiſe had the acquaintance of an inquiſitive merchant of *Dantzick*, and alſo of an ingenious chymiſt, that ſpent ſome time in that city and the neighbouring country, along whoſe coaſt our European amber is wont to be dragged out of the ſea; I inquired of them, whether they had never obſerved in amber a property like that which is reported of coral: and one of them, as I remember the other alſo, hath aſſured me upon his own particular obſervation, that lumps of amber are ſometimes taken ſoft out of the ſea, and grow hard in the air; which is the more credible to me, becauſe I have at a *Polonian* noble-man's ſeen (beſides other intercepted things) a whole ſpider, and that none of the leaſt, perfectly incloſed in a piece of hard and tranſparent yellow amber. And elſewhere I have ſeen ten or twelve (if I miſ-remember not the number) pieces of ſuch amber, which contained, one a fly, another a ſpider, a third a ſtraw, and each of the reſt ſome ſuch other thing. And it ſeems not impoſſible, that the contact of the external air may put the parts of ſuch ſmall bodies into a new motion, whereby ſome voluble corpuſcles, that hinder their reciprocal adheſion, may be excluded, and the

particles

particles themſelves preſſed or otherwiſe diſpoſed into a cloſer order. And we find, that ſome oil-colours, after they are brought to their due temper, may be preſerved very long in the ſame degree of ſoftneſs, if they and the ſhells, that contain them, be kept all the while under water, whereas in the air they would quickly change their texture, and become dry and hard.

BUT though in this laſt mentioned example, and ſome others, the removal of the body out of the water into the air ſeem manifeſtly to contribute to its growing hard, yet it ſeems not to us ſo eaſy to determine, what ſhare the air has in effecting ſuch indurations: for *Gaſſendus* relates of *Pierеſkius*, that he being wont in the ſummer time to waſh himſelf in one of the leſſer ſtreams of the river of *Rhône*, he there made the following obſervation. Once upon a time he felt the ground, which he had wont to find even and ſoft, to be grown hard with little round balls or bunches, like hard boiled eggs, when the ſhell is peeled off; at which wondering, he took ſome of them up, and carried them home, that he might ſhew them to his maſter, and demand of him the reaſon. But the miracle was increaſed, when a few days after returning to the river, he found thoſe litttle balls or lumps turned into perfect pebble ſtones, which he obſerved likewiſe to befall thoſe, which he had carried and laid up at home. But how far this ſtory will prove, that ſuch coagulations muſt be effected by a ſubſtantial form of a petrifying liquor, we define not; eſpecially ſince, not to repeat what we delivered already touching calcined marble out of *Fournier*, we have elſewhere delivered upon our own obſervation, that two or three ſpoonfuls of ſuch pap of burnt alabaſter, as we have lately been ſpeaking of, (and inſtead of which artificers uſe another ſtone called by them plaiſter of *Paris*, burnt and tempered up with fair water) did in the bottom of a veſſel-full of water, into which we poured it, in a ſhort time coagulate into a hard lump, notwithſtanding the water, that ſurrounded it; which, it ſeems, by the texture of the maſs, was kept out of its pores, as it is out of thoſe of the oils of cinnamon and cloves, which, though fluid bodies, and ſinking in water, ſuffer not its particles to inſinuate themſelves into theirs: and artificers obſerve, that the coagulating property of burnt alabaſter will be very much impaired, if not loſt, if the powder be kept too long, eſpecially in the open air, before it be made uſe of; and when it has been once tempered with water, and ſuffered to grow hard, they tell me they cannot by any burning or powdering of it again make it near ſo ſerviceable for their purpoſe as before; ſo much doth the coagulation of theſe powders mixed with water ſeem to depend upon their texture and other mechanical qualities.

Gaſſend. in vita Pireskii, Lib. 1.

I REMEMBER alſo, that though the bones found in the hearts of deer, and ſo magnified by phyſicians, do, in the air, acquire a hard and bony conſiſtence; yet having had the curioſity to conſider one of them in the heart of a deer newly killed, I found it there of a cartilaginous ſoftneſs and flexibility.

AND here I will adventure further to confeſs, that I have oftentimes doubted, whether or no, not only conſiſtent bodies, but ſome of the moſt ſolid ones in the world, may not have been fluid in the form either of ſteams or liquors, before their coalition and their concretion either into ſtones or other mineral bodies. I know there are many, who think, that ſtones, marchaſites, and other ſuch ſolid and durable bodies, were made together at the creation or other beginning of the univerſe, and who will not admit, that ſuch concretions can be now generated. But not here to debate that famous controverſy, whether ſtones may be ſaid to grow and to be nouriſhed, in the ſtrict ſenſe of thoſe expreſſions, I think it not difficult to ſhew, that ſuch parcels of matter are now to be met with in the form of ſtones, as did not before appear under that form; but whilſt it was divided into minute parts, either was it ſelf ſome fluid body or other, or at leaſt did as a material part concur to the conſtituting of one, that was ſo. Of this, beſides what we elſewhere deliver concerning it, we ſhall anon have occaſion to mention ſome proofs; and therefore we ſhall now only mention two or three inſtances. The firſt whereof ſhall be, that we ſaw, among the rarities of a perſon exceedingly curious of them, a ſtone flat on the outſides; on one of whoſe internal ſurfaces was moſt lively engraven the figure of a ſmall fiſh, with all the fins, ſcales, *&c.* which was affirmed to have been incloſed in the body of that ſtone, and to have been accidentally diſcovered, when the ſtone chancing to receive a rude knock upon its edge, ſplit aſunder. I remember alſo, that a while ſince a houſe-keeper of mine in the country informed me, that whilſt a little before he cauſed in my abſence one of my walls to be repaired, the maſon I was wont to employ caſually breaking a ſtone to make uſe of it about the building, found in it (to his wonder) a piece of wood, that ſeemed part of the branch of ſome tree, and conſequently afterwards incloſed with that ſolid caſe, wherein he found it. This cavity in the body of the ſtone, and, as I remember, the ſtick itſelf he took out of it, he forthwith brought my houſe-keeper, to whom I have given directions to ſend them me. For this example ſeems to me a more cogent proof of the increaſe of ſtones, than ſome others, that eminent naturaliſts much rely on, for reaſons diſcourſed of in another place*: where we alſo make particular mention of that ghur or metalline juice, which though the Latin writers of chymical, and even of metalline, matters have not, that I remember, given us any account of, yet I find a German or two, that were very converſant in the mines themſelves, to have in books written in their own language taken a ſpecial notice of it. Beſides, I have at preſent ſomething to deliver upon my own obſervation, which, unleſs we will ſuppoſe (what ſeems not probable) that there were from the beginning made together with and in the midſt

* In ſome of the Author's papers about the origin of minerals.

of great maſſes of one kind of mineral little parcels of another of a quite differing ſort, ſeems manifeſtly enough to argue, that either whole quarries of ſtone, or heavy and ſhining minerals, or both, may have been fluid bodies. The obſervation, whereon I ground this conjecture, is, not only, that we have met with in lead-ore, and alſo in *Minera Antimonii* particles of a white ſtone or ſpar environed with a metalline body, though I think I have yet by me ſuch lumps of ore; but chiefly, that I have, with my own hands, taken a hard and ponderous ſhining mineral, which I keep for a rarity, like a marchaſite, of the ſhape of a pear, and of about the bigneſs of a walnut, out of the very body of a ſtone, wherein I ſuſpected it to be incloſed, and which environed it on all ſides: and this I took not out of a ſmall and looſe ſtone, but a large ſtone digged out to make ſtatues of. And I remember, that one of thoſe, that wrought upon it, told me, that in faſhioning it into ſtatues they found ſome more minerals in the ſame parcel of ſtone, which were alſo preſented me. To which I ſhall add, that an ingenious ſtatuary having in another place taken much pains to ſaw aſunder a very large ſtone, when he came to the midſt of it, found he could ſaw on no further, and the ſtone being afterwards broken, he perceived, that that, which ſo obſtinately reſiſted his ſaws, was a round marchaſite, which he brought to me, as a lover of ſuch curioſities. But I made him for my further ſatisfaction bring me alſo that part of the ſtone, wherein the marchaſite ſtuck, and by comparing them together diſcerned, that as much of the ſtone, as was contiguous to the marchaſite, had a kind of ruſt about it, and fitted the marchaſite ſo cloſe, as if either the marchaſite had been formerly liquid, and had afterwards been as it were moulded in that receptacle, or the ſtone had been formerly of ſome ſoft or fluid matter, which did exactly accommodate it ſelf to the ſhape of the other body; or elſe, as if both the matter of the ſtone and that of the marchaſite had been at once fluid bodies, but had each of them preſerved its own ſurface diſtinct (according to what we formerly noted of differing fluids) till one of them (probably the marchaſite) firſt growing hard, the other, as being yet of a more yielding conſiſtence, accommodated it ſelf to the harder's figure.

BUT the moſt eminent inſtances to declare, how much the fluidity and firmneſs of bodies depend upon the contrivance and texture of their parts, are afforded us by thoſe waters, which being permitted to reſt a while, do ſpontaneouſly ceaſe to be fluid, and coagulate into ſtone it ſelf. There was lately an ingenious man, who going to viſit ſome leaden mines, wherein he had a ſhare, found in the mountain, in whoſe entrails they were hid, a cave, from whoſe arched roof there dropped down a petreſcent liquor, which oftentimes before it could fall to the ground congealed, and by appoſition of like matter increaſed ſo much, that they hung from the roof like icicles in a froſty-night from the ſides of a houſe; and of theſe he gathered and brought me divers, which are perfect ſtones hard and brittle, and of eight or ten inches long, and proportionably thick. Another ingenious friend of mine being lately in *France*, in the cave ſo famous for petrifying liquor to be there ſeen, obſerving ſome drops of water to congeal into ſtone, whilſt he ſtood by, took them away with him, and ſent them me in a letter. Nay, we ſhall ſcarce deny, that an external agent of almoſt inſenſible bulk may turn animal bodies into ſtony ones, by introducing a new texture into their parts, if we will, with ſome modern writers, believe *Aventinus*, who in his *Bavarian Hiſtory* has recorded, that at a time and place by him ſpecified, above forty countrymen, as alſo ſome milk-maids with their cows killed upon an earthquake, had their bodies by a terrene ſpirit turned into ſtatues, which, he ſays, were ſeen by the chancellor of *Auſtria* and himſelf. And ſome relations of this nature we meet with in other authors, which, if they be allowed of, ſeem much to confirm our doctrine; for in theſe ſtrange petrifications, the hardening of the bodies ſeems to be effected principally, if not only, as in the induration of the fluid ſubſtances of an egg into a chick, by altering the diſpoſition of their parts, ſince the petrifying wind or ſteam cannot be ſuppoſed to have any ſuch conſiderable (perhaps not any ſenſible) proportion as to bulk to the body changed by it, as to be thought to effect this change principally as an ingredient.

ADD we to all theſe things, that *Pamphilio Piacentino* is by another author quoted for writing an unparallelled ſtory, which becauſe written in Italian, I ſhall Engliſh the ſubſtance of it, which is this: 'That a woman in *Venice*, 'after having eaten an apple, was taken with 'hideous tortures, and in the ſpace of twenty-'four hours dying, was turned into exceeding 'hard ſtone; and this was judged to be the ef-'fect of the poiſoned apple ſhe had eaten.' Which narrative, if we may believe it as confidently as the famous alledger of it *Pamphilio* appears to do, would ſeem to argue, that even to the wonderful induration of bodies there is ſometimes no other principle requiſite, than what may reſult from the lucky mixture of the parts of ſeveral bodies. And leſt we ſhould ſeem to build altogether upon the obſervations of others, which cannot by us be now brought to ſtrict examination, we will have recourſe to a practicable experiment of our own trying, which, though we have elſewhere mentioned, we ſhall not ſcruple here to repeat, becauſe we there omitted to ſpeak of that circumſtance of it, which is the moſt pertinent to our preſent deſign.

TAKE then two ounces of quickſilver, two ounces and a half of the beſt verdigreaſe, about half an ounce or an ounce of common ſalt, a pint or pound of white-wine vinegar, and as much fair water; mingle the verdigreaſe, quickſilver, and the ſalt very well, and put the mixture with a little of the vinegar and water into a new frying-pan, (I tried it in a new earthen veſſel, but without good ſucceſs) in which fry it over the fire for divers hours, keeping it continually ſtirred, and putting in more vinegar

gar and water from time to time, as that already put in conſumes away: then take out the mixture, and in ſeveral clean waters waſh it carefully from the adhering ſalts; then dry away all the aqueous moiſture with a clean linen cloth, and you ſhall have a bright amalgama almoſt like quickſilver. Now that which is remarkable and to our preſent purpoſe in this experiment, is, that though this dried mixture be a good while after it is perfectly cold not only ſoft, but ſo near to fluid, that I have caſt it into moulds, and made imboſſed images of it, (when it has been dexterouſly made, but ſcarce otherwiſe;) I have found, that by laying it a few hours in the air, which ſeemed leſs cold than it ſelf, it has acquired ſuch a hardneſs, that being thrown againſt the floor it would rebound, and was brittle like overhardened ſteel. And yet in this example the induration of the amalgam appears not to proceed from an innate and inward principle, but from the new texture reſulting from the coalition of the mingled ingredients, that make up the amalgam, whoſe parts being variouſly moved, partly by the fire (and, perhaps too, by the ſalts) and partly by the native propenſity to motion of the mercurial corpuſcles, were by little and little, or by degrees, ſo diſpoſed, that whereas before touching one another but looſely, it was eaſy to thruſt ſome of them towards the middle of the body, without ſtirring much of the maſs (as to ſenſe) by this change of texture, the particles are brought to touch one another more cloſely and in greater portions of their ſurfaces, and to be ſo complicated, intangled, or otherwiſe connected among themſelves, that you cannot endeavour to thruſt one of them out of its place, but that its motion ſhall be reſiſted by many others, to whom it is ſo faſtened, that you cannot move one part of the maſs without either moving the whole with it, or manifeſtly breaking it off from the whole, and thereby deſtroying the continuity and unity of the body.

Now whereas, in ſetting down this experiment, we ſpoke as if ſeveral ingredients did concur to conſtitute the ſoft maſs, which afterwards grew ſo hard, we might very ſafely do ſo, ſince the quickſilver was not ſo barely changed in texture, as that formerly ſaid to have been coagulated by the meer fume of lead, but concealed in its ſelf a great number of metalline corpuſcles beſides others, as we made appear by ſeparating from the amalgam, meerly by the force of fire, a pretty quantity of true and perfect copper. That the ſalts alſo both were ingredients (though in ſmall proportion) of the maſs, and might have ſome operation upon the other particles, we may render probable by this, that having purpoſely expoſed ſome of this maſs for a pretty while to a moiſt air, we found, as we looked for, that the formerly inviſible particles of ſalt, that had ſo inſinuated themſelves into the amalgam, that all the water, wherein it was waſhed, did not ſeparate them from it, had ſo wrought upon the metalline particles, that were moſt outward, that they had in many parts of the ſurface of the maſs turned themſelves with it into a kind of verdigreaſe, which ſeemed almoſt to hide the ſurface of the concretion. And that in the more inward parts of a much harder body than our yielding amalgam, where cupreous particles abound, ſaline corpuſcles may have a great operation, may appear by certain ſorts of minerals to be found in ſome parts of *England*, and elſewhere, under the form of ſtones, of which they make vitriol: for theſe abounding with vitriolate, that is, both ſaline and metalline particles, will, after they are taken out of the ground, and laid in the open air, by the working of the inward ſalt, ſome ſooner and ſome later, ſwell and burſt aſunder, which could hardly come to paſs, without a great change made in the internal diſpoſition of the parts of ſuch ſtony concretions. And I remember, that having laid a mineral, of kin to theſe ſtones, a while in the air, though but in a chamber, I found its ſurface powdered with little grains of vitriol, as both their colour and their taſte informed me.

Now whether or no we ſuppoſe, that the fire did put the parts of the amalgama into any laſting agitation, yet the maſs being almoſt fluid after it was taken from the fire, its parts may, according to our notion of fluidity, be well ſuppoſed to have ſome kind of motion among themſelves; and it will not be denied, that the fire might concur with other things, to make that motion convenient to cauſe the parts to faſten themſelves to one another: for that the motion, wherein a ſoft and almoſt fluid body is once put, may poſſibly tend to harden it long after that motion ſeems to be extinct, may be made probable by what has been affirmed to me by eminent and experienced maſons, namely, that the beſt ſort of lime made into mortar will not have attained its utmoſt compactneſs till twenty-five or thirty years (perhaps not till three or fourſcore) after it has been imployed in building; and this is given me as one of the reaſons, why in the demoliſhing of antient fabricks, it is ſometimes more eaſy to break the ſtone than the mortar.

AND laſtly, that we alſo made mention of the texture reſulting from the mingled ingredients of our amalgam, we might juſtify by ſaying, that having changed the proportion of the quickſilver to the verdigreaſe, we found, that the amalgam coagulated much more ſlowly, and, when it was coagulated, was much leſs hard, than when one uſed the quantities above ſpecified.

HERE I ſhould put a period for the preſent to this diſcourſe, but that having in a late writer met with a notable obſervation of the natural induration of a ſoft body, I think it worthy to be here annexed; partly, becauſe the French book is not common, no more than the obſervation; and partly, that by conferring together this natural induration with that artificial one freſhly mentioned, it may the better appear, how nature and art have ſometimes reſembling operations in rendering bodies ſolid. My * author then (by name *Pierre Pelleprat*) being not long ſince ſent with ſome other Jeſuits

* *Relation des Miſſions des P. P. J. J.* Part. II. Cap. 1.

ſuits upon the laudable errand of preaching the goſpel to the Indians of the Southern *America*, has among other things this paſſage in the ſhort relation he makes of the American continent: 'There is (ſays he) one thing wor-'thy of obſervation near the mouth of this 'great river, (he ſpeaks of that of the Ama-'zons) which is, that men find there a kind of 'green clay, that is ſoft as long as it is in the 'water, ſo that one may print on it all kind 'of figures, and give it what ſhape one pleaſes; 'but when it is expoſed to the air, it hardens 'to that degree, that diamonds are not much 'harder than the ſtones it affords.——I have '(adds he) ſeen hatchets made of this clay, 'which the ſavages employed to cut wood 'with, when they had not the uſe of ours, '*&c.*'

AND now at laſt, I ſee it is time to put a period to a diſcourſe, that has been unawares lengthened far too much already: but yet I think you will eaſily pardon me, if I conclude it not abruptly; but with the recital of an experiment, which having had the honour to be ſeen, as to the main part of it, by an illuſtrious meeting of curious men, their having been pleaſed to ſpeak very advantageouſly of it to others excited a curioſity among them, to know by what artifice effects, that were ſo uncommon, had been produced. The ſcope therefore, and the manner of making the experiment, were in ſhort as follows.

BEING deſirous to ſhew, how much fluidity and firmneſs may depend upon the texture and upon the motion or reſt of the inſenſible parts of bodies, I firſt make with good ſpirit of vinegar, a ſolution of coral ſo ſtrong, that when it is filtrated and cooled, it will commonly, after ſome time, begin to have a kind of ſediment at the bottom; the clear liquor I gently pour off, when the experiment is to be made, and to this I put a convenient proportion of very well dephlegmed ſpirit of wine, which, if it be poured on very ſlowly and warily, may be made for a pretty while to ſwim upon it in the form of a diſtinct liquor: but if by a few ſhakes I mingle them together, they will preſently unite into a concretion, of which, when the experiment ſucceeds very well (as it did when I ſhewed it to the above-mentioned aſſembly) not one drop will fall to the ground, upon turning up the wide-mouth'd glaſs it ſhould be made in, and holding it with the mouth directly downwards.

AND this ſo haſtily-produced conſiſtence may be durable enough, if it be carefully looked to: but to diſpatch the whole experiment in a ſhort time, I take a little ſtrong ſpirit of nitre (which perhaps is not needful if good aqua fortis be at hand) and putting about an equal, or other convenient quantity of it to this mixture, I nimbly ſtir it and the ſpirit together: whereupon the whole is reduced in a very few minutes to a tranſparent liquor.

N. B. THOUGH I have divers times made and ſhewn this experiment, yet there are ſo many circumſtances requiſite to make the firſt part of it ſucceed very well, (for to make it ſucceed in ſome meaſure is not ſo difficult) that the event has ſometimes deceived me, in ſpite of the ſeveral trials I have made. Wherefore it will not be amiſs to intimate,

FIRST, That one of the firſt times, if not the firſt, I made ſuch an odd concretion, was, with the ſolution not made with ſpirit of vinegar, but with ſpirit of verdigreaſe: (which I commonly diſtil without additament) though afterwards I was invited to prefer ſtrong ſpirit of vinegar, which was the liquor, wherewith the recited experiment was exhibited.

SECONDLY, That it often happens, that if the ſolution of coral (which is not the only body wherewith I have made ſuch trials with indifferent good ſucceſs) be not ſufficiently ſtrong and impregnated with ſaline parts, or the ſpirit of wine be not ſufficiently rectified, the ſhaking of the two liquors will not change the conſiſtence of the whole mixture, but leaves ſome part of it fluid; or elſe the concretion will not begin preſently to be made, but require to be waited for a while.

THIRDLY, That I once at leaſt (if not oftener) obſerved, that when by mingling the two liquors and ſhaking them in a narrow-mouthed glaſs, whoſe orifice was ſtopped, they would not concoagulate (as it was confidently expected they ſhould) yet by trying the experiment in a wide-mouthed glaſs, to which the air had free acceſs, it ſucceeded to my content.

FOURTHLY, That in the reduction of the concretion to a fluid body, it is not proper to employ in ſtirring it a knife or any other metalline body except it be of gold; but rather ſome ſtick of glaſs, or at leaſt ſome clean ſtick of wood, leſt the menſtruum ſhould corrode it, and thereby ſpoil, or at leaſt blemiſh the experiment.

FIFTHLY, that the proportion betwixt the coralline ſolution and the ſpirit of wine depends ſo much upon the ſtrength of the former liquor, and the dephlegmedneſs of the latter, that it is ſcarce poſſible to determine generally and exactly, what quantity of each ought to be taken; and therefore a trial or two made with a little of the particular ſolution you intend to employ (for ſome ſolutions require more, others leſs ſpirit of wine to concoagulate adequately with them) will better direct you, what proportion of ſpirit will ſuit that particular parcel of liquor, than any general rule I can propoſe.

I KNOW I might here, and perhaps it may be expected, that I ſhould take an occaſion to treat alſo of hardneſs, ſoftneſs, brittleneſs, toughneſs, ſtiffneſs, and thoſe other qualities, that are of kin to fluidity and firmneſs; but though I confeſs, I once had thoughts of writing a kind of hiſtory of more qualities than thoſe, yet remembering that wiſe counſel given us by one of the ancients, *Noſcenda eſt menſura ſui*, I am now very well content, after having already tired my ſelf and, I fear, you, to recommend ſo uſeful but difficult a work to perſons more able and more at leiſure, than I find my ſelf, to go through with ſo great an undertaking; contenting my ſelf at preſent, to have attempted in what has been delivered concerning a couple of qualities of ſuch extent, that every ſenſibly big body in the univerſe ſeems indowed with

one or other of them (I mean concerning fluidity and firmneſs) the explicating of qualities ſomewhat more intelligibly than is wont to be done in the Peripatetick ſchools, and to have opened a way (which I hope many will tread) of applying chymical obſervations and experiments to the deduction of thoſe effects of qualities from ſuch general and obvious affections of matter; as bigneſs, motion, and figure, which even the hermetical writers have hitherto contented themſelves to refer to ſalt, ſulphur, mercury, and the like: the chymical notion of which three principles, though of very good uſe in ſome other (eſpecially of the more practical) parts of phyſiology, ſeems not as yet to have brought any great light to ſuch matters as we have been treating of, having been hitherto directed not ſo much to the indagation of cauſes, as to the production of effects.

OF ABSOLUTE REST IN BODIES.

An Advertiſement.

SINCE it hath not been thought amiſs, that ſomething ſhould be intimated to the reader about the occaſion of the enſuing tract, I ſhall acquaint him, with it as briefly as I can, by telling him, that it was this. Some very ingenious gentlemen happening to meet as viſitants at the author's lodgings, fell accidentally into a diſcourſe about the abſolute reſt ſuppoſed to be in many bodies, that ſeemed to have its riſe from a miſtake of the true meaning of a paſſage or two in the *Hiſtory of Fluidity and Firmneſs*, (that was then reprinting.) But the conference chancing to have a period put to it, whilſt ſeveral things pertinent to the author's purpoſe remained yet unſaid; the curiouſneſs of the ſubject invited him to draw up (haſtily enough) the ſum of what he had ſaid, and might further have ſaid, if opportunity had ſerved, about the point in debate, for the further ſatisfaction of an inquiſitive virtuoſo, that was preſent at it. And this was the riſe of the following diſcourſe, which being written on an occaſion adminiſtered by the *Hiſtory of Fluidity and Firmneſs*, whereof a new edition was ready to come abroad; it was thought not improper, that this tract ſhould attend it, as a kind of Appendix, without the firſt and laſt part of a letter, whereof the body only is neceſſary to the deſign of it.

An ESSAY of the inteſtine Motions of the particles of quieſcent Solids:

Where the abſolute Reſt of Bodies is called in queſtion.

SECT. I.

TO remove the doubt or ſcruple, that began to be diſcourſed of juſt before we laſt parted, I ſhall need to do little more than enlarge the particulars, which (you know) I had then time but briefly to make mention of. For the ſtate of the queſtion was (as you may remember) this, *Whether there be among bodies any abſolute reſt?* On which occaſion I anſwered, that reſt being a word, that to me ſeemed ſomewhat ambiguous, I thought it was requiſite to clear the ſenſe of the queſtion, before I offered at anſwering it.

FOR the word reſt, when we ſpeak of diſtinct maſſes of matter, looked upon as quieſcent, does in the vulgar acception of the term ſignify, ſuch a ſtate of a viſible and entire body, or (rather) of the corpuſcles it conſiſts of, that they are actually unmoved as to ſight; the eye (and perhaps not the touch) being not able to diſcern any local motion in them.

CONSONANTLY to this firſt member of the diſtinction of the word *reſt*, I briefly intimated to the company, that in this ſenſe of a corpuſcle's being at reſt, I thought it manifeſt, that there is ſuch a thing *in rerum natura*; ſince without granting ſuch a reſt in the component particles of ſome kind of bodies, as diamonds, iron, porphyry, *&c.* it will be (I conceive) very hard to explain, how there can be ſuch ſolid maſſes (as thoſe minerals are) made up of ſmall and ſeparable particles. Which being ſaid, I added, that I ſaw no reaſon, why ſuch a kind of firmneſs, where the inward motion of the inſenſible particles is almoſt infinitely ſlow, may not ſuffice to give an account of as great a firmneſs as

we uſe really to find among conſiſtent bodies.

BUT whereas I had intimated to the company, by the lately begun diſtinction, that beſides this popular ſenſe of the word reſt, there was a ſecond more rigid and philoſophical notion, or kind of reſt, which for diſtinction-ſake may be called abſolute or perfect reſt, which imports a continuance of a body in the ſame place *preciſely*, and includes an abſolute negation of all local motion, though never ſo ſlow or imperceptible; I told them, that in this rigid ſenſe of the word reſt, I durſt not affirm, that there are any bodies at reſt in the univerſe (at leaſt for any long time) but willingly allowed it to be made a problem, whether there be any or no; adding, that perhaps I inclined to the negative part of the queſtion.

HAVING thus hiſtorically ſummed up what paſſed betwixt us about the ſtate of the controverſy, I need not tell you, that the doubt I expreſſed was thought to reliſh too much of a paradox; and therefore ſince the company's quick ſeparation allowed me then no opportunity of enlarging, and ſince I promiſed no better arguments, than might be expected in a point, that I propoſed but as problematical; I ſhall now endeavour to ſhew you, that the ſide of the problem I was judged inclined to, is (at leaſt) not ſo improbable as ſome thought it.

TO prove negatives directly, being wont (as you well know) to be no eaſy taſk, and eſpecially in ſuch caſes as this; you will not, I preſume, expect, that I ſhould attempt the proving of my conjecture otherwiſe than by ſhewing poſitively, that ſome of thoſe bodies, which we think to have their parts moſt at reſt, are not exempted from having inteſtine motions in them; ſince it will be conſequent to ſuch a proof, that it muſt be probable, that in other bodies, whoſe ſolidity is confeſſed to be inferiour, the component particles are not in a ſtate of perfect reſt.

SECT. II.

IF it were neceſſary and expedient, I ſhould begin my arguments by ſaying ſomething againſt abſolute reſt, in favour of the contrary opinion, by arguing *à priori*, as they ſpeak, from the conſtitution of the world, whether we conſider it according to the Epicurean or the Carteſian hypotheſis of the origin of things. For the Epicureans ſuppoſing this world to be produced by the caſual concourſe of atoms, and aſcribing to every particular atom an innate and unloſeable mobility, or, rather, an actual motion, or a reſtleſs endeavour after it; it is conſonant to think, that though in concretions they ſo entangle one another, that they cannot in a ſhort time, or a viſible manner clear themſelves from one another, yet they do inceſſantly ſtrive to diſ-entangle themſelves and get away: by which means there are always in the atoms even of ſolid bodies actual endeavours of each of the diſtinct atoms to extricate it ſelf from the reſt; (which endeavours uſually at laſt ſucceed, whence comes the decay and deſtruction of bodies:) and in the mean while theſe perpetual and contrary endeavours produce inteſtine commotions in the internal parts of the body, wherein theſe atoms were impriſoned.

ON the other ſide, according to the Carteſian doctrine, the *materia ſubtilis*, that conſtantly paſſes like a ſtream through the pores even of the ſolideſt bodies, may well be ſuppoſed in its paſſage to be continually ſhaking, or otherwiſe agitating the inſenſible particles, that make up the body, that ſeems to be at reſt, without diſcovering their motion to the eye: as when in ſummer-time (to explain my ſelf by a compariſon) a gentle breath of wind paſſes through a grove removed a pretty way off from the ſpectator, though his eye diſcern no change in the grove he looks on, yet the wind, as it blows through the trees, will ſhake ſome of the branches as well as the flexible twigs; and not only blow the leaves into various poſtures, but blow ſome of them quite away.

I MIGHT eaſily enlarge on this ſubject, but having elſewhere done it on another occaſion, I think it may be now more proper to ſatisfy ſome of the company, who are yet entangled with the ſame prejudice with many other very learned men, who look upon it as a precarious and chimerical fancy of the Atomiſts, to imagine, that in ſolid, and, as to ſenſe, quieſcent bodies, there ſhould be any inteſtine motion of the component particles, neither the motions nor the corpuſcles themſelves being to be ſeen, and both of them being therefore as well incredible as inviſible.

A SOLEMN debate of the whole queſtion about the minuteneſs of atoms belongs not to this place, where it may ſuffice to anſwer the objection.

SECT. III.

AND firſt, as I have elſewhere hinted, it may appear by divers of the phænomena above-cited, (in the *Hiſtory of Fluidity*) that when water and ſeveral other liquors ſeem to be continued maſſes of matter, and to be as much at reſt, as the very glaſſes, that contain them; their conſtituent corpuſcles are in an actual and various, though ſlow and unperceived, motion.

NEXT, that there may be likewiſe ſuch a motion in the minute parts of ſilver and iron themſelves, may be eaſily argued, by heating thoſe metals, till they come to be almoſt red hot: for then, though the eye can diſcern no motion of the corpuſcles thoſe metals conſiſt of, yet their being able to burn thoſe, that hold them in their naked hands, ſhews, that their briſk motions may be diſcovered by the help of the touch; and if you ſpit upon them, the liquor will boil, as if it were over the fire. And leſt it ſhould be objected, that ſo anomalous and violent an agent as the fire is neceſſary to theſe trials, I ſhall add, that, provided the minute parts be ſufficiently agitated, it matters not, whether the motion be produced by fire or no: for by the nimbly hammering of iron or ſilver, you may put the minute parts into ſuch a motion, as will make the metal very hot to the touch, and being communicated to ſpittle or water, will excite bubbles, and ſcatter the diſſipated parts of that liquor into the air, in the form of ſmoke or vapours;

pours: nay, I elſewhere ſhew, how I have eaſily excited a very ſenſible, though not a viſible agitation, and heat in the internal parts of a metal, barely by my naked hands, without any external inſtrument whatſoever.

And whereas it may be objected, that though the motion already generated is unſeen, yet we may diſcern a change of the component corpuſcles of a body, which are in the act of altering its texture, and introducing a new alteration or quality in the body to be wrought on, or deſtroying ſome pre-exiſtent quality: I briefly anſwer (for I would not here repeat what I have elſewhere ſaid of this point) by this clear experiment, that though your eye can diſcern no change in the outward and viſible, much leſs in the more latent and internal corpuſcles of iron; a vigorous loadſtone, by paſſing along its axis from one pole of the ſtone to the other, and back again, yet the texture of the iron is by that action of the loadſtone ſo changed, that it acquires, and then loſes thoſe admirable qualities we call the attractive and directive virtue or faculty peculiar to magnetical bodies.

And to ſhew you, that the inviſible motions even of metalline bodies may be quick and briſk enough, and may be ſenſible, though not viſible; we ſhall need to conſider but the ſtate of a good bell ſo long after the clapper has ſtruck it, that no ſhaking or other motion is to be ſeen in the body of the bell it ſelf, and yet it cauſes in the air an odd kind of ringing, or, if I may ſo call it, undulating ſound or motion, which will ſometimes laſt a conſiderable while; and if the bell be fitted for ſharp notes, it will not be without a ſhrilneſs: for if ſounds proceed, as is elſewhere made probable, from the nimble percuſſions of the air put into a quick and waving motion by ſonorous bodies. this acuteneſs of ſound will ſhew, that whilſt to the eye the bell ſeems to be at reſt, yet the minute parts of it continue in a very briſk motion, without which they could not ſtrike the air ſtrongly, and faſt enough, to make it produce ſo ſhrill a noiſe in the ear.

But, I confeſs to you, that my thoughts preſent me a difficulty, which, though un-mentioned at our meeting, may afford an objection, perhaps more difficult than any of (not to ſay all) the foregoing; namely, that it is ſcarce imaginable, how ſuch ſolid and hard bodies ſhould have their internal parts wrought upon by ſuch ſlight agents as the air, and perhaps ſome yet minuter matter, that is diſperſed in it; and how it is poſſible, that where there is an actual motion, it ſhould be ſo ſlow, that a corpuſcle of iron, for inſtance, ſeated in the internal part of a magnetick needle, ſhould ſpend ſo long time, as our conjecture requires, in travelling ſo little a ſpace as from thence to the next ſuperficies of the needle. But to this double objection, though ſome inſtances, which you will meet with in the following part of this paper, may be properly applied to ſolve it; yet not to make your curioſity wait, I will here ſpeak a word or two to each of the members of the objection.

SECT. IV.

And to the firſt, I ſay, that theſe inteſtine motions of the corpuſcles of hard bodies need not be ſolely, nor perhaps principally aſcribed to thoſe obvious external agents, to which we are wont to refer them, ſince theſe may but excite or aſſiſt the more principal or internal cauſes of the motions we ſpeak of, as you may gather from what was but lately mentioned of the connate and unlooſeable mobility of the atoms, according to *Epicurus*, and the permeation of the moſt ſolid bodies by the Carteſian *materia ſubtilis*; and we may ſee by the ſudden effects of the loadſtone, in endowing ſteel with magnetick qualities, and depriving it of them again, (both which ſuppoſe the intervention of a change of texture, and this a production of local motion in the metal) that very minute and inſenſible corpuſcles of matter are not uncapable of effecting durable changes in the ſolideſt bodies.

And as for the other member of the objection, I confeſs it is not eaſy for us, who are wont (perhaps too much) to follow our eyes for guides in judging of things corporeal, and to deny exiſtence to moſt things, whereto nature has denied a viſible bulk: it is not eaſy, I ſay, for us to imagine ſo great a ſlowneſs, as it is very poſſible for nature to make uſe of her operations, though our not being able to diſcern the motion of a ſhadow of a dial-plate, or that of the index upon a clock or watch, ought to make us ſenſible of the incompetency of our eyes to diſcern ſome motions of natural bodies, which reaſon tells us ought to be incomparably ſlower than theſe. But not now to diſpute about the exiſtence and attributes of infinite ſlowneſs, or at leaſt a ſlowneſs in the next poſſible degree to infinite; I conſider, that it has not, that I know of, been demonſtrated, nor attempted to be ſo; that the motion of the corpuſcles, for example, of the needle above-mentioned, muſt be made in a direct line from the place, where it was firſt ſuppoſed to be, to the ſuperficies of the needle; for it ſeems more rational, and to agree better with the phænomena, to ſuppoſe, that the way of this corpuſcle in the body it would quit is extremely crooked and intricate (almoſt like that of a ſquib in the air, or on the ground) for it being on the one hand urged on by the cauſes, whatever they be, that make it ſtrive to fly away, and on the other hand hindered by the corpuſcles, whereto it is connected, and by the occurſions of other corpuſcles, whoſe motions may be oppoſite to, or diſagreeing with thoſe of our deſigned corpuſcle; it may probably, before it can extricate it ſelf, be reduced to encounter and wreſtle, as it were, with many other corpuſcles, and be by them ſometimes thruſt or impelled to the right-hand and to the left, and ſometimes alſo repelled inwards, even after it is come to the ſuperficial part of the needle, whence it may not preſently have the the liberty to fly away, but may be drawn back by ſome other corpuſcle, wherewith it is yet connected, and which happening to be it ſelf thruſt inward, may draw after it, and ſo entangle

tangle again our almoſt diſbanded corpuſcle: beſides that the gravity of the component particles of a body is oftentimes ſuch, that it is eaſier for the agent, that puts them in motion, to continue them in that ſlow motion among themſelves, than drive them up into ſo light a medium as the air; as experience ſhews in thoſe bodies, that are called fixed, as gold, and glaſs, though in actual fuſion.

BUT I forget, that I promiſed you to decline ſpeculations, and therefore I ſhall only name to you a couple of inſtances, which will ſerve to confirm both what I was lately ſaying, and what I am now in proving.

SECT. V.

THE firſt of theſe I ſhall take from what is uſually granted as matter of fact; namely, that if a ſpring, though made of ſo hard a body as ſteel, be forcibly bent, and kept but a moderate while in that poſture, as ſoon as the force, that kept it bent, is removed, it will again return to its former figure; but if it be kept too long in that forced poſition, it will by degrees loſe that, which they call the motion of reſtitution, and retain its new crooked figure, though the force, that bent it, be removed; which ſhews both the power of ſome of the more familiar agents in nature, and (which is that, the ſhewing whereof I here chiefly aim at,) that where there is a continued endeavour of the parts of a body, to put themſelves into another ſtate, yet the motion, or rather the progreſs may be much more ſlow, than men ſeem as yet to have taken notice of, ſince it was a great while before the texture of the corpuſcles of the ſteel were ſo altered, as to make them loſe their former ſpringineſs.

BUT I will ſecond this with a more illuſtrious experiment, which will at once confirm what I have juſt now ſaid, and ſhew, that the air or the inviſible corpuſcles harboured in it may have no inconſiderable power to act upon, and effect changes in the ſolideſt bodies,

TO this purpoſe I ſhall only obſerve to you, that though if a bar of iron having one of its ends held perpendicularly, and at a fit diſtance, to the lily or north-point of the mariner's-compaſs, (I mean that, which points towards the north) it will, as I elſewhere mention, drive it away towards the eaſt or weſt: and if this ſame lower end of the bar of iron be put into a contrary poſture, it will preſently loſe its temporary magnetiſm, as I elſewhere declare. Yet, if this bar be very long kept upright in a window or other convenient place, then, as ſome late magnetical writers will tell you, it will have acquired a conſtant and durable magnetick power. Which is a phænomenon, that makes exceedingly for our preſent purpoſe, ſince it hence appears, both that the air, together with the magnetical effluvia of the earth, that it receives in its pores, is able without outward force to work durable changes in ſo ſolid a body as iron, and that the motions of the internal parts, (for theſe are requiſite to the change of the metal's texture,) are performed with a wonderful ſlowneſs, ſince the bar muſt be very long expoſed to the air, perhaps before it acquires any durable magnetiſm at all, but at leaſt before it acquires ſo vigorous and fixed a magnetiſm, as by this means it may attain to.

BUT, becauſe moſt of the inſtances to be propoſed in the following part of this eſſay may ſerve for confirmations of what we have been diſcourſing, I ſhall proceed to them; yet not till I have advertiſed you, that I purpoſely decline to mention divers phænomena, that may even by learned men be thought fit examples on this occaſion, (ſuch as the nutrition, growth, and waſting of animals and vegetables) becauſe ſuch bodies receiving conſtant ſupplies of corpuſcles, of ſeveral, and often unknown, natures, there may be difficulties ſuggeſted about them, not eaſy to be cleared without longer diſcourſes, than I can allow this eſſay.

SECT. VI.

THE firſt inſtance then, that I ſhall mention about vegetable ſubſtances, ſhall be taken from *lignum vitæ*, or *guaiacum*, (for many artificers give them the ſame name, and uſe them promiſcuouſly for the ſame purpoſes;) of which, though it ſeem to be the ſolideſt wood we know, (inſomuch, that I as well as ſome others have ordinarily uſed it to pound ſolid bodies in) yet the ſkilfulleſt tradeſmen I have met with, have upon my inquiry informed me, that if it be wrought, before it be well ſeaſoned by length of time, it will ſhew itſelf very frangible; which an eminent turner told me he had often found to his loſs: for having turned divers fine pieces of work of *lignum vitæ*, before it was duly ſeaſoned, he found almoſt all of them by the heat of the ſun (which the uſes of many of them required they ſhould ſometimes be expoſed to) crack, and cleave aſunder, into I know not how many parts; whereby thoſe fine pieces of workmanſhip were quite ſpoiled. And I remember, that having inquired of an old experienced tradeſman, of whom I bought an excellent mortar of *lignum vitæ*, how long he had kept the wood in ſeaſoning before I had the mortar, he anſwered me (if I much miſ-remember not) twenty years, under which time it is not fully ſeaſoned for ſome purpoſes; of which opinion of his having occaſionally ſpoken to the lately-mentioned turner, this experienced workman much confirmed me in it; as he likewiſe did in an obſervation I not long ſince made about the ſlow and unperceived motion, that may be, not only in the more looſe and fugitive aqueous parts of *lignum vitæ*, but in far more unlikely ones. For he told me, that he had often found, in turning that wood, cavities of ſeveral ſizes in the very inward and ſolid part of the wood (which every way encompaſſed them) and in thoſe cavities conſiderable quantities of a certain gum, much cried up by ſome for an anti-venereal medicine.

THE uſe I would make of theſe examples is this, that ſince ſo ſolid a body as a trunk of *lignum vitæ* is, when the tree is newly felled, may require ſo long a time as twenty years, or upwards, to be ſeaſoned, *i. e.* brought to its full

full compactneſs and toughneſs: and ſince the account, upon which time ſeaſons wood, ſeems to be this, that by degrees the looſer aqueous, and more fugitive parts exhale into the air, whereby the remaining ſolid ones are brought into a cloſer order, and have leiſure to be ſo placed among themſelves, as is moſt convenient to make their texture firm and durable; it will follow, that even in the internal parts of this ſolid wood there muſt be, not only in the looſer and lighter corpuſcles, that extricate themſelves, and exhale away, a true local motion, though much too ſlow to fall immediately under the diſcernment of our ſenſes. And, if the lately mentioned gum be either totally, or ſo much as in part generated, as to ſenſe, after the felling of the tree, as ſome analogous inſtances, that I have elſewhere taken notice of, make it probable; then the example will further be conſiderable to our preſent purpoſe, by ſhewing, that a ſubſtance ſo groſs, and ſo little volatile in compariſon of the aqueous parts, as is the brittle gum I ſpeak of, may permeate, to a great thickneſs, a very ſolid and inanimate ſubſtance; which cannot be done without an inteſtine, though inſenſible motion among the parts of the wood, and probably a marvellouſly ſlow motion of thoſe of the gum.

SECT. VII.

BUT it will poſſibly ſeem more ſtrange, that very thin pieces of wood, and thoſe ſawed off from a tree of a much looſer texture, ſhould be much longer in ſeaſoning, than that ſolid and ponderous wood we have been ſpeaking of. And indeed this diſcovery is not to be made, as in *lignum vitæ*, by the brittleneſs, or other obvious qualities in the wood, but by a ſubtiler way: and accordingly having purpoſely conſulted with the makers of muſical inſtruments, and with ſome ancient muſicians, I was much confirmed by them in my opinion: and I remember, the laſt maker of viols, lutes, &c. of whom I inquired of what age he thought ſuch inſtruments, eſpecially lutes, ought to be, to attain their full and beſt ſeaſoning for ſonorouſneſs; he replied, that in ſome of them twenty years would be requiſite, in others forty, according to the nature and thickneſs of the wood, and other circumſtances. But an ancient muſician, that was preſent at what was ſaid, informed me, that there were ſome famous lutes, one or two of which he named to me, that attained not their full ſeaſoning and beſt reſonance, till they were about fourſcore year old. And thus much for inanimate vegetable ſubſtances.

SECT. VIII.

As for calcined ſtones made up into lime, and ſorts of raw ſtones, I have already obſerved from the credible relations of maſons and others, that the walls in ſome buildings attain not their hardneſs and ſolidity, till they are forty years old, or perhaps much ancienter; and ſince in gradually proceeding to this degree of ſolidity, theſe walls reſemble the ſeaſoning of *lignum vitæ* formerly explicated, the motion of the internal parts may be argued from the change of texture as well in theſe as in that.

AND, if I would rob other tracts (to which they more properly belong) I could here eaſily add ſome ſuch inſtances of the hardening and ſoftening of ſtones by time, as would much confirm what I have now been delivering; but I ſhall rather chuſe to confine myſelf here to the two examples following, not taken notice of in quarries or by maſons.

THE firſt is, that there are marchaſites, conſiſting as well of a ſtony as of a metalline ſubſtance, which, though harder than many other ſorts of ſtones, and even than marble, have yet ſo great a motion in their internal parts, that if they be expoſed to the air, not only they will have a vitriolate efflorescence, if I may ſo ſpeak, on their ſuperficies (as I have obſerved in divers other marchaſites) but they will in tract of time burſt the ſtone in pieces; of which ſort I had ſome time ſince, and I hope I have yet a bulky marchaſite, that I procured from a virtuoſo, that lives juſt by a vitriol-work, whither theſe among other vitriol-ſtones are brought, and where this ſtone being choſen for its largeneſs, was taken up, and carefully kept by that ingenious perſon, till it burſt of itſelf, and till I ſent for it. And to ſatisfy myſelf a little further, that the internal parts of marchaſites may be as well diſpoſed to be vitriolated as the external; I remember I broke a hard marchaſite, that I had from another place, and laying it ſome ſhort time in a chamber-window, I found the new ſuperficies made by the fracture about the middle of the ſtone to have acquired an efflorescence of a vitriolate nature.

THE other inſtance, which is very odd, and much talked of, is this: an ingenious gentleman of my acquaintance, caſually meeting me one day, told me, that he had a turquois-ſtone, which, if he were not miſtaken, had a wonderful property; for there being in it ſeveral ſpots of colours differing from the reſt of the gem, theſe ſpots ſeemed, though very ſlowly, to move from one part of the ſtone to the other. And this he thought himſelf to have taken notice of for very many months, (perhaps a couple of years.) This relation ſeemed ſo ſtrange, that the relator was not at all ſurprized, when to aſcertain my ſelf of the truth of it, I deſired to have the ring, this ſtone was ſet in, for a while in my own keeping; to which he readily aſſenting, beſides that I took very heedful notice of the ſituation of the ſpots, I employed a very ingenious youth, that then lived with me, and was ſkilled in drawing, to make the picture of the ſtone with the ſpots as they were then placed, and afterwards to have a watchful eye upon it, and from time to time (as once perhaps in two or three weeks) to draw a new picture of them; by comparing of ſeveral of which pictures, it was unanimouſly concluded, that the ſpots did ſhift places in the turquois, as if the matter they conſiſted of made its way through the ſubſtance of the ſtone; as we lately noted, that the gum of *lignum vitæ* ſeemed to do through the ſubſtance of the wood. And as far as we obſerved, the motion of theſe ſpots was exceeding

ceeding ſlow and irregular, though perhaps it might have been reduced to a ſomewhat leſs uncertainty, were it not, that by an unwelcome accident we were deprived of the opportunity of continuing our obſervations long enough. And this brings into my mind, that the turquois being a ſtone, of which I had met ſtrange ſtories in good authors, I once aſked ſeveral queſtions about it of a noted jeweller; and inquiring, among other particulars, whether he had not obſerved ſome changes, that ſeemed ſpontaneous in the ſubſtance or colour of the ſtone? he replied, that in ſome few turquoiſes he had obſerved two differing blues in differing parts of the ſame ſtone, and that one of thoſe colours would by ſlow and unperceived degrees invade, and at length overſpread that part of the ſtone, which the other colour poſſeſſed before. I ſhall here add, that the ſame gentleman, that lent me the ſpotted turquois, ſhewed me afterward an agate haft of a knife, where was a certain cloud, which he told me an ingenious perſon had for ſome years obſerved to remove to and fro in the ſtone, and had a while ſince, to convince the relator, lent him the agate, of whoſe phænomena he promiſed me an account, when he ſhall have had the ſtone in his cuſtody for a competent time; till the expiration of which, it may ſuffice to have ſaid of this agate what I have now related.

SECT. IX.

BUT becauſe that diamonds and glaſs are generally looked upon, eſpecially by chymiſts, as bodies of the cloſeſt and firmeſt texture, that nature and art afford, if we could ſhew an inteſtine motion even in the parts of theſe, fitter inſtances for our purpoſe could not in reaſon be deſired; I ſhall venture to ſay ſomething of each of them, though what I have to ſay about diamonds, is propoſed rather to ground a ſuſpicion of what may be, than a demonſtration, that it muſt be.

IN the firſt place then, to remove that prejudice, that may be entertained from the incomparable hardneſs of diamonds (which I confeſs experience has made me admire) as if bodies ſo hard and ſolid could not have their parts put into motion but by ſome extraordinary, not to ſay, prodigious force; I ſhall only repeat here, what I have elſewhere ſhewn, that diamonds are bodies, that eaſily enough become actually electrical, and that ſome diamonds (of which ſort I have a ſmall one by me) will by rubbing upon a cloath be brought to ſhine in the dark; the quiſt of both theſe tranſient qualities requiring a change of texture even in the internal parts; and the friction that produces that change, doing it immediately by putting the parts of the ſtone into local motion, it may be thence argued, that a very moderate force may ſuffice to beget an internal motion in the inward particles of diamonds themſelves.

AND I am not ſure, but that more hidden agents may make impreſſions upon theſe hardeſt bodies. For in a ring, that I am wont to wear on my little finger, which has no diamond, ſave one more than that ſhining one I lately mentioned, I have, I know not how often, ſeemed to my ſelf to obſerve a manifeſtly greater clearneſs and ſparklingneſs at ſome times than at others, though I could not refer it to the clearneſs or dulneſs of the weather, the moiſture or dryneſs of the air, the ſuperficial clearneſs or foulneſs of the ſtone, or any other manifeſt cauſe I could think of. And in this I was the more inclined to think I might not be miſtaken, becauſe, beſides that the notice I took of it, was frequent, I have by me a rough diamond juſt as it came from the rock, in whoſe electrical faculty I have taken notice of changes as to the degree of ſtrength, wherewith it attracted, and that within the compaſs of a very little time, though I could not find any cauſe, whereto I could refer ſo ſurprizing a phænomenon. And I muſt not here omit, that chancing one day to ſhew the newly mentioned diamond ring to a very ingenious lady, that uſed to wear in rings and bracelets ſtore of thoſe gems, and telling her what changes I had taken notice of in the diamonds; ſhe, who had obſerved more about gems than any lady I had yet met with, appeared but little ſurprized at what I told her, and affirmed to me, that ſhe had divers times obſerved the like alterations in ſome diamonds of hers, which ſometimes would look more ſparklingly than they were wont, and ſometimes far more dull than ordinary. And when I objected, that poſſibly that dulneſs might be imputed to the weather, or ſome caſual foulneſs of the ſurface of the ſtone, ſhe replied, *that ſhe had* been aware of thoſe circumſtances, rubbing the ſtones clean, and otherwiſe taking care to ſecure an obſervation, which ſhe had made too often to have deceived her ſelf in it. If I remember aright, I have elſewhere mentioned how I ſaw a conſiderable, but cloudy, *Hungarian* diamond, which the owner would have preſented me, made clearer by lying for ſome time in a cold liquor; wherein he affirmed, that upon his keeping it longer the ſtone would loſe more and more of its cloudineſs; and what I myſelf ſaw ſufficed me to argue, that changes may be produced even in the inward parts of ſuch diamonds by agents, *that* act without any appearing violence.

SECT. X.

AND if it be true, that diamonds, as I elſewhere obſerve about many other ſtones, may be generated from time to time in the bowels of the earth, it may not perhaps be abſurd to imagine, that even true diamonds, that ſeem perfect, and are fit for rings, may long continue to have an inſenſible motion through the whole ſtone, whereby the corpuſcles it conſiſts of are diſpoſed into a more convenient texture for the conſtituting of an extremely hard body. For though it be taken for granted, that adamantine bodies, becauſe they are generally exceeding hard, are equally ſo, yet that ſuppoſition is not favoured by experience. And I remember, that to ſatisfy my ſelf further about ſuch matters, I repaired to an ancient artificer eminent in his trade, which was the cutting and ſetting of diamonds; and that having demanded of him, whether he found, that all diamonds were of equal hardneſs; he anſwered me, that

that having dealt in theſe gems near 20 years in *Amſterdam*, and divers years in *England*, he perceived, that there are of later years brought over worſe and worſe ſorts of diamonds; and that he finds ſeveral of the recent diamonds ſo ſoft and brittle in compariſon of thoſe he was anciently wont to ſet (and which he with other jewellers called diamonds of the old rock) that he is often afraid, and unwilling to meddle with them, when they are brought to him, leſt he ſhould ſpoil them in the cutting, or poliſhing. But this I only repeat hiſtorically, till further obſervation ſhall diſcover, whether theſe are diamonds not yet fully ripe, and capable of growing harder by further maturation; or whether they be of a peculiar ſort of diamonds, whoſe nature it is to be always ſofter than thoſe of the old rock.

SECT. XI.

THIS brings into my mind a confirmation of the unequal hardneſs of diamonds, whatever be the cauſe of it, which I met with in a little book, lately publiſhed in his own language by a Frenchman, who giving his reader an account of the eaſtern diamond-mines from the relation, as he affirms, of a late eye-witneſs, ſpeaks thus of the third and laſt mine called *Gazerpoli: They are very clear, and of a good water, but they cannot be ground by mutual attrition* (if I underſtand the term he uſes) *but with ſtones of the ſame mine; for if one ſhould employ for that purpoſe the ſtones of another mine, thoſe of* Gazerpoli *would be broken in pieces. They do alſo eaſily break upon the wheel, and thoſe, that are not verſed in the knowledge of ſtones, may eaſily be deceived* (in them.) Of which our author adds the example of a Portugueſe, who refuſing 1200 crowns for one of them at *Leghorn*, when he went to have it cut at *Venice*, it broke upon the wheel into fifteen or twenty pieces.

Egrezes, pag. m. 17, 18.

ANOTHER example, that ſeems to make more for our preſent purpoſe, is afforded by the ſame author, ſpeaking of the ſecond mine, which breeds the greateſt ſtones called gane or colonor; for he ſays, that *ſur la plus part, i. e.* upon the moſt of theſe ſtones after they are cut, there appears always, as it were, a kind of greaſineſs or unctuoſity, which invites you ever and anon to have recourſe to your handkerchief to wipe it off, which one would gueſs to proceed from ſome inſenſible effluvium, that exhaling out of the ſtone, comes to be checked and condenſed by the air on the ſuperficies of it, as it happens to ſweat on the ſkins of animals: the truth of which conjecture I would examine by very nice ſcales, if I could procure ſuch diamonds.

SECT. XII.

AND becauſe rubies, though inferiour in hardneſs to diamonds, are yet harder than moſt other gems, and much more than marble and the like coarſer ſtones, I will not omit, on this occaſion, what was more than once affirmed to me by an obſerving lady, whom, if ſhe were not too nearly related to me, I could ſcarce mention without an elogy. For caſually caſting my eye upon a fair ruby ſhe wore upon her finger, and deſiring to conſider it more attentively, ſhe pulled off the rich ring it was ſet in, and reaching it me, told me it was worth my curioſity to conſider it. For beſides that it was ſo fine a ſtone, that it was thought worth being left her as a legacy by a great lady (her dear friend) that was famous, as I knew, for the variety of the rich jewels ſhe was miſtreſs of; this ruby would not unfrequently vary the degrees of its luſtre, ſhe knew not why. For ſometimes it ſeemed to be ennobled by a more vivid fire than ordinary, and at other times it would be manifeſtly more dull and cloudy than it is wont to be: and this not imputable, as ſhe expreſly aſſured me upon repeated obſervations, to the cloudineſs of the weather, or any ſuperficial foulneſs of the ſtone. And, that I might be convinced as well as ſhe her ſelf was, ſhe deſired me to rub it very clean, and then take notice of the preſent luſtre of it, of which ere long ſhe preſumed ſhe could ſhew me a manifeſt alteration, (for I was then come to viſit her, and paſs ſome weeks with her in her houſe) but my occaſions calling me away within a few days after, I had not time to wait for the event of her promiſe.

HOW far what has been ſaid concerning diamonds may be allowed to be argumentative towards the ſcope of this diſcourſe, I ſhall willingly leave to the diſcovery of time, and further obſervation; the mention I have made of the foregoing particulars having been invited partly by the nobleneſs of the ſubject, which made me willing to add theſe relations to what I have elſewhere written about them; and partly becauſe thus much at leaſt ſeems probably deducible from what I noted about the exciting of diamonds by rubbing, both to attract, and to ſhine, that notwithſtanding their incomparable hardneſs, an inteſtine motion of their minute parts may be without any conſiderable violence quickly produced.

SECT. XIII.

AND now it will be time to conſider the other body I promiſed to take notice of, namely, glaſs. For this being thought ſo compact and firm a body, that it is indeſtructible by art or nature, and being alſo of ſo cloſe a texture, that the ſubtleſt chymical ſpirits (that are yet known) cannot pervade it; and laſtly having given ſuch proofs of the fixedneſs of its parts, as to have long indured the violence even of a glaſs-houſe-fire, we can ſcarce imagine a body more unlikely to have any motion amongſt its component particles: and yet, that they may not be always at perfect reſt among themſelves, I have been induced to think by the following, and the like obſervations.

FIRST, having inquired of a famous and experienced maker of teleſcopes, as well as of thoſe, that uſe ſuch inſtruments, whether he did not obſerve, that the Venice-glaſſes he employed would ſometimes crack of themſelves, whilſt

they were yet in plates, and ſometimes do the like after they were ground into convexes, and poliſhed up; he anſwered affirmatively. And though it ſeemed improbable, that glaſſes brought ſo far off as from *Venice*, and many of them kept a good while here in *England* before there be occaſion to grind them, and perhaps longer after their having been ground before they crack, ſhould after all this time retain an internal motion among their component particles; yet I have been induced to conjecture, that ſome ſaline corpuſcles, more numerous than the nature of the glaſs required, may by degrees, though ſlow and unperceived, ſo tend towards the ſuperficies of the glaſs, as either to get out of the pores of it, or crack, or burſt the glaſs in endeavouring to force their paſſage outward. For having purpoſely inquired of the abovenamed artificer, and ſome other obſerving men, that deal in optical glaſſes, whether it had not been taken notice of, that there would ſometimes be, eſpecially in winter and very moiſt weather, a kind of efflorescence of a ſaltiſh taſte manifeſtly diſcernable upon the ſurfaces of their glaſſes; I was anſwered in the affirmative, eſpecially by the above-mentioned artificer, who having more occaſion and opportunity to take notice of ſuch things, told me, that he had by taſting found theſe exſudations ſenſibly ſaltiſh.

SECT. XIV.

AND I was the more apt to entertain the lately propoſed conjecture, becauſe of a thick glaſs cup, that I have yet by me, in the making of which, to render it the more diaphanous, I ſuppoſed an over-great proportion of ſalt had been employed. For this cup, though for a while it continued clear and intire, yet before the enſuing winter was ended, though it did not ſo crack as to fall to pieces, but ſtill retains its former ſhape, yet it was flawed with ſuch a multitude of little cracks, that at a diſtance it looks like a white, not like a cryſtalline cup.

SECT. XV.

I REMEMBER alſo, that I have ſometimes, though not often, had veſſels and other bodies of glaſs of a conſiderable thickneſs, which have of their own accord broken ſuddenly aſunder, with noiſe enough to make me take notice of it. And that this did not always happen for want of the glaſs's being gradually or ſlowly cooled, or, in the workmen's language, nealed; I was perſuaded, not only by the ſpontaneous cracking, not without a loud noiſe of a thick and empty glaſs veſſel, that had for I know not how many months been kept locked up in my ſtudy; but by the like accidents, which I after found had happened unto others. For inquiring of ſome, that made great ſtore of glaſs veſſels, as well as of others that ſold them; I learned from both, that they had ſometimes by their loſſes been made to take notice, that glaſſes, that had been long made, and kept unemployed, would break of themſelves, when there was no viſible outward agent near enough to be ſuſpected of the having broken them. And ſince this very page began to be written, I had a fair cryſtal phial, not too well ſtopped, which cracked at the thick bottom, in a glaſs-cabinet (that was fixed to a wall) where I kept that with other choice phials under lock and key; no other of the included glaſſes (full nor empty) nor yet of the external glaſſes appearing any way cracked or injured. Nay, even great and ſtrong looking-glaſſes are not quite exempted from theſe accidents. For I remember, that having purpoſely inquired of an honeſt man, that furniſhed the greateſt part of *London* with large looking glaſſes, whether he did not ſometimes find them crack, and that with noiſe; he ſhewed me divers large plates of excellent glaſs, and aſſured me, that ſometimes after they had been a good while in his ſhop, ſome of them would of themſelves, not only crack with a loud noiſe, but now and then alſo (though rarely) fly aſunder with that violence, as to break ſome of the neighbouring plates, though thick and ſtrong.

SECT. XVI.

AND having alſo a mind to inquire further, whether this diſpoſition to break, in ſome ſorts of glaſs, might not continue much longer than I had opportunity to obſerve, I addreſſed my ſelf to an ingenious maſter of a glaſs-houſe, and demanded of him, how long he had taken notice of glaſs to continue ſound and whole, and yet afterwards to break of it ſelf. He replied, that he had once a great parcel of glaſſes packed up, which not having the occaſion he expected to vend and make uſe of, lay by him for a great while; and yet when afterwards he had unpacked them, and ranged them, in a ſhort time a great many of them, amounting to about a fourth or third part of the whole number, cracked of themſelves; and when I aſked, how long the parcels had lain by, before they were opened, he replied, that it was, as he remembred, between four and five years.

SECT. XVII.

THESE inſtances, (to which I could add divers others) I have therefore mentioned, becauſe either of the two hypotheſes, in congruity whereunto they ſeem likelieſt to be intelligibly explicable, will favour the doctrine hitherto patronized. For according to the atomical theory, it may be conceived, that there is a conſtant inteſtine motion of the ſmall parts of the glaſs upon the ſcore of their conſtituent atoms, which endeavour or tend to extricate themſelves and get away, which at laſt they do, by breaking the glaſs in ſome brittle, or other fit place; where (after a multitude of encounters and evolutions) a competent number of them may happen to be got together, and find their motion (outwards) withſtood: whence may enſue ſo unequal an agitation there of the formerly coherent parts of the glaſs, as to make the more agitated ones part from them, that are leſs ſo; and conſequently crack the glaſs. To which agrees what I have often obſerved in chymical and mechanical trials made with glaſs-veſſels, that if there be any grain of ſand or gravel, or any little lump of the alkalizate

matter

matter glaſs is made of, conſpicuouſly incloſed in the ſubſtance of the veſſel, it will both be much the more apt to break, and, if it do, will almoſt always begin to crack at that place, (whence uſually as from a center ſeveral cracks go ſeveral ways;) the part of the glaſs, where the blemiſh is, being commonly of a differing texture from the reſt (as is often manifeſt to the very eye) and being by that incongruous texture diſpoſed to be put into a motion differing from, and perhaps very diſproportionate to that of the neighbouring parts.

SECT. XVIII.

I Must not here ſtay to examine, whether or no this motion of the internal parts may not (in divers caſes) be made more efficacious by the penetration of ſome ſubtile and moiſt matter into the glaſs's pores, (eſpecially the more ſuperficial ones of ſome glaſs of a looſer ſort) and ſo by degrees vitiate the texture of the body, and promoting the agitation and ſwelling of the ſaline corpuſcles, enable them to burſt the glaſs, after ſome ſuch manner, as the marchaſites I lately mentioned, came to have a vitriolate efflorescence, and even to be burſt by the operation of the air; this, I ſay, I muſt not now ſtay to examine, becauſe I would haſten to propoſe the ſecond hypotheſis, and tell you, that (elſe) we may, congruouſly to what we elſewhere diſcourſe, imagine, that in tract of time, there is produced in ſome parts of a glaſs a texture, that makes it reſiſt more than it did formerly the free paſſage of the æther, or ſome other ſubtile matter, that was accuſtomed (perhaps ſtream-like) to permeate it before; which tranſient matter now finding its paſſage obſtructed (and, perchance, almoſt quite hindered) by the vitiating of the pores of the glaſs, or ſome other (inconvenient) change of texture in it, and endeavouring to continue its wonted motion through it, does ſo ſtretch the pores, or otherwiſe offer violence to the texture of the body, that it cauſes a divulſion in the parts, which, according as it is more or leſs forcibly or ſuddenly made, does either barely crack the glaſs, or make it fly aſunder. To the precedent doctrine theſe two things agree not ill: the firſt, that glaſs is a body eaſily made electrical by rubbing, which makes it probable, that its particles may eaſily be put into motion. And the ſecond, that ſuch a divulſion may be made in glaſs by but an inequal motion between the neighbouring parts; as may appear by the chymical practice of cracking glaſſes, which they often think fit to do, only by applying a red-hot iron to the place, till it be ſufficiently heated, and whilſt it is very hot, moiſtening it with cold water (or even ſpittle) which by cooling the part, that it touched, and conſequently checking the agitation of the corpuſcles it meets there, whilſt the contiguous parts retain their former vehement agitation, occaſions a diſcontinuity or divulſion in the glaſs, ſome of whoſe parts are in ſo ſwift, and others are in ſo ſlow a motion.

SECT. XIX.

And on this occaſion I ſhall add chiefly, becauſe I would not pretermit ſo conſiderable a phænomenon, that even when glaſs ſeems to have loſt the degree of heat, that one would think neceſſary to have its ſhape or bigneſs ſenſibly altered; there may remain yet ſo much agitation in the minute parts, as, when they are modified by the air, by the cold, or by ſome other) inviſible agent, to make them alter the bulk or ſhape of the whole veſſel they compoſe; and that (which one would not expect) by enlarging the veſſel, at leaſt if we allow not in the caſe any change of figure: for it has often been obſerved in thoſe glaſs-houſes, where they work white glaſſes, as they call thoſe, that are pure and clear, that when they have blown glaſſes into a mold, to give them more exactly the deſired ſhape and ſize, theſe glaſſes, when they are cold, cannot well be put again into the ſame mold they were blown in, and require, that the cells of garde-phials, that are to receive them, be made a little larger: which obſervation an eminent artificer of my acquaintance, that gets conſiderably by fitting fine glaſſes to caſes, has much confirmed to me by his complaints of the inconvenience, eaſy to be incurred, by the not knowing, or not remembering ſo unlikely an effect of the cooling of glaſs. But I muſt not proſecute the conſideration of theſe, and the like phænomena, nor examine, which of the preceding explications is preferable, having mentioned them, as I was ſaying, chiefly to ſhew, that, which of them ſoever we pitch upon, it will argue an inteſtine motion in the corpuſcles of the glaſs, which motion we ſhall think may be very ſlow, if we conſider how long a time it is on ſome occaſions, in producing its effects, before it brings them to be diſcernable to our ſenſes.

SECT. XX.

Having thus made it probable, that among the parts of ſuch ſolid bodies, as I have hitherto inſtanced in, there may not be ſuch a perfect reſt, as is generally believed; it will, I ſuppoſe, be expected, that I ſhould now draw this conſequence from what has been ſaid, that there is no ſuch thing as abſolute reſt in nature. But ſince at my firſt mentioning this paradox to you, I propoſed it but as problematical, and ſince I conſider, that we are not yet ſure, but that though many of the parts of ſolid bodies may not be always moveleſs, yet ſome others of them may ſometimes, for a while at leaſt, be at perfect reſt: I ſhall conclude, as I began, and without reſolutely denying, that there can be any ſuch thing *in rerum naturâ*, as abſolute reſt, I ſhall content my ſelf to ſay, that it is not either abſurd to doubt, whether there be or no; nor improbable to think, that there is not, ſince we have not found it in thoſe very bodies, where, with the greateſt likelihood, it might have been expected.

THE SCEPTICAL CHYMIST: OR Chymico-Phyſical Doubts and Paradoxes, TOUCHING THE EXPERIMENTS,

Whereby vulgar Spagyriſts are wont to endeavour to evince their Salt, Sulphur and Mercury, to be the true Principles of Things.

To which, in this Edition, are ſubjoined divers Experiments and Notes about the Produciblenes of Chymical Principles.

A PREFACE INTRODUCTORY to the following Treatiſe.

TO give the reader an account, why the following treatiſe is ſuffered to paſs abroad ſo maimed and imperfect, I muſt inform him, that it is now long ſince, that to gratify an ingenious gentleman, I ſet down ſome of the reaſons, that kept me from fully acquieſcing either in the peripatetical, or in the chymical doctrine of the material principles of mixed bodies. This diſcourſe, ſome years after, falling into the hands of ſome learned men, had the good luck to be ſo favourably received, and advantageouſly ſpoken of by them, that having had more than ordinary invitations given me to make it publick, I thought fit to review it, that I might retrench ſome things, that ſeemed not ſo fit to be ſhewn to every reader, and ſubſtitute ſome of thoſe other things, that occurred to me of the trials and obſervations I had ſince made. What became of my papers, I elſewhere mention in a preface, where I complain of it; but ſince I writ that, I found many ſheets, that belonged to the ſubjects I am now about to diſcourſe of. Wherefore, ſeeing that I had then in my hands as much of the firſt Dialogue, as was requiſite to ſtate the caſe, and ſerve for an Introduction as well to the Conference betwixt *Carneades* and *Eleutherius*, as to ſome other Dialogues, which for certain reaſons are not herewith publiſhed, I reſolved to ſupply, as well as I could, the contents of a paper belonging to the ſecond of the following diſcourſes, which I could not poſſibly retrieve, though it were the chief of them all. And having once more tried the opinion of friends, but not the ſame, about this imperfect work, I found it ſuch, that I was content, in compliance with their deſires, that not only it ſhould be publiſhed, but that it ſhould be publiſhed as ſoon as conveniently might be. I had, indeed, all along the Dialogues ſpoken of my ſelf, as of a third perſon; for they containing diſcourſes, which were among the firſt treatiſes, that I ventured long ago to write of matters philoſophical, I had reaſon to deſire, with the painter, to *latere pone tabulam*, and hear what men would ſay of them, before I owned my ſelf to be their author. But, beſides, that now I find, it is not unknown to many, who it is, that writ them, I am made to believe, that it is not inexpedient, they ſhould be known to come from a perſon altogether a ſtranger to chymical affairs. And I made the leſs ſcruple to let them come abroad uncompleated, partly, becauſe my affairs and pre-ingagements to publiſh divers other treatiſes, allowed me ſmall hopes of being able in a great while to compleat thoſe Dialogues. And partly becauſe I am not unapt to think, that they may come abroad ſeaſonably enough, though not for the author's reputation, yet for other purpoſes. For I obſerve, that of late chymiſtry begins, as indeed it deſerves, to be cultivated by learned men, who before deſpiſed it; and to be pretended to by many, who never cultivated it, that they may be thought not to be ignorant of it: whence it is come to paſs, that divers chymical notions about matters philoſophical are taken for granted and employed, and ſo adopted by very eminent writers both naturaliſts and phyſicians. Now this, I fear, may prove ſomewhat prejudicial to the advancement of ſolid philoſophy: for though I am a great lover of chymical experiments, and though I have no mean eſteem of divers chymical remedies, yet I diſtinguiſh theſe from their notions about the cauſes of things and their manner of generation. And, for aught I can hitherto diſcern, there are a thouſand phænomena in nature, beſides a multitude

titude of accidents relating to the human body, which will ſcarcely be clearly and ſatisfactorily made out by them, that confine themſelves to deduce things from ſalt, ſulphur and mercury, and the other notions peculiar to the chymiſts, without taking much more notice than they are wont to do, of the motions and figures of the ſmall parts of matter, and the other more catholick and fruitful affections of bodies. Wherefore it will not, perhaps, be now unſeaſonable to let our *Carneades* warn men, not to ſubſcribe to the grand doctrine of the chymiſts, touching their three hypoſtatical principles, till they have a little examined it, and conſidered, how they can clear it from his objections, divers of which, it is like, they may never have thought on; ſince a chymiſt ſcarce would, and none but a chymiſt could propoſe them. I hope alſo, it will not be unacceptable to ſeveral ingenious perſons, who are unwilling to determine of any important controverſy, without a previous conſideration of what may be ſaid on both ſides, and yet have greater deſires to underſtand chymical matters, than opportunities of learning them, to find here together, beſides ſeveral experiments of my own, purpoſely made to illuſtrate the doctrine of the elements, divers others, ſcarce to be met with, otherwiſe than ſcattered among many chymical books; and to find theſe aſſociated experiments ſo delivered, as that an ordinary reader, if he be but acquainted with the uſual chymical terms, may eaſily enough underſtand them; and even a wary one may ſafely rely on them. Theſe things I add, becauſe a perſon, any thing verſed in the writings of chymiſts cannot but diſcern by their obſcure, ambiguous, and almoſt ænigmatical way of expreſſing what they pretend to teach, that they have no mind to be underſtood at all, but by the ſons of art (as they call them) nor to be underſtood even by theſe, without difficulty and hazardous trials. Inſomuch that ſome of them ſcarce ever ſpeak ſo candidly, as when they make uſe of that known chymical ſentence; *ubi palam locuti ſumus, ibi nihil diximus.* And, as the obſcurity of what ſome writers deliver makes it very difficult to be underſtood; ſo the unfaithfulneſs of too many others makes it unfit to be relied on. For though unwillingly, yet I muſt for the truth's ſake, and the reader's, warn him not to be forward to believe chymical experiments, when they are ſet down only by way of preſcriptions, and not of relations; that is, unleſs he, that delivers them, mentions his doing it upon his own particular knowledge, or upon the relation of ſome credible perſon, avowing it upon his own experience. For I am troubled, I muſt complain, that even eminent writers, both phyſicians and philoſophers, whom I can eaſily name, if it be required, have of late ſuffered themſelves to be ſo far impoſed upon, as to publiſh and build upon chymical experiments, which queſtionleſs they never tried; for if they had, they would, as well as I, have found them not to be true. And indeed, it were to be wiſhed, that now, that thoſe begin to quote chymical experiments, that are not themſelves acquainted with chymical operations, men would leave off that indefinite way of vouching, the chymiſts ſay this, or the chymiſts affirm that; and would rather, for each experiment they alledge, name the author or authors, upon whoſe credit they relate it: for by this means, they would ſecure themſelves from the ſuſpicion of falſhood (to which the other practice expoſes them) and they would leave the reader to judge of what is fit for him to believe of what is delivered, whilſt they employ not their own great names to countenance doubtful relations; and they will alſo do juſtice to the inventors or publiſhers of the true experiments, as well as upon the obtruders of falſe ones. Whereas, by that general way of quoting the chymiſts, the candid writer is defrauded of the particular praiſe, and the impoſtor eſcapes the perſonal diſgrace, that is due to him.

THE remaining part of this Preface muſt be imployed in ſaying ſomething for *Carneades*, and ſomething for my ſelf.

AND firſt, *Carneades* hopes, that he will be thought to have diſputed civilly and modeſtly enough for one, that was to play the antagoniſt and the ſceptick: and if he any where ſeems to ſlight his adverſaries tenets and arguments, he is willing to have it looked upon as what he was induced to, not ſo much by his opinion of them, as the examples of *Themiſtius* and *Philoponus*, and the cuſtom of ſuch kind of diſputes.

NEXT, in caſe that ſome of his arguments ſhall not be thought of the moſt cogent ſort, that may be, he hopes it will be conſidered, that it ought not to be expected, that they ſhould be ſo. For his part being chiefly but to propoſe doubts and ſcruples, he does enough, if he ſhews, that his adverſaries arguments are not ſtrongly concluding, though his own be not ſo neither. And if there ſhould appear any diſagreement betwixt the things he delivers in divers paſſages, he hopes it will be conſidered, that it is not neceſſary, that all the things a ſceptick propoſes ſhould be conſonant; ſince it being his work to ſuggeſt doubts againſt the opinion he queſtions, it is allowable for him to propoſe two or more ſeveral hypotheſes about the ſame thing; and to ſay, that it may be accounted for this way, or that way, or the other way, though theſe ways be perhaps inconſiſtent among themſelves. Becauſe it is enough for him, if either of the propoſed hypotheſes be but as probable as that he calls in queſtion. And if he propoſe many, that are each of them probable, he does the more ratify his doubts, by making it appear the more difficult to be ſure, that that way, which they all differ from, is the true. And our *Carneades*, by holding the negative, has this advantage, that if among all the inſtances he brings to invalidate the vulgar doctrine of thoſe he diſputes with, any one be irrefragable, that alone is ſufficient to overthrow a doctrine, which univerſally aſſerts what he oppoſes. For it cannot be true, that all bodies whatſoever, that are reckoned among the perfectly mixt ones, are compounded of ſuch a determinate number of ſuch or ſuch ingredients, in caſe any one ſuch body can be pro-

duced

duced, that is not ſo compounded; and he hopes too, that accurateneſs will be the leſs expected from him, becauſe his undertaking obliges him to maintain ſuch opinions in chymiſtry, and that chiefly by chymical arguments, as are contrary to the very principles of the chymiſts, from whoſe writings it is not therefore like he ſhould receive any intentional aſſiſtance, except from ſome paſſages of the bold and ingenious *Helmont*, with whom he yet diſagrees in many things, (which reduce him to explicate divers chymical phænomena, according to other notions;) and of whoſe ratiocinations, not only ſome ſeem very extravagant, but even the reſt are not wont to be as conſiderable as his experiments. And though it be true indeed, that ſome Ariſtotelians have occaſionally written againſt the chymical doctrine he oppugns, yet ſince they have done it according to their principles, and ſince our *Carneades* muſt as well oppoſe their hypotheſis as that of the Spagyriſt, he was fain to fight his adverſaries with his own weapons, thoſe of the Peripatetick being improper, if not hurtful, for a perſon of his tenets; beſides that thoſe Ariſtotelians, (at leaſt thoſe he met with,) that have written againſt the chymiſts, ſeem to have had ſo little experimental knowledge in chymical matters, that by their frequent miſtakes and unſkilful way of oppugning, they have too often expoſed themſelves to the deriſion of their adverſaries, for writing ſo confidently againſt what they appear ſo little to underſtand.

And laſtly, *Carneades* hopes, he ſhall do the ingenious this piece of ſervice, that by having thus drawn the chymiſts doctrine out of their dark and ſmoky laboratories, and both brought it into the open light, and ſhewn the weakneſs of their proofs, that have hitherto been wont to be brought for it, either judicious men ſhall henceforth be allowed calmly and after due information to diſbelieve it, or thoſe abler chymiſts, that are zealous for the reputation of it, will be obliged to ſpeak plainer than hitherto has been done, and maintain it by better experiments and arguments than thoſe *Carneades* hath examined: ſo that he hopes the curious will one way or other derive either ſatisfaction or inſtruction from his endeavours. And as he is ready to make good the profeſſion he makes in the cloſe of his diſcourſe, of being ready to be better informed, ſo he expects either to be indeed informed, or to be let alone. For though, if any truly knowing chymiſts ſhall think fit in a civil and rational way to ſhew him any truth, touching the matter in diſpute, that he yet diſcerns not, *Carneades* will not refuſe either to admit, or to own a conviction; yet if any impertinent perſon ſhall, either to get himſelf a name, or for what other end ſoever, wilfully or careleſly miſtake the ſtate of the controverſy, or the ſenſe of his arguments, or ſhall rail inſtead of arguing, as hath been done of late, in print, by divers chymiſts *; or laſtly, ſhall write againſt them in a canting way, I mean, ſhall expreſs himſelf in ambiguous or obſcure terms, or argue from experiments not intelligibly enough delivered, *Carneades* profeſſes, that he values his time ſo much, as not to think the anſwering ſuch trifles worth the loſs of it.

And now having ſaid thus much for *Carneades*, I hope the reader will give me leave to ſay ſomething for my ſelf.

And firſt, if ſome moroſe readers ſhall find fault with my having made the interlocutors upon occaſion compliment with one another, and that I have almoſt all along written theſe Dialogues, in a ſtyle more faſhionable than that of meer ſcholars is wont to be, I hope I ſhall be excuſed by them, that ſhall conſider, that to keep a due decorum in the diſcourſes, it was fit, that in a book written by a gentleman, and wherein only gentlemen are introduced as ſpeakers, the language ſhould be more ſmooth, and the expreſſions more civil, than is uſual in the more ſcholaſtick way of writing. And indeed, I am not ſorry to have this opportunity of giving an example, how to manage even diſputes with civility; whence, perhaps, ſome readers will be aſſiſted to diſcern a difference betwixt bluntneſs of ſpeech and ſtrength of reaſon, and find, that a man may be a champion for truth, without being an enemy to civility; and may confute an opinion without railing at them that hold it; to whom, he that deſires to convince and not to provoke them, muſt make ſome amends by his civility to their perſons for his ſeverity to their miſtakes; and muſt ſay as little elſe as he can, to diſpleaſe them, when he ſays, that they are in an error.

But, perhaps, other readers will be leſs apt to find fault with the civility of my diſputants, than the chymiſts will be, upon the reading of ſome paſſages of the following Dialogue, to accuſe *Carneades* of aſperity. But, if I have made my Sceptick ſometimes ſpeak ſlightingly of the opinions he oppoſes, I hope it will not be found, that I have done any more, than became the part he was to act, of an opponent: eſpecially, if what I have made him ſay, be compared with what the prince of the Roman orators himſelf makes both great perſons and friends ſay of one another's opinions, in his excellent Dialogues, *de naturâ Deorum*: and I ſhall ſcarce be ſuſpected of partiality in the caſe, by them, that take notice, that there is full as much (if not far more) liberty of ſlighting their adverſaries tenets, to be met with in the diſcourſes of thoſe, with whom *Carneades* diſputes. Nor need I make the interlocutors ſpeak otherwiſe than freely in a Dialogue, wherein it was ſufficiently intimated, that I meant not to declare my own opinion of the arguments propoſed, much leſs of the whole controverſy it ſelf, otherwiſe than as it may by an attentive reader be gueſſed at by ſome paſſages of *Carneades*; (I ſay, ſome paſſages, becauſe I make not all, that he ſays, eſpecially in the heat of diſputation, mine,) partly in this diſcourſe, and partly in ſome other † Dialogues betwixt the,

* *G.* and *F.* and *H.* and others, in their books againſt one another.

† The Dialogues here meant are thoſe about heat, fire, flame, &c. (ſeen by two Secretaries of the Royal Society) that the author ſomewhere complains to have been miſſing, with other things of his, preſently after the haſty removal of his goods by night in the great fire of *London*.

the ſame ſpeakers (though they treat not immediately of the elements) which have long lain by me, and expect the entertainment, that theſe preſent diſcourſes will meet with. And indeed they will much miſtake me, that ſhall conclude from what I now publiſh, that I am at defiance with chymiſtry, or would make my readers ſo. I hope the *ſpecimina* I have lately publiſhed of an attempt to ſhew the uſefulneſs of chymical experiments to contemplative philoſophers, will give thoſe, that read them, other thoughts of me, and I had a deſign (but wanted opportunity) to publiſh with theſe papers an eſſay I have lying by me, the greater part of which is apologetical for one ſort of chymiſts. And at leaſt, as for thoſe, that know me, I hope the pains I have taken in the fire will both convince them, that I am far from being an enemy to the chymiſts art, (though I am no friend to many, that diſgrace it by profeſſing it,) and perſuade them to beleive me, when I declare, that I diſtinguiſh betwixt thoſe chymiſts, that are either cheats, or but laborants, and the true *adepti*; by whom, could I enjoy their converſation, I would both willingly and thankfully be inſtructed; eſpecially concerning the nature and generation of metals: and poſſibly, thoſe, that know how little I have remitted of my former addictedneſs to make chymical experiments, will eaſily believe, that one of the chief deſigns of this ſceptical diſcourſe was, not ſo much to diſcredit chymiſtry, as to give an occaſion and a kind of neceſſity to the more knowing artiſts, to lay aſide a little of their over-great reſervedneſs, and either explicate or prove the chymical theory better than ordinary chymiſts have done, or, by enriching us with ſome of their nobler ſecrets, to evince, that their art is able to make amends even for the deficiences of their theory. And thus much I ſhall make bold to add, that we ſhall much undervalue chymiſtry, if we imagine, that it cannot teach us things far more uſeful, not only to phyſick, but to philoſophy, than thoſe, that are hitherto known to vulgar chymiſts. And yet, as for inferiour Spagyriſts themſelves, they have, by their labours, deſerved ſo well of the common wealth of learning, that methinks it is pity they ſhould ever miſs the truth, which they have ſo induſtriouſly ſought. And though I be no admirer of the theorical part of their art, yet my conjectures will much deceive me, if the practical part be not hereafter much more cultivated, than hitherto it has been, and do not both employ philoſophy and philoſophers, and hope to make men ſuch. Nor would I, that have been diverted by other ſtudies as well as affairs, be thought to pretend being a profound Spagyriſt, by finding ſo many faults in the doctrine, wherein the generality of chymiſts ſcruple not to acquieſce: for beſides that it is moſt commonly far eaſier to frame objections againſt any propoſed hypotheſis, than to propoſe an hypotheſis not liable to objections (beſides this, I ſay) it is no ſuch great matter, if whereas beginners in chymiſtry are commonly at once imbued with the theory and operations of their profeſſion, I, who had the good fortune to learn the operations from illiterate perſons, upon whoſe credit I was not tempted to take up any opinion about them, ſhould conſider things with leſs prejudice, and conſequently with other eyes than the generality of learners; and ſhould be more diſpoſed to accommodate the phænomena, that occurred to me, to other notions than to thoſe of the Spagyriſts. And having at firſt entertained a ſuſpicion, that the vulgar principles were leſs general and comprehenſive, or leſs conſiderately deduced from chymical operations, than was believed, it was not uneaſy for me both to take notice of divers phænomena, over-looked by prepoſſeſt perſons, that ſeemed not to ſuit ſo well with the hermetical doctrine; and to deviſe ſome experiments likely to furniſh me with objections againſt it, not known to many, that having practiſed chymiſtry longer, perchance, than I have yet lived, may have far more experience, than I, of particular proceſſes.

To conclude, whether the notions I have propoſed, and the experiments I have communicated, be conſiderable, or not, I willingly leave others to judge; and this only I ſhall ſay for myſelf, that I have endeavoured to deliver matters of fact ſo faithfully, that I may as well aſſiſt the leſs ſkilful readers to examine the chymical hypotheſis, as provoke the ſpagyrical philoſophers to illuſtrate it: which if they do, and that either the chymical opinion, or the peripatetick, or any other theory of the elements differing from that I am moſt inclined to, ſhall be intelligibly explicated, and duly proved to me; what I have hitherto diſcourſed will not hinder it from making a proſelyte of a perſon, that loves fluctuation of judgment little enough to be willing to be eaſed of it by any thing but error.

Advertiſement.

THE reader is deſired to take notice, that, as the date of the licence witneſſes, this book ſhould have been printed long ago, and there has been a miſtake in the bottom of the title-page, where the year 1680. has been put inſtead of the year 1679, in which it was really printed off, though not publickly expoſed to ſale, till the beginning of this month of *January* 1678-79.

PHYSIOLOGICAL CONSIDERATIONS

TOUCHING

The Experiments wont to be employed to evince, either the four Peripatetick Elements, or the three chymical Principles of mixt Bodies.

Part of the Firſt Dialogue.

I PERCEIVE, that divers of my friends have thought it very ſtrange to hear me ſpeak ſo irreſolvedly, as I have been wont to do, concerning thoſe things, which ſome take to be the elements, and others to be the principles of all mixed bodies. But I bluſh not to acknowledge, that I much leſs ſcruple to confeſs, that I doubt, when I do ſo, than to profeſs, that I know what I do not: and I ſhould have much ſtronger expectations than I dare yet entertain, to ſee philoſophy ſolidly eſtabliſhed, if men would more carefully diſtinguiſh thoſe things, that they know, from thoſe, that they ignore or do but think, and then explicate clearly the things they conceive they underſtand, acknowledge ingenuouſly what it is they ignore, and profeſs ſo candidly their doubts, that the induſtry of intelligent perſons might be ſet on work to make further enquiries, and the eaſineſs of leſs diſcerning men might not be impoſed on. But becauſe a more particular account will probably be expected of my unſatisfiedneſs, not only with the peripatetick, but with the chymical doctrine of the primitive ingredients of bodies; it may poſſibly ſerve to ſatisfy others of the excuſeableneſs of my diſſatisfaction, to peruſe the enſuing relation of what paſſed a while ſince at a meeting of perſons of ſeveral opinions, in a place that need not here be named; where the ſubject, whereof we have been ſpeaking, was amply and variouſly diſcourſed of.

IT was on one of the faireſt days of this ſummer, that the inquiſitive *Eleutherius* came to invite me to make a viſit with him to his friend *Carneades*. I readily conſented to this motion, telling him, that if he would but permit me to go firſt and make an excuſe at a place not far off, where I had at that hour appointed to meet, but not about a buſineſs either of moment, or that could not well admit of a delay, I would preſently wait on him, becauſe of my knowing *Carneades* to be ſo converſant with nature and with furnaces, and ſo unconfined to vulgar opinions, that he would probably, by ſome ingenious paradox or other, give our minds at leaſt a pleaſing exerciſe, and perhaps enrich them with ſome ſolid inſtruction. *Eleutherius* then firſt going with me to the place where my apology was to be made, I accompanied him to the lodging of *Carneades*, where when we were come, we were told by the ſervants, that he was retired with a couple of friends (whoſe names they alſo told us) to one of the arbours in his garden, to enjoy under its cool ſhades a delightful protection from the yet troubleſome heat of the ſun.

ELEUTHERIUS being perfectly acquainted with that garden, immediately led me to the arbour, and relying on the intimate familiarity, that had been long cheriſhed betwixt him and *Carneades*; in ſpight of my reluctancy to what might look like an intruſion upon his privacy, drawing me by the hand, he abruptly entered the arbour, where we found *Carneades*, *Philoponus*, and *Themiſtius*, ſitting cloſe about a little round table, on which, beſides paper, pen, and ink, there lay two or three open books. *Carneades* appeared not at all troubled at this ſurpriſe, but riſing from the table, received his friend with open looks and arms, and welcoming me alſo with his wonted freedom and civility, invited us to reſt our ſelves by him; which, as ſoon as we had exchanged with his two friends (who were ours alſo) the civilities accuſtomed on ſuch occaſions, we did. And he, preſently after we had ſeated our ſelves, ſhutting the books that lay open, and turning to us with a ſmiling countenance, ſeemed ready to begin ſome ſuch unconcerning diſcourſe, as is wont to paſs, or rather waſte the time in promiſcuous companies.

BUT *Eleutherius* gueſſing at what he meant to do, prevented him by telling him, I perceive, *Carneades*, by the books, that you have been now ſhutting, and much more by the poſture, wherein I found perſons ſo qualified to diſcourſe of ſerious matters, and ſo accuſtomed to do it, that you three were, before our coming, ingaged in ſome philoſophical conference; which I hope you will either proſecute, and allow us to be partakers of, in recompence of the freedom we have uſed in preſuming to ſurpriſe you, or elſe give us leave to repair the injury we ſhould otherwiſe do you, by leaving you to the freedom we have interrupted, and puniſhing our ſelves for our boldneſs, by depriving our ſelves of the happineſs of your company. With theſe laſt words he and I roſe up, as if we meant to be gone; but *Carneades* ſuddenly laying hold on his arm, and ſtopping him by it, ſmilingly told him, we are not ſo forward to loſe good company as you ſeem to imagine; eſpecially ſince you are pleaſed to be preſent at what we ſhall ſay, about ſuch a ſubject as that you found us conſidering. For that being the number of the elements, principles, or material ingredients of bodies, is an enquiry, whoſe truth is of that importance, and of that difficulty, that it may as well deſerve, as require, to be ſearched into by ſuch ſkilful indagators of nature, as your ſelves. And therefore we ſent to invite the bold and acute *Leucippus* to lend us ſome light by his atomical

para-

paradox, upon which we expected ſuch pregnant hints, that it was not without a great deal of trouble, that we had lately word brought us, that he was not to be found; and we had likewiſe begged the aſſiſtance of your preſence and thoughts, had not the meſſenger we employed to *Leucippus* informed us, that as he was going, he ſaw you both paſs by towards another part of the town; and this fruſtrated expectation of *Leucippus* his company, who told me but laſt night, that he would be ready to give me a meeting where I pleaſed to-day, having very long ſuſpended our conference about the freſhly-mentioned ſubject, it was ſo newly begun when you came in, that we ſhall ſcarce need to repeat any thing, to acquaint you with what had paſſed betwixt us before your arrival; ſo that I cannot but look upon it as a fortunate accident, that you ſhould come ſo ſeaſonably, to be not hearers alone, but, we hope, interlocutors at our conference. For we ſhall not only allow of your preſence at it, but deſire your aſſiſtance, in it; which I add, both for other reaſons, and becauſe though theſe learned gentlemen (ſays he, turning to his two friends) need not fear to diſcourſe before any auditory, provided it be intelligent enough to underſtand them, yet for my part, (continues he with a new ſmile,) I ſhall not dare to vent my unpremeditated thoughts before two ſuch criticks, unleſs, by promiſing to take your turns of ſpeaking, you will allow me mine of quarrelling with was has been ſaid. He and his friends added divers things to convince us, that they were both deſirous, that we ſhould hear them, and reſolved againſt our doing ſo, unleſs we allowed them ſometimes to hear us. *Eleutherius*, after having a while fruitleſsly endeavoured to obtain leave to be ſilent, promiſed he would not be ſo always, provided, that he were permitted, according to the freedom of his genius and principles, to ſide with one of them in the managing of one argument, and, if he ſaw cauſe, with his antagoniſt, in the proſecution of another, without being confined to ſtick to any one party or opinion, which was after ſome debate accorded him. But I, conſcious to my own diſabilities, told them reſolutely, that I was as much more willing, as more fit, to be a hearer than a ſpeaker, among ſuch knowing perſons, and on ſo abſtruſe a ſubject. And that therefore I beſeeched them, without neceſſitating me to proclaim my weakneſſes, to allow me to leſſen them, by being a ſilent auditor of their diſcourſes: to ſuffer me to be at which, I could preſent them no motive, ſave that their inſtructions would make them in me a more intelligent admirer. I added, that I deſired not to be idle, whilſt they were employed, but would, if they pleaſed, by writing down in ſhort hand what ſhould be delivered, preſerve diſcourſes, that I knew would merit to be laſting. At firſt, *Carneades* and his two friends utterly rejected this motion; and all that my reſoluteneſs to make uſe of my ears, not tongue, at their debates, could do, was to make them acquieſce in the propoſition of *Eleutherius*, who thinking himſelf concerned, becauſe he brought me thither, to afford me ſome faint aſſiſtance, was content, that I ſhould regiſter their arguments, that I might be the better able, after the concluſion of their conference, to give them my ſenſe upon the ſubject of it, (the number of elements or principles) which he promiſed I ſhould do at the end of the preſent debates, if time would permit, or elſe at our next meeting. And this being by him undertaken in my name, though without my conſent, the company would by no means receive my proteſtation againſt it, but caſting, all at once, their eyes on *Carneades*, they did by that, and their unanimous ſilence, invite him to begin; which (after a ſhort pauſe, during which he turned himſelf to *Eleutherius* and me) he did in this manner.

NOTWITHSTANDING the ſubtile reaſonings I have met with in the books of the Peripateticks, and the pretty experiments, that have been ſhewed me in the laboratories of chymiſts, I am of ſo diffident, or dull a nature, as to think, that if neither of them can bring more cogent arguments to evince the truth of their aſſertion than are wont to be brought; a man may rationally enough retain ſome doubts concerning the very number of thoſe material ingredients of mixt bodies, which ſome would have us call elements, and others principles. Indeed, when I conſidered, that the tenets concerning the elements are as conſiderable amongſt the doctrines of natural philoſophy, as the elements themſelves are among the bodies of the univerſe, I expected to find thoſe opinions ſolidly eſtabliſhed, upon which ſo many others are ſuperſtructed. But when I took the pains impartially to examine the bodies themſelves, that are ſaid to reſult from the blended elements, and to torture them into a confeſſion of their conſtituent principles, I was quickly induced to think, that the number of the elements has been contended about by philoſophers with more earneſtneſs than ſucceſs. This unſatisfiedneſs of mine has been much wondered at by theſe two gentlemen, (at which words he pointed at *Themiſtius* and *Philoponus*) who, though they differ almoſt as much betwixt themſelves about the queſtion we are to conſider, as I do from either of them, yet they both agree very well in this, that there is a determinate number of ſuch ingredients as I was juſt now ſpeaking of, and that what that number is, I ſay not, may be (for what may not ſuch as they perſuade?) but is wont to be clearly enough demonſtrated both by reaſon and experience. This has occaſioned our preſent conference. For our diſcourſe this afternoon having fallen from one ſubject to another, and at length ſettled on this, they proffered to demonſtrate to me, each of them the truth of his opinion, out of both the topicks, that I have freſhly named. But on the former (that of reaſon ſtrictly ſo taken) we declined inſiſting at the preſent, leſt we ſhould not have time enough before ſupper to go through the reaſons and experiments too. The latter of which we unanimouſly thought the moſt requiſite to be ſeriouſly examined. I muſt deſire you then to take notice gentlemen, (continued *Carneades*) that my preſent buſineſs

doth not oblige me ſo to declare my own opinion on the ſubject in queſtion, as to aſſert or deny the truth either of the peripatetick, or the chymical doctrine, concerning the number of the elements; but only to ſhew you, that neither of theſe doctrines hath been ſatisfactorily proved by the arguments commonly alledged on its behalf. So that if I really diſcern (as, perhaps, I think I do) that there may be a more rational account than ordinary given of one of theſe opinions, I am left free to declare my ſelf of it, notwithſtanding my preſent engagement; it being obvious to all your obſervation, that a ſolid truth may be generally maintained by no other, than incompetent arguments. And to this declaration I hope it will be needleſs to add, that my taſk obliges me not to anſwer the arguments, that may be drawn either for *Themiſtius* or *Philoponus*'s opinion from the topick of reaſon, as expoſed to experiments; ſince it is theſe only, that I am to examine, and not all theſe neither, but ſuch of them alone, as either of them ſhall think fit to inſiſt on, and as have hitherto been wont to be brought either to prove, that it is the four peripatetick elements, or that it is the three chymical principles, that all compounded bodies conſiſt of. Theſe things (adds *Carneades*) I thought my ſelf obliged to premiſe, partly leſt you ſhould do theſe gentlemen (pointing at *Themiſtius* and *Philoponus*, and ſmiling on them) the injury of meaſuring their parts by the arguments they are ready to propoſe, the laws of our conference confining them to make uſe of thoſe, that the vulgar of philoſophers (for even of them there is a vulgar) has drawn up to their hands; and partly, that you ſhould not condemn me of preſumption for diſputing againſt perſons over whom I can hope for no advantage, that I muſt not derive from the nature, or rules of our controverſy, wherein I have but a negative to defend, and wherein too I am like on ſeveral occaſions to have the aſſiſtance of one of my diſagreeing adverſaries againſt the other.

PHILOPONUS and *Themiſtius* ſoon returned this compliment with civilities of the like nature, in which *Eleutherius* perceiving them engaged, to prevent the further loſs of that time, of which they were not like to have very much to ſpare, he minded them, that their preſent buſineſs was not to exchange compliments, but arguments: and then addreſſing his ſpeech to *Carneades*, I eſteemed it no ſmall happineſs (ſays he) that I am come here ſo luckily this evening. For I have been long diſquieted with doubts concerning this very ſubject, which you are now ready to debate. And ſince a queſtion of this importance is to be now diſcuſſed by perſons, that maintain ſuch variety of opinions concerning it, and are both ſo able to inquire after truth, and ſo ready to imbrace it by whomſoever and on what occaſion ſoever it is preſented them; I cannot but promiſe my ſelf, that I ſhall, before we part, either loſe my doubts or the hopes of ever finding them reſolved. *Eleutherius* pauſed not here; but, to prevent their anſwer, added almoſt in the ſame breath, And I am not a little pleaſed to find, that you are reſolved, on this occaſion, to inſiſt rather on experiments than ſyllogiſms. For I, and no doubt you, have long obſerved, that thoſe dialectical ſubtleties, that the ſchoolmen too often employ about phyſiological myſteries, are wont much more to declare the wit of him, that uſes them, than increaſe the knowledge or remove the doubts of ſober lovers of truth. And ſuch captious ſubtleties do indeed often puzzle, and ſometimes ſilence men, but rarely ſatisfy them; being like the tricks of jugglers, whereby men doubt not but they are cheated, though oftentimes they cannot declare by what ſlights they are impoſed on. And therefore I think you have done very wiſely to make it your buſineſs to conſider the phænomena relating to the preſent queſtion, which have been afforded by experiments, eſpecially ſince it might ſeem injurious to our ſenſes, by whoſe mediation we acquire ſo much of the knowledge we have of things corporal, to have recourſe to far-fetched and abſtracted ratiocinations, to know what are the ſenſible ingredients of thoſe ſenſible things, that we daily ſee and handle, and are ſuppoſed to have the liberty to untwiſt (if I may ſo ſpeak) into the primitive bodies they conſiſt of. He annexed, that he wiſhed therefore they would no longer delay his expected ſatisfaction, if they had not, as he feared they had, forgotten ſomething preparatory to their debate; and that was to lay down, what ſhould be all along underſtood by the word principle or element. *Carneades* thanked him for his admonition, but told him, that they had not been unmindful of ſo requiſite a thing. But that being gentlemen, and very far from the litigious humour of loving to wrangle about words, or terms, or notions as empty, they had, before his coming in, readily agreed promiſcuouſly to uſe, when they pleaſed, elements and principles, as terms equivalent; and to underſtand both by the one and the other thoſe primitive and ſimple bodies, of which the mixt ones are ſaid to be compoſed, and into which they are ultimately reſolved. And upon the ſame account (he added) we agreed to diſcourſe of the opinions to be debated, as we have found them maintained by the generality of the aſſertors of the four elements of the one party, and of thoſe, that receive the three principles on the other, without tying our ſelves to inquire ſcrupulouſly, what notion either *Ariſtotle* or *Paracelſus*, or this or that interpreter, or follower of either of thoſe great perſons, framed of elements or principles; our deſign being to examine, not what theſe or thoſe writers thought or taught, but what we find to be the obvious and moſt general opinion of thoſe, who are willing to be accounted favourers of the peripatetick or chymical doctrine, concerning this ſubject.

I SEE not (ſays *Eleutherius*) why you might not immediately begin to argue, if you were but agreed which of your two friendly adverſaries ſhall be firſt heard. And it being quickly reſolved on, that *Themiſtius* ſhould firſt propoſe the proofs for his opinion, becauſe it was the ancienter, and the more general, he made not the company expect long before he thus addreſſed himſelf to *Eleutherius*, as to the perſon leaſt intereſted in the diſpute.

IF you have taken ſufficient notice of the late confeſſion, which was made by *Carneades*, and which (though his civility dreſſed it up in complemental expreſſions) was exacted of him by his juſtice, I ſuppoſe you will be eaſily made ſenſible, that I engage in this controverſy with great and peculiar diſadvantages, beſides thoſe, which his parts and my perſonal diſabilities would bring to any other cauſe, to be maintained by me againſt him. For he juſtly apprehending the force of truth, though ſpeaking by no better a tongue than mine, has made it the chief condition of our duel, that I ſhould lay aſide the beſt weapons I have, and thoſe I can beſt handle; whereas, if I were allowed the freedom, in pleading for the four elements, to employ the arguments ſuggeſted to me by reaſon to demonſtrate them, I ſhould almoſt as little doubt of making you a proſelyte to thoſe unſever'd teachers, Truth and *Ariſtotle*, as I do of your candour and your judgment. And I hope you will however conſider, that that great favourite and interpreter of nature, *Ariſtotle*, who was (as his *Organum* witneſſes) the greateſt maſter of logick, that ever lived, diſclaimed the courſe taken by other petty philoſophers, (ancient and modern) who not attending the coherence and conſequences of their opinions, are more ſollicitous to make each particular opinion plauſible independently upon the reſt, than to frame them all ſo, as not only to be conſiſtent together, but to ſupport each other. For that great man, in his vaſt and comprehenſive intellect, ſo framed each of his notions, that being curiouſly adapted into one ſyſtem, they need not each of them any other defence than that, which their mutual coherence gives them; as it is in an arch, where each ſingle ſtone, which, if ſever'd from the reſt, would be perhaps defenceleſs, is ſufficiently ſecured by the ſolidity and entireneſs of the whole fabrick, of which it is a part. How juſtly this may be applied to the preſent caſe, I could eaſily ſhew you, if I were permitted to declare to you, how harmonious *Ariſtotle*'s doctrine of the elements is with his other principles of philoſophy; and how rationally he has deduced their number from that of the combinations of the four firſt qualities from the kinds of ſimple motion belonging to ſimple bodies, and from I know not how many other principles and phænomena of nature, which ſo conſpire with his doctrine of the elements, that they mutually ſtrengthen and ſupport each other. But ſince it is forbidden me to inſiſt on reflections of this kind, I muſt proceed to tell you, that though the aſſertors of the four elements, value reaſon ſo highly, and are furniſhed with arguments enough drawn from thence, to be ſatisfied, that there muſt be four elements, though no man had ever yet made any ſenſible trial to diſcover their number, yet they are not deſtitute of experience to ſatisfy others, that are wont to be more ſwayed by their ſenſes, than their reaſon. And I ſhall proceed to conſider the teſtimony of experience, when I ſhall have firſt advertiſed you, that if men were as perfectly rational, as it is to be wiſhed they were, this ſenſible way of probation would be as needleſs, as it is wont to be imperfect. For it is much more high and philoſophical to diſcover things *à priori*, than *à poſteriori*. And therefore the Peripateticks have not been very ſollicitous to gather experiments to prove their doctrines, contenting themſelves with a few only, to ſatisfy thoſe, that are not capable of a nobler conviction. And indeed they employ experiments rather to illuſtrate than to demonſtrate their doctrines, as aſtronomers uſe ſpheres of paſtboard, to deſcend to the capacities of ſuch, as muſt be taught by their ſenſes, for want of being arrived to a clear apprehenſion of purely mathematical notions and truths. I ſpeak thus *Eleutherius* (adds *Themiſtius*) only to do right to reaſon, and not out of diffidence of the experimental proof I am to alledge. For though I ſhall name but one, yet it is ſuch a one, as will make all other appear as needleſs, as it ſelf will be found ſatisfactory. For if you but conſider a piece of green wood burning in a chimney, you will readily diſcern in the diſbanded parts of it the four elements, of which we teach it and other mixt bodies to be compoſed. The fire diſcovers it ſelf in the flame by its own light; the ſmoke, by aſcending to the top of the chimney, and there readily vaniſhing into air, like a river loſing it ſelf in the ſea, ſufficiently manifeſts to what element it belongs, and gladly returns. The water in its own form, boiling and hiſſing at the ends of the burning wood, betrays itſelf to more than one of our ſenſes; and the aſhes by their weight, their fierineſs, and their dryneſs, put it paſt doubt, that they belong to the element of earth. If I ſpoke (continues *Themiſtius*) to leſs knowing perſons, I would perhaps make ſome excuſe for building upon ſuch an obvious and eaſy analyſis; but it would be, I fear, injurious, not to think ſuch an apology needleſs to you, who are too judicious either to think it neceſſary, that experiments to prove obvious truths ſhould be far fetched, or to wonder, that among ſo many mixt bodies, that are compounded of the four elements, ſome of them ſhould, upon a ſlight analyſis, manifeſtly exhibit the ingredients they conſiſt of. Eſpecially ſince it is very agreeable to the goodneſs of nature, to diſcloſe, even in ſome of the moſt obvious experiments, that men make, a truth ſo important and ſo requiſite to be taken notice of by them. Beſides, that our analyſis, by how much the more obvious we make it, by ſo much the more ſuitable it will be to the nature of that doctrine, which it is alledged to prove; which being as clear and intelligible to the underſtanding as obvious to the ſenſe, it is no marvel the learned part of mankind ſhould ſo long and ſo generally imbrace it. For this doctrine is very different from the whimſies of chymiſts and other modern innovators; of whoſe hypotheſes we may obſerve, as naturaliſts do of leſs perfect animals, that as they are haſtily formed, ſo they are commonly ſhort lived. For ſo theſe, as they are often framed in one week, are, perhaps, thought fit to be laughed at the next; and being built, perchance, but upon two or three experiments,

are deſtroyed by a third or fourth, whereas the doctrine of the four elements was framed by *Ariſtotle*, after he had leiſurely conſidered thoſe theories of former philoſophers, which are now with great applauſe revived, as diſcovered by theſe latter ages; and had ſo judiciouſly detected and ſupplied the errors and defect of former hypotheſes concerning the elements, that his doctrine of them has been ever ſince deſervedly embraced by the lettered part of mankind: all the philoſophers, that preceded him, having, in their ſeveral ages, contributed to the completeneſs of this doctrine, as thoſe of ſucceeding times have acquieſced in it. Nor has an hypotheſis, ſo deliberately and maturely eſtabliſhed, been called in queſtion, till in the laſt century *Paracelſus* and ſome few other ſooty empiricks, rather than (as they are fain to call themſelves) philoſophers, having their eyes darkened, and their brains troubled with the ſmoke of their own furnaces, began to rail at the Peripatetick doctrine, which they were too illiterate to underſtand, and to tell the credulous world, that they could ſee but three ingredients in mixed bodies; which, to gain themſelves the repute of inventors, they endeavoured to diſguiſe, by calling them, inſtead of earth, and fire, and vapour, ſalt, ſulphur, and mercury; to which they gave the canting title of hypoſtatical principles. But when they came to deſcribe them, they ſhewed how little they underſtood what they meant by them, by diſagreeing as much from one another, as from the truth they agreed in oppoſing: for they deliver their hypotheſes as darkly as their proceſſes; and it is almoſt as impoſſible for any ſober man to find their meaning, as it is for them to find their elixir. And, indeed, nothing has ſpread their philoſophy, but their great brags and undertakings; notwithſtanding all which, (ſays *Themiſtius* ſmiling) I ſcarce know any thing they have performed worth wondering at, ſave that they have been able to draw *Philoponus* to their party, and to engage him to the defence of an unintelligible hypotheſis, who knows ſo well as he does, that principles ought to be like diamonds, as well very clear, as perfectly ſolid.

THEMISTIUS having after theſe laſt words declared by his ſilence, that he had finiſhed his diſcourſe, *Carneades* addreſſing himſelf, as his adverſary had done, to *Eleutherius*, returned this anſwer to it: I hoped for a demonſtration, but I perceive *Themiſtius* hopes to put me off with an harangue, wherein he cannot have given me a greater opinion of his parts, than he has given me diſtruſt for his hypotheſis, ſince for it even a man of ſuch learning can bring no better arguments. The rhetorical part of his diſcourſe, though it make not the leaſt part of it, I ſhall ſay nothing to, deſigning to examine only the argumentative part, and leaving it to *Philoponus* to anſwer thoſe paſſages, wherein either *Paracelſus* or chymiſts are concerned. I ſhall obſerve to you, that in what he has ſaid beſides, he makes it his buſineſs to do theſe two things. The one to propoſe and make out an experiment to demonſtrate the common opinion about the four elements; and the other, to inſinuate divers things, which he thinks may repair the weakneſs of his argument, from experience, and upon other accounts bring ſome credit to the otherwiſe defenceleſs doctrine he maintains.

TO begin then with his experiment of the burning wood, it ſeems to me to be obnoxious to not a few conſiderable exceptions.

AND firſt, if I would now deal rigidly with my adverſary, I might here make a great queſtion of the very way of probation, which he and others employ, without the leaſt ſcruple, to evince, that the bodies commonly called mixt are made up of earth, air, water, and fire, which they are pleaſed alſo to call elements; namely, that upon the ſuppoſed analyſis made by the fire of the former ſort of concretes, there are wont to emerge bodies reſembling thoſe, which they take for the elements. For, not to anticipate here, what I foreſee I ſhall have occaſion to inſiſt on, when I come to diſcourſe with *Philoponus* concerning the right, that fire has to paſs for the proper and univerſal inſtrument of analyzing mixed bodies; not to anticipate that, I ſay, if I were diſpoſed to wrangle, I might alledge, that by *Themiſtius* his experiment it would appear rather, that thoſe he calls elements, are made of thoſe he calls mixed bodies, than mixed bodies of the elements. For, in *Themiſtius*'s analyzed wood, and in other bodies diſſipated and altered by the fire, it appears, and he confeſſes, that, which he takes for elementary fire and water, are made out of the concrete; but it appears not, that the concrete was made up of fire and water. Nor has either he, or any man, for aught I know, of his perſuaſion, yet proved, that nothing can be obtained from a body by the fire, that was not pre-exiſtent in it.

AT this unexpected objection, not only *Themiſtius*, but the reſt of the company appeared not a little ſurprized; but after a while, *Philoponus* conceiving his opinion, as well as that of *Ariſtotle*, concerned in that objection: You cannot ſure (ſays he, to *Carneades*) propoſe this difficulty, not to call it cavil, otherwiſe than as an exerciſe of wit, and not as laying any weight upon it. For how can that be ſeparated from a thing, that was not exiſtent in it? When, for inſtance, a refiner mingles gold and lead, and expoſing this mixture upon a cupel to the violence of the fire, thereby ſeparates it into pure and refulgent gold and lead (which driven off together with the droſs of the gold, is thence called *lithargyrum auri*) can any man doubt, that ſees theſe two ſo differing ſubſtances ſeparated from the maſs, that they were exiſtent in it, before it was committed to the fire?

I SHOULD (replies *Carneades*) allow your argument to prove ſomething, if, as men ſee, the refiners commonly take beforehand both lead and gold to make the maſs you ſpeak of, ſo we did ſee nature pull down a parcel of the element of fire, that is fancied to be placed I know not how many thouſand leagues off, contiguous to the orb of the moon, and to blend it with a quantity of each of the three elements, to compoſe every mixed body, upon whoſe reſolution

ſolution the fire preſents us with fire, and earth, and the reſt. And let me add, *Philoponus*, that to make your reaſoning cogent, it muſt be firſt proved, that the fire does only take the elementary ingredients aſunder, without otherwiſe altering them. For elſe it is obvious, that bodies may afford ſubſtances, which were not pre-exiſtent in them; as fleſh too long kept produces maggots; and old cheeſe, mites; which I ſuppoſe you will not affirm to be ingredients of thoſe bodies. Now that fire does not always barely ſeparate the elementary parts, but, ſometimes at leaſt, alter alſo the ingredients of bodies, if I did not expect ere long a better occaſion to prove it, I might make probable out of your very inſtance, wherein there is nothing elementary ſeparated by the great violence of the refiner's fire: the gold and lead, which are the two ingredients ſeparated upon the analyſis being confeſſedly yet perfectly mixed bodies, and the litharge being lead indeed, but ſuch lead, as is differing in conſiſtence and other qualities from what it was before. To which I muſt add, that I have ſometimes ſeen, and ſo queſtionleſs have you, much oftener, ſome parcels of glaſs adhering to the teſt or cupel, and this glaſs, though emergent, as well as the gold or litharge, upon your analyſis, you will not, I hope, allow to have been a third ingredient of the maſs, out of which the fire produced it.

BOTH *Philoponus* and *Themiſtius* were about to reply, when *Eleutherius* apprehending, that the proſecution of this diſpute would take up time, which might be better employed, thought fit to prevent them, by ſaying to *Carneades*, You made at leaſt half a promiſe, when you firſt propoſed this objection, that you would not (now at leaſt) inſiſt on it; nor indeed does it ſeem to be of abſolute neceſſity to your cauſe, that you ſhould. For though you ſhould grant, that there are elements, it would not follow, that there muſt be preciſely four; and therefore I hope you will proceed to acquaint us with your other and more conſiderable objections againſt *Themiſtius*'s opinion, eſpecially ſince there is ſo great a diſproportion in bulk betwixt the earth, water and air, on the one part, and thoſe little parcels of reſembling ſubſtances, that the fire ſeparates from concretes, on the other part, that I can ſcarce think, that you are ſerious, when to loſe no advantage againſt your adverſary, you ſeem to deny it to be rational, to conclude theſe great ſimple bodies to be the elements, and not the products of compounded ones.

WHAT you alledge (replies *Carneades*) of the vaſtneſs of the earth and water, has long ſince made me willing to allow them to be the greateſt and chief maſſes of matter to be met with here below: but I think I could ſhew you, if you would give me leave, that this will prove only, that the elements, as you call them, are the chief bodies, that make up the neighbouring part of the world, but not that they are ſuch ingredients as every mixt body muſt conſiſt of. But ſince you challenge me of ſomething of a promiſe, though it be not an entire one, yet I ſhall willingly perform it. And indeed I intended not, when I firſt mentioned this objection, to inſiſt on it at preſent againſt *Themiſtius*, (as I plainly intimated in my way of propoſing it) being only deſirous to let you ſee, that though I diſcerned my advantages, yet I was willing to forego ſome of them, rather than appear a rigid adverſary of a cauſe ſo weak, that it may with ſafety be favourably dealt with. But I muſt here profeſs, and deſire you to take notice of it, that though I paſs on to another argument, it is not becauſe I think this firſt invalid. For you will find, in the progreſs of our diſpute, that I had ſome reaſon to queſtion the very way of probation imployed both by Peripateticks and Chymiſts, to evince the being and number of the elements. For that there are ſuch, and that they are wont to be ſeparated by the analyſis made by fire, is indeed taken for granted by both parties, but has not (for aught I know) been ſo much as plauſibly attempted to be proved by either. Hoping then, that when we come to that part of our debate, wherein conſiderations relating to this matter are to be treated of, you will remember what I have now ſaid, and that I do rather for a while ſuppoſe, than abſolutely grant the truth of what I have queſtioned, I will proceed to another objection.

AND hereupon *Eleutherius* having promiſed him not to be unmindful, when time ſhould ſerve, of what he had declared;

I CONSIDER then (ſays *Carneades*) in the next place, that there are divers bodies, out of which *Themiſtius* will not prove in haſte, that there can be ſo many elements as four extracted by the fire. And I ſhould, perchance, trouble him, if I ſhould aſk him, what Peripatetick can ſhew us, (I ſay not, all the four elements, for that would be too rigid a queſtion, but) any one of them extracted out of gold by any degree of fire whatſoever. Nor is gold the only body in nature, that would puzzle an Ariſtotelian, (that is no more) to analyze by the fire into elementary bodies; ſince, for aught I have yet obſerved, both ſilver and calcined Venetian talc, and ſome other concretes, not neceſſary here to be named, are ſo fixt, that to reduce any of them into four heterogeneous ſubſtances has hitherto proved a taſk much too hard, not only for the diſciples of *Ariſtotle*, but thoſe of *Vulcan*, at leaſt, whilſt the latter have employed only fire to make the analyſis.

THE next argument (continues *Carneades*) that I ſhall urge againſt *Themiſtius*'s opinion ſhall be this; that as there are divers bodies, whoſe analyſis by fire cannot reduce them into ſo many heterogenous ſubſtances or ingredients as four, ſo there are others, which may be reduced into more, as the blood (and divers other parts) of men and other animals; which yield when analyzed five diſtinct ſubſtances, phlegm, ſpirit, oil, ſalt and earth, as experience has ſhewn us in diſtilling man's blood, hartſhorn, and divers other bodies, that, belonging to the animal-kingdom, abound with a not uneaſily ſequeſtrable ſalt.

THE

THE SCEPTICAL CHYMIST:

PART I.

I AM (ſays *Carneades*) ſo unwilling to deny *Eleutherius* any thing, that though, before the reſt of the company, I am reſolved to make good the part I have undertaken of a ſceptick; yet I ſhall readily, ſince you will have it ſo, lay aſide for a while the perſon of an adverſary to the Peripateticks and Chymiſts; and before I acquaint you with my objections againſt their opinions, acknowledge to you, what may be (whether truly or not) tolerably enough added, in favour of a certain number of principles of mixt bodies, to that grand and known argument from the analyſis of compound bodies, which I may poſſibly hereafter be able to confute.

AND that you may the more eaſily examine, and the better judge of what I have to ſay, I ſhall caſt it into a pretty number of diſtinct propoſitions, to which I ſhall not premiſe any thing; becauſe I take it for granted, that you need not be advertiſed, that much of what I am to deliver, whether for or againſt a determinate number of ingredients of mixt bodies, may be indifferently applied to the four Peripatetick elements, and the three chymical principles, though divers of my objections will more peculiarly belong to theſe laſt named; becauſe the chymical hypotheſis ſeeming to be much more countenanced by experience than the other, it will be expedient to inſiſt chiefly upon the diſproving of that; eſpecially ſince moſt of the arguments, that are imployed againſt it, may, by a little variation, be made to conclude, at leaſt as ſtrongly againſt the leſs plauſible Ariſtotelian doctrine.

To proceed then to my propoſitions, I ſhall begins with this, that

Prop. I. *It ſeems not abſurd to conceive, that at the firſt production of mixt bodies, the univerſal matter, whereof they among other parts of the univerſe conſiſted, was actually divided into little particles, of ſeveral ſizes and ſhapes, variouſly moved.*

THIS (ſays *Carneades*) I ſuppoſe you will eaſily enough allow. For beſides that, which happens in the generation, corruption, nutrition, and waſting of bodies, that, which we diſcover partly by our microſcopes of the extream littleneſs of even the ſcarce ſenſible parts of concretes, and partly by the chymical reſolutions of mixt bodies, and by divers other operations of ſpagyrical fires upon them, ſeems ſufficiently to manifeſt their conſiſting of parts very minute, and of differing figures. And that there does alſo intervene a various local motion of ſuch ſmall bodies, will ſcarce be denied; whether we chuſe to grant the origin of concretions aſſigned by *Epicurus*, or that related by *Moſes*. For the firſt, as you well know, ſuppoſes not only all mixt bodies, but all others to be produced by the various and caſual occurſions of atoms, moving themſelves to and fro by an internal principle in the immenſe or rather infinite vacuum. And as for the inſpired hiſtorian, he, informing us, that the great and wiſe author of things did not immediately create plants, beaſts, birds, *&c.* but produced them out of thoſe portions of the pre-exiſtent, though created, matter, that he calls water and earth, allows us to conceive, that the conſtituent particles, whereof theſe new concretes were to conſiſt, were variouſly moved, in order to their being connected into the bodies they were, by their various coalitions and textures, to compoſe.

BUT (continues *Carneades*) preſuming, that the firſt propoſition needs not be longer inſiſted on, I will paſs on to the ſecond, and tell you that

Prop. II. *Neither is it poſſible that of theſe minute particles divers of the ſmalleſt and neighbouring ones were here and there aſſociated into minute maſſes or cluſters, and did by their coalitions conſtitute great ſtore of ſuch little primary concretions or maſſes, as were not eaſily diſſipable into ſuch particles, as compoſed them.*

To what may be deduced, in favour of this aſſertion from the nature of the thing it ſelf, I will add ſomething out of experience; which, though I have not known it uſed to ſuch a purpoſe, ſeems to me more fairly to make out, that there may be elementary bodies, that the more queſtionable experiments of Peripreticks and Chymiſts prove, that there are ſuch. I conſider then, that gold will mix and be colliquated not only with ſilver, copper, tin and lead, but with antimony, *Regulus Martis*, and many other minerals, with which it will compoſe bodies very differing both from gold, and the other ingredients of the reſulting concretes. And the ſame gold will alſo by common aqua regis, and (I ſpeak it knowingly) by divers other menſtruums be reduced into a ſeeming liquor, inſomuch, that the corpuſcles of gold will, with thoſe of the menſtruum, paſs through cap-paper, and with them alſo coagulate into a cryſtalline ſalt. And I have further tried, that with a ſmall quantity of a certain ſaline ſubſtance I prepared, I can eaſily enough ſublime gold into the form of red cryſtals of a conſiderable length; and many other ways may gold be diſguiſed, and help to conſtitute bodies of very differing natures both from it and from one another, and nevertheleſs be afterward reduced to the ſelf-ſame numerical, yellow,

yellow, fixt, ponderous and malleable gold it was before its commixture. Nor is it only the fixedeſt of metals, but the moſt fugitive, that I may employ in favour of our propoſition: for quickſilver will, with divers metals, compoſe an amalgam; with divers menſtruums, it ſeems to be turned into a liquor; with aqua fortis, it will be brought into either a red or white powder, or precipitate; with oil of vitriol, into a pale yellow one; with ſulphur, it will compoſe a blood-red and volatile cinabar; with ſome ſaline bodies, it will aſcend in form of a ſalt, which will be diſſoluble in water; with regulus of antimony and ſilver, I have ſeen it ſublimed into a kind of cryſtals; with another mixture, I reduced it into a malleable body, into a hard and brittle ſubſtance by another: and ſome there are, who affirm, that by proper additaments they can reduce quickſilver into oil, nay into glaſs, to mention no more. And yet out of all theſe exotick compounds, we may recover the very ſame running mercury, that was the main ingredient of them, and was ſo diſguiſed in them. Now the reaſon (proceeds *Carneades*) that I have repreſented theſe things concerning gold and quickſilver, is, that it may not appear abſurd to conceive, that ſuch little primary maſſes or cluſters, as our propoſition mentions, may remain undiſſipated, notwithſtanding their entering into the compoſition of various concretions, ſince the corpuſcles of gold and mercury, though they be not primary concretions of the moſt minute particles of matter, but confeſſedly mixed bodies, are able to concur plentifully to the compoſition of ſeveral very differing bodies, without loſing their own nature or texture, or having their coheſion violated by the divorce of their aſſociated parts or ingredients.

GIVE me leave to add, (ſays *Eleutherius*) on this occaſion, to what you now obſerved, that as confidently as ſome chymiſts, and other modern innovators in philoſophy are wont to object againſt the Peripateticks, that from the mixture of their four elements there could ariſe but an inconſiderable variety of compound bodies; yet, if the Ariſtotelians were but half as well verſed in the works of nature, as they are in the writings of their maſter, the propoſed objection would not ſo calmly triumph, as for want of experiments they are fain to ſuffer it to do. For if we aſſign to the corpuſcles, whereof each element conſiſts, a peculiar ſize and ſhape, it may eaſily enough be manifeſted, that ſuch differingly-figured corpuſcles may be mingled in ſuch various proportions, and may be connected ſo many ſeveral ways, that an almoſt incredible number of variouſly qualified concretes may be compoſed of them. Eſpecially ſince the corpuſcles of one element may barely, by being aſſociated among themſelves, make up little maſſes of differing ſize and figure from their conſtituent parts: and ſince alſo, to the ſtrict union of ſuch minute bodies there ſeems oftentimes nothing requiſite, beſides the bare contact of a great part of their ſurfaces. And how great a variety of phænomena the ſame matter, without the addition of any other, and only ſeveral ways diſpoſed or contexed, is able to exhibit, may partly appear by the multitude of differing engines, which by the contrivances of ſkilful mechanicians, and the dexterity of expert workmen, may be made of iron alone. But, in our preſent caſe, being allowed to deduce compound bodies from four very differently qualified ſorts of matter, he, who ſhall but conſider, what you freſhly took notice of, concerning the new concretes reſulting from the mixture of incorporated minerals, will ſcarce doubt, but that the four elements, managed by nature's ſkill, may afford a multitude of differing compounds.

I AM thus far of your mind (ſays *Carneades*) that the Ariſtotelians might with probability deduce a much greater number of compound bodies from the mixture of their four elements, than according to their preſent hypotheſis they can, if inſtead of vainly attempting to deduce the variety and proprieties of all mixed bodies from the combinations and temperaments of the four elements, as they are (among them) endowed with the four firſt qualities, they had endeavoured to do it by the bulk and figure of the ſmalleſt parts of thoſe ſuppoſed elements. For from theſe more catholick and fruitful accidents of the elementary matter may ſpring a great variety of textures, upon whoſe account a multitude of compound bodies may very much differ from one another. And what I now obſerve touching the four Peripatetick elements, may be alſo applied, *mutatis mutandis*, (as they ſpeak) to the chymical principles. But (to take notice of that by the by) both the one and the other muſt, I fear, call in to their aſſiſtance ſomething, that is not elementary, to excite or regulate the motion of the parts of the matter, and diſpoſe them after the manner requiſite to the conſtitution of particular concretes. For that otherwiſe they are like to give us but a very imperfect account of the origin of very many mixed bodies, it would, I think, be no hard matter to perſuade you, if it would not ſpend time, and were no digreſſion, to examine, what they are wont to alledge of the origin of the textures and qualities of mixed bodies, from a certain ſubſtantial form, whoſe origination they leave more obſcure than what it is aſſumed to explicate.

BUT to proceed to a new propoſition.

Prop. III. *I ſhall not peremptorily deny, that from moſt of ſuch mixed bodies, as partake either of animal or vegetable nature, there may, by the help of the fire, be actually obtained a determinate number (whether three, four, or five, or fewer or more) of ſubſtances, worthy of differing denominations.*

OF the experiments, that induce me to make this conceſſion, I am like to have occaſion enough to mention ſeveral in the proſecution of my diſcourſe. And therefore, that I may not hereafter be obliged to trouble you and my ſelf with needleſs repetitions, I ſhall now only deſire you to take notice of ſuch experiments,

ments, when they ſhall be mentioned, and in your thoughts refer them hither.

To theſe three conceſſions, I have but this fourth to add, that

Prop. IV. *It may likewiſe be granted, that thoſe diſtinct ſubſtances, which concretes generally either afford, or are made up of, may, without very much inconvenience, be called the elements or principles of them.*

WHEN I ſaid, without very much inconvenience, I had in my thoughts that ſober admonition of *Galen*, *cum de re conſtat, de verbis non eſt litigandum*. And therefore alſo I ſcruple not to ſay, elements or principles, partly becauſe the chymiſts are wont to call the ingredients of mixed bodies, principles, as the Ariſtotelians name them, elements; I would here exclude neither: and, partly becauſe it ſeems doubtful, whether the ſame ingredients may not be called principles; as not being compounded of any more primary bodies; and elements, in regard that all mixed bodies are compounded of them. But I thought it requiſite to limit my conceſſion, by premiſing the words, *very much*, to the word *inconvenience*; becauſe, that though the inconvenience of calling the diſtinct ſubſtances, mentioned in the propoſition, elements or principles, be not very great, yet that it is impropriety of ſpeech, and conſequently in a matter of this moment not to be altogether overlooked, you will perhaps think, as well as I, by that time you ſhall have heard the following part of my diſcourſe, by which you will beſt diſcern what conſtruction to put upon the former propoſitions, and how far they may be looked upon, as things that I concede as true, and how far as things I only repreſent as ſpecious enough to be fit to be conſidered.

AND now *Eleutherius* (continues *Carneades*) I muſt reſume the perſon of a ſceptick, and, as ſuch, propoſe ſome part of what may be either diſliked, or at leaſt doubted of, in the common hypotheſis of the chymiſts; which if I examine with a little the more freedom, I hope I need not deſire you (a perſon to whom I have the happineſs of being ſo well known) to look upon it as ſomething more ſuitable to the employment, whereto the company has, for this meeting, doomed me, than either to my humour or my cuſtom.

Now though I might preſent you many things againſt the vulgar chymical opinion of the three principles, and the experiments wont to be alledged as demonſtrations of it; yet thoſe I ſhall at preſent offer you, may be conveniently enough comprehended in four capital conſiderations: touching all which I ſhall only premiſe this in general, that ſince it is not my preſent taſk ſo much to aſſert an hypotheſis of my own, as to give an account wherefore I ſuſpect the truth of that of the chymiſts, it ought not to be expected, that all my objections ſhould be of the moſt cogent ſort, ſince it is reaſon enough to doubt of a propoſed opinion, that there appears no cogent reaſon for it.

To come then to the objections themſelves; I conſider in the firſt place, that notwithſtanding what common chymiſts have proved or taught, it may reaſonably enough be doubted, how far, and in what ſenſe, fire ought to be eſteemed the genuine and univerſal inſtrument of analyzing mixed bodies.

THIS doubt, you may remember, was formerly mentioned, but ſo tranſiently diſcourſed of, that it will now be fit to inſiſt upon it; and manifeſt, that it was not ſo inconſiderately propoſed as our adverſaries then imagined.

BUT, before I enter any further into this diſquiſition, I cannot but here take notice, that it were to be wiſhed, our chymiſts had clearly informed us, what kind of diviſion of bodies by fire muſt determine the number of the elements: for it is nothing near ſo eaſy, as many ſeem to think, to determine diſtinctly the effects of heat, as I could eaſily manifeſt, if I had leiſure to ſhew you, how much the operations of fire may be diverſified by circumſtances. But not wholly to paſs by a matter of this importance, I will firſt take notice to you, that guaiacum (for inſtance) burnt with an open fire in a chimney, is ſequeſtered into aſhes and ſoot, whereas the ſame wood diſtilled in a retort does yield far other heterogeneities, (to uſe the Helmontian expreſſion) and is reſolved into oil, ſpirit, vinegar, water and charcoal; the laſt of which, to be reduced into aſhes, requires the being farther calcined than it can be in a cloſe veſſel. Beſides, having kindled amber, and held a clean ſilver ſpoon, or ſome other concave and ſmooth veſſel, over the ſmoke of its flame, I obſerved the ſoot, into which that fume condenſed, to be very differing from any thing, that I had obſerved to proceed from the ſteam of amber purpoſely (for that is not uſual) diſtilled *per ſe* in cloſe veſſels. Thus having, for trial's ſake, kindled camphire, and catched the ſmoke, that copiouſly aſcended out of the flame, it condenſed into a black and unctuous ſoot, which would not have been gueſſed by the ſmell or other properties to have proceeded from camphire: whereas having (as I ſhall otherwhere more fully declare) expoſed a quantity of that fugitive concrete to a gentle heat in a cloſe glaſs-veſſel, it, ſublimed up without ſeeming to have loſt any thing of its whiteneſs, or its nature; both which it retained, though afterwards I ſo increaſed the fire, as to bring it to fuſion. And, beſides camphire, there are divers other bodies (that I elſewhere name) in which the heat in cloſe veſſels is not wont to make any ſeparation of heterogeneities, but only a comminution of parts, thoſe that riſe firſt being homogeneal with the others, though ſubdivided into ſmaller particles: whence ſublimations have been ſtyled, *The Peſtles of the Chymiſts*. But not here to mention what I elſewhere take notice of, concerning common brimſtone once or twice ſublimed, that, expoſed to a moderate fire in ſubliming-pots, it riſes all into dry, and almoſt taſteleſs, flowers; whereas being expoſed to a naked fire, it affords ſtore of a ſaline and fretting liquor: not to mention this, I ſay, I will further obſerve to you, that as it is conſiderable in the analyſis of mixt bodies, whether the fire act on them, when they are expoſed to the open air,

air, or ſhut up in cloſe veſſels, ſo is the degree of fire, by which the analyſis is attempted, of no ſmall moment. For a mild balneum will ſever unfermented blood (for inſtance) but into phlegm and *caput mortuum*, the latter whereof (which I have ſometimes had) hard, bittle, and of divers colours, (tranſparent almoſt like toitoiſe-ſhell) preſſed by a good fire in a retort yields a ſpirit, an oil or two, and a volatile ſalt, beſides another *caput mortuum*. It may be alſo pertinent to our preſent deſign, to take notice of what happens in the making and diſtilling of ſoap; for by one degree of fire, the ſalt, the water, and the oil or greaſe, whereof that factitious concrete is made up, being boiled up together, are eaſily brought to mingle and incorporate into one maſs; but by another and further degree of heat, the ſame maſs may be again divided into an oleaginous and aqueous, a ſaline and an earthy part. And ſo we may obſerve, that impure ſilver and lead being expoſed together to a moderate fire, will thereby be colliquated into one maſs, and mingle *per minima*, as they ſpeak; whereas a much vehementer fire will drive or carry off the baſer metals (I mean the lead, and the copper or other alloy) from the ſilver, though not, for aught appears, ſeparate them from one another. Beſides, when a vegetable abounding in fixed ſalt is analyzed by a naked fire, as one degree of heat will reduce it into aſhes, (as the chymiſts themſelves teach us) ſo, by only a further degree of fire, thoſe aſhes may be vitrified and turned into glaſs. I will not ſtay to examine, how far a mere chymiſt might on this occaſion demand, if it be lawful for an Ariſtotelian to make aſhes (which he miſtakes for mere earth) paſs for an element, becauſe by one degree of fire it may be produced, why a chymiſt may not upon the like principle argue, that glaſs is one of the elements of many bodies, becauſe that alſo may be obtained from them, barely by the fire? I will not, I ſay, loſe time to examine this, but obſerve, that by a method of applying the fire, ſuch ſimilar bodies may be obtained from a concrete, as chymiſts have not been able to ſeparate; either by barely burning it in an open fire, or by barely diſtilling it in cloſe veſſels. For to me it ſeems very conſiderable, and I wonder, that men have taken ſo little notice of it, that I have not, by any of the common ways of diſtillation in cloſe veſſels, ſeen any ſeparation made of ſuch a volatile ſalt as is afforded us by wood, when that is firſt by an open fire divided into aſhes and ſoot, and that ſoot is afterwards placed in a ſtrong retort, and compelled by an urgent fire to part with its ſpirit, oil and ſalt. For though I dare not peremptorily deny, that in the liquors of guaiacum and other woods diſtilled in retorts after the common manner, there may be ſaline parts, which by reaſon of the analogy may pretend to the name of ſome kind of volatile ſalts; yet queſtionleſs there is a great diſparity betwixt ſuch ſalts, and that which we have ſometimes obtained upon the firſt diſtillation of ſoot, (though for the moſt part it has not been ſeparated from the firſt or ſecond rectification, and ſometimes not till the third). For we could never yet ſee ſeparated from woods analyzed only the vulgar way in cloſe veſſels any volatile ſalt in a dry and ſaline form, as that of ſoot, which we have often had very cryſtalline, and geometrically figured. And then, whereas the ſaline parts of the ſpirits of guaiacum, *&c.* appear upon diſtillation ſluggiſh enough, the ſalt of ſoot ſeems to be one of the moſt volatile bodies in all nature; and if it be well made, will readily aſcend with the mild heat of a furnace, warmed only by the ſingle wiek of a lamp, to the top of the higheſt glaſs veſſels that are commonly made uſe of for diſtillation. And beſides all this, the taſte and ſmell of the ſalt of ſoot are exceeding differing from thoſe of the ſpirits of guaiacum, *&c.* and the former not only ſmells and taſtes much leſs like a vegetable ſalt, than like that of hartſhorn, and other animal concretes; but in divers other properties ſeems more of kin to the family of animals, than to that of vegetable ſalts, as I may elſewhere (God permitting) have an occaſion more particularly to declare. I might likewiſe by ſome other examples manifeſt, that the chymiſts, to have dealt clearly, ought to have more explicitly and particularly declared by what degree of fire, and in what manner of application of it, they would have us judge a diviſion made by the fire to be a true analyſis into their principles, and the productions of it to deſerve the name of elementary bodies. But it is time, that I proceed to mention the particular reaſons, that incline me to doubt, whether the fire be the true and univerſal analyzer of mixt bodies; of which reaſons, what has been already objected may paſs for one.

IN the next place, I obſerve, that there are ſome mixt bodies, from which it has not been yet made appear, that any degree of fire can ſeparate either ſalt, or ſulphur, or mercury, much leſs all the three. The moſt obvious inſtance of this truth is gold, which is a body ſo fixed, and wherein the elementary ingredients (if it have any) are ſo firmly united to each other, that we find not in the operations, wherein gold is expoſed to the fire, how violent ſoever, that it does diſcernably ſo much as loſe of its fixedneſs or weight, ſo far is it from being diſſipated into thoſe principles, whereof one at leaſt is acknowledged to be fugitive enough; and ſo juſtly did the ſpagyrical poet ſomewhere exclaim,

Cuncta adeo miris illic compagibus hærent.

AND I muſt not omit on this occaſion to mention to you, *Eleutherius*, the memorable experiment, that I remember I met with in *Gaſto Claveus*, who, though a lawyer by profeſſion, ſeems to have had no ſmall curioſity and experience in chymical affairs. He relates then, that having put into one ſmall earthen veſſel, an ounce of the moſt pure gold, and into another the like weight of pure ſilver, he placed them both in that part of a glaſs-houſe furnace, wherein the workmen keep their metal, (as our Engliſh artificers call their liquid glaſs) continually melted; and, that having there kept both the

Gaſto Claveus *Apolog. Argur. & Cryſopera.*

the gold and the ſilver in conſtant fuſion for two months together, he afterwards took them out of the furnace and the veſſels, and weighing both of them again, found, that the ſilver had not loſt above a 12th part of its weight, but the gold had not of his loſt any thing at all. And though our author endeavours to give us of this a ſcholaſtick reaſon, which I ſuppoſe you would be as little ſatisfied with, as I was when I read it; yet for the matter of fact, which will ſerve our preſent turn, he aſſures us, that though it be ſtrange, yet experience it ſelf taught it him to be moſt true.

AND though there be not perhaps any other body to be found ſo perfectly fixed as gold, yet there are divers others ſo fixed or compoſed, at leaſt of ſo ſtrictly united parts, that I have not yet obſerved the fire to ſeparate from them any one of the chymiſts principles. I need not tell you, what complaints the more candid and judicious of the chymiſts themſelves are wont to make of thoſe boaſters, that confidently pretend, that they have extracted the ſalt or ſulphur of quickſilver, when they have diſguiſed it by additaments, wherewith it reſembles the concretes, whoſe names are given it; whereas by a ſkilful and rigid examen, it may be eaſily enough ſtripped of its diſguiſes, and made to appear again in the priſtine form of running mercury. The pretended ſalts and ſulphurs being ſo far from being elementary parts extracted out of the body of mercury, that they are rather (to borrow a term of the grammarians) de-compound bodies, made up of the whole metal and the menſtruum, or other additaments imployed to diſguiſe it. And as for ſilver, I never could ſee any degree of fire make it part with any of its three principles. And though the experiment lately mentioned from *Claveus* may beget a ſuſpicion, that ſilver may be diſſipated by fire, provided it be extremely violent and very laſting; yet it will not neceſſarily follow, that becauſe the fire was able at length to make the ſilver loſe a little of its weight, it was therefore able to diſſipate it into its principles. For firſt I might alledge, that I have obſerved little grains of ſilver to lie hid in the ſmall cavities (perhaps glaſſed over by a vitrifying heat) in crucibles, wherein ſilver has been long kept in fuſion, whence ſome goldſmiths of my acqaaintance make a benefit by grinding ſuch crucibles to powder, to recover out of them the latent particles of ſilver. And hence I might argue, that perhaps *Claveus* was miſtaken, and imagined, that ſilver to have been driven away by the fire, that indeed lay in minute parts hid in his crucible, in whoſe pores ſo ſmall a quantity, as he miſſed of ſo ponderous a body, might very well lie concealed.

BUT ſecondly, admitting, that ſome parts of the ſilver were driven away by the violence of the fire, what proof is there, that it was either the ſalt, the ſulphur, or the mercury of the metal, and not rather a part of it homogeneous to what remained? for beſides that the ſilver, that was left, ſeemed not ſenſibly altered, which probably would have appeared, had ſo much of any one of its principles been ſeparated from it; we find in other mineral bodies of a leſs permanent nature than ſilver, that the fire may divide them into ſuch minute parts, as to be able to carry them away with itſelf, without at all deſtroying their nature. Thus we ſee, that in the refining of ſilver, the lead, that is mixed with it (to carry away the copper or other ignoble mineral that embaſes the ſilver) will, if it be let alone, in time evaporate away upon the teſt; but if (as is moſt uſual amongſt thoſe, that refine great quantities of metals together) the lead be blown off from the ſilver by bellows, that, which would elſe have gone away in the form of unheeded ſteams, will, in great part, be collected not far from the ſilver, in the form of a darkiſh powder or calx; which, becauſe it is blown off from ſilver, they call litharge of ſilver. And thus *Agricola* in divers places informs us, when copper, or the ore of it is colliquated by the violence of the fire with Cadmia, the ſparks, that in great multitudes do fly upwards, do ſome of them ſtick to the vaulted roofs of the furnaces, in the form of little and (for the moſt part) white bubbles; which therefore the Greeks, and, in imitation of them, our drugſters call pompholyx: and others more heavy partly adhere to the ſides of the furnace, and partly (eſpecially if the covers be not kept upon the pots) fall to the ground, and by reaſon of their aſhy colour, as well as weight, were called by the ſame Greeks σποδὸς, which, I need not tell you, in their language ſignifies aſhes. I might add, that I have not found, that from Venetian talc (I ſay Venetian, becauſe I have found other kinds of that mineral more open) from the lapis oſſifragus, (which the ſhops call oſtiocolla) from *Muſcovia* glaſs, from pure and fuſible ſand (to mention now no other concretes) thoſe of my acquaintance, that have tried, have been able by the fire to ſeparate any one of the hypoſtatical principles: which you will the leſs ſcruple to believe, if you conſider, that glaſs may be made by the bare colliquation of the ſalt and earth remaining in the aſhes of a burnt plant, and that yet common glaſs, once made, does ſo far reſiſt the violence of the fire, that moſt chymiſts think it a body more undeſtroyable than gold it ſelf. For if the artificer can ſo firmly unite ſuch comparative groſs particles as thoſe of earth and ſalt, that make up common aſhes, into a body indiſſoluble by fire, why may not nature aſſociate in divers bodies, the more minute elementary corpuſcles, ſhe has at hand, too firmly to let them be ſeparable by the fire? And on this occaſion, *Eleutherius*, give me leave to mention to you two or three ſlight experiments, which will, I hope, be found more pertinent to our preſent diſcourſe, than at firſt perhaps they will appear. The firſt is, that, having (for trial's ſake) put a quantity of that fugitive concrete, camphire, into a glaſs veſſel, and placed it in a gentle heat, I found it (not leaving behind, according to my eſtimate, not ſo much as one grain) to ſublime to the top of the veſſel into flowers; which in whiteneſs, ſmell, *&c.* ſeemed not to differ from the camphire it ſelf. Another experiment is that of *Helmont*, who, in ſeveral places affirms, that a coal kept in a

Agricola *de Natura Foſſil.* Lib. 9. cap. 11, *and* 12.

glaſs

glaſs exactly cloſed will never be calcined to aſhes, though kept never ſo cloſe in a ſtrong fire. To countenance which, I ſhall tell you this trial of my own, that having ſometimes diſtilled ſome woods, as particularly box, whilſt our *caput mortuum* remained in the retort, it continued black like charcoal, though the retort were earthen, and kept red-hot in a vehement fire: but as ſoon as ever it was brought out of the candent veſſel into the open air, the burning coals did haſtily degenerate or fall aſunder, without the aſſiſtance of any new calcination, into pure white aſhes. And to theſe two I ſhall add but this obvious and known obſervation, that common ſulphur (if it be pure and freed from its vinegar) being leiſurely ſublimed in cloſe veſſels, riſes into dry flowers, which may be preſently melted into a body of the ſame nature with that which afforded them. Though, if brimſtone be burnt in the open air, it gives, you know, a penetrating fume, which being caught in a glaſs-bell, condenſes into that acid liquor called oil of ſulphur *per campanam*. The uſe I would make of theſe experiments, collated with what I lately told you out of *Agricola*, is this, that even among the bodies, that are not fixt, there are divers of ſuch a texture, that it will be hard to make it appear, how the fire, as chymiſts are wont to imploy it, can reſolve them into elementary ſubſtances. For ſome bodies being of ſuch a texture, that the fire can drive them into the cooler and leſs hot part of the veſſels, wherein they are included, and, if need be, remove them from place to place, to fly the greateſt heat, more eaſily than it can divorce their elements (eſpecially without the aſſiſtance of the air) we ſee, that our chymiſts cannot analyze them in cloſe veſſels, and of other compound bodies the open fire can as little ſeparate the elements. For what can a naked fire do to analyze a mixt body, if its component principles be ſo minute, and ſo ſtrictly united, that the corpuſcles of it need leſs heat to carry them up, than is requiſite to divide them into their principles? So that of ſome bodies the fire cannot in cloſe veſſels make any analyſis at all; and others will in the open air fly away in the forms of flowers or liquors, before the heat can prove able to divide them into their principles. And this may hold, whether the various ſimilar parts of a concrete be combined by nature or by art; for in factitious ſal armoniac we find the common and the urinous ſalts ſo well mingled, that both in the open fire, and in ſubliming veſſels they riſe together, as one ſalt, which ſeems in ſuch veſſels irreſoluble by fire alone. For I can ſhew you ſal armoniac, which after the ninth ſublimation does ſtill retain its compounded nature. And indeed I ſcarce know any one mineral, from which by fire alone chymiſts are wont to ſever any ſubſtance ſimple enough to deſerve the name of an element or principle. For though out of native cinnabar they diſtil quickſilver, and though from many of thoſe ſtones, that the ancients called *Pyrites*, they ſublime brimſtone, yet both that quickſilver and this ſulphur, being very often the ſame with the common minerals, that are ſold in the ſhops under thoſe names, are themſelves too much compounded bodies to paſs for the elements of ſuch. And thus much, *Eleutherius*, for the ſecond argument, that belongs to my firſt conſideration; the others I ſhall the leſs inſiſt on, becauſe I have dwelt ſo long upon this.

PROCEED we then, in the next place, to conſider, that there are divers ſeparations to be made by other means, which either cannot at all, or elſe cannot ſo well be made by the fire alone. When gold and ſilver are melted into one maſs, it would lay a great obligation upon refiners and goldſmiths, to teach them the art of ſeparating them by the fire, without the trouble and charge they are fain to be at to ſever them. Whereas they may be very eaſily parted by the affuſion of ſpirit of nitre or aqua fortis; which the French therefore call *eau de depart*. So likewiſe the metalline part of vitriol will not be ſo eaſily and conveniently ſeparated from the ſaline part, even by a violent fire, as by the affuſion of certain alkalizate ſalts, in a liquid form, upon the ſolution of vitriol made in common water. For thereby the acid ſalt of the vitriol leaving the copper, it had corroded, to join with the added ſalts, the metalline part will be precipitated to the bottom almoſt like mud. And that I may not give inſtances only in decompound bodies, I will add a not uſeleſs one of another kind. Not only chymiſts have not been able (for aught is vulgarly known) by fire alone to ſeparate true ſulphur from antimony; but though you may find in their books many plauſible proceſſes of extracting it, yet he, that ſhall make as many fruitleſs trials as I have done to obtain it, by moſt of them will, I ſuppoſe, be eaſily perſuaded, that the productions of ſuch proceſſes are antimonial ſulphurs rather in name than nature. But though antimony ſublimed by itſelf is reduced but to a volatile powder, or antimonial flowers, of a compounded nature like the mineral, that affords them; yet I remember, that ſome years ago I ſublimed out of antimony a ſulphur, and that in greater plenty than ever I ſaw obtained from that mineral, by a method, which I ſhall therefore acquaint you with, becauſe chymiſts ſeem not to have taken notice, of what importance ſuch experiments may be in the indagation of the nature, and eſpecially of the number of the elements. Having then purpoſely for trial ſake digeſted eight ounces of good and well powdered antimony with twelve ounces of oil of vitriol, in a well ſtopped glaſs-veſſel, for about ſix or ſeven weeks; and having cauſed the maſs (grown hard and brittle) to be diſtilled in a retort placed in ſand, with a ſtrong fire; we found the antimony to be ſo opened, or altered by the menſtruum, wherewith it had been digeſted, that whereas crude antimony, forced up by the fire, ariſes only in flowers, our antimony thus handled afforded us partly in the receiver, and partly in the neck and at the top of the retort, about an ounce of ſulphur, yellow and brittle like common brimſtone, and of ſo ſulphureous a ſmell, that upon the unluting the veſſels it infected the room with a ſcarce ſupportable ſtink. And this ſulphur, beſides the colour

and ſmell, had the perfect inflammability of common brimſtone, and would immediately kindle (at the flame of a candle) and burn blue like it. And though it ſeemed, that the long digeſtion, wherein our antimony and menſtruum were detained, did conduce to the better unlocking of the mineral, yet if you have not the leiſure to make ſo long a digeſtion, you may, by incorporating with powdered antimony a convenient quantity of oil of vitriol, and committing them immediately to diſtillation, obtain a little ſulphur like unto the common one, and more combuſtible than, perhaps, you will at firſt take notice of. For I have obſerved, that though (after its being firſt kindled) the flame would ſometimes go out too ſoon of itſelf, if the ſame lump of ſulphur were held again to the flame of a candle, it would be rekindled and burn a pretty while, not only after the ſecond, but after the third or fourth accenſion. You, to whom I think I ſhewed my way of diſcovering ſomething of ſulphureous in oil of vitriol, may perchance ſuſpect, *Eleutherius*, either that this ſubſtance was ſome venereal ſulphur, that lay hid in that liquor, and was by this operation only reduced into a manifeſt body; or elſe, that it was a compound of the unctuous parts of the antimony, and the ſaline ones of the vitriol, in regard, that (as *Günther* informs us) divers learned men would have ſulphur to be nothing but a mixture, made in the bowels of the earth, of vitriolate ſpirits and a certain combuſtible ſubſtance: But the quantity of ſulphur we obtained by digeſtion was much too great to have been latent in the oil of vitriol. And that vitriolate ſpirits are not neceſſary to the conſtruction of ſuch a ſulphur as ours, I could eaſily manifeſt, if I would acquaint you with the ſeveral ways, by which I have obtained, though not in ſuch plenty, a ſulphur of antimony, coloured and combuſtible like common brimſtone. And though I am not now minded to diſcover them, yet I ſhall tell you, that to ſatisfy ſome ingenious men, that diſtilled vitriolate ſpirits are not neceſſary to the obtaining of ſuch a ſulphur as we have been conſidering, I did by the bare diſtillation of only ſpirit of nitre, from its weight of crude antimony, ſeparate, in a ſhort time, a yellow and very inflammable ſulphur; which, for aught I know, deſerves as much the name of an element, as any thing, that chymiſts are wont to ſeparate from any mineral by the fire. I could perhaps tell you of other operations upon antimony, whereby that may be extracted from it, which cannot be forced out of it by the fire; but I ſhall reſerve them for a fitter opportunity, and only annex at preſent this ſlight, but not impertinent experiment: That whereas I lately obſerved to you, that the urinous and common ſalts, whereof ſal armoniac conſiſts, remained unſever'd by the fire in many ſucceſſive ſublimations, they may be eaſily ſeparated, and partly without any fire at all, by pouring upon the concrete finely powdered, a ſolution of ſalt of tartar, or of the ſalt of wood-aſhes: for upon your diligently mixing of theſe, you will find your noſe invaded with a very ſtrong ſmell of urine, and perhaps too your eyes forced to water, by the ſame ſubtile and piercing body, that produces the ſtink; both theſe effects proceeding from hence, that by the alcalizate ſalt, the ſea ſalt, that entered the compoſition of the ſal armoniac, is mortified and made more fixt, and thereby a divorce is made between it and the volatile urinous ſalt; which being at once ſet at liberty, and put into motion, begins preſently to fly away, and to offend the noſtrils and eyes it meets with by the way. And if the operation of theſe ſalts be in convenient glaſſes promoted by warmth, though but by that of a bath, the aſcending ſteams may eaſily be caught and reduced into a penetrant ſpirit, abounding with a ſalt, which I have ſometimes found to be ſeparable in a cryſtalline form. I might add to theſe inſtances, that whereas ſublimate, conſiſting, as you know, of ſalts and quickſilver combined and carried up together by heat, may be ſublimed, I know not how often, by a like degree of fire, without ſuffering any divorce of the component bodies, the mercury may be eaſily ſever'd from the adhering ſalts, if the ſublimate be diſtilled from ſalt of tartar, quick lime, or ſuch alkalizate bodies. But I will rather obſerve to you, *Eleutherius*, what divers ingenious men have thought ſomewhat ſtrange; that by ſuch an additament, that ſeems but only to promote the ſeparation, there may be eaſily obtained from a concrete, that by the fire alone is eaſily diviſible into all the elements, that vegetables are ſuppoſed to conſiſt of, ſuch a ſimilar ſubſtance, as differs in many reſpects from them all, and conſequently has by many of the moſt intelligent chymiſts been denied to be contained in the mixt body. For I know a way, and have practiſed it, whereby common tartar, without the addition of any thing, that is not perfectly a mineral, except ſalt-petre, may by one diſtillation in an earthen retort be made to afford good ſtore of real ſalt readily diſſoluble in water; which I found to be neither acid, nor of the ſmell of tartar, and to be almoſt as volatile as ſpirit of wine it ſelf, and to be indeed of ſo differing a nature from all, that is wont to be ſeparated by fire from tartar; and divers learned men, with whom I diſcourſed of it, could hardly be brought to believe, that ſo fugitive a ſalt could be afforded by tartar, till I aſſured it them upon my own knowledge. And if I did not think you apt to ſuſpect me to be rather too backward than too forward to credit or affirm unlikely things, I could convince you, by what I have yet lying by me, of that anomalous ſalt.

Lib. 1. *Obſervat.* cap. 6.

THE fourth thing, that I ſhall alledge to countenance my firſt conſideration, is, that the fire, even when it divides a body into ſubſtances of divers conſiſtencies, does not moſt commonly analyze it into hypoſtatical principles, but only diſpoſes its parts into new textures, and thereby produces concretes of a new indeed, but yet of a compound nature. This argument it will be requiſite for me to proſecute ſo fully hereafter, that I hope you will then confeſs, that it is not for want of good proofs, that I deſire leave to ſuſpend my proofs, till the ſeries of my diſcourſe

ſhall

ſhall make it more proper and ſeaſonable to propoſe them.

IT may be further alledged on the behalf of my firſt conſideration, that ſome ſuch diſtinct ſubſtances may be obtained from ſome concretes without fire, as deſerve no leſs the name of elementary, than many, that chymiſts extort by the violence of the fire.

WE ſee, that the inflammable ſpirit, or, as the chymiſts eſteem it, the ſulphur of wine, may not only be ſeparated from it by the gentle heat of a bath, but may be diſtilled either by the help of the ſun-beams, or even of a dunghill, being indeed of ſo fugitive a nature, that it is not eaſy to keep it from flying away, even without the application of external heat. I have likewiſe obſerved, that a veſſel full of urine being placed in a dunghill, the putrefaction is wont, after ſome weeks, ſo to open the body, that the parts diſbanding the ſaline ſpirit, will within no very long time, if the veſſel be not ſtopped, fly away of itſelf; inſomuch, that from ſuch urine I have been able to diſtil little or nothing elſe than a nauſeous phlegm, inſtead of the active and piercing ſalt and ſpirit, that it would have afforded, when firſt expoſed to the fire, if the veſſel had been carefully ſtopped.

AND this leads me to conſider, in the fifth place, that it will be very hard to prove, that there can no other body or way be given, which will, as well as the fire, divide concretes into ſeveral homogeneous ſubſtances, which may conſequently be called their elements or principles, as well as thoſe ſeparated or produced by the fire. For ſince we have lately ſeen, that nature can ſucceſsfully employ other inſtruments than the fire to ſeparate diſtinct ſubſtances from mixed bodies, how know we, but that nature has made, or art may make, ſome ſuch ſubſtance, as may be a fit inſtrument to analyze mixt bodies, or that ſome ſuch method may be found by human induſtry or luck, by whoſe means compound bodies may be reſolved into other ſubſtances, than ſuch as they are wont to be divided into by the fire? And why the products of ſuch an analyſis may not as juſtly be called the component principles of the bodies, that afford them, it will not be eaſy to ſhew; eſpecially ſince I ſhall hereafter make it evident, that the ſubſtances, which chymiſts are wont to call the ſalts, and ſulphurs, and mercuries of bodies, are not ſo pure and elementary as they preſume, and as their hypotheſis requires. And this may therefore be the more freely preſſed upon the chymiſts, becauſe neither the Paracelſians, nor the Helmontians, can reject it without apparent injury to their reſpective maſters. For *Helmont* does more than once inform his readers, that both *Paracelſus* and himſelf were poſſeſſors of the famous liquor, alkaheſt, which for its great power in reſolving bodies irreſoluble by vulgar fires, he ſomewhere ſeems to call *Ignis Gehennæ*. To this liquor he aſcribes, (and that in great part upon his own experience) ſuch wonders, that if we ſuppoſe them all true, I am ſo much the more a friend to knowledge than to wealth, that I ſhould think the alkaheſt a nobler and more deſirable ſecret, than the philoſophers ſtone it ſelf. Of this univerſal diſſolvent he relates, that having digeſted with it for a competent time a piece of oaken charcoal, it was thereby reduced into a couple of new and diſtinct liquors, diſcriminated from each other by their colour and ſituation, and that the whole body of the coal was reduced into thoſe liquors, both of them ſeparable from his immortal menſtruum, which remained as fit for ſuch operations as before. And he moreover tells us in divers places of his writings, that by his powerful, and unwearied agent, he could diſſolve metals, marchaſites, ſtones, vegetable and animal bodies of what kind ſoever, and even glaſs itſelf (firſt reduced to powder,) and in a word, all kind of mixt bodies in the world, into their ſeveral ſimilar ſubſtances, without any reſidence or *caput mortuum*. And laſtly, we may gather this further from his informations, that the homogeneous ſubſtances obtainable from compound bodies by his piercing liquor, were oftentimes different enough both as to number and as to nature, from thoſe into which the ſame bodies are wont to be divided by common fire. Of which I ſhall need in this place to mention no other proof, than that whereas we know, that in our common analyſis of a mixt body, there remains a terreſtrial and very fixed ſubſtance, oftentimes aſſociated with a ſalt as fixed; our author tells us, that by his way he could diſtil over all concretes without any *caput mortuum*, and conſequently could make thoſe parts of the concrete volatile, which in the vulgar analyſis would have been fixt. So that if our chymiſts will not reject the ſolemn and repeated teſtimony of a perſon, who cannot but be acknowledged for one of the greateſt ſpagyriſts, that they can boaſt of, they muſt not deny, that there is to be found in nature another agent able to analyze compound bodies leſs violently, and both more genuinely and more univerſally than the fire. And for my own part, though I cannot but ſay on this occaſion what (you know) our friend Mr. *Boyle* is wont to ſay, when he is aſked his opinion of any ſtrange experiment, *That he, that hath ſeen it, hath more reaſon to believe it, than he that hath not*; yet I have found *Helmont* ſo faithful a writer, even in divers of his improbable experiments (I always except that extravagant treatiſe *De Magnetica Vulnerum Curatione*, which ſome of his friends affirm to have been firſt publiſhed by his enemies) that I think it ſomewhat harſh to give him the lye, eſpecially to what he delivers upon his own proper trial. And I have heard from very credible eye-witneſſes ſome things, and ſeen ſome others my ſelf, which argue ſo ſtrongly, that a circulated ſalt, or a menſtruum (ſuch as it may be) may, by being abſtracted from compound bodies, whether mineral, animal, or vegetable, leave them more unlocked than a wary naturaliſt would eaſily believe; that I dare not confidently meaſure the power of nature and art by that of the menſtruums, and other inſtruments that eminent chymiſts themſelves are as yet wont to employ about the analyzing of bodies; nor deny, that a menſtruum

ſtruum may at leaſt from this or that particular concrete obtain ſome apparently ſimilar ſubſtance, differing from any obtainable from the ſame body by any degree or manner of application of the fire. And I am the more backward to deny peremptorily, that there may be ſuch openers of compound bodies, becauſe among the experiments, that make me ſpeak thus warily, there wanted not ſome, in which it appeared not, that one of the ſubſtances, not ſeparable by common fires and menſtruums, could retain any thing of the ſalt, by which the ſeparation was made.

AND here, *Eleutherius*, (ſays *Carneades*) I ſhould conclude as much of my diſcourſe as belongs to the firſt conſideration I propoſed, but that I foreſee, that what I have delivered will appear liable to two ſuch ſpecious objections, that I cannot ſafely proceed any further, till I have examined them.

AND firſt, one ſort of oppoſers will be forward to tell me, that they do not pretend by fire alone to ſeparate out of all compound bodies their hypoſtatical principles; it being ſufficient, that the fire divides them into ſuch, though afterwards they employ other bodies to collect the ſimilar parts of the compound; as it is known, that though they make uſe of water to collect the ſaline parts of aſhes from the terreſtrial, wherewith they are blended, yet it is the fire only, that incinerates bodies, and reduces the fixed part of them into the ſalt and earth, whereof aſhes are made up. This objection is not, I confeſs, inconſiderable, and I might in great part allow of it, without granting it to make againſt me, if I would content my ſelf to anſwer, that it is not againſt thoſe, that make it, that I have been diſputing, but againſt thoſe vulgar chymiſts, who themſelves believe, and would fain make others do ſo, that the fire is not only an univerſal, but an adequate and ſufficient inſtrument to analyze mixt bodies with. For as to their practice of extracting the fixed ſalt out of aſhes by the affuſion of water, it is obvious to alledge, that the water does only aſſemble together the ſalt the fire had before divided from the earth: as a ſieve does not further break the corn, but only bring together into two diſtinct heaps the flower and the bran, whoſe corpuſcles before lay promiſcuouſly blended together in the meal. This I ſay I might alledge, and thereby exempt my ſelf from the need of taking any farther notice of the propoſed objection. But not to loſe the riſe it may afford me of illuſtrating the matter under conſideration, I am content briefly to conſider it, as far forth as my preſent diſquiſition may be concerned in it.

NOT to repeat then what has been already anſwered, I ſay further, that though I am ſo civil an adverſary, that I will allow the chymiſts, after the fire has done all its work, the uſe of fair water to make their extractions with, in ſuch caſes wherein the water does not cooperate with the fire to make the analyſis; yet ſince I grant this but upon ſuppoſition, that the water does only waſh off the ſaline particles, which the fire alone has before extricated in the analyzed body, it will not be reaſonable, that this conceſſion ſhould extend to other liquors, that may add to what they diſſolve, nor ſo much as to other caſes than thoſe newly mentioned: which limitation I deſire you would be pleaſed to bear in mind, till I ſhall anon have occaſion to make uſe of it. And this being thus premiſed, I ſhall proceed to obſerve,

FIRST, that many of the inſtances I propoſed in the preceding diſcourſe are ſuch, that the objection we are conſidering will not at all reach them. For fire can no more with the aſſiſtance of water, than without it, ſeparate any of the three principles, either from gold, ſilver, mercury, or ſome others of the concretes named above.

HENCE we may infer, that fire is not an univerſal analyzer of all mixt bodies, ſince of metals and minerals, wherein chymiſts have moſt exerciſed themſelves, there appear ſcarce any, which they are able to analyze by fire, nay, from which they can unqueſtionably ſeparate ſo much as any one of their hypoſtatical principles; which may well appear no ſmall diſparagement, as well to their hypotheſis, as to their pretenſions.

IT will alſo remain true, notwithſtanding the objection, that there may be other ways, than the wonted analyſis by fire, to ſeparate from a compound body ſubſtances as homogeneous as thoſe, that chymiſts ſcruple not to reckon among their *tria prima*, (as ſome of them, for brevity ſake, call their three principles.)

AND it appears, that by convenient additaments ſuch ſubſtances may be ſeparated by the help of the fire, as could not be ſo by the fire alone: witneſs the ſulphur of antimony.

AND laſtly, I muſt repreſent, that ſince it appears too, that the fire is but one of the inſtruments, that muſt be employed in the reſolution of bodies, we may reaſonably challenge the liberty of doing two things. For whenever any menſtruum or other additament is employed, together with the fire, to obtain a ſulphur or a ſalt from a body, we may well take the freedom to examine, whether or no that menſtruum do barely help to ſeparate the principle obtained by it, or whether there intervene not a coalition of the parts of the body wrought upon with thoſe of the menſtruum, whereby the produced concrete may be judged to reſult from the union of both. And it will be farther allowable for us to conſider, how far any ſubſtance, ſeparated by the help of ſuch additaments, ought to paſs for one of the *tria prima*; ſince by one way of handling the ſame mixt body, it may, according to the nature of the additaments, and the method of working upon it, be made to afford differing ſubſtances from it by other additaments, and another method, nay and (as may appear by what I formerly told you about tartar) differing from any of the ſubſtances, into which a concrete is diviſible by the fire without additaments, though, perhaps, thoſe additaments do not, as ingredients, enter the compoſition of the obtained body, but only diverſify the operation of the fire upon the concrete; and though that concrete by the fire alone may be divided into a number of differing ſubſtances, as great

as

as any of the chymiſts, that I have met with, teach us that of the elements to be. And having ſaid thus much (ſays *Carneades*) to the objection likely to be propoſed by ſome chymiſts, I am now to examine that, which I foreſee will be confidently preſſed by divers Peripateticks, who, to prove fire to be the true analyzer of bodies, will plead, That it is the very definition of heat given by *Ariſtotle*, and generally received, *congregare homogenea, & heterogenea ſegregare*, 'to aſſemble things of a 'reſembling, and disjoin thoſe of a differing 'nature.' To this I anſwer, that this effect is far from being ſo eſſential to heat, as it is generally imagined; for it rather ſeems, that the true and genuine property of heat is, to ſet a moving, and thereby to diſſociate the parts of bodies, and ſubdivide them into minute particles, without regard to their being homogeneous or heterogeneous; as is apparent in the boiling of water, the diſtillation of quickſilver, or the expoſing of bodies to the action of the fire, whoſe parts either are not (at leaſt in that degree of heat appear not) diſſimilar, where, all that the fire can do, is to divide the body into very minute parts, which are of the ſame nature with one another, and with their totum, as their reduction by condenſation evinces. And even when the fire ſeems moſt ſo *congregare homogenea, & ſegregare heterogenea*, it produces that effect but by accident; for the fire does but diſſolve the cement, or rather ſhatter the frame, or ſtructure, that kept the heterogeneous parts of bodies together, under one common form; upon which diſſolution the component particles of the mixt, being freed and ſet at liberty, do naturally, and oftentimes without any operation of the fire, aſſociate themſelves each with its like, or rather do take thoſe places, which their ſeveral degrees of gravity and levity, fixedneſs or volatility (either natural, or adventitious from the impreſſion of the fire) aſſign them. Thus in the diſtillation (for inſtance) of man's blood, the fire does firſt begin to diſſolve the nexus or cement of the body; and then the water, being the moſt volatile, and eaſy to be extracted, is either by the igneous atoms, or the agitation they are put into by the fire, firſt carried up, till forſaken by what carried it up, its weight ſinks it down, into the receiver: but all this while the other principles of the concrete remain unſever'd, and require a ſtronger degree of heat to make a ſeparation of its more fixt elements; and therefore the fire muſt be increaſed, which carries over the volatile ſalt and the ſpirit, they being, though believed to be differing principles, and though really of different conſiſtency, yet of an almoſt equal volatility. After them, as leſs fugitive, comes over the oil, and leaves behind the earth and the alcali, which being of an equal fixedneſs, the fire ſevers them not, for all the definition of the ſchools. And if into a red-hot earthen or iron retort you caſt the matter to be diſtilled, you may obſerve, as I have often done, that the predominant fire will carry up all the volatile elements confuſedly in one fume, which will afterwards take their places in the receiver, either according to the degree of their gravity, or according to the exigency of their reſpective textures; the ſalt adhering, for the moſt part, to the ſides and top, and the phlegm faſtening itſelf there too in great drops, the oil and ſpirit placing themſelves under, or above one another, according as their ponderouſneſs makes them ſwim or ſink. For it is obſervable, that though oil or liquid ſulphur be one of the elements ſeparated by this fiery analyſis, yet the heat, which accidentally unites the particles of the other volatile principles, has not always the ſame operation on this, there being divers bodies, which yield two oils, whereof the one ſinks to the bottom of that ſpirit, on which the other ſwims; as I can ſhew you in ſome oils of the ſame deer's blood, which are yet by me: nay, I can ſhew you two oils carefully made of the ſame parcel of human blood, which not only differ extremely in colour, but ſwim upon one another without mixture, and, if by agitation confounded, will of themſelves divorce again.

AND that the fire doth oftentimes divide bodies, upon the account, that ſome of their parts are more fixt, and ſome more volatile, how far ſoever either of theſe two may be from a pure elementary nature, is obvious enough, if men would but heed it in the burning of wood, which the fire diſſipates into ſmoke and aſhes: for not only the latter of theſe is confeſſedly made up of two ſuch differing bodies as earth and ſalt; but the former being condenſed into that ſoot, which adheres to our chimneys, diſcovers itſelf to contain both ſalt and oil, and ſpirit and earth, (and ſome portion of phlegm too) which being, all almoſt, equally volatile to that degree of fire, which forces them up, (the more volatile parts helping, perhaps, as well as the urgency of the fire, to carry up the more fixt ones, as I have often tried in dulcified colcothar, ſublimed by ſal armoniac blended with it) are carried up together, but may afterwards be ſeparated by other degrees of fire, whoſe orderly gradation allows the diſparity of their volatileneſs to diſcover it ſelf. Beſides, if differing bodies united into one maſs be both ſufficiently fixt, the fire finding no parts volatile enough to be expelled or carried up, makes no ſeparation at all; as may appear by a mixture of colliquated ſilver and gold, whoſe component metals may be eaſily ſever'd by aqua fortis or aqua regis (according to the predominancy of the ſilver or the gold) but in the fire alone, though vehement, the metals remain unſever'd, the fire only dividing the body into ſmaller particles (whoſe littleneſs may be argued from their fluidity) in which either the little nimble atoms of fire, or its briſk and numberleſs ſtrokes upon the veſſels, hinder reſt and continuity, without any ſequeſtration of elementary principles. Moreover, the fire ſometimes does not ſeparate, ſo much as unite, bodies of a differing nature; provided they be of an almoſt reſembling fixedneſs, and have in the figure of their parts an aptneſs, to coalition, as we ſee in the making of many plaiſters, ointments, *&c.* And in ſuch metalline mixtures as that made by melting

melting together two parts of clean braſs with one of pure copper, of which ſome ingenious tradeſmen caſt ſuch curious patterns (for gold and ſilver works) as I have ſometimes taken great pleaſure to look upon. Sometimes the bodies mingled by the fire are differing enough as to fixidity and volatility, and yet are ſo combined by the firſt operation of the fire, that it ſelf does ſcarce afterwards ſeparate them, but only pulverize them; whereof an inſtance is afforded us by the common preparation of mercurius dulcis, where the ſaline particles of the vitriol, ſea-ſalt, and ſometimes nitre, employed to make the ſublimate, do ſo unite themſelves with the mercurial particles made uſe of, firſt to make ſublimate, and then to dulcify it, that the ſaline and metalline parts ariſe together in many ſucceſſive ſublimations, as if they all made but one body. And ſometimes too, the fire does not only not ſever the differing elements of a body, but combine them ſo firmly, that nature her ſelf does very ſeldom, if ever, make unions leſs diſſoluble. For the fire meeting with ſome bodies exceedingly and almoſt equally fixt, inſtead of making a ſeparation, makes an union ſo ſtrict, that it ſelf, alone, is unable to diſſolve it; as we ſee, when an alcalizate ſalt and the terreſtrial reſidue of the aſhes are incorporated with pure ſand, and by vitrification made one permanent body, (I mean the coarſe or greeniſh ſort of glaſs) that mocks the greateſt violence of the fire, which though able to marry the ingredients of it, yet is not able to divorce them. I can ſhew you ſome pieces of glaſs, which I ſaw flow down from an earthen crucible purpoſely expoſed for a good while, with ſilver in it, to a very vehement fire. And ſome that deal much in the fuſion of metals inform me, that the melting of a great part of a crucible into glaſs is no great wonder in their furnaces. I remember, I have obſerved too in the melting of great quantities of iron out of the ore, by the help of ſtore of charcoal (for they affirm that ſea-coal will not yield a flame ſtrong enough) that by the prodigious vehemence of the fire, excited by vaſt bellows (made to play by great wheels turned about by water) part of the materials expoſed to it, was, inſtead of being analyzed, colliquated, and turned into a dark, ſolid, and very ponderous glaſs, and that in ſuch quantity, that in ſome places I have ſeen the very high-ways, near ſuch iron-works, mended with heaps of ſuch lumps of glaſs, inſtead of ſtones and gravel. And I have alſo obſerved, that ſome kind of fire-ſtone it ſelf, having been employed in furnaces wherein it was expoſed to very ſtrong and laſting fires, has had all its fixt parts ſo wrought on by the fire, as to be perfectly vitrified, which I have tried by forcing from it pretty large pieces of perfect and tranſparent glaſs. And leſt you might think, *Eleutherius*, that the queſtioned definition of heat may be demonſtrated, by the definition, which is wont to be given and acquieſced in, of its contrary quality, cold; whoſe property is taught to be *tam homogenea, quam heterogenea congregare*, give me leave to repreſent to you, that neither is this definition unqueſtionable; for not to mention the exceptions, which a logician, as ſuch, may take at it, I conſider, that the union of heterogeneous bodies, which is ſuppoſed to be the genuine production of cold, is not performed by every degree of cold. For we ſee, for inſtance, that in the urine of healthy men, when the liquor has been ſuffered a while to ſtand, the cold makes a ſeparation of the thinner part from the groſſer, which ſubſides to the bottom, and grows opacous there; whereas, if the urinal be warm, theſe parts readily mingle again, and the whole liquor becomes tranſparent as before. And when, by glaciation, wood, ſtraw, duſt, water, *&c.* are ſuppoſed to be united into one lump of ice, the cold does not cauſe any real union or adunation, (if I may ſo ſpeak) of theſe bodies, but only hardening the aqueous parts of the liquor into ice, the other bodies, being accidentally preſent in that liquor, are frozen up in it, but not really united. And accordingly, if we expoſe a heap of money, conſiſting of gold, ſilver and copper coins, or any other bodies of differing natures, which are deſtitute of aqueous moiſture, capable of congelation, to never ſo intenſe a cold, we find not, that theſe differing bodies are at all thereby ſo much as compacted, much leſs united together; and even in liquors themſelves we find phænomena, which induce us to queſtion the definition, which we are examining. If *Paracelſus* his authority were to be looked upon as a ſufficient proof in matters of this nature, I might here inſiſt on that proceſs of his, whereby he teaches, that the eſſence of wine may be ſever'd from the phlegm and ignoble part by the aſſiſtance of congelation. And becauſe much weight has been laid upon this proceſs, not only by Paracelſians, but other writers, ſome of whom ſeem not to have peruſed it themſelves, I ſhall give you the entire paſſage in the author's own words, as I lately found them in the ſixth book of his *Archidoxis*, an extract whereof I have yet about me; and it ſounds thus: *De vino ſciendum eſt, fæcem phlegmaque ejus eſſe mineram, & vini ſubſtantiam eſſe corpus, in quo conſervatur eſſentia, prout auri in auro latet eſſentia. Juxta quod practicam nobis ad memoriam ponimus, ut non obliviſcamur, ad hunc modum: Recipe Vinum vetuſtiſſimum & optimum, quod habere poteris, calore ſaporeque ad placitum; hoc in vas vitreum infundas, ut tertiam ejus partem impleat, & ſigillo Hermetis occluſum in equino ventre menſibus quatuor, & in continuato calore tencatur, qui non deficiat. Quo peracto, hyeme, cum frigus & gelu maxime ſæviunt, his per menſem exponatur, ut congeletur. Ad hunc modum frigus vini ſpiritum una cum ejus ſubſtantia protrudit in vini centrum, ac ſeparat a phlegmate: congelatum abjice; quod vero congelatum non eſt, id ſpiritum cum ſubſtantia eſſe judicato. Hunc in pelicanum poſitum in arenæ digeſtione non adeo calida per aliquod tempus manere finito; poſtmodum eximito vini magiſterium, de quo locuti ſumus.*

BUT I dare not, *Eleutherius*, lay much weight upon this proceſs, becauſe I have found, that, if it were true, it would be but ſeldom practicable in this country upon the beſt wine: for

though this preſent winter hath been extraordinary cold, yet in very keen froſts, accompanied with laſting ſnows, I have not been able in any meaſure to freeze a thin phial full of ſack; and even with ſnow and ſalt I could freeze little more than the ſurface of it; and I ſuppoſe, *Eleutherius*, that it is not every degree of cold, that is capable of congealing liquors, which is able to make ſuch an analyſis (if I may ſo call it) of them by ſeparating their aqueous and ſpirituous parts: for I have ſometimes, though not often, frozen ſeverally red-wine, urine and milk, but could not obſerve the expected ſeparation. And the Dutchmen, that were forced to winter in that icy region near the arctick circle, called *Nova Zembla*, although they relate, as we ſhall ſee below, that there was a ſeparation of parts made in their frozen beer about the middle of *November*, yet of the freezing of their ſack in *December* following they give but this account: *Yea and our ſack, which is ſo hot, was frozen very hard, ſo that when we were every man to have his part, we were forced to melt it in the fire; which we ſhared every ſecond day, about half a pint for a man, wherewith we were forced to ſuſtain our ſelves.* In which words they imply not, that their ſack was divided by the froſt into differing ſubſtances, after ſuch manner as their beer had been. All which notwithſtanding, *Eleutherius*, ſuppoſe that it may be made to appear, that even cold ſometimes may *congregare homogenea, & heterogenea ſegregare*; and to manifeſt this, I may tell you, that I did once, purpoſely, cauſe to be decocted in fair water a plant abounding with ſulphureous and ſpirituous parts; and having expoſed the decoction to a keen north-wind in a very froſty night, I obſerved, that the more aqueous parts of it were turned by the next morning into ice, towards the innermoſt part of which, the more agile and ſpiritous parts, as I then conjectured, having retreated, to ſhun, as much as might be, their invironing enemy, they had there preſerved themſelves unfrozen in the form of a high coloured liquor; the aqueous and ſpirituous parts having been ſo ſlightly (blended rather than) united in the decoction, that they were eaſily ſeparable by ſuch a degree of cold, as would not have been able to have divorced the parts of urine or wine, which by fermentation or digeſtion are wont, as trial has informed me, to be more intimately aſſociated each with other. But I have already intimated, *Eleutherius*, that I ſhall not inſiſt on this experiment, not only becauſe, having made it but once, I may poſſibly have been miſtaken in it; but alſo (and that principally) becauſe of that much more full and eminent experiment of the ſeparative virtue of extreme cold, that was made againſt their wills, by the forementioned Dutchmen that wintered in *Nova Zembla*; the relation of whoſe voyage being a very ſcarce book, it will not be amiſs to give you that memorable part of it, which concerns our preſent theme, as I cauſed the paſſage to be extracted out of the Engliſhed voyage it ſelf.

'GERARD DE VEER, *John Cornelyſon* and 'others, ſent out of *Amſterdam*, *Anno Dom.* '1596, being forced by unſeaſonable weather 'to winter in *Nova Zembla*, near *Ice-haven*; 'on the thirteenth of *October*, three of us (ſays 'the relation) went aboard the ſhip, and laded 'a ſled with beer; but when we had laden it, 'thinking to go to our houſe with it, ſuddenly 'there aroſe ſuch a wind, and ſo great a ſtorm 'and cold, that we were forced to go into the 'ſhip again, becauſe we were not able to ſtay 'without; and we could not get the beer into 'the ſhip again, but were forced to let it ſtand 'without upon the ſled. The fourteenth, as 'we came out of the ſhip, we found the barrel 'of beer ſtanding upon the ſled, but it was 'faſt frozen at the heads; yet by reaſon of 'the great cold, the beer, that purged out, froze 'as hard upon the ſide of the barrel, as if it 'had been glued thereon: and in that ſort 'we drew it to our houſe, and ſet the barrel 'an end, and drank it up; but firſt we were 'forced to melt the beer, for there was ſcarce 'any unfrozen beer in the barrel: but in that 'thick yeaſt, that was unfrozen, lay the 'ſtrength of the beer, ſo that it was too ſtrong 'to drink alone, and, that which was frozen 'taſted like water; and being melted, we 'mixed one with the other, and ſo drank it; 'but it had neither ſtrength nor taſte.'

AND on this occaſion I remember, that having, the laſt very ſharp winter, purpoſely tried to freeze, among other liquors, ſome beer moderately ſtrong, in glaſs-veſſels, with ſnow and ſalt, I obſerved, that there came out of the neck a certain thick ſubſtance, which, it ſeems, was much better able than the reſt of the liquor (that I found turned into ice) to reſiſt a froſt; and which, by its colour and conſiſtence, ſeemed manifeſtly enough to be yeaſt; whereat, I confeſs, I ſomewhat marvelled, becauſe I did not either diſcern by the taſte, or find by enquiry, that the beer was at all too new, to be very fit to be drank. I might confirm the Dutchmen's relation, by what happened a while ſince to a near friend of mine, who complained to me, that having brewed ſome beer or ale for his own drinking in *Holland* (where he then dwelt) the keenneſs of the late bitter winter froze the drink, ſo as to reduce it into ice, and a ſmall proportion of a very ſtrong and ſpirituous liquor. But I muſt not entertain you any longer concerning cold, not only becauſe you may think I have but loſt my way into a theme, which does not directly belong to my preſent undertaking; but becauſe I have already enlarged my ſelf too much, upon the firſt conſideration I propoſed, though it appears ſo much a paradox, that it ſeemed to require, that I ſhould ſay much to keep it from being thought a meer extravagance: yet ſince I undertook but to make the common aſſumption of our Chymiſts and Ariſtotelians appear queſtionable, I hope I have ſo performed that taſk, that I may now proceed to my following conſiderations, and inſiſt leſs on them than I have done on the firſt.

THE SCEPTICAL CHYMIST:

PART II.

THE ſecond conſideration I deſire to have notice taken of, is this; that it is not ſo ſure, as both Chymiſts and Ariſtotelians are wont to think it, that every ſeemingly ſimilar or diſtinct ſubſtance, that is ſeparated from a body by the help of the fire, was pre-exiſtent in it, as a principle or element of it.

THAT I may not make this paradox a greater than needs muſt, I will firſt briefly explain what the propoſition means, before I proceed to argue for it.

AND, I ſuppoſe, you will eaſily believe, that I do not mean, that any thing is ſeparable from a body by fire, that was not materially pre-exiſtent in it: for it far exceeds the power of meerly natural agents, and conſequently of the fire, to produce anew ſo much as one atom of matter, which they can but modify and alter, not create; which is ſo obvious a truth, that almoſt all ſects of philoſophers have denied the power of producing matter to ſecond cauſes, and the Epicureans and ſome others have done the like, in reference to their gods themſelves.

NOR does the propoſition peremptorily deny, but that ſome things obtained by the fire from a mixed body may have been more than barely-materially pre-exiſtent in it; ſince there are concretes, which before they be expoſed to the fire, afford us ſeveral documents of their abounding, ſome with ſalt, and others with ſulphur. For it will ſerve the preſent turn, if it appear, that divers things obtained from a mixed body expoſed to the fire were not its ingredients before; for, if this be made to appear, it will be rational enough to ſuſpect, that chymiſts may deceive themſelves, and others, in concluding reſolutely and univerſally, thoſe ſubſtances to be the elementary ingredients of bodies barely ſeparated by the fire, of which it yet may be doubted, whether there be ſuch or no; at leaſt till ſome other argument, than that drawn from the analyſis, be brought to reſolve the doubt.

THAT then, which I mean by the propoſition I am explaining, is, that it may without abſurdity be doubted, whether or no the differing ſubſtances obtainable from a concrete diſſipated by the fire were ſo exiſtent in it, in that form (at leaſt, as to their minute parts) wherein we find them, when the analyſis is over, that the fire did only disjoin and extricate the corpuſcles of one principle from thoſe of the other, wherewith before they were blended.

HAVING thus explained my propoſition, I ſhall endeavour to do two things, to prove it; the firſt of which is to ſhew, that ſuch ſubſtances, as chymiſts call principles, may be produced *de novo* (as they ſpeak.) And the other is to make it probable, that by the fire we may actually obtain from ſome mixed bodies ſuch ſubſtances, as were not, in the newly-expounded ſenſe, pre-exiſtent in them.

TO begin then with the firſt of theſe, I conſider, that if it be as true, as it is probable, that compounded bodies differ from one another but in the various textures reſulting from the bigneſs, ſhape, motion, and contrivance of their ſmall parts, it will not be irrational to conceive, that one and the ſame parcel of the univerſal matter may, by various alterations and contextures, be brought to deſerve the name, ſometimes of a ſulphureous, and ſometimes of a terrene, or aqueous body. And this I could more largely explicate, but that our friend Mr. *Boyle* has promiſed us ſomething about qualities, wherein the theme I now willingly reſign him, will, I queſtion not, be ſtudiouſly inquired into. Wherefore, what I ſhall now advance in favour of what I have lately delivered, ſhall be deduced from experiments made divers years ſince. The firſt of which would have been much more conſiderable, but that by ſome intervening accidents I was neceſſitated to loſe the beſt time of the year, for a trial of the nature of that I deſigned; it being about the middle of *May*, before I was able to begin an experiment, which ſhould have then been two months old; but ſuch as it was, it will not, perhaps, be impertinent to give you this narrative of it. At the time newly mentioned, I cauſed my gardener (being by urgent occaſions hindered from being preſent my ſelf) to dig out a convenient quantity of good earth, and dry it well in an oven, to weigh it, to put in an earthen-pot almoſt level with the ſurface of the ground, and to ſet in it a ſelected ſeed, he had before received from me, for that purpoſe, of ſquaſh, which is an Indian kind of pompion, that grows apace; this ſeed I ordered him to water only with rain or ſpring-water. I did not, (when my occaſions permitted me to viſit it) without delight behold how faſt it grew, though unſeaſonably ſown; but the haſtening winter hindered it from attaining any thing near its due and wonted magnitude, (for I found the ſame autumn, in my garden, ſome of thoſe plants, by meaſure, as big about as my middle) and made me order the having it taken up; which about the middle of *October* was carefully done by the ſame gardener, who a while after ſent me this account of it: *I have weighed the pompion with the ſtalk and leaves, all which weighed three pound wanting a quarter; then I took the earth, baked it as formerly, and found it juſt as much as I did at firſt, which made me think, I had not dried it ſufficiently.*

Then

then I put it into the oven twice more, after the bread was drawn, and weighed it the ſecond time, but found it ſhrink little or nothing.

BUT to deal candidly with you, *Eleutherius*, I muſt not conceal from you the event of another experiment of this kind made this preſent ſummer, wherein the earth ſeems to have been much more waſted; as may appear by the following account, lately ſent me by the ſame gardener, in theſe words: *To give you an account of your cucumbers, I have gained two indifferent fair ones, the weight of them is ten pound and a half, the branches with the roots weighed four pounds wanting two ounces; and when I had weighed them, I took the earth, and baked it in ſeveral ſmall earthen diſhes in an oven; and when I had ſo done, I found the earth wanted a pound and a half of what it was formerly; yet I was not ſatisfied, doubting the earth was not dry: I put it into an oven the ſecond time, (after the bread was drawn,) and after I had taken it out and weighed it, I found it to be the ſame weight. So I ſuppoſe there was no moiſture left in the earth. Neither do I think, that the pound and half, that was wanting, was drawn away by the cucumber, but a great part of it, in the ordering, was in duſt (and the like) waſted: (the cucumbers are kept by themſelves, leſt you ſhould ſend for them.)* But yet in this trial, *Eleutherius*, it appears, that though ſome of the earth, or rather the diſſoluble ſalt harboured in it, were waſted, the main body of the plant conſiſted of tranſmuted water. And I might add, that a year after I cauſed the formerly mentioned experiment, touching large pompions, to be reiterated, with ſo good ſucceſs, that if my memory does not much miſ-inform me, it did not only much ſurpaſs any, that I made before, but ſeemed ſtrangely to conclude what I am pleading for; though (by reaſon, I have unhappily loſt the particular account my gardener writ me up of the circumſtances) I dare not inſiſt upon them. The like experiment may be as conveniently tried with the ſeeds of any plant, whoſe growth is haſty, and its ſize bulky. If tobacco will in theſe cold climates grow well in earth undunged, it would not be amiſs to make a trial with it; for it is an annual plant, that ariſes where it proſpers, ſometimes as high as a tall man, and I have had leaves of it in my garden, near a foot and a half broad. But the next time I try this experiment, it ſhall be with ſeveral ſeeds of the ſame ſort, in the ſame pot of earth, that ſo the event may be the more conſpicuous. But, becauſe every body has not conveniency of time and place for this experiment neither, I made, in my chamber, ſome ſhorter and more expeditious trials. I took a top of ſpearmint, about an inch long, and put it into a good phial full of ſpring water, ſo as the upper part of the mint was above the neck of the glaſs, and the lower part immerſed in the water; within a few days this mint began to ſhoot forth roots into the water, and to diſplay its leaves, and aſpire upwards; and in a ſhort time it had numerous roots and leaves, and theſe very ſtrong and fragrant of the odour of the mint; but the heat of my chamber, as I ſuppoſe, killed the plant, when it was grown to have a pretty thick ſtalk, which with the various and ramified roots, which it ſhot into the water as if it had been earth, preſented in its tranſparent flower-pot a ſpectacle not unpleaſant to behold. The like I tried with ſweet-marjoram; and I found the experiment ſucceed alſo, though ſomewhat more ſlowly, with balm and penyroyal, to name now no other plants. And one of theſe vegetables, cheriſhed only by water, having obtained a competent growth, I did, for trial's ſake, cauſe to be diſtilled in a ſmall retort, and thereby obtained ſome phlegm, a little empyreumatical ſpirit, a ſmall quantity of aduſt oil, and a *caput mortuum*; which appearing to be a coal, I concluded it to conſiſt of ſalt and earth: but the quantity of it was ſo ſmall, that I forbore to calcine it. The water I uſed to nouriſh this plant was not ſhifted nor renewed; and I choſe ſpring-water rather than rain-water, becauſe the latter is more diſcernably a kind of *πανσπερμία*, which, though it be granted to be freed from groſſer mixtures, ſeems yet to contain in it, beſides the ſteams of ſeveral bodies wandering in the air, which may be ſuppoſed to impregnate it, a certain ſpirituous ſubſtance, which may be extracted out of it, and is by ſome miſtaken for the ſpirit of the world corporified, upon what grounds, and with what probability, I may elſewhere, perchance, but muſt not now, diſcourſe to you.

BUT perhaps I might have ſaved a great part of my labour. For I find, that *Helmont* (an author more conſiderable for his experiments, than many learned men are pleaſed to think him) having had an opportunity to proſecute an experiment much of the ſame nature with thoſe I have been now ſpeaking of, for five years together, obtained at the end of that time ſo notable a quantity of tranſmuted water, that I ſhould ſcarce think it fit to have his experiment, and mine mentioned together, were it not, that the length of time requiſite to this may deter the curioſity of ſome, and exceed the leiſure of others; and partly, that ſo paradoxical a truth, as that, which theſe experiments ſeem to hold forth, needs to be confirmed by more witneſſes than one, eſpecially ſince the extravagancies and untruths, to be met with in *Helmont*'s treatiſe of the magnetic cure of wounds, have made his teſtimonies ſuſpected in his other writings; though as to ſome of the unlikely matters of fact he delivers in them, I might ſafely undertake to be his compurgator. But that experiment of his, which I was mentioning to you, he ſays, was this: he took 200 pound of earth dried in an oven, and having put it into an earthen veſſel, and moiſtened it with rain-water, he planted in it the trunk of a willow-tree of five pound weight; this he watered, as need required, with rain or with diſtilled water; and to keep the neighbouring earth from getting into the veſſel, he employed a plate of iron tinned over and perforated with many holes. Five years being effluxed, he took out the tree, and weighed it, and (with computing the leaves, that fell during four autumns) he found it to weigh

169 pound, and about three ounces. And having again dryed the earth it grew in, he found it want of its former weight of 200 pound, about a couple only of ounces; ſo that 164 pound of the roots, wood, and bark, which conſtituted the tree, ſeem to have ſprung from the water. And though it appears not, that *Helmont* had the curioſity to make any analyſis of this plant, yet what I lately told you I did to one of the vegetables I nouriſhed with water only, will I ſuppoſe keep you from doubting, that if he had diſtilled this tree, it would have afforded him the like diſtinct ſubſtances as another vegetable of the ſame kind. I need not ſubjoin, that I had it alſo in my thoughts to try, how experiments, to the ſame purpoſe with thoſe I related to you, would ſucceed in other bodies than vegetables, becauſe importunate avocations having hitherto hindered me from putting my deſign in practice, I can yet ſpeak but conjecturally of the ſucceſs: but the beſt is, that the experiments already made and mentioned to you need not the aſſiſtance of new ones, to verify as much, as my preſent taſk makes it concern me to prove by experiments of this nature.

ONE would ſuſpect (ſays *Eleutherius* after his long ſilence) by what you have been diſcourſing, that you are not far from *Helmont*'s opinion about the origination of compound bodies, and perhaps too diſlike not the arguments, which he imploys to prove it.

WHAT Helmontian opinion, and what arguments do you mean? (aſks *Carneades*)

WHAT you have been newly diſcourſing (replies *Eleutherius*) tells us, that you cannot but know, that this bold and acute Spagyriſt ſcruples not to aſſert, that all mixt bodies ſpring from one element; and that vegetables, animals, marchaſites, ſtones, metals, *&c.* are materially but ſimple water diſguiſed into theſe various forms, by the plaſtick or formative vertue of their ſeeds. And as for his reaſons, you may find divers of them ſcattered up and down his writings; the conſiderableſt of which ſeem to be theſe three; the ultimate reduction of mixt bodies into inſipid water, the viciſſitude of the ſuppoſed elements, and the production of perfectly mixt bodies out of ſimple water. And firſt he affirms, that the *ſal circulatus Paracelſi*, or his liquor alkaheſt, does adequately reſolve plants, animals, and minerals into one liquor or more, according to their ſeveral internal diſparities of parts, (without *caput mortuum*, or the deſtruction of their ſeminal vertues;) and that the alkaheſt being abſtracted from theſe liquors in the ſame weight and virtue wherewith it diſſolved them, the liquors may by frequent cohobations from chalk or ſome other idoneous matter, be totally deprived of their ſeminal endowments, and return at laſt to their firſt matter, inſipid water: ſome other ways he propoſes here and there to diveſt ſome particular bodies of their borrowed ſhapes, and make them remigrate to their firſt ſimplicity. The ſecond topick, whence *Helmont* draws his arguments, to prove water to be the material cauſe of mixt bodies, I told you was this, that the other ſuppoſed elements may be tranſmuted into one another. But the experiments by him here and there produced on this occaſion are ſo uneaſy to be made and to be judged of, that I ſhall not inſiſt on them; not to mention, that if they were granted to be true, his inference from them is ſomewhat diſputable. And therefore I ſhall paſs on to tell you, that as, in his firſt argument, our paradoxical author endeavours to prove water the ſole element of mixt bodies, by their ultimate reſolution, when by his alkaheſt, or ſome other conquering agent, the ſeeds have been deſtroyed, which diſguiſed them; or when by time thoſe ſeeds are wearied, or exantlated, or unable to act their parts upon the ſtage of the univerſe any longer; ſo in his third argument he endeavours to evince the ſame concluſion, by the conſtitution of bodies, which he aſſerts to be nothing but water ſubdued by ſeveral virtues. Of this he gives here and there in his writings ſeveral inſtances, as to plants and animals; but divers of them being difficult either to be tried or to be underſtood, and others of them being not altogether unobnoxious to exceptions, I think you have ſingled out the principal and leſs queſtionable experiment, when you lately mentioned that of the willow-tree. And having thus, continues *Eleutherius*, to anſwer your queſtion, given you a ſummary account of what, I am confident, you know better than I do, I ſhall be very glad to receive your ſenſe of it, if the giving it me will not too much divert you from the proſecution of your diſcourſe.

THAT *if* (replies *Carneades*) was not needleſsly annexed: for thoroughly to examine ſuch an hypotheſis and ſuch arguments, would require ſo many conſiderations, and conſequently ſo much time, that I ſhould not now have the leiſure to perfect ſuch a digreſſion, and much leſs to finiſh my principal diſcourſe. Yet thus much I ſhall tell you at preſent, that you need not fear my rejecting this opinion for its novelty; ſince, however the Helmontians may, in compliment to their maſter, pretend it to be a new diſcovery, yet though the arguments be for the moſt part his, the opinion it ſelf is very antient: for *Diogenes Laertius* and divers other authors ſpeak of *Thales*, as the firſt among the *Grecians*, that made diſquiſitions upon nature. And of this *Thales*, I remember, *Tully* informs us, that he taught all things were at firſt made of water. And it ſeems by *Plutarch* and *Juſtin Martyr*, that the opinion was ancienter than he: for they tell us, that he uſed to defend his tenet by the teſtimony of *Homer*. And a Greek author, the ſcholiaſt of *Apollonius*, upon theſe words,

De naturâ Deorum.

Ἐξ ἰλύος ἐβλάστησε χθὼν ἅπασα. Argonaut. 4.
The earth of ſlime was made,

affirms (out of *Zeno*) that the chaos, whereof all things were made, was, according to *Heſiod*, water; which, ſettling firſt, became ſlime, and then condenſed into ſolid earth. And the ſame opinion about the generation of ſlime ſeems to have been entertained by *Orpheus*, out of whom one of the ancients cites this teſtimony, Athenagoras. Ἐκ

Ἐκ τοῦ ὕδατος ἰλὺς κατέστη.
Of water ſlime was made.

It ſeems alſo by what is delivered in * *Strabo* out of another author concerning the Indians, that they likewiſe held, that all things had differing beginnings, but that, of which the world was made, was water. And the like opinion has been by ſome of the ancients aſcribed to the Phenicians, from whom *Thales* himſelf is conceived to have borrowed it; as probably the Greeks did much of theology, and, as I am apt to think, of their philoſophy too; ſince the deviſing of the atomical hypotheſis commonly aſcribed to *Leucippus* and his diſciple *Democritus* is by learned men attributed to one *Moſchus* a Phenician. And poſſibly the opinion is yet ancienter than ſo; for it is known, that the Phenicians borrowed moſt of their learning from the Hebrews. And among thoſe, that acknowledge the books of *Moſes*, many have been inclined to think water to have been the primitive and univerſal matter, by peruſing the beginning of *Geneſis*, where the waters ſeem to be mentioned as the material cauſe, not only of ſublunary compound bodies, but of all thoſe, that make up the univerſe; whoſe component parts did orderly, as it were, emerge out of that vaſt abyſs, by the operation of the ſpirit of God, who is ſaid to have been moving himſelf, as hatching females do, (as the original Deuter. xxxii. 11. Jerem. xxiii. 9. מרחפת, *Merahephet*, is ſaid to import, and it ſeems to ſignify, in one of the two other places, wherein alone I have met with it in the Hebrew bible) upon the face of the waters; which being, as may be ſuppoſed, divinely impregnated with the ſeeds of all things, were by that productive incubation qualified to produce them. But you, I preſume, expect, that I ſhould diſcourſe of this matter like a naturaliſt, not a philologer. Wherefore I ſhall add, to countenance *Helmont*'s opinion, that whereas he gives not, that I remember, any inſtance of any mineral body, nor ſcarce of any animal, generated of water, a French chymiſt, Monſieur *de Rochas*, has preſented his readers an experiment, which if it were punctually ſuch as he has delivered it, is very notable. He then, diſcourſing of the generation of things according to certain chymical and metaphorical notions (which I confeſs are not to me intelligible) ſets down, among divers ſpeculations not pertinent to our ſubject, the following narrative, which I ſhall repeat to you the ſenſe of in Engliſh, with as little variation from the literal ſenſe of the French words, as my memory will enable me. *Having* (ſays he) *diſcerned ſuch great wonders by the natural operation of water, I would know what may be done with it by art imitating nature. Wherefore I took water, which I well knew not to be compounded, nor to be mixed with any other thing than that ſpirit of life* (whereof he had ſpoken before) *and with a heat artificial, continual and proportionate, I prepared and diſpoſed it by the above mentioned graduations of coagulation, congelation, and fixation, until it was turned into earth, which earth produced animals, vegetables and minerals. I tell not what animals, vegetables and minerals, for that is reſerved for another occaſion: but the animals did move of themſelves, eat,* &c.— *and by the true anatomy I made of them, I found, that they were compoſed of much ſulphur, little mercury, and leſs ſalt.—The minerals began to grow and increaſe by converting into their own nature one part of the earth thereunto diſpoſed; they were ſolid and heavy. And by this truly demonſtrative ſcience, namely chymiſtry, I found, that they were compoſed of much ſalt, little ſulphur, and leſs mercury.*

BUT (ſays *Carneades*) I have ſome ſuſpicions concerning this ſtrange relation, which make me unwilling to declare an opinion of it, unleſs I were ſatisfied concerning divers material circumſtances, that our author has left unmentioned; though, as for the generation of living creatures, both vegetable and ſenſitive, it needs not ſeem incredible, ſince we find, that our common water (which indeed is often impregnated with variety of ſeminal principles and rudiments) being long kept in a quiet place, will putrify and ſtink, and then perhaps too, produce moſs and little worms, or other inſects, according to the nature of the ſeeds that were lurking in it. I muſt likewiſe deſire you to take notice, that as *Helmont* gives us no inſtance of the production of minerals out of water, ſo the main argument, that he employs to prove, that they and other bodies may be reſolved into water, is drawn from the operations of his alkaheſt, and conſequently cannot be ſatisfactorily examined by you and me.

YET certainly (ſays *Eleutherius*) you cannot but have ſomewhat wondered as well as I, to obſerve, how great a ſhare of water goes to the making up of divers bodies, whoſe diſguiſes promiſe nothing near ſo much. The diſtillation of eels, though it yielded me ſome oil, and ſpirit, and volatile ſalt, beſides the *caput mortuum*, yet were all theſe ſo diſproportionate to the phlegm, that came from them, (and in which at firſt they boiled as in a pot of water) that they ſeemed to have been nothing but coagulated phlegm; which does likewiſe ſtrangely abound in vipers, though they are eſteemed very hot in operation, and will in a convenient air ſurvive ſome days the loſs of their heads and hearts, ſo vigorous is their vivacity. Man's blood it ſelf, as ſpirituous and as elaborate a liquor as it is reputed, does ſo abound in phlegm, that, the other day, diſtilling ſome of it on purpoſe to try the experiment (as I had formerly done in deer's blood) out of about ſeven ounces and a half of pure blood we drew near ſix ounces of phlegm, before any of the more operative principles began to ariſe and invite us to change the receiver. And to ſatisfy my ſelf, that ſome of theſe animal phlegms were void enough of ſpirit to deſerve that name, I would not content my ſelf to taſte them only, but fruitleſsly poured on them acid liquors, to try if they contained any volatile ſalt or ſpirit, which (had there been any there) would probably have diſcovered it ſelf by making an ebullition with the affuſed liquor. And now I mention corroſive ſpirits, I am minded to inform

* *Univerſarum rerum primordia diverſa eſſe, faciendi autem mundi initium aquam.* Strabo Geograph. Lib. 15. *circa medium.*

form you, that though they ſeem to be nothing elſe but fluid ſalts, yet they abound in water, as you may obſerve, if either you entangle, and ſo fix their ſaline part, by making them corrode ſome idoneous body, or elſe if you mortify it with a contrary ſalt; as I have very manifeſtly obſerved in the making a medicine ſomewhat like *Helmont*'s Balſamus Samech, with diſtilled vinegar inſtead of ſpirit of wine, wherewith he prepare it. For you would ſcarce believe (what I have lately obſerved) that of that acid ſpirit, the ſalt of tartar, from which it is diſtilled, will, by mortifying and retaining the acid ſalt, turn into worthleſs phlegm near twenty times its weight; before it be ſo fully impregnated as to rob no more diſtilled vinegar of its ſalt. And though ſpirit of wine exquiſitely rectified ſeem of all liquors to be the moſt free from water, it being ſo igneous, that it will flame all away without leaving the leaſt drop behind it, yet even this fiery liquor is by *Helmont* not improbably affirmed, in caſe what he relates be true, to be materially water, under a ſulphureous diſguiſe: for according to him, in the making that excellent medicine, *Paracelſus* his Balſamus Samech, (which is nothing but ſal tartari dulcified, by diſtilling from it ſpirit of wine till the ſalt be ſufficiently glutted with its ſulphur, and till it ſuffer the liquor to be drawn off, as ſtrong as it was poured on) when the ſalt of tartar from which it is diſtilled hath retained, or deprived it of the ſulphureous parts of the ſpirit of wine, the reſt, which is incomparably the greater part of the liquor, will remigrate into phlegm. I added that clauſe [*In caſe what he relates be true*] becauſe I have not as yet ſufficiently tried it my ſelf. But not only ſomething of experiment keeps me from thinking it, as many chymiſts do, abſurd, (though I have, as well as they, in vain tried it with ordinary ſalt of tartar) but beſides that *Helmont* often relates it, and draws conſequences from it; a perſon noted for his ſoberneſs and ſkill in ſpagyrical preparations, having been aſked by me, whether the experiment might not be made to ſucceed, if the ſalt and ſpirit were prepared, according to a way ſuitable to my principles, he affirmed to me, that he had that way, I propoſed, made *Helmont*'s experiment ſucceed very well, without adding any thing to the ſalt and ſpirit. But our way is neither ſhort nor eaſy.

I HAVE indeed (ſays *Carneades*) ſometimes wondered to ſee, how much phlegm may be obtained from bodies by the fire. But concerning that phlegm I may anon have occaſion to note ſomething, which I therefore ſhall not now anticipate. But to return to the opinion of *Thales*, and of *Helmont*, I conſider, that ſuppoſing the alkaheſt could reduce all bodies into water, yet whether that water, becauſe inſipid, muſt be elementary, may not groundleſsly be doubted: for I remember the candid and eloquent *Petrus Laurembergius*, in his notes upon *Sala*'s aphoriſms, affirms, that he ſaw an inſipid menſtruum, that was a powerful diſſolvent, and (if my memory does not much miſ-inform me) could diſſolve gold. And the water, which may be drawn from quickſilver without addition, though it be almoſt taſteleſs, you will, I believe, think of a differing nature from ſimple water, eſpecially if you digeſt in it appropriated minerals. To which I ſhall add but this, that this conſideration may be further extended. For I ſee no neceſſity to conceive, that the water mentioned in the beginning of *Geneſis*, as the univerſal matter, was ſimple and elementary water; ſince though we ſhould ſuppoſe it to have been an agitated congeries or heap conſiſting of a great variety of ſeminal principles and rudiments, and of other corpuſcles fit to be ſubdued and faſhioned by them, it might yet be a body fluid like water, in caſe the corpuſcles, it was made up of, were by their Creator made ſmall enough, and put into ſuch an actual motion, as might make them glide along one another. And as we now ſay, the ſea conſiſts of water, (notwithſtanding the ſaline, terreſtrial, and other bodies mingled with it,) ſuch a liquor may well enough be called water, becauſe that was the greateſt of the known bodies, whereunto it was like; though, that a body may be fluid enough to appear a liquor, and yet contain corpuſcles of a very differing nature, you will eaſily believe, if you but expoſe a good quantity of vitriol in a ſtrong veſſel to a competent fire. For although it contains both aqueous, earthy, ſaline, ſulphureous, and metalline corpuſcles, yet the whole maſs will at firſt be fluid like water, and boil like a ſeething-pot.

I MIGHT eaſily (continues *Carneades*) enlarge my ſelf on ſuch conſiderations, if I were now obliged to give you my judgment of the Thaleſian and Helmontian hypotheſis. But, whether or no we conclude, that all things were at firſt generated of water, I may deduce from what I have tried concerning the growth of vegetables, nouriſhed with water, all that I now propoſed to my ſelf or need at preſent to prove; namely, that ſalt, ſpirit, earth, and even oil (though that be thought of all bodies the moſt oppoſite to water) may be produced out of water; and conſequently, that a Chymical principle, as well as a Peripatetick element, may (in ſome caſes) be generated anew, or obtained from ſuch a parcel of matter, as was not endowed with the form of ſuch a principle or element before.

AND having thus, *Eleutherius*, evinced, that it is poſſible, that ſuch ſubſtances as thoſe, that chymiſts are wont to call their *tria prima*, may be generated anew; I muſt next endeavour to make it probable, that the operation of the fire does actually (ſometimes) not only divide compounded bodies into ſmall parts, but compound thoſe parts after a new manner: whence conſequently, for aught we know, there may emerge as well ſaline and ſulphureous ſubſtances, as bodies of other textures. And, perhaps, it will aſſiſt us in our inquiry after the effects of the operations of the fire upon other bodies, to conſider a little, what it does to thoſe mixtures, which being productions of the art of man, we beſt know the compoſition of. You may then be pleaſed to take notice, that though ſoap is made up by the ſoap-boilers of oil or greaſe,

greaſe, and ſalt, and water diligently incorporated together; yet if you expoſe the maſs they conſtitute to a gradual fire in a retort, you ſhall then indeed make a ſeparation, but not of the ſame ſubſtances, that were united into ſoap, but of others of a diſtant and yet not an elementary nature, and eſpecially of an oil very ſharp and fœtid, and of a very differing quality from that, which was imployed to make the ſoap. So, if you mingle in a due proportion ſal armoniac with quick-lime, and, diſtil them by degrees of fire, you ſhall not divide the ſal armoniac from the quick-lime, though the one be a volatile, and the other a fixed ſubſtance, but that, which will aſcend, will be a ſpirit much more fugitive, penetrant, and ſtinking, than ſal armoniac; and there will remain with the quick-lime all, or very near all the ſea-ſalt, that concurred to make up the ſal armoniack; concerning which ſea-ſalt I ſhall, to ſatisfy you how well it was united to the lime, inform you, that I have, by making the fire at length very vehement, cauſed both the ingredients to melt in the retort itſelf into one maſs, and ſuch maſſes are apt to relent in the moiſt air. If it be here objected, that theſe inſtances are taken from factitious concretes, which are more compounded than thoſe, which nature produces; I ſhall reply, that beſides that I have mentioned them as much to illuſtrate what I propoſed, as to prove it; it will be difficult to evince, that nature herſelf does not make decompounded bodies; I mean, mingle together ſuch mixt bodies, as are already compounded of elementary, or rather of more ſimple ones. For vitriol (for inſtance) though I have ſometimes taken it out of mineral earths, where nature had without any aſſiſtance of art prepared it to my hand, is really, though chymiſts are pleaſed to reckon it among ſalts, a decompounded body, conſiſting (as I ſhall have occaſion to declare anon) of a terreſtrial ſubſtance, of a metal, and alſo of at leaſt one ſaline body, of a peculiar, and not elementary nature. And we ſee alſo in animals, that their blood may be compoſed of divers very differing mixt bodies, ſince we find it obſerved, that divers ſea-fowl taſte rank of the fiſh, on which they ordinarily feed; and *Hippocrates* himſelf obſerves, that a child may be purged by the milk of the nurſe, if ſhe have taken elaterium; which argues, that the purging corpuſcles of the medicament concur to make up the milk of the nurſe; and that white liquor is generally by phyſicians ſuppoſed to be but blanched and altered blood. And I remember I have obſerved, not far from the *Alps*, that at a certain time of the year the butter of that country was very offenſive to ſtrangers, by reaſon of the rank taſte of a certain herb, whereon the cows were then wont plentifully to feed. But (proceeds *Carneades*) to give you inſtances of another kind, to ſhew, that things may be obtained by the fire from a mixt body, that were not pre-exiſtent in it, let me remind you, that from many vegetables there may without any addition be obtained glaſs; a body, which I preſume you will not ſay was pre-exiſtent in it, but produced by the fire. To which I ſhall add but this one example more, namely, that by a certain artificial way of handling quick-ſilver, you may without addition ſeparate from it at leaſt a fifth, or fourth part of clear liquor; which, with an ordinary Peripatetick, would paſs for water, and which a vulgar chymiſt would not ſcruple to call phlegm, and which, for aught I have yet ſeen or heard, is not reducible into mercury again, and conſequently is more than a diſguiſe of it. Now, beſides that divers chymiſts will not allow mercury to have any, or at leaſt any conſiderable quantity of either of the ignoble ingredients, earth and water; beſides this, I ſay, the great ponderouſneſs of quick-ſilver makes it very unlikely, that it can have ſo much water in it, as may be thus obtained from it, ſince mercury weighs twelve or fourteen times as much as water of the ſame bulk. Nay, for a further confirmation of this argument, I will add this ſtrange relation, that two friends of mine, the one a phyſician, and the other a mathematician, and both of them perſons of unſuſpected credit, have ſolemnly aſſured me, that after many trials, they made to reduce mercury into water, in order to a philoſophical work, upon gold (which yet, by the way, I know proved unſucceſsful) they did once, by divers cohobations reduce a pound of quick-ſilver into almoſt a pound of water, and this, without the addition of any other ſubſtance, but only by preſſing the mercury by a ſkilfully managed fire, in purpoſely contrived veſſels. But of theſe experiments, our friend, (ſays *Carneades*, pointing at the Regiſter of this dialogue) will, perhaps, give you a more particular account, than it is neceſſary for me to do; ſince what I have now ſaid, may ſufficiently evince, that the fire may ſometimes as well alter bodies as divide them, and by it we may obtain from a mixed body, what was not pre-exiſtent in it. And how are we ſure, that in no other body, what we call phlegm is barely ſeparated, not produced ed by the action of the fire? ſince ſo many other mixed bodies are of a much leſs conſtant, and more alterable nature, than mercury (by many tricks it is wont to put upon chymiſts, and, by the experiments I told you of, about an hour ſince,) appears to be. But, becauſe I ſhall ere long have occaſion to reſume into conſideration the power of the fire to produce new concretes, I ſhall no longer inſiſt on this argument at preſent: only I muſt mind you, that if you will not diſbelieve *Helmont*'s relations, you muſt confeſs, that the *tria prima* are neither ingenerable, nor incorruptible ſubſtances; ſince by his alkaheſt ſome of them may be produced of bodies, that were before of another denomination; and by the ſame powerful menſtruum all of them may be reduced into inſipid water.

HERE *Carneades* was about to paſs on to his third conſideration, when *Eleutherius* being deſirous to hear what he could ſay, to clear his ſecond general conſideration from being repugnant to what he ſeemed to think the true theory of miſtion, prevented him, by telling him, I ſomewhat wonder, *Carneades*, that you,

who are in ſo many points unſatisfied with the Peripatetick opinion touching the elements and mixed bodies, ſhould alſo ſeem averſe to that notion touching the manner of miſtion, wherein the chymiſts (though perhaps without knowing, that they do ſo) agree with moſt of the antient philoſophers, that preceded *Ariſtotle*; and that for reaſons ſo conſiderable, that divers modern naturaliſts and phyſicians, in other things unfavourable enough to the Spagyriſts, do in this caſe ſide with them againſt the common opinion of the ſchools. If you ſhould aſk me (continues *Eleutherius*) what reaſons I mean? I ſhould partly by the writings of *Sennertus* and other learned men, and partly by my own thoughts, be ſupplied with more, than it were at preſent proper for me to inſiſt largely on. And therefore, I ſhall mention only, and that briefly, three or four. Of theſe, I ſhall take the firſt, from the ſtate of the controverſy it ſelf, and the genuine notion of miſtion, which, though much intricated by the ſchoolmen, I take in ſhort to be this: *Ariſtotle*, at leaſt, as many of his interpreters expound him, and as indeed he teaches in ſome places, where he profeſſedly diſſents from the ancients, declares miſtion to be ſuch a mutual penetration, and perfect union of the mingled elements, that there is no portion of the mixed body, how minute ſoever, which does not contain all, and every of the four elements, or in which, if you pleaſe, all the elements are not. And I remember, that he reprehends the miſtion taught by the ancients, as too ſlight or groſs, for this reaſon, that bodies mixed according to their hypotheſis, though they appear to human eyes, would not appear ſuch to the acute eyes of a lynx, whoſe perfecter ſight would diſcern the elements, if they were no otherwiſe mingled, than as his predeceſſors would have it, to be but blended, not united; whereas the ancients, though they did not all agree about what kind of bodies were mixed, yet they did almoſt unanimouſly hold, that in a compounded body, though the *Miſcibilia*, whether elements, principles, or whatever they pleaſed to call them, were aſſociated in ſuch ſmall parts, and with ſo much exactneſs, that there was no ſenſible part of the maſs, but ſeemed to be of the ſame nature with the reſt, and with the whole; yet as to the atoms, or other inſenſible parcels of matter, whereof each of the *Miſcibilia* conſiſted, they retained each of them its own nature, being but by appoſition or juxta-poſition united with the reſt into one body. So that although by virtue of this compoſition the mixed body did, perhaps, obtain divers new qualities; yet ſtill the ingredients, that compounded it, retaining their own nature, were by the deſtruction of the compoſitum ſeparable from each other, the minute parts diſingaged from thoſe of a differing nature, and aſſociated with thoſe of their own ſort, returning to be again, fire, earth, or water, as they were before they chanced to be ingredients of that compoſitum. This may be explained (continues *Eleutherius*,) by a piece of cloth made of white and black threads interwoven, wherein though the whole piece appear neither white nor black, but of a reſulting colour, that is grey, yet each of the white and black threads, that compoſe it, remains what it was before, as would appear, if the threads were pulled aſunder, and ſorted each colour by it ſelf. This (purſues *Eleutherius*) being, as I underſtand it, the ſtate of the controverſy, and the Ariſtotelians, after their maſter, commonly defining, that miſtion is *miſcibilium alteratorum unio*, that ſeems to comport much better with the opinion of the Chymiſts, than with that of their adverſaries; ſince, according to that, as the newly-mentioned example declares, there is but a juxta-poſition of ſeparable corpuſcles, retaining each its own nature; whereas, according to the Ariſtotelians, when what they are pleaſed to call a mixed body, reſults from the concourſe of the elements, the *Miſcibilia* cannot ſo properly be ſaid to be altered, as deſtroyed, ſince there is no part in the mixed body, how ſmall ſoever, that can be called either fire, or air, or water, or earth.

NOR, indeed, can I well underſtand, how bodies can be mingled other ways, than as I have declared, or, at leaſt, how they can be mingled, as our Peripateticks would have it. For whereas *Ariſtotle* tells us, that, if a drop of wine be put into ten thouſand meaſures of water, the wine being overpowered by ſo vaſt a quantity of water, will be turned into it, he ſpeaks, to my apprehenſion, very improbably. For, though one ſhould add to that quantity of water as many drops of wine, as would a thouſand times exceed it all, yet, by his rule, the whole liquor ſhould not be a *crama*, a mixture of wine and water, wherein the wine would be predominant, but water only; ſince the wine being added but by a drop at a time, would ſtill fall into nothing but water, and conſequently would be turned into it. And, if this would hold in metals too, it were a rare ſecret for goldſmiths, and refiners; for by melting a maſs of gold, or ſilver, and by but caſting into it lead or antimony, grain after grain, they might at pleaſure, within a reaſonable compaſs of time, turn what quantity they deſire, of the ignoble into the noble metals. And, indeed, ſince a pint of wine, and a pint of water, amount to about a quart of liquor, it ſeems manifeſt to ſenſe, that theſe bodies do not totally penetrate one another, as one would have it; but, that each retains its own dimenſions; and conſequently, that they are, by being mingled, only divided into minute bodies, that do but touch one another with their ſurfaces, as do the grains of wheat, rye, barley, *&c.* in a heap of ſeveral ſorts of corn. And unleſs we ſay, that as when one meaſure of wheat, for inſtance, is blended with a hundred meaſures of barley, there happens only a juxta-poſition and ſuperficial contact betwixt the grains of wheat, and as many or thereabouts of the grains of barley; ſo, when a drop of wine is mingled with a great deal of water, there is but an appoſition of ſo many vinous corpuſcles to a correſpondent number of aqueous ones: unleſs I ſay, this be ſaid, I ſee not how that abſurdity will be avoided, whereunto the Stoical notion of miſtion (name-

ly by σύγχυσις, or confuſion) was liable, according to which the leaſt body may be coextended with the greateſt: ſince in a mixt body, wherein, before the elements were mingled, there was, for inſtance, but one pound of water to ten thouſand of earth, yet according to them there muſt not be the leaſt part of that compound, that conſiſted not as well of earth, as water. But I inſiſt, perhaps, too long (ſays *Eleutherius*) upon the proofs afforded me by the nature of miſtion: wherefore I will but name two or three other arguments; whereof the firſt ſhall be, that, according to *Ariſtotle* himſelf, the motion of a mixt body follows the nature of the predominant element, as thoſe, wherein the earth prevails, tend towards the centre of heavy bodies. And ſince many things make it evident, that in divers mixt bodies the elementary qualities are as well active, though not altogether ſo much ſo, as in the elements themſelves; it ſeems not reaſonable to deny the actual exiſtence of the elements in thoſe bodies, wherein they operate.

To which I ſhall add this convincing argument, that experience manifeſts, and *Ariſtotle* confeſſes it, that the *Miſcibilia* may be again ſeparated from a mixt body, as is obvious in the chymical reſolutions of plants and animals, which could not be, unleſs they did actually retain their forms in it. For ſince, according to *Ariſtotle*, and I think according to truth, there is but one common maſs of all things, which he has been pleaſed to call *materia prima*; and ſince it is not therefore the matter, but the form, that conſtitutes and diſcriminates things, to ſay, that the elements remain not in a mixt body, according to their forms, but according to their matter, is not to ſay, that they remain there at all; ſince although thoſe portions of matter were earth and water, *&c.* before they concurred, yet the reſulting body being once conſtituted, may as well be ſaid to be ſimple as any of the elements; the matter being confeſſedly of the ſame nature in all bodies, and the elementary forms being, according to this hypotheſis, periſhed and aboliſhed.

AND laſtly, and if we will conſult chymical experiments, we ſhall find the advantages of the chymical doctrine above the Peripatetick title little leſs than palpable. For in that operation, that refiners call quartation, which they employ to purify gold, although three parts of ſilver be ſo exquiſitely mingled by fuſion with a fourth part of gold (whence the operation is denominated) that the reſulting maſs acquires ſeveral new qualities, by virtue of the compoſition, and that there is ſcarce any ſenſible part of it, that is not compoſed of both the metals; yet if you caſt this mixture into aqua fortis, the ſilver will be diſſolved in the menſtruum, and the gold like a dark or black powder will fall to the bottom of it, and either body may be again reduced into ſuch a metal as it was before; which ſhews, that it retained its nature, notwithſtanding its being mixt *per minima* with the other. We likewiſe ſee, that though one part of pure ſilver be mingled with eight or ten parts, or more, of lead; yet the fire will upon the cupel eaſily and perfectly ſeparate them again. And that, which I would have you peculiarly conſider on this occaſion, is, that not only in chymical anatomies there is a ſeparation made of the elementary ingredients, but that ſome mixt bodies afford a very much greater quantity of this or that element or principle, than of another; as we ſee, that turpentine and amber yield much more oil and ſulphur, than they do water; whereas wine, which is confeſſed to be a perfectly mixt body, yields but a little inflammable ſpirit, or ſulphur, and not much more earth; but affords a vaſt proportion of phlegm or water. Which could not be, if, as the Peripateticks ſuppoſe, every, even of the minuteſt particles, were of the ſame nature with the whole, and conſequently did contain both earth and water, and air, and fire. Wherefore as to what *Ariſtotle* principally, and almoſt only objects, that unleſs his opinion be admitted, there would be no true and perfect miſtion, but only aggregates or heaps of contiguous corpuſcles, which, though the eye of a man cannot diſcern, yet the eye of a lynx might perceive not to be of the ſame nature with one another and with their totum, as the nature of miſtion requires, if he do not beg the queſtion, and make miſtion to conſiſt in what other naturaliſts deny to be requiſite to it, yet he, at leaſt, objects that as a great inconvenience, which I cannot take for ſuch, till he have brought as conſiderable arguments as I have propoſed to prove the contrary, to evince, that nature makes other miſtions than ſuch as I have allowed, wherein the *Miſcibilia* are reduced into minute parts, and united as far as ſenſe can diſcern: which if you will not grant to be ſufficient for a true miſtion, he muſt have the ſame quarrel with nature her ſelf, as with his adverſaries.

WHEREFORE (continues *Eleutherius*) I cannot but ſomewhat marvel, that *Carneades* ſhould oppoſe the doctrine of the chymiſts in a particular, wherein they do as well agree with his old miſtreſs, Nature, as diſſent from his old adverſary, *Ariſtotle*.

I MUST not (replies *Carneades*) engage my ſelf at preſent to examine throughly the controverſies concerning miſtion: and if there were no third thing, but that I were reduced to embrace abſolutely and unreſervedly either the opinion of *Ariſtotle*, or that of the philoſophers, that went before him, I ſhould look upon the latter, which the chymiſts have adopted, as the more defenſible opinion. But becauſe differing in the opinions about the elements from both parties, I think I can take a middle courſe, and diſcourſe to you of miſtion, after a way, that does neither perfectly agree, nor perfectly diſagree with either: as I will not peremptorily define, whether there be not caſes, wherein ſome phænomena of miſtion ſeem to favour the opinion, that the chymiſts patrons borrowed of the ancients, I ſhall only endeavour to ſhew you, that there are ſome caſes, which may keep the doubt, which makes up my ſecond general conſideration, from being unreaſonable.

I SHALL then freely acknowledge to you, (ſays *Carneades*) that I am not over-well ſatisfied

fied with the doctrine, that is aſcribed to *Ariſtotle*, concerning miſtion; eſpecially, ſince it teaches, that the four elements may again be ſeparated from the mixt body; whereas, if they continued not in it, it would not be ſo much a ſeparation as a production. And I think the ancient philoſophers, that preceded *Ariſtotle*, and chymiſts, who have ſince received the ſame opinion, do ſpeak of this matter more intelligibly, if not more probably, than the Peripateticks: but though they ſpeak congruouſly enough to their believing, that there are a certain number of primogenial bodies, by whoſe concourſe all thoſe we call mixt are generated, and which, in the deſtruction of mixt bodies, do barely part company, and reduce from one another, juſt ſuch as they were when they came together; yet I, who meet with very few opinions, that I can entirely acquieſce in, muſt confeſs to you, that I am inclined to differ, not only from the Ariſtotelians, but from the old philoſophers and the chymiſts, about the nature of miſtion. And if you will give me leave, I ſhall briefly propoſe to you my preſent notion of it, provided you will look upon it, not ſo much as an aſſertion as an hypotheſis; in talking of which, I do not now pretend to propoſe and debate the whole doctrine of miſtion, but to ſhew, that it is not improbable, that ſometimes mingled ſubſtances may be ſo ſtrictly united, that it doth not by the uſual operations of the fire, by which chymiſts are wont to ſuppoſe themſelves to have made the analyſis of mixt bodies, ſufficiently appear, that in ſuch bodies the *Miſcibilia*, that concurred to make them up, do each of them retain its own peculiar nature; and by the Spagyriſts fires may be more eaſily extricated and recovered, than altered; either by a change of texture in the parts of the ſame ingredient, or by an aſſociation with ſome parts of another ingredient, more ſtrict than was that of the parts of this or that *Miſcibile* among themſelves. At theſe words, *Eleutherius* having preſſed him to do what he propoſed, and promiſed to do what he deſired;

I CONSIDER then (reſumes *Carneades*) that, not to mention thoſe improper kinds of miſtion, wherein homogeneous bodies are joined, as when water is mingled with water, or two veſſels full of the ſame kind of wine with one another, the miſtion I am now to diſcourſe of ſeems, generally ſpeaking, to be but an union *per minima* of any two or more bodies of differing denominations; as when aſhes and ſand are colliquated into glaſs, or antimony and iron into regulus martis, or wine and water are mingled, and ſugar is diſſolved in the mixture. Now in this general notion of miſtion it does not appear clearly comprehended, that the *Miſcibilia* or ingredients do in their ſmall parts ſo retain their nature, and remain diſtinct in the compound, that they may thence by the fire be again taken aſunder: for though I deny not, that in ſome miſtions of certain permanent bodies this recovery of the ſame ingredients may be made, yet I am not convinced, that it will hold in all, or even in moſt, or that it is neceſſarily deducible from chymical experiments, and the true notion of miſtion. To explain this a little, I aſſume, that bodies may be mingled, and that very durably, that are not elementary, nor have been reſolved into elements or principles, that they may be mingled; as is evident in the regulus of colliquated antimony, and iron newly mentioned; and in gold coin, which laſts ſo many ages; wherein generally the gold is alloyed by the mixture of a quantity, greater or leſſer, (in our mints they uſe about a 12th part) of either ſilver, or copper, or both. Next, I conſider, that there being but one univerſal matter of things, as it is known that the Ariſtotelians themſelves acknowledge, who call it *materia prima*, (about which nevertheleſs I like not all their opinions) the portions of this matter ſeem to differ from one another but in certain qualities or accidents, fewer or more; upon whoſe account the corporeal ſubſtance they belong to receives its denomination, and is referred to this or that particular ſort of bodies: ſo that if it come to loſe, or be deprived of thoſe qualities, though it ceaſes not to be a body, yet it ceaſes from being that kind of body as a plant, or animal, or red, green, ſweet, ſour, or the like. I conſider, that it very often happens, that the ſmall parts of bodies cohere together but by immediate contact and reſt, and that, however, there are few bodies, whoſe minute parts ſtick ſo cloſe together, to what cauſe ſoever their combination be aſcribed, but that it is poſſible to meet with ſome other body, whoſe ſmall parts may get between them, and ſo diſjoin them; or may be fitted to cohere more ſtrongly with ſome of them, than thoſe ſome do with the reſt; or at leaſt may be combined ſo cloſely with them, as that neither the fire, nor the other uſual inſtruments of chymical anatomies will ſeparate them. Theſe things being premiſed, I will not peremptorily deny, but that there may be ſome cluſters of particles, wherein the particles are ſo minute, and the coherence ſo ſtrict, or both, that when bodies of differing denominations, and conſiſting of ſuch durable cluſters, happen to be mingled, though the compound body made up of them may be very differing from either of the ingredients, yet each of the little maſſes or cluſters may ſo retain its own nature, as to be again ſeparable, ſuch as it was before. As when gold and ſilver being melted together in a due prodortion (for in every proportion, the refiners will tell you, that the experiment will not ſucceed) aqua fortis will diſſolve the ſilver, and leave the gold untouched; by which means, as you lately noted, both the metals may be recovered from the mixed maſs. But (continues *Carneades*) there are other cluſters, wherein the particles ſtick not ſo cloſe together, but that they may meet with corpuſcles of another denomination, which are diſpoſed to be more cloſely united with ſome of them, than they were among themſelves. And in ſuch caſe, two thus combining corpuſcles loſing that ſhape, or ſize, or motion, or other accident, upon whoſe account they were endowed with ſuch a determinate quality or nature, each of them really ceaſes to be a corpuſcle of the ſame denomination

denomination it was before; and from the coalition of theſe there may emerge a new body, as really one, as either of the corpuſcles was before they were mingled, or, if you pleaſe, confounded: ſince this concretion is really endowed with its own diſtinct qualities, and can no more by the fire, or any other known way of analyſis, be divided again into the corpuſcles, that at firſt concurred to make it, than either of them could, by the ſame means, be ſubdivided into other particles. But (ſays *Eleutherius*) to make this more intelligble by particular examples; if you diſſolve copper in aqua fortis, or ſpirit of nitre, (for I remember not which I uſed, nor do I think it much material) you may by cryſtallizing the ſolution obtain a goodly vitriol; which, though by virtue of the compoſition it have manifeſtly divers qualities, not to be met with in either of the ingredients, yet it ſeems, that the nitrous ſpirits, or at leaſt many of them, may in this compounded maſs retain their former nature: for having for trial-ſake diſtilled this vitriol ſpirit, there came over ſtore of red fumes, which by that colour, by their peculiar ſtink, and by their ſourneſs, manifeſted themſelves to be nitrous ſpirits, and that the remaining calx continued copper, I ſuppoſe you will eaſily believe. But if you diſſolve minium, which is but lead powdered by the fire, in good ſpirit of vinegar, and cryſtallize the ſolution, you ſhall not only have a ſaccharine ſalt exceedingly differing from both its ingredients; but the union of ſome parts of the menſtruum with ſome of thoſe of the metal is ſo ſtrict, that the ſpirit of vinegar ſeems to be, as ſuch, deſtroyed; ſince the ſaline corpuſcles have quite loſt that acidity, upon whoſe account the liquor was called ſpirit of vinegar; nor can any ſuch acid parts, as were put to the minium, be ſeparated by any known way from the *ſaccharum Saturni* reſulting from them both. For not only there is no ſourneſs at all, but an admirable ſweetneſs to be taſted in the concretion; and not only I found not that ſpirit of wine, which otherwiſe will immediately hiſs, when mingled with ſtrong ſpirit of vinegar, would hiſs being poured upon *ſaccharum Saturni*, wherein yet the acid ſalt of vinegar, did it ſurvive, may ſeem to be concentrated; but upon the diſtillation of *ſaccharum Saturni* by it ſelf, I found indeed a liquor very penetrant, but not at all acid, and differing as well in ſmell and other qualities, as in taſte, from the ſpirit of vinegar; which likewiſe ſeemed to have left ſome of its parts very firmly united to the *caput mortuum*, which though of a leaden nature was in ſmell, colour, *&c.* differing from minium. Which brings into my mind, that though two powders, the one blue, and the other yellow, may appear a green mixture, without either of them loſing its own colour, as a good microſcope has ſometimes informed me; yet having mingled minium and ſal armoniac in a requiſite proportion, and expoſed them in a glaſs veſſel to the fire, the whole maſs became white, and the red corpuſcles were deſtroyed: for though the calcined lead was ſeparable from the ſalt, yet you will eaſily believe it did not part from it in the form of a red powder, ſuch as was the minium, when it was put to the ſal armoniac. I leave it alſo to be conſidered, whether in blood, and divers other bodies, it be probable, that each of the corpuſcles, that concur to make a compound body, doth, though ſome of them in ſome caſes may, retain its own nature in it, ſo that chymiſts may extricate each ſort of them from all the others, wherewith it concurred to make a body of one denomination.

I KNOW there may be a diſtinction betwixt matter immanent, when the material parts remain, and retain their own nature in the things materiated, as ſome of the ſchoolmen ſpeak, (in which ſenſe, wood, ſtones and lime are the matter of a houſe;) and tranſient, which in the materiated thing is ſo altered, as to receive a new form, without being capable of re-admitting again the old. In which ſenſe the friends of this diſtinction ſay, that chyle is the matter of blood, and blood that of a human body, of all whoſe parts it is preſumed to be the aliment. I know alſo, that it may be ſaid, that of material principles, ſome are common to all mixt bodies, as *Ariſtotle*'s four elements, or the chymiſts *tria prima*; others peculiar, which belong to this or that ſort of bodies; as butter and a kind of whey may be ſaid to be the proper principles of cream: and I deny not, but that theſe diſtinctions may in ſome caſes be of uſe; but partly by what I have ſaid already, and partly by what I am to ſay, you may eaſily enough gueſs, in what ſenſe I admit them, and diſcern, that in ſuch a ſenſe they will either illuſtrate ſome of my opinions, or at leaſt will not overthrow any of them.

TO proſecute then what I was ſaying before, I will add to this purpoſe, that ſince the major part of chymiſts credit what thoſe they call philoſophers affirm of their ſtone, I may repreſent to them, that though when common gold and lead are mingled together, the lead may be ſever'd almoſt unaltered from the gold; yet if inſtead of gold a tantillum of the red elixir be mingled with the ſaturn, their union will be ſo indiſſoluble in the perfect gold, that will be produced by it, that there is no known, nor perhaps no poſſible way of ſeparating the diffuſed elixir from the fixed lead, but they both conſtitute a moſt permanent body, wherein the ſaturn ſeems to have quite loſt its properties, that made it be called lead, and to have been rather tranſmuted by the elixir, than barely aſſociated to it. So that it ſeems not always neceſſary, that the bodies, that are put together *per minima*, ſhould each retain its own nature; ſo as when the maſs it ſelf is diſſipated by the fire, to be more diſpoſed to re-appear in its priſtine form, than in any new one, which by a ſtricter aſſociation of its parts with thoſe of ſome of the other ingredients of the compoſitum, than with one another, it may have acquired.

AND if it be objected, that unleſs the hypotheſis I oppoſe be admitted, in ſuch caſes as I have propoſed, there would not be an union, but a deſtruction of mingled bodies, which ſeems all one as to ſay, that of ſuch bodies there is no miſtion at all; I anſwer, that though the ſubſtances, that are mingled, remain, only

their accidents are deſtroyed, and though we may with tolerable congruity call them *Miſcibilia*, becauſe they are diſtinct bodies before they are put together, however afterwards they are ſo confounded, that I ſhould rather call them concretions, or reſulting bodies, than mixed ones; and though, perhaps, ſome other and better account may be propoſed, upon which the name of miſtion may remain; yet, if what I have ſaid be thought reaſon, I ſhall not wrangle about words, though I think it fitter to alter a term of art, than reject a new truth, becauſe it ſuits not with it. If it be alſo objected, that this notion of mine, concerning miſtion, though it may be allowed, when bodies already compounded are put to be mingled, yet it is not applicable to thoſe miſtions, that are immediately made of the elements, or principles themſelves; I anſwer in the firſt place, that I here conſider the nature of miſtion ſomewhat more generally, than the chymiſts; who yet cannot deny, that there are oftentimes mixtures, and thoſe very durable ones, made of bodies, that are not elementary. And in the next place, that though it may be probably pretended, that in thoſe mixtures, that are made immediately of the bodies, that are called principles or elements, the mingled ingredients may better retain their own nature in the compounded maſs, and be more eaſily ſeparated from thence; yet, beſides that it may be doubted, whether there be any ſuch primary bodies, I ſee not why the reaſon I alledged, of the deſtructibility of the ingredients of bodies in general, may not ſometimes be applicable to ſalt, ſulphur, or mercury; till it be ſhewn upon what account we are to believe them privileged. And however, (if you pleaſe but to recall to mind, to what purpoſe I told you at firſt, I meant to ſpeak of miſtion at this time) you will perhaps allow, that what I have hitherto diſcourſed about it, may not only give ſome light to the nature of it in general, (eſpecially when I ſhall have an opportunity to declare to you my thoughts on that ſubject more fully) but may on ſome occaſions alſo be ſerviceable to me in the enſuing part of this diſcourſe.

BUT to look back now to that part of our diſcourſe, whence this excurſion concerning miſtion has ſo long diverted us, though we there deduced, from the differing ſubſtances obtained from a plant nouriſhed only with water, and from ſome other things, that it was not neceſſary, that nature ſhould always compound a body at firſt of all ſuch differing bodies, as the fire could afterwards make it afford; yet this is not all, that may be collected from thoſe experiments. For from them there ſeems alſo deducible ſomething, that ſubverts another foundation of the chymical doctrine. For ſince that (as we have ſeen) out of fair water alone, not only ſpirit, but oil, and ſalt, and earth may be produced; it will follow, that ſalt and ſulphur are not primogenial bodies, and principles, ſince they are every day made out of plain water by the texture, which the ſeed or ſeminal principle of plants put it into. And this would not perhaps ſeem ſo ſtrange, if, through pride or negligence, we were not wont to overlook the obvious and familiar workings of nature; for if we conſider what ſlight qualities they are, that ſerve to denominate one of the *tria prima*, we ſhall find, that nature does frequently enough work as great alterations in divers parcels of matter: for to be readily diſſoluble in water, is enough to make the body, that is ſo, paſs for a ſalt. And yet I ſee not, why from a new ſhuffling and diſpoſition of the component particles of a body, it ſhould be much harder for nature to compoſe a body diſſoluble in water, of a portion of water, that was not ſo before, than of the liquid ſubſtance of an egg, which will eaſily mix with water, to produce by the bare warmth of a hatching hen, membranes, feathers, tendons, and other parts, that are not diſſoluble in water as that liquid ſubſtance was: nor is the hardneſs and brittleneſs of ſalt more difficult for nature to introduce into ſuch a yielding body as water, than it is for her to make the bones of a chick out of the tender ſubſtance of the liquors of an egg. But inſtead of proſecuting this conſideration, as I eaſily might, I will proceed as ſoon as I have taken notice of an objection, that lies in my way. For I eaſily foreſee it will be alledged, that the above mentioned examples are all taken from plants, and animals, in whom the matter is faſhioned by the plaſtick power of the ſeed, or ſomething analogus thereunto. Whereas the fire does not act like any of the ſeminal principles, but deſtroys them all, when they come within its reach. But to this I ſhall need at preſent to make but this eaſy anſwer, that whether it be a ſeminal principle, or any other, which faſhions that matter after thoſe various manners I have mentioned to you, yet it is evident, that either by the plaſtick principle alone, or that and heat together, or by ſome other cauſe capable to contex the matter, it is yet poſſible, that the matter may be anew contrived into ſuch bodies. And it is only for the poſſibility of this, that I am now contending.

THE SCEPTICAL CHYMIST:

PART III.

WHAT I have hitherto diſcourſed, *Eleutherius*, (ſays his friend to him) has, I preſume, ſhewn you, that a conſidering man may very well queſtion the truth of thoſe very ſuppoſitions, which Chymiſts as well as Peripateticks, without proving, take for granted; and upon which depends the validity of the inferences they draw from their experiments. Wherefore having diſpatched that, which though a chymiſt perhaps will not, yet I do, look upon as the moſt important, as well as difficult, part of my taſk, it will now be ſeaſonable for me to proceed to the conſideration of the experiments themſelves, wherein they are wont ſo much to triumph and glory. And theſe will the rather deſerve a ſerious examination, becauſe thoſe, that alledge them, are wont to do it with ſo much confidence and oſtentation, that they have hitherto impoſed upon almoſt all perſons, without excepting philoſophers and phyſicians themſelves, who have read their books, or heard them talk. For ſome learned men have been content rather to believe what they ſo boldly affirm, than be at the trouble and charge, to try whether or no it be true. Others again, who have curioſity enough to examine the truth of what is averred, want ſkill and opportunity to do what they deſire. And the generality even of learned men, ſeeing the chymiſts (not contenting themſelves with the ſchools to amuſe the world with empty words) actually perform divers ſtrange things, and, among thoſe, reſolve compound bodies into ſeveral ſubſtances, not known by former philoſophers to be contained in them; men I ſay, ſeeing theſe things, and hearing with what confidence chymiſts aver the ſubſtances obtained from compound bodies by the fire to be the true elements, or, (as they ſpeak) hypoſtatical principles of them, are forward to think it but juſt, as well as modeſt, that according to the logicians rule, the ſkilful artiſts ſhould be credited in their own art; eſpecially when thoſe things, whoſe nature they ſo confidently take upon them to teach others, are not only productions of their own ſkill, but ſuch as others know not elſe what to make of.

BUT though (continues *Carneades*) the chymiſts have been able upon ſome or other of the mentioned accounts, not only to delight but amaze, and almoſt to bewitch even learned men; yet ſuch as you and I, who are not unpractiſed in the trade, muſt not ſuffer our ſelves to be impoſed upon by hard names, or bold aſſertions; nor to be dazled by that light which ſhould but aſſiſt us to diſcern things the more clearly. It is one thing to be able to help nature to produce things, and another thing to underſtand well the nature of the things produced. As we ſee, that many perſons, that can beget children, are for all that as ignorant of the number and nature of the parts, eſpecially the internal ones, that conſtitute a child's body, as they that never were parents. Nor do I doubt, but you will excuſe me, if, as I thank the chymiſts for the things their analyſis ſhews me, ſo I take the liberty to conſider, how many, and what they are, without being aſtoniſhed at them; as if, whoſoever hath ſkill enough to ſhew men ſome new thing of his own making, had the right to make them believe whatſoever he pleaſes to tell them concerning it.

WHEREFORE, I will now proceed to my third general conſideration; which is, that it does not appear, that three is preciſely and univerſally the number of the diſtinct ſubſtances or elements, whereinto mixt bodies are reſoluble by the fire: I mean, that it is not proved by chymiſts, that all the compound bodies, which are granted to be perfectly mixt, are upon their chymical analyſis diviſible each of them into juſt three diſtinct ſubſtances, neither more nor leſs, which are wont to be looked upon as elementary, or may as well be reputed ſo as thoſe, that are ſo reputed. Which laſt clauſe I ſubjoin, to prevent your objecting, that ſome of the ſubſtances I may have occaſion to mention by and by, are not perfectly homogeneous, nor conſequently worthy of the name of principles. For that which I am now to conſider is, into how many differing ſubſtances, that may plauſibly paſs for the elementary ingredients of a mixt body, it may be analyzed by the fire; but whether each of theſe be uncompounded I reſerve to examine, when I ſhall come to the next general conſideration; where I hope to evince, that the ſubſtances, which the chymiſts not only allow, but aſſert to be the component principles of the body reſolved into them, are not wont to be uncompounded.

Now there are two kind of arguments (purſues *Carneades*) which may be brought to make my third propoſition ſeem probable; one ſort of them being of a more ſpeculative nature, and the other drawn from experience. To begin then with the firſt of theſe.

BUT as *Carneades* was going to do as he had ſaid, *Eleutherius* interrupted him, by ſaying with a ſomewhat ſmiling countenance;

IF you have no mind I ſhould think, that the proverb, *that good wits have bad memories*, is rational and applicable to you, you muſt not forget now you are upon the ſpeculative conſiderations, that may relate to the number of the elements, that yourſelf did not long ſince deliver and concede ſome propoſitions in favour of the chymical doctrine, which I may without diſparagement to you think it uneaſy, even for *Carneades* to anſwer.

I HAVE not, replies he, forgot the conceſſions you mean; but I hope too, that you have not forgot neither with what cautions they were made, when I had not yet aſſumed the perſon I am now ſuſtaining. But however, I ſhall, to content you, ſo diſcourſe of my third general conſideration, as to let you ſee, that I am not unmindful of the things you would have me remember.

To talk then again according to ſuch principles as I then made uſe of, I ſhall repreſent, that if it be granted rational to ſuppoſe, as I then did, that the elements conſiſted at firſt of certain ſmall and primary coalitions of the minute particles of matter into corpuſcles very numerous, and very like each other, it will not be abſurd to conceive, that ſuch primary cluſters may be of far more ſorts than three or five; and conſequently, that we need not ſuppoſe, that in each of the compound bodies we are treating of, there ſhould be found juſt three ſorts of ſuch primitive coalitions, as we are ſpeaking of.

AND if, according to this notion, we allow a conſiderable number of differing elements, I may add, that it ſeems very poſſible, that to the conſtitution of one ſort of mixt bodies two kinds of elementary ones may ſuffice (as I lately exemplified to you, in that moſt durable concrete, glaſs,) another ſort of mixts may be compoſed of three elements, another of four, another of five, and another perhaps of many more. So that, according to this notion, there can be no determinate number aſſigned, as that of the elements of all ſorts of compound bodies whatſoever; it being very probable, that ſome concretes conſiſt of fewer, ſome of more elements. Nay, it does not ſeem impoſſible, according to theſe principles, but that there may be two ſorts of mixts, whereof the one may not have any of all the ſame elements as the other conſiſts of; as we oftentimes ſee two words, whereof the one has not any one of the letters to be met with in the other; or as we often meet with divers electuaries, in which no ingredient (except ſugar) is common to any two of them. I will not here debate, whether there may not be a multitude of theſe corpuſcles, which by reaſon of their being primary and ſimple, might be called elementary, if ſeveral ſorts of them ſhould convene to compoſe any body, which are as yet free, and neither as yet contexed and entangled with primary corpuſcles of other kinds, but remain liable to be ſubdued and faſhioned by ſeminal principles, or the like powerful and tranſmuting agent; by whom they may be ſo connected among themſelves, or with the parts of the bodies, as to make the compound bodies, whoſe ingredients they are, reſoluble into more, or other elements than thoſe that chymiſts have hitherto taken notice of.

To all which I may add, that ſince it appears, by what I obſerved to you of the permanency of gold and ſilver, that even corpuſcles, that are not of an elementary, but compounded nature, may be of ſo durable a texture, as to remain indiſſoluble in the ordinary analyſis that Chymiſts make of bodies by the fire; it is not impoſſible, but that, though there were but three elements, yet there may be a greater number of bodies, which the wonted ways of anatomy will not diſcover to be no elementary bodies.

BUT, (ſays *Carneades*) having thus far, in compliance to you, talked conjecturally of the number of the elements, it is now time to conſider, not of how many elements it is poſſible that nature may compound mixed bodies, but (at leaſt, as far as the ordinary experiments of chymiſts will inform us) of how many ſhe doth make them up.

I SAY then, that it does not by theſe ſufficiently appear to me, that there is any one determinate number of elements to be uniformly met with in all the ſeveral ſorts of bodies allowed to be perfectly mixed.

AND for the more diſtinct proof of this propoſition, I ſhall in the firſt place repreſent, that there are divers bodies, which I could never ſee by fire divided into ſo many as three elementary ſubſtances. I would fain (as I ſaid lately to *Philoponus*) ſee that fixed and noble metal we call gold, ſeparated into ſalt, ſulphur and mercury: and if any man will ſubmit to a competent forfeiture in caſe of failing, I ſhall willingly, in caſe of proſperous ſucceſs, pay for both the materials and the charges of ſuch an experiment. It is not, that after what I have tried my ſelf I dare peremptorily deny, that there may out of gold be extracted a certain ſubſtance, which I cannot hinder chymiſts from calling its tincture or ſulphur; and which leaves the remaining body deprived of its wonted colour. Nor am I ſure, that there cannot be drawn out of the ſame metal a real quick and running mercury. But for the ſalt of gold, I never could either ſee it, or be ſatisfied that there was ever ſuch a thing ſeparated, *in rerum naturâ*, by the relation of any credible eye-witneſs. And for the ſeveral proceſſes, that promiſe that effect, the materials, that muſt be wrought upon, are ſomewhat too precious and coſtly to be waſted upon ſo groundleſs adventures, of which not only the ſucceſs is doubtful, but the very poſſibility is not yet demonſtrated. Yet that, which moſt deters me from ſuch trials, is not their chargeableneſs, but their unſatisfactorineſs, though they ſhould ſucceed. For the extraction of this golden ſalt being in chymiſts proceſſes preſcribed to be effected by corroſive menſtruums, or the intervention of other ſaline bodies, it will remain doubtful to a wary perſon, whether the emergent ſalt be that of the gold itſelf, or of the ſaline bodies or ſpirits employed to prepare it; for that ſuch diſguiſes of metals do often impoſe upon artiſts, I am ſure *Eleutherius* is not ſo much a ſtranger to chymiſtry as to ignore. I would likewiſe willingly ſee the three principles ſeparated from the pure ſort of virgin-ſand, from oſteocolla, from refined ſilver, from quickſilver freed from its adventitious ſulphur, from Venetian talc, which by long detention in an extreme reverberium, I could but divide into ſmaller particles, not the conſtituent principles; nay, which, when I cauſed it to be kept I know not how long, in a glaſs-houſe fire, came out in the figure its lumps had, when put in, though

though altered to an almoſt amethyſtine colour; and from divers other bodies, which it were now unneceſſary to enumerate. For though I dare not abſolutely affirm it to be impoſſible to analyze theſe bodies into their *tria prima*; yet becauſe neither my own experiments, nor any competent teſtimony hath hitherto either taught me, how ſuch an analyſis may be made, or ſatisfied me, that it hath been ſo; I muſt take the liberty to refrain from believing it, till the chymiſts prove it, or give us intelligible and practicable proceſſes to perform what they pretend. For whilſt they affect that enigmatical obſcurity, with which they are wont to puzzle the readers of their divulged proceſſes concerning the analytical preparation of gold or mercury, they leave wary perſons much unſatisfied, whether or no the differing ſubſtances, they promiſe to produce, be truly the hypoſtatical principles, or only ſome intermixtures of the divided bodies with thoſe employed to work upon them, as is evident in the ſeeming cryſtals of ſilver, and thoſe of mercury; which, though by ſome inconſiderately ſuppoſed to be the ſalts of thoſe metals, are plainly but mixtures of the metalline bodies with the ſaline parts of aqua fortis, or other corroſive liquors; as is evident by their being reducible into ſilver or quickſilver, as they were before.

I CANNOT but confeſs (ſaith *Eleutherius*) that though chymiſts may, upon probable grounds, affirm themſelves able to obtain their *tria prima* from animals and vegetables, yet I have often wondered, that they ſhould ſo confidently pretend alſo, to reſolve all metalline and other mineral bodies into ſalt, ſulphur, and mercury. For it is a ſaying almoſt proverbial among thoſe chymiſts themſelves, that are accounted philoſophers, and our famous countryman *Roger Bacon* has particularly adopted it; that *facilius eſt aurum facere, quam deſtruere*. And I fear, with you, that gold is not the only mineral, from which chymiſts are wont fruitleſly to attempt the ſeparating of their three principles. I know indeed (continues *Eleutherius*) that the learned *Sennertus*, even in that book, where he takes not upon him to play the advocate for the chymiſts, but the umpire betwixt them and the Peripateticks, expreſſes himſelf roundly, thus; *Salem omnibus ineſſe (mixtis ſcilicet) & ex iis fieri poſſe omnibus in reſolutionibus chymicis verſatis notiſſimum eſt.* And in the next page, *quod de ſale dixi*, ſays he, *idem de ſulphure dici poteſt.* But, by his favour, I muſt ſee very good proofs, before I believe ſuch general aſſertions, how boldly ſoever made; and he, that would convince me of their truth, muſt firſt teach me ſome true and practicable way of ſeparating ſalt and ſulphur from gold, ſilver, and thoſe many different ſorts of ſtones, that a violent fire does not bring to lime, but to fuſion: and not only I, for my own part, never ſaw any of thoſe newly named bodies ſo reſolved; but *Helmont*, who was much better verſed in the chymical anatomizing of bodies than either *Sennertus* or I, has ſomewhere this reſolute paſſage; *Scio* (ſays he) *ex arena, ſilicibus & ſaxis, non calcariis, nunquam ſulphur aut mercurium trahi poſſe:* nay, *Quercetanus* himſelf, though the grand ſtickler for the *tria prima*, has this confeſſion of the irreſolubleneſs of diamonds; *Adamas* (ſaith he) *omnium factus lapidum ſolidiſſimus ac duriſſimus ex artiſſima videlicet trium principiorum unione ac cohærentia, quæ nulla arte ſeparationis in ſolutionem principiorum ſuorum ſpiritualium disjungi poteſt.* And indeed, purſues *Eleutherius*, I was not only glad, but ſomewhat ſurprized to find you inclined to admit, that there may be a ſulphur and a running mercury drawn from gold; for unleſs you do (as your expreſſion ſeemed to intimate) take the word ſulphur in a very looſe ſenſe, I muſt doubt, whether our chymiſts can ſeparate a ſulphur from gold: for when I ſaw you make the experiment, that I ſuppoſe invited you to ſpeak as you did, I did not judge the golden tincture to be the true principle of ſulphur extracted from the body, but an aggregate of ſome ſuch highly coloured parts of the gold, as a chymiſt would have called a ſulphur incombuſtible, which in plain Engliſh ſeems to be little better than to call it a ſulphur and no ſulphur. And as for metalline mercuries, I had not wondered at it, though you had expreſſed much more ſeverity in ſpeaking of them; for I remember, that having once met an old and famous artiſt, who had long been (and ſtill is) chymiſt to a great monarch, the repute he had of a very honeſt man invited me to deſire him to tell me ingenuouſly, whether or no, among his many labours, he had ever really extracted a true and running mercury out of metals; to which queſtion he freely replied, that he had never ſeparated a true mercury from any metal; nor had ever ſeen it really done by any man elſe. And though gold is, of all metals, that, whoſe mercury chymiſts have moſt endeavoured to extract, and which they do the moſt brag they have extracted; yet the experienced *Angelus Sala*, in his ſpagyrical account of the ſeven terreſtrial planets (that is, the ſeven metals) affords us this memorable teſtimony, to our preſent purpoſe: *Quanquam* (ſays he) *&c. experientia tamen (quam ſtultorum magiſtram vocamus) certe comprobavit, mercurium auri adeo fixum, maturum, & arctè cum reliquis ejuſdem corporis ſubſtantiis conjungi, ut nullo modo retrogredi poſſit.* To which he ſubjoins, that he himſelf had ſeen much labour ſpent upon that deſign, but could never ſee any ſuch mercury produced thereby. And I eaſily believe what he annexes; *that he had often ſeen detected many tricks and impoſtures of cheating alchymiſts.* For, the moſt part of thoſe, that are fond of ſuch charletans, being unſkilful or credulous, or both, it is very eaſy for ſuch as have ſome ſkill, much craft, more boldneſs, and no conſcience, to impoſe upon them: and therefore, though many profeſſed alchymiſts, and divers perſons of quality have told me, that they have made or ſeen the mercury of gold, or of this or that other metal; yet I have been ſtill apt to fear, that either theſe perſons have had a deſign to deceive others, or have had not ſkill and circumſpection enough to keep themſelves from being deceived.

Quercet. apud Blich. in Theſſalo redivivo, pag. 99

Sennert. lib. de conſ. & diſſenſ. pag. 147.

Helmon. pag. 409.

You recall to my mind (ſays *Carneades*) a certain experiment I once deviſed, innocently to deceive ſome perſons, and let them and others ſee, how little is to be built upon the affirmation of thoſe, that are either unſkilful or unwary, when they tell us they have ſeen alchymiſts make the mercury of this or that metal: and to make this the more evident, I made my experiment much more ſlight, ſhort and ſimple, than the chymiſts uſual proceſſes to extract metalline mercuries; which operations being commonly more elaborate and intricate, and requiring a much more longer time, give the alchymiſts a greater opportunity to cozen, and conſequently are more obnoxious to the ſpectators ſuſpicion. And that, wherein I endeavoured to make my experiment look the more like a true analyſis, was, that I not only pretended, as well as others, to extract a mercury from the metal I wrought upon, but likewiſe to ſeparate a large proportion of manifeſt and inflammable ſulphur. I take then of the filings of copper about a dram or two; of common ſublimate, powdered, the like weight; and ſal armoniac near about as much as of ſublimate: theſe three being well mingled together, I put into a ſmall phial with a long neck, or, which I find better, into a glaſs-urinal, which (having firſt ſtopped it with cotton) to avoid the noxious fumes, I approach by degrees to a competent fire of well kindled coals, or (which looks better, but more endangers the glaſs) to the flame of a candle; and after a while the bottom of the glaſs being held juſt upon the kindled coals, or in the flame, you may in about a quarter of an hour, or, perchance, in half that time, perceive in the bottom of the glaſs ſome running mercury; and if then you take away the glaſs, and break it, you ſhall find a parcel of quickſilver, perhaps altogether, and perhaps part of it in the pores of the ſolid maſs. You ſhall find too, that the remaining lump being held to the flame of the candle, will readily burn with a greeniſh flame, and after a little while (perchance preſently) will in the air acquire a greeniſh-blue, which being the colour, that is aſcribed to copper, when its body is unlocked, it is eaſy to perſuade men, that this is the true ſulphur of *Venus*, eſpecially ſince not only the ſalts may be ſuppoſed partly to be flown away, and partly to be ſublimed to the upper part of the glaſs, (whoſe inſide will commonly appear whitened by them) but the metal ſeems to be quite deſtroyed, the copper no longer appearing in a metalline form, but almoſt in that of a reſinous lump: whereas, indeed, the caſe is only this, that the ſaline parts of the ſublimate, together with the ſal armoniac, being excited and actuated by the vehement heat, fall upon the copper, (which is a metal they can more eaſily corrode than ſilver) whereby the ſmall parts of the mercury being freed from the ſalts, that kept them aſunder, and being by the heat tumbled up and down after many occurſions, they convene into a conſpicuous maſs of liquor; and as for the ſalts, ſome of the more volatile of them ſubliming to the upper part of the glaſs, the others corrode the copper, and uniting themſelves with it, do ſtrangely alter and diſguiſe its metallick form, and compoſe with it a new kind of concrete, inflammable like ſulphur; concerning which, I ſhall not now ſay any thing, ſince I can refer you to the diligent obſervations, which I remember Mr. *Boyle* has made concerning this odd kind of verdigreaſe. But, continues *Carneades* ſmiling, you know I was not cut out for a mountebank, and therefore I will haſten to reſume the perſon of a ſceptick, and take up my diſcourſe, where you diverted me from proſecuting it.

In the next place then I conſider, that, as there are ſome bodies, which yield not ſo many as the three principles; ſo there are many others, that in their reſolution exhibit more principles than three; and that therefore the ternary number is not that of the univerſal and adequate principles of bodies. If you allow of the diſcourſe I lately made you, touching the primary aſſociations of the ſmall particles of matter, you will ſcarce think it improbable, that of ſuch elementary corpuſcles there may be more ſorts than either three, or four, or five. And if you will grant, what will ſcarce be denied, that corpuſcles of a compounded nature may, in all the wonted examples of chymiſts, paſs for elementary, I ſee not why you ſhould think it impoſſible, that aqua fortis, or aqua regis, will make a ſeparation of colliquated ſilver and gold, though the fire cannot: ſo there may be ſome agent found out ſo ſubtile and ſo powerful, at leaſt in reſpect of thoſe particular compounded corpuſcles, as to be able to reſolve them into thoſe more ſimple ones, whereof they conſiſt, and conſequently increaſe the number of the diſtinct ſubſtances, whereinto the mixed body has been hitherto thought reſoluble. And if that be true, which I recited to you a while ago out of *Helmont*, concerning the operations of the alkaheſt, which divides bodies into other diſtinct ſubſtances, both as to number and nature, than the fire does; it will not a little countenance my conjecture. But confining our ſelves to ſuch ways of analyzing mixed bodies, as are already not unknown to chymiſts, it may without abſurdity be queſtioned, whether beſides thoſe groſſer elements of bodies, which they call ſalt, ſulphur and mercury, there may not be ingredients of a more ſubtile nature, which being extremely little, and not being in themſelves viſible, may eſcape unheeded at the junctures of the diſtillatory veſſels, though never ſo carefully luted. For let me obſerve to you one thing, which, though not taken notice of by chymiſts, may be a notion of good uſe in divers caſes to a naturaliſt, that we may well ſuſpect, that there may be ſeveral ſorts of bodies, which are not immediate objects of any one of our ſenſes; ſince we ſee, that not only thoſe little corpuſcles, that iſſue out of the loadſtone, and perform the wonders, for which it is juſtly admired; but the effluviums of amber, jet, and other electrical concretes, though by their effects upon the particular bodies diſpoſed to receive their action, they ſeem to fall under the cognizance of our ſight, yet do

they

they not as electrical immediately affect any of our ſenſes, as do the bodies, whether minute or greater; that we ſee, feel, taſte, *&c.* But, (continues *Carneades*) becauſe you may expect I ſhould, as the chymiſts do, conſider only the ſenſible ingredients of mixt bodies, let us now ſee what experience will, even as to theſe, ſuggeſt to us.

IT ſeems then queſtionable enough, whether from grapes variouſly ordered there may not be drawn more diſtinct ſubſtances by the help of the fire, than from moſt other mixt bodies. For the grapes themſelves being dried into raiſins and diſtilled, will (beſides alkali, phlegm, and earth) yield a conſiderable quantity of an empyreumatical oil, and a ſpirit of a very different nature from that of wine. Alſo the unfermented juice of grapes affords other diſtilled liquors than wine doth. The juice of grapes, after fermentation, will yield a *ſpiritus ardens*; which, if competently rectified, will all burn away without leaving any thing remaining. The ſame fermented juice degenerating into vinegar yields an acid and corroding ſpirit. The ſame juice tunned up arms itſelf with tartar; out of which may be ſeparated, as out of other bodies, phlegm, ſpirit, oil, ſalt and earth: not to mention what ſubſtances may be drawn from the vine itſelf, probably differing from thoſe, which are ſeparated from tartar, which is a body by itſelf, that has few reſemblers in the world. And I will further conſider, that what force ſoever you will allow this inſtance, to evince, that there are ſome bodies, that yield more elements than others, it can ſcarce be denied, but that the major part of bodies, that are diviſible into elements, yield more than three. For, beſides thoſe, which the chymiſts are pleaſed to name hypoſtatical, moſt bodies contain two others, phlegm and earth; which concurring as well as the reſt to the conſtitution of mixts, and being as generally, if not more, found in their analyſis, I ſee no ſufficient cauſe, why they ſhould be excluded from the number of elements. Nor will it ſuffice to object, as the Paracelſians are wont to do, that the *tria prima* are the moſt uſeful elements, and the earth and water but worthleſs and unactive; for elements being called ſo, in relation to the conſtituting of mixt bodies, it ſhould be upon the account of its ingrediency, not of its uſe, that any thing ſhould be affirmed or denied to be an element: and as for the pretended uſefulneſs of earth and water, it would be conſidered, that uſefulneſs, or the want of it, denotes only a reſpect or relation to us; and therefore the preſence, or abſence of it, alters not the intrinſick nature of the thing. The hurtful teeth of vipers are, for aught I know, uſeleſs to us, and yet are not to be denied to be parts of their bodies; and it were hard to ſhew of what greater uſe to us, than phlegm and earth, are thoſe undiſcerned ſtars, which our new teleſcopes diſcover to us, in many blanched places of the ſky: and yet we cannot but acknowledge them conſtituent, and conſiderably great parts of the univerſe. Beſides that, whether or no the phlegm and earth be immediately uſeful, but neceſſary to conſtitute the body whence they are ſeparated; and conſequently, if the mixt body be not uſeleſs to us, thoſe conſtituent parts, without which it could not have been that mixed body, may be ſaid not to be unuſeful to us: and though the earth and water be not ſo conſpicuouſly operative (after ſeparation) as the other three more active principles, yet in this caſe it will not be amiſs to remember the lucky fable of *Menenius Agrippa*, of the dangerous ſedition of the hands and legs, and other more buſy parts of the body, againſt the ſeemingly unactive ſtomach. And to this caſe alſo we may not unfitly apply that reaſoning of an Apoſtle, to another purpoſe; *If the ear ſhall ſay, becauſe I am not the eye, I am not of the body; is it therefore not of the body? If the whole body were eye, where were the hearing? If the whole were for hearing, where the ſmelling?* In a word, ſince earth and water appear, as clearly and as generally as the other principles, upon the reſolution of bodies, to be the ingredients, whereof they are made up; and ſince they are uſeful (if not immediately to us, or rather to phyſicians) to the bodies they conſtitute, and ſo, though in ſomewhat a remoter way, are ſerviceable to us; to exclude them out of the number of elements, is not to imitate nature.

AND on this occaſion I cannot but take notice, that whereas the great argument, which the chymiſts are wont to employ to vilify earth and water, and make them be looked upon as uſeleſs and unworthy to be reckoned among the principles of mixed bodies, is, that they are not endowed with ſpecifick properties, but only with elementary qualities; of which they uſe to ſpeak very ſlightingly, as of qualities contemptible and unactive; I ſee no ſufficient reaſon for this practice of the chymiſts: for it is confeſſed, that heat is an elementary quality, and yet that an almoſt innumerable company of conſiderable things are performed by heat, is manifeſt to them, that duly conſider the various phænomena, wherein it intervenes as a principal actor; and none ought leſs to ignore or diſtruſt this truth than a chymiſt; ſince almoſt all the operations and productions of his art are performed chiefly by the means of heat. And as for cold it ſelf, upon whoſe account they ſo deſpiſe the earth and water, if they pleaſe to read in the voyages of our Engliſh and Dutch navigators in *Nova Zembla* and other northern regions, what ſtupendous things may be effected by cold, they would not perhaps think it ſo deſpicable. And not to repeat what I lately recited to you out of *Paracelſus* himſelf, who by the help of an intenſe cold teaches to ſeparate the quinteſſence of wine; I will only now obſerve to you, that the conſervation of the texture of many bodies, both animate and inanimate, does ſo much depend upon the convenient motion both of their own fluid and looſer parts, and of the ambient bodies, whether air, water, *&c.* that not only in human bodies we ſee, that the immoderate or unſeaſonable coldneſs of the air (eſpecially when it finds ſuch bodies over-heated) does very frequently diſcompoſe the œconomy of

them,

them, and occaſion variety of diſeaſes; but in the ſolid and durable body of iron it ſelf, in which one would not expect, that ſudden cold ſhould produce any notable change, it may have ſo great an operation, that if you take a wire, or other ſlender piece of ſteel, and having brought it in the fire to a white heat, you ſuffer it afterwards to cool leiſurely in the air, it will, when it is cold, be much of the ſame hardneſs it was of before. Whereas, if as ſoon as you remove it from the fire, you plunge it into cold water, it will upon the ſudden refrigeration acquire a very much greater hardneſs than it had before; nay, and will become manifeſtly brittle. And that you may not impute this to any peculiar quality in the water, or other liquor, or unctuous matter, wherein ſuch heated ſteel is wont to be quenched, that it may be tempered; I know a very ſkilful tradeſman, that divers times hardens ſteel by ſuddenly cooling it in a body, that is neither a liquor, nor ſo much as moiſt. A trial of that nature I remember I have ſeen made. And, however, by the operation, that water has upon ſteel quenched in it, whether upon the account of its coldneſs and moiſture, or upon that of any other of its qualities, it appears, that water is not always ſo inefficacious and contemptible a body, as our chymiſts would have it paſs for. And, what I have ſaid of the efficacy of cold and heat, might perhaps be eaſily enough carried further by other conſiderations and experiments; were it not, that having been mentioned only upon the by, I muſt not inſiſt on it, but proceed to another ſubject.

BUT (purſues *Carneades*) though I think it evident, that earth and phlegm are to be reckoned among the elements of moſt animal and vegetable bodies, yet it is not upon that account alone, that I think divers bodies reſoluble into more ſubſtances than three. For there are two experiments, that I have ſometimes made, to ſhew, that at leaſt ſome mixts are diviſible into more diſtinct ſubſtances than five. The one of theſe experiments, though it will be more ſeaſonable for me to mention it fully anon, yet in the mean time, I ſhall tell you thus much of it; that out of two diſtilled liquors, which paſs for elements of the bodies, whence they are drawn, I can, without addition, make a true yellow and inflammable ſulphur, nothwithſtanding that the two liquors remain afterwards diſtinct. Of the other experiment, which, perhaps, will not be altogether unworthy your notice, I muſt now give you this particular account: I had long obſerved, that by the diſtillation of divers woods, both in ordinary, and ſome unuſual ſorts of veſſels, the copious ſpirit, that came over, had, beſides a ſtrong taſte to be met with in the empyreumatical ſpirits of many other bodies, an acidity almoſt like that of vinegar: wherefore I ſuſpected, that though the ſouriſh liquor diſtilled, for inſtance, from box-wood, be looked upon by chymiſts as barely the ſpirit of it, and therefore as one ſingle element or principle; yet it does really conſiſt of two differing ſubſtances, and may be diviſible into them; and conſequently, that ſuch woods and other mixts, as abound with ſuch a vinegar, may be ſaid to conſiſt of one element or principle, more than the chymiſts as yet are aware of. Wherefore bethinking my ſelf, how the ſeparation of theſe two ſpirits might be made, I quickly found, that there were ſeveral ways of compaſſing it. But that of them, which I ſhall at preſent mention, was this: having diſtilled a quantity of box-wood *per ſe*, and ſlowly rectified the ſouriſh ſpirit, the better to free it both from oil and phlegm, I caſt into this rectified liquor a convenient quantity of powdered coral, expecting that the acid part of the liquor would corrode the coral, and being aſſociated with it, would be ſo retained by it, that the other part of the liquor, which was not of an acid nature, nor fit to faſten upon the corals, would be permitted to aſcend alone. Nor was I deceived in my expectation; for having gently abſtracted the liquor from the corals, there came over a ſpirit of a ſtrong ſmell, and of a taſte very piercing, but without any ſourneſs; and which was in divers qualities manifeſtly different, not only from a ſpirit of vinegar, but from ſome ſpirit of the ſame wood, that I purpoſely kept by me without depriving it of its acid ingredient. And to ſatisfy you, that theſe two ſubſtances were of a very differing nature, I might inform you of ſeveral trials, that I made, but muſt not name ſome of them, becauſe I cannot do ſo without making ſome unſeaſonable diſcoveries. Yet *this* I ſhall tell you at preſent, that the four ſpirit of box not only would, as I juſt now related, diſſolve corals, which the other would not faſten on, but being poured upon ſalt of tartar, would immediately boil and hiſs, whereas the other would lie quietly upon it. The acid ſpirit poured upon minium made a ſugar of lead, which I did not find the other to do: ſome drops of this penetrant ſpirit being mingled with ſome drops of the blue ſyrup of violets, ſeemed rather to dilute, than otherwiſe alter the colour; whereas the acid ſpirit turned the ſyrup of a reddiſh colour, and would probably have made it of as pure a red, as acid ſalts are wont to do, had not its operation been hindered by the mixture of the other ſpirit. A few drops of the compound ſpirit being ſhaken into a pretty quantity of the infuſion of lignum nephriticum, preſently deſtroyed all the bluiſh colour, whereas the other ſpirit would not take it away. To all which it might be added, that having for trial's ſake poured fair water upon the corals, that remained in the bottom of the glaſs, wherein I had rectified the double ſpirit (if I may ſo call it) that was firſt drawn from the box, I found, according to my expectation, that the acid ſpirit had really diſſolved the corals, and had coagulated with them. For by the affuſion of fair water, I obtained a ſolution, which (to note that ſingularity upon the by) was red, whence the water being evaporated, there remained a ſoluble ſubſtance much like the ordinary ſalt of coral, as chymiſts are pleaſed to call that magiſtery of corals, which they make by diſſolving them in common ſpirit of vinegar, and abſtracting

abſtracting the menſtruum *ad ſiccitatem*. I know not whether I ſhould ſubjoin on this occaſion, that the ſimple ſpirit of box, if chymiſts will have it therefore ſaline becauſe it has a ſtrong taſte, will furniſh us with a new kind of ſaline bodies, differing from thoſe hitherto taken notice of. For whereas of the three chief ſorts of ſalts, the acid, the alcalizate, and the ſulphureous, there is none, that ſeems to be friends with both the other two, as I may, ere it be long, have occaſion to ſhew; I did not find, but that the ſimple ſpirit of box did agree very well (at leaſt as far as I had occaſion to try it) both with the acid and the other ſalts. For though it would lie very quiet with ſalt of tartar, ſpirit of urine, or other bodies, whoſe ſalts were either of an alcalizate or fugitive nature; yet did not the mingling of oil of vitriol itſelf produce any hiſſing or effervescence, which you know is wont to enſue upon the affuſion of that highly acid liquor upon either of the bodies newly mentioned.

I THINK my ſelf, (ſays *Eleutherius*) beholden to you for this experiment; not only becauſe I foreſee you will make it helpful to you in the enquiry you are now upon, but becauſe it teaches us a method, whereby we may prepare a numerous ſort of new ſpirits, which though more ſimple than any that are thought elementary, are manifeſtly endowed with peculiar and powerful qualities, ſome of which may probably be of conſiderable uſe in phyſick, as well alone as aſſociated with other things; as one may hopefully gueſs by the redneſs of that ſolution your ſour ſpirit made of corals, and by ſome other circumſtances of your narrative. And ſuppoſe (purſues *Eleutherius*) that you are not ſo confined, for the ſeparation of the acid parts of theſe compound ſpirits from the other, to employ corals; but that you may as well make uſe of any alcalizate ſalt, or of pearls, or crabs eyes, or any other body, upon which common ſpirit of vinegar will eaſily work, and, to ſpeak in an *Helmontian* phraſe, exantlate it ſelf.

I HAVE not yet tried, (ſays *Carneades*) of what uſe the mentioned liquors may be in phyſick, either as medicines or as menſtruums: but I could mention now (and may another time) divers of the trials, that I made to ſatisfy my ſelf of the difference of theſe two liquors. But that, as I allow your thinking what you newly told me about corals, I preſume you will allow me, from what I have ſaid already, to deduce this corollary; that there are divers compound bodies, which may be reſolved into four ſuch differing ſubſtances, as may as well merit the name of principles, as thoſe to which the chymiſts freely give it. For ſince they ſcruple not to reckon that, which I call the compound ſpirit of box, for the ſpirit, or, as others would have it, the mercury of that wood; I ſee not, why the acid liquor, and the other, ſhould not each of them, eſpecially that laſt named, be looked upon as more worthy to be called an elementary principle; ſince it muſt needs be of a more ſimple nature than the liquor, which was found to be diviſible into that, and the acid ſpirit. And this further uſe (continues *Carneades*) may be made of our experiment to my preſent purpoſe, that it may give us a riſe to ſuſpect, that ſince a liquor reputed by the chymiſts to be, without diſpute, homogeneous, is, by ſo ſlight a way, diviſible into two diſtinct and more ſimple ingredients, ſome more ſkilful or happier experimenter than I, may find a way either further to divide one of theſe ſpirits, or to reſolve ſome or other, if not all, of thoſe other ingredients of mixt bodies, that have hitherto paſſed among chymiſts for their elements or principles.

THE SCEPTICAL CHYMIST:

PART IV.

AND thus much (ſays *Carneades*) may ſuffice to be ſaid of the number of the diſtinct ſubſtances ſeparable from mixt bodies by the fire: wherefore I now proceed to conſider the nature of them, and ſhew you, that though they ſeem homogeneous bodies, yet have they not the purity and ſimplicity that is requiſite to elements; and I ſhould immediately proceed to the proof of my aſſertion, but that the confidence, wherewith chymiſts are wont to call each of the ſubſtances we ſpeak of by the name of ſulphur or mercury, or the other of the hypoſtatical principles, and the intolerable ambiguity they allow themſelves in their writings and expreſſions, makes it neceſſary for me, in order to the keeping you either from miſtaking me, or thinking I miſtake the controverſy, to take notice to you, and complain of the unreaſonable liberty they give themſelves of playing with names at pleaſure. And indeed if I were obliged in this diſpute, to have ſuch regard to the phraſeology of each particular chymiſt, as not to write any thing, which this or that author may not pretend, not to contradict this or that ſenſe, which he may give us as occaſion ſerves to his ambiguous expreſſions, I ſhould ſcarce know how to diſpute, nor which way to turn my ſelf. For I find that even eminent writers, (ſuch as *Raymund Lully*, *Paracelſus*, and others) do ſo abuſe the terms they employ, that as they will now and then give divers things one name; ſo

they will oftentimes give one thing many names; and ſome of them (perhaps) ſuch, as do much more properly ſignify ſome diſtinct body of another kind; nay, even in technical words or terms of art, they refrain not from this confounding liberty; but will, as I have obſerved, call the ſame ſubſtance, ſometimes the ſulphur, and ſometimes the mercury of a body. And now I ſpeak of mercury, I cannot but take notice, that the deſcriptions they give us of that principle or ingredient of mixt bodies, are ſo intricate, that even thoſe, that have endeavoured to poliſh and illuſtrate the notions of the chymiſts, are fain to confeſs, that they know not what to make of it either by ingenuous acknowledgments, or deſcriptions, that are not intelligible.

I MUST confeſs, (ſays *Eleutherius*) I have, in the reading of *Paracelſus*, and other chymical authors, been troubled to find, that ſuch hard words and equivocal expreſſions, as you juſtly complain of, do, even when they treat of principles, ſeem to be ſtudiouſly affected by thoſe writers; whether to make themſelves to be admired by their readers, and their art appear more venerable and myſterious, or, (as they would have us think) to conceal from them a knowledge themſelves judge ineſtimable.

BUT whatever (ſays *Carneades*) theſe men may promiſe themſelves from a canting way of delivering the principles of nature, they will find the major part of knowing men ſo vain, as when they underſtand not what they read, to conclude, that it is rather the writer's fault than their own. And thoſe, that are ſo ambitious to be admired by the vulgar, that rather than go without the admiration of the ignorant they will expoſe themſelves to the contempt of the learned, thoſe ſhall, by my conſent, freely enjoy their option. As for the myſtical writers ſcrupling to communicate their knowledge, they might leſs to their own diſparagement, and to the trouble of their readers, have concealed it by writing no books, than by writing bad ones. If *Themiſtius* were here, he would not ſtick to ſay, that chymiſts write thus darkly, not becauſe they think their notions too precious to be explained, but becauſe they fear, that if they were explained, men would diſcern, that they are far from being precious. And indeed I fear, that the chief reaſon, why chymiſts have written ſo obſcurely of their three principles, may be, that not having clear and diſtinct notions of them themſelves, they cannot write otherwiſe than confuſedly of what they but confuſedly apprehend: not to ſay, that divers of them, being conſcious to the invalidity of their doctrine, might well enough diſcern, that they could ſcarce keep themſelves from being confuted, but by keeping themſelves from being clearly underſtood. But though much may be ſaid to excuſe the chymiſts when they write darkly, and ænigmatically, about the preparation of their elixir, and ſome few other grand arcana, the divulging of which they may, upon grounds plauſible enough, eſteem unfit; yet when they pretend to teach the general principles of natural philoſophers, this equivocal way of writing is not to be endured. For in ſuch ſpeculative enquiries, where the naked knowledge of the truth is the thing principally aimed at, what does he teach me worth thanks, that does not, if he can, make his notion intelligible to me, but by myſtical terms, and ambiguous phraſes darkens what he ſhould clear up; and makes me add the trouble of gueſſing at the ſenſe of what he equivocally expreſſes, to that of examining the truth of what he ſeems to deliver? And if the matter of the philoſopher's ſtone, and the manner of preparing it, be ſuch myſteries, as they would have the world believe them, they may write intelligibly and clearly of the principles of mixt bodies in general, without diſcovering what they call the great work. But for my part (continues *Carneades*) what my indignation at this un-philoſophical way of teaching principles has now extorted from me, is meant chiefly to excuſe my ſelf, if I ſhall hereafter oppoſe any particular opinion or aſſertion, that ſome follower of *Paracelſus* or any eminent artiſt may pretend not to be his maſter's. For, as I told you long ſince, I am not obliged to examine private men's writings, (which were a labour as endleſs as unprofitable) being only engaged to examine thoſe opinions about the *tria prima*, which I find thoſe chymiſts I have met with to agree in moſt: and I doubt not, but my arguments againſt their doctrine will be in great part eaſily enough applicable even to thoſe private opinions, which they do not ſo directly and expreſly oppoſe. And indeed, that, which I am now entering upon, being the conſideration of the things themſelves, whereinto Spagyriſts reſolve mixt bodies by the fire, if I can ſhew, that theſe are not of an elementary nature, it will be no great matter what names theſe or thoſe chymiſts have been pleaſed to give them. And I queſtion not, that to a wiſe man, and conſequently to *Eleutherius*, it will be leſs conſiderable to know, what men have thought of things, than what they ſhould have thought.

IN the fourth and laſt place, then, I conſider, that as generally as chymiſts are wont to appeal to experience, and as confidently as they uſe to inſtance the ſeveral ſubſtances ſeparated by the fire from a mixt body, as a ſufficient proof of their being its component elements; yet thoſe differing ſubſtances are many of them far enough from elementary ſimplicity, and may be yet looked upon as mixt bodies, moſt of them alſo retaining, ſomewhat at leaſt, if not very much, of the nature of thoſe concretes whence they were forced. I am glad (ſays *Eleutherius*) to ſee the vanity or envy of the canting chymiſts thus diſcovered and chaſtiſed; and I could wiſh, that learned men would conſpire together to make theſe deluding writers ſenſible, that they muſt no longer hope with impunity to abuſe the world. For whilſt ſuch men are quietly permitted to publiſh books with promiſing titles, and therein to aſſert what they pleaſe, and contradict others, and even themſelves as they pleaſe, with as little danger of being confuted as of being underſtood, they are encouraged to get themſelves a name, at the

coſt

coſt of the readers, by finding, that intelligent men are wont, for the reaſon newly mentioned, to let their books and them alone: and the ignorant and credulous (of which the number is ſtill much greater than that of the other) are forward to admire moſt what they leaſt underſtand. But if judicious men, ſkilled in chymical affairs, ſhall once agree to write clearly and plainly of them, and thereby keep men from being ſtunned, as it were, or impoſed upon by dark or empty words; it is to be hoped, that theſe men finding, that they can no longer write impertinently and abſurdly, without being laughed at for doing ſo, will be reduced either to write nothing, or books, that may teach us ſomething, and not rob men, as formerly, of invaluable time; and ſo ceaſing to trouble the world with riddles or impertinencies, we ſhall either by their books receive an advantage, or by their ſilence eſcape an inconvenience.

BUT after all this is ſaid (continues *Eleutherius*) it may be repreſented in favour of the chymiſts, that, in one regard the liberty they take in uſing names, if it be excuſable at any time, may be more ſo when they ſpeak of the ſubſtances, whereinto their analyſis reſolves mixt bodies: ſince as parents have the right to name their own children, it has ever been allowed to the authors of new inventions, to impoſe names upon them. And therefore the ſubjects we ſpeak of being ſo the productions of the chymiſts art, as not to be otherwiſe, but by it, obtainable; it ſeems but equitable to give the artiſts leave to name them as they pleaſe: conſidering alſo, that none are ſo fit and likely to teach us what thoſe bodies are, as they to whom we owed them.

I TOLD you already (ſays *Carneades*) that there is great difference betwixt the being able to make experiments, and the being able to give a philoſophical account of them. And I will not now add, that many a mine-digger may meet, whilſt he follows his work, with a gem or a mineral which he knows not what to make of, till he ſhews it a jeweller or a mineraliſt to be informed what it is. But that which I would rather have here obſerved, is, that the chymiſts I am now in debate with have given up the liberty you challenged for them, of uſing names at pleaſure, and confined themſelves by their deſcriptions, though but ſuch as they are, of their principles; ſo that although they might freely have called any thing their analyſis preſents them with, either ſulphur, or mercury, or gas, or blas, or what they pleaſed; yet when they have told me, that ſulphur (for inſtance) is a primogeneal and ſimple body, inflammable, odorous, *&c.* they muſt give me leave to diſbelieve them, if they tell me, that a body, that is either compounded or uninflammable, is ſuch a ſulphur; and to think they play with words, when they teach, that gold and ſome other minerals abound with an incombuſtible ſulphur, which is as proper an expreſſion, as a ſun-ſhine night, or a fluid ice.

BUT before I deſcend to the mention of particulars belonging to my fourth conſideration, I think it convenient to premiſe a few generals; ſome of which I ſhall the leſs need to inſiſt on at preſent, becauſe I have touched on them already.

AND firſt I muſt invite you to take notice of a certain paſſage in *Helmont* *; which though I have not found much heeded by his readers, he himſelf mentions as a notable thing, and I take to be a very conſiderable one: for whereas the diſtilled oil of oil-olive, though drawn *per ſe*, is (as I have tried) of a very ſharp and fretting quality, and of an odious taſte, he tells us, that ſimple oil being only digeſted with *Paracelſus*'s *ſal circulatum*, is reduced into diſſimilar parts, and yields a ſweet oil, very differing from the oil diſtilled from ſallet oil; as alſo, that by the ſame way there may be ſeparated from wine a very ſweet and gentle ſpirit, partaking of a far other and nobler quality than that which is immediately drawn by diſtillation, and called dephlegmed aqua vitæ, from whoſe acrimony this other ſpirit is exceedingly remote; although the *ſal circulatum* that makes theſe anatomies be ſeparated from the analyzed bodies, in the ſame weight and with the ſame qualities it had before. Which affirmation of *Helmont*, if we admit to be true, we muſt acknowledge, that there may be a very great diſparity betwixt bodies of the ſame denomination (as ſeveral oils, or ſeveral ſpirits) ſeparable from compound bodies: for beſides the differences I ſhall anon take notice of, betwixt thoſe diſtilled oils that are commonly known to chymiſts, it appears by this, that by means of the *ſal circulatum*, there may be quite another ſort of oils obtained from the ſame body: and who knows, but that there may be yet other agents bound in nature, by whoſe help there may, whether by tranſmutation or otherwiſe, be obtained from the bodies vulgarly called mixt, oils or other ſubſtances, differing from thoſe of the ſame denomination, known either to vulgar chymiſts, or even to *Helmont* himſelf? But for fear you ſhould tell me, that this is but a conjecture grounded upon another man's relation, whoſe truth we have not the means to experiment, I will not inſiſt upon it; but leaving you to conſider of it at leiſure, I ſhall proceed to what is next.

SECONDLY, then, if that be true, which was the opinion of *Leucippus*, *Democritus*, and other prime anatomiſts of old, and is in our days revived by no mean philoſophers; namely, that our culinary fire, ſuch as chymiſts uſe, conſiſts of ſwarms of little bodies ſwiftly moving, which by their ſmallneſs and motion are able to permeate the ſolideſt and compacteſt bodies, and

* *Illud notabile, in vino eſſe ſpiritum quendam mitiorem ulterioris & nobilioris qualitatis participem, quam qui immediatè per diſtillationem elicitur, diciturque aqua vitæ dephlegmata, quid facilius in ſimplici olivarum oleo ad oculum ſpectatur. Quippe diſtillatum oleum abſque lateorum aut tegularum additamento, quodque oleum philoſophorum dicitur, multum differt ab ejus oleitate, quæ elicitur prius reductio oleo ſimplici in partes diſſimilares ſola digeſtione & ſalis circulati Paracelſici appoſitione; ſi quidem ſal circulatum idem in pondere & quantitatibus priſtinis ab oleo ſegregatur, poſtquam oleum olivarum in ſui heterogeneitates eſt diſpoſitum. Dulce enim tunc oleum olivarum ex oleo, prout & ſuaviſſimus vini ſpiritus à vino hoc pacto ſeparantur, longeque in aquæ vitæ acrimonia diſtinctus.* Helmont. Aura vitalis, pag. 725.

and even glaſs it ſelf; if this (I ſay) be true, ſince we ſee, that in flints and other concretes, the fiery part is incorporated with the groſſer, it will not be irrational to conjecture, that multitudes of theſe fiery corpuſcles, getting in at the pores of the glaſs, may aſſociate themſelves with the parts of the mixt body whereon they work, and with them conſtitute new kinds of compound bodies, according as the ſhape, ſize, and other affections of the parts of the diſſipated body happen to diſpoſe them, in reference to ſuch combinations; of which alſo there may be the greater number, if it be likewiſe granted, that the corpuſcles of the fire, though all exceeding minute, and very ſwiftly moved, are not all of the ſame bigneſs, nor figure: and if I had not weightier conſiderations to diſcourſe to you of, I could name to you, to countenance what I have newly ſaid, ſome particular experiments, by which I have been induced to think, that the particles of an open fire working upon ſome bodies may really aſſociate themſelves therewith, and add to the quantity. But becauſe I am not ſure, that when the fire works upon bodies included in glaſſes, it does it by a real trajection of the fiery corpuſcles themſelves, through the ſubſtance of the glaſs, I will proceed to what is next to be mentioned.

I COULD (ſays *Eleutherius*) help you to ſome proofs, whereby I think it may be made very probable, that when the fire acts immediately upon a body, ſome of its corpuſcles may ſtick to thoſe of the burnt body, as they ſeem to do in quick-lime, but in greater numbers and more permanently. But for fear of retarding your progreſs, I ſhall deſire you to defer this inquiry till another time, and proceed as you intended.

YOU may then, in the next place, (ſays *Carneades*) obſerve with me, that not only there are ſome bodies, as gold, and ſilver, which do not by the uſual examens, made by fire, diſcover themſelves to be mixt; but if (as you may remember I formerly told you) it be a de-compound body, that is diſſipable into ſeveral ſubſtances, by being expoſed to the fire it may be reſolved into ſuch, as are neither elementary, nor ſuch as it was upon its laſt mixture compounded of; but into new kinds of mixts. Of this I have already given you ſome examples in ſoap, ſugar of lead, and vitriol. Now if we ſhall conſider, that there are ſome bodies, as well natural, (as that I laſt named) as factitious, manifeſtly de-compounded; that in the bowels of the earth nature may, as we ſee ſhe ſometimes does, make ſtrange mixtures; that animals are nouriſhed with other animals and plants; and that theſe themſelves have almoſt all of them their nutriment and growth, either from a certain nitrous juice harboured in the pores of the earth, or from the excrements of animals, or from the putrified bodies, either of living creatures or vegetables, or from other ſubſtances of a compounded nature; if, I ſay, we conſider this, it may ſeem probable, that there may be among the works of nature (not to mention thoſe of art) a greater number of de-compound bodies, than men take notice of; and indeed, as I have formerly alſo obſerved, it does not at all appear, that all mixtures muſt be of elementary bodies; but it ſeems far more probable, that there are divers ſorts of compound bodies, even in regard of all or ſome of their ingredients, conſidered antecedently to their mixture. For though ſome ſeem to he made up by the immediate coalitions of the elements, or principles themſelves, and therefore may be called *prima miſta*, or *miſta primaria*; yet it ſeems, that many other bodies are mingled (if I may ſo ſpeak) at the ſecond hand, their immediate ingredients being not elementary, but theſe primary mixt newly ſpoken of; and from divers of thoſe ſecondary ſorts of mixts may reſult, by a further compoſition, a third ſort, and ſo onwards. Nor is it improbable, that ſome bodies are made up of mixt bodies, not all of the ſame order, but of ſeveral; as (for inſtance) a concrete may conſiſt of ingredients, whereof the one may have been a primary, the other a ſecondary mixt body; (as I have in native cinnaber, by my way of reſolving it, found both that coarſer part, that ſeems more properly to be ore, and a combuſtible ſulphur, and a running mercury:) or perhaps without any ingredient of this latter ſort, it may be compoſed of mixt bodies, ſome of them of the firſt, and ſome of the third kind. And this may perhaps be ſomewhat illuſtrated by reflecting upon what happens in ſome chymical preparations of thoſe medicines which they call their bezoardicum's. For firſt, they take antimony and iron, which may be looked upon as *prima miſta*; of theſe they compound a ſtarry regulus, and to this they add, according to their intention, either gold or ſilver, which makes with it a new and further compoſition. To this they add ſublimate, which is itſelf a de-compound body, (conſiſting of common quickſilver, and divers ſalts united by ſublimation into a cryſtalline ſubſtance) and from this ſublimate, and the other metalline mixtures, they draw a liquor, which may be allowed to be of a yet more compounded nature. If it be true, as chymiſts affirm it, that by this art ſome of the gold or ſilver mingled with the regulus may be carried over the helm with it by the ſublimate; as indeed a ſkilful and candid perſon complained to me a while ſince, that an experienced friend of his and mine, having by ſuch a way brought over a great deal of gold, in hope to do ſomething further with it, which might be gainful to him, has not only miſſed of his aim, but is unable to recover his volatilized gold out of the antimonial butter, wherewith it is ſtrictly united.

NOW (continues *Carneades*) if a compound body conſiſt of ingredients, that are not merely elementary; it is not hard to conceive, that the ſubſtances, into which the fire diſſolves it, though ſeemingly homogeneous enough, may be of a compounded nature, thoſe parts of each body, that are moſt of kin, aſſociating themſelves into a compound of a new kind. As when (for example ſake) I have cauſed vitriol and ſal armoniac, and ſalt-petre to be mingled and diſtilled together, the liquor, that came over, manifeſted it ſelf not to be either ſpirit of nitre,

nitre, or of ſal armoniac, or of vitriol. For none of theſe would diſſolve crude gold, which yet my liquor was able readily to do; and thereby manifeſted it ſelf to be a new compound, conſiſting at leaſt of ſpirit of nitre, and ſal armoniac, (for the latter diſſolved in the former, will work on gold) which nevertheleſs are not by any known way ſeparable, and conſequently would not paſs for a mixt body, if we our ſelves did not, to obtain it, put and diſtill together divers concretes, whoſe diſtinct operations were known beforehand. And to add on this occaſion the experiment I lately promiſed you, becauſe it is applicable to our preſent purpoſe, I ſhall acquaint you, that ſuſpecting the common oil of vitriol not to be altogether ſuch a ſimple liquor, as chymiſts preſume it, I mingled it with an equal or a double quantity (for I tried the experiment more than once) of common oil of turpentine, ſuch as together with the other liquor I bought at the drugſters. And having carefully (for the experiment is nice, and ſomewhat dangerous) diſtilled the mixture in a ſmall glaſs retort, I obtained, according to my deſire, (beſides the two liquors I had put in) a pretty quantity of a certain ſubſtance, which ſticking all about the neck of the retort, diſcovered it ſelf to be ſulphur, not only by a very ſtrong ſulphureous ſmell, and by the colour of brimſtone; but alſo by this, that being put upon a coal, it was immediately kindled, and burned like common ſulphur. And of this ſubſtance I have yet by me ſome little parcels, which you may command and examine when you pleaſe. So that from this experiment I may deduce either one, or both of theſe propoſitions, that a real ſulphur may be made by the conjunction of two ſuch ſubſtances as chymiſts take for elementary, and which did not either of them apart appear to have any ſuch body in it; or, that oil of vitriol, though a diſtilled liquor, and taken for part of the ſaline principle of the concrete, that yields it, may yet be ſo compounded a body, as to contain, beſides its ſaline part, a ſulphur like common brimſtone, which would hardly be itſelf a ſimple or un-compounded body.

I MIGHT (purſues *Carneades*) remind you, that I formerly repreſented it as poſſible, that as there may be more elements than five, or ſix; ſo the elements of one body may be different from thoſe of another: whence it would follow, that from the reſolution of de-compound bodies there may reſult mixts of an altogether new kind, by the coalition of elements, that never perhaps convened before. I might, I ſay, mind you of this, and add divers things to this ſecond conſideration; but for fear of wanting time, I willingly pretermit them, to paſs on to the third, which is this, that the fire does not always barely reſolve or take aſunder, but may alſo after a new manner mingle and compound together the parts (whether elementary or not) of the body diſſipated by it.

THIS is ſo evident (ſays *Carneades*) in ſome obvious examples, that I cannot but wonder at their ſupineneſs, that have not taken notice of it. For when wood being burnt in a chimney is diſſipated by the fire into ſmoke and aſhes, that ſmoke compoſes ſoot, which is ſo far from being any one of the principles of the wood, that (as I noted above) you may by a further analyſis ſeparate five or ſix diſtinct ſubſtances from it. And as for the remaining aſhes, the chymiſts themſelves teach us, that by a further degree of fire they may be indiſſolubly united into glaſs. It is true, that the analyſis, which the chymiſts principally build upon, is made, not in the open air, but in cloſe veſſels; but however, the examples lately produced may invite you ſhrewdly to ſuſpect, that heat may as well compound as diſſipate the parts of mixt bodies: and not to tell you, that I have known a vitrification made even in cloſe veſſels, I muſt remind you, that the flowers of antimony, and thoſe of ſulphur, are very mixt bodies, though they aſcend in cloſe veſſels; and that it was in ſtopt glaſſes, that I brought up the whole body of camphire. And whereas it may be objected, that all theſe examples are of bodies forced up in a dry, not a fluid form, as are the liquors wont to be obtained by diſtillation; I anſwer, that beſides it is poſſible, that a body may be changed from conſiſtent to fluid, or from fluid to conſiſtent, without being otherwiſe much altered, as may appear by the eaſineſs, wherewith in winter, without any addition or ſeparation of viſible ingredients, the ſame ſubſtance may be quickly hardened into brittle ice, and thawed again into fluid water; beſides this, I ſay, it would be conſidered, that common quickſilver itſelf, which the eminenteſt chymiſts confeſs to be a mixt body, may be driven over the helm in its priſtine form of quickſilver, and conſequently, in that of a liquor. And certainly it is poſſible, that very compounded bodies may concur to conſtitute liquors; ſince, not to mention, that I have found it poſſible, by the help of a certain menſtruum, to diſtill gold it ſelf through a retort, even with a moderate fire; let us but conſider what happens in butter of antimony. For if that be carefully rectified, it may be reduced into a very clear liquor; and yet if you caſt a quantity of fair water upon it, there will quickly precipitate a ponderous and vomitive calx, which made before a conſiderable part of the liquor, and yet is indeed (though ſome eminent chymiſts would have it mercurial) an antimonial body, carried over and kept diſſolved by the ſalts of the ſublimate, and conſequently a compounded one; as you may find, if you will have the curioſity to examine this white powder by a ſkilful reduction. And that you may not think, that bodies, as compounded as flowers of brimſtone, cannot be brought to concur to conſtitute diſtilled liquors; and alſo, that you may not imagine, with divers learned men, that pretend no ſmall ſkill in chymiſtry, that at leaſt no mixt body can be brought over the helm, but by corroſive ſalts; I am ready to ſhew you, when you pleaſe, among other ways of bringing over flowers of brimſtone (perhaps I might add, even mineral ſulphurs) ſome, wherein I employ none but oleaginous bodies to make volatile liquors, in which not only the colour, but (which is a much ſurer mark) the ſmell and ſome operations manifeſt, that there

is brought over a ſulphur, that makes part of the liquor.

ONE thing more there is, *Eleutherius*, (ſays *Carneades*) which is ſo pertinent to my preſent purpoſe, that, though I have touched upon it before, I cannot but on this occaſion take notice of it. And it is this; that the qualities or accidents, upon whoſe account chymiſts are wont to call a portion of matter by the name of mercury, or ſome other of their principles, are not ſuch, but that it is poſſible as great (and therefore why not the like?) may be produced by ſuch changes of texture, and other alterations, as the fire may make in the ſmall parts of a body. I have already proved, when I diſcourſed of the ſecond general conſideration, by what happens to plants nouriſhed only with fair water, and eggs hatched into chickens, that by changing the diſpoſition of the component parts of a body, nature is able to effect as great changes in a parcel of matter reputed ſimilar, as thoſe requiſite to denominate one of the *tria prima*. And, though *Helmont* do ſomewhere wittily call the fire the deſtructor and the artificial death of things; and, although another eminent chymiſt and phyſician be pleaſed to build upon this, that fire can never generate any thing but fire; yet you will, I doubt not, be of another mind, if you conſider, how many new ſorts of mixed bodies chymiſts themſelves have produced by means of the fire; and particularly, if you conſider, how that noble and permanent body, glaſs, is not only manifeſtly produced by the violent action of the fire, but has never, for aught we know, been produced any other way. And, indeed, it ſeems but an inconſiderate aſſertion of ſome Helmontians, that every ſort of body of a peculiar denomination muſt be produced by ſome ſeminal power; as I think I could evince, if I thought it ſo neceſſary, as it is for me to haſten to what I have further to diſcourſe. Nor need it much move us, that there are ſome, who look upon whatſoever the fire is employed to produce, not as upon natural, but artificial bodies. For there is not always ſuch a difference, as many imagine, betwixt the one and the other; nor is it ſo eaſy as they think, clearly to aſſign that, which properly, conſtantly, and ſufficiently, diſcriminates them. But not to engage my ſelf in ſo nice a diſquiſition, it may now ſuffice to obſerve, that a thing is commonly termed artificial, when a parcel of matter is by the artificer's hand, or tools, or both, brought to ſuch a ſhape or form, as he deſigned before-hand in his mind: whereas in many of the chymical productions the effect would be produced, whether the artificer intended it or no; and is oftentimes very much other than he intended or looked for: and the inſtruments employed are not tools artificially faſhioned and ſhaped, like thoſe of tradeſmen, for this or that particular work; but, for the moſt part, agents of nature's own providing, and whoſe chief powers of operation they receive from their own nature or texture, not the artificer. And, indeed, the fire is as well a natural agent as ſeed: and the chymiſt; that imploys it, does but apply natural agents and patients, who being thus brought together, and acting according to their reſpective natures, perform the work themſelves; as apples, plums, or other fruit, are natural productions, though the gardener bring and faſten together the ſcions and the ſtock, and both water, and do perhaps divers other ways contribute to its bearing fruit. But, to proceed to what I was going to ſay; you may obſerve with me, *Eleutherius*, that, as I told you once before, qualities ſlight enough may ſerve to denominate a chymical principle. For, when they anatomize a compound body by the fire, if they get a ſubſtance inflammable, and that will not mingle with water, that they preſently call ſulphur; what is ſapid and diſſoluble in water, that muſt paſs for ſalt; whatſoever is fixed and indiſſoluble in water, that they name earth. And I was going to add, that whatſoever volatile ſubſtance they know not what to make of, not to ſay, whatſoever they pleaſe, that they call mercury. But that theſe qualities may either be produced, otherwiſe than by ſuch as they call ſeminal agents, or may belong to bodies of a compounded nature, may be ſhewn, among other inſtances, in glaſs made of aſhes, where the exceeding ſtrong-taſted alcalizate ſalt joining with the earth becomes inſipid, and with it conſtitutes a body; which, though alſo dry, fixed and indiſſoluble in water, is yet manifeſtly a mixed body; and made ſo by the fire it ſelf.

AND I remember to our preſent purpoſe, that *Helmont*, amongſt other medicines that he commends, has a ſhort proceſs, wherein, though the directions for practice are but obſcurely intimated, yet I have ſome reaſon not to diſbelieve the proceſs, without affirming or denying any thing about the virtues of the remedy to be made by it. *Quando* (ſays he) *oleum cinnamomi, &c. ſuo ſali alkali miſcetur abſque omni aqua, trium menſium artificioſa occultaque circulatione, totum in ſalem volatilem commutatum eſt, vere eſſentiam ſui ſimplicis in nobis exprimit, & uſque in prima noſtri conſtitutiva ſeſe ingerit.* A not unlike proceſs he delivers in another place; from whence, if we ſuppoſe him to ſay true, I may argue, that ſince by the fire there may be produced a ſubſtance, that is as well ſaline and volatile, as the ſalt of hartſhorn, blood, *&c.* which paſs for elementary; and ſince that this volatile ſalt is really compounded of a chymical oil and a fixed ſalt, the one made volatile by the other, and both aſſociated by the fire, it may well be ſuſpected, that other ſubſtances, emerging upon the diſſipation of bodies by the fire, may be new ſorts of mixts, and conſiſt of ſubſtances of differing natures: and particularly, I have ſometimes ſuſpected, that ſince the volatile ſalts of blood, hartſhorn, *&c.* are fugitive, and endowed with an exceeding ſtrong ſmell, either that chymiſts do erroneouſly aſcribe all odours to ſulphurs, or that ſuch ſalts conſiſt of ſome oily parts well incorporated with the ſaline ones. And the like conjecture I have alſo made concerning ſpirit of vinegar, which though the chymiſts think one of the principles of that body, and though being an acid ſpirit it ſeems to be much leſs

Helmont p. 412.

of

of kin, than volatile ſalts, to ſulphurs; yet, not to mention its piercing ſmell, which I know not with what congruity the chymiſts will deduce from ſalt, I wonder they have not taken notice of what their own *Tyrocinium Chymicum* teaches us concerning the diſtillation of *ſaccharum Saturni*; out of which, *Beguinus* aſſures us, that he diſtilled, beſides a very fine ſpirit, no leſs than two oils, the one blood-red and ponderous, but the other ſwimming upon the top of the ſpirit, and of a yellow colour; of which, he ſays, that he kept then ſome by him, to verify what he delivers. And though I remember not, that I have had two diſtinct oils from ſugar of lead, yet that it will, though diſtilled without addition, yield ſome oil, diſagrees not with my experience. I know the chymiſts will be apt to pretend, that theſe oils are but the volatilized ſulphur of lead; and will perhaps argue it from what *Beguinus* relates, that when the diſtillation is ended, you'll find a *caput mortuum* extremely black, and (as he ſpeaks) *nullius momenti*, as if the body, or at leaſt the chief part of the metal it ſelf, were by the diſtillation carried over the helm. But ſince you know, as well as I, that *ſaccharum Saturni* is a kind of magiſtery, made only by calcining of lead *per ſe*, diſſolving it in diſtilled vinegar, and cryſtallizing the ſolution; if I had leiſure to tell you, how differing a thing I did, upon examination, find the *caput mortuum*, ſo ſlighted by *Beguinus*, to be, from what he repreſents it, I believe you would think the conjecture propoſed leſs probable than one or other of theſe three; either that this oil did formerly concur to conſtitute the ſpirit of vinegar, and ſo that what paſſes for a chymical principle, may yet be further reſoluble into diſtinct ſubſtances; or that ſome parts of the ſpirit, together with ſome parts of the lead, may conſtitute a chymical oil, which therefore, though it paſs for homogeneous, may be a very compounded body; or at leaſt, that by the action of the diſtilled vinegar and the ſaturnine calx one upon another, part of the liquor may be ſo altered, as to be tranſmuted from an acid ſpirit into an oil. And though the truth of either of the two former conjectures would make the example I have reflected on, more pertinent to my preſent argument; yet you'll eaſily diſcern, the third and laſt conjecture cannot be unſerviceable to confirm ſome other paſſages of my diſcourſe.

Tyroc. Chym. L. 1. C. 4.

To return then to what I was ſaying juſt before I mentioned *Helmont*'s experiment; I ſhall ſubjoin, that chymiſts muſt confeſs alſo, that in the perfectly dephlegmed ſpirit of wine, or other fermented liquors, that, which they call the ſulphur of the concrete, loſes, by the fermentation, the property of oil, (which the chymiſts likewiſe take to be the true ſulphur of the mixt) of being unmingleable with the water. And if you will credit **Helmont*, a pound of the pureſt ſpirit of wine may barely, by the help of pure ſalt of tartar, (which is but the fixed ſalt of wine) be reſolved or tranſmuted into ſcarce half an ounce of ſalt, and as much elementary water, as amounts to the remaining part of the mentioned weight. And it may (as I think I formerly alſo noted) be doubted, whether that fixed and alcalizate ſalt, which is ſo unanimouſly agreed on, to be the ſaline principle of incinerated bodies, be not, as it is alcalizate, a production of the fire? For though the taſte of tartar, for example, ſeem to argue, that it contains a ſalt before it be burned; yet that ſalt being very acid, is of a quite differing taſte from the lixiviate ſalt of calcined tartar. And though it be not truly objected againſt the chymiſts, that they obtain all ſalts they make, by reducing the body they work on into aſhes with violent fires, (ſince hartſhorn, amber, blood, and divers other mixts, yield a copious ſalt, before they be burned to aſhes) yet this volatile ſalt differs much, as we ſhall ſee anon, from the fixed alcalizate ſalt I ſpeak of; which, for aught I remember, is not producible by any known way, without incineration. It is not unknown to chymiſts, that quickſilver may be precipitated, without addition, into a dry powder, that remains ſo in water. And ſome eminent Spagyriſts, and even *Raimund Lully* himſelf, teach, that meerly by the fire, quickſilver may in convenient veſſels be reduced (at leaſt in great part) into a thin liquor like water, and mingleable with it. So that by the bare action of the fire, it is poſſible, that the parts of a mixed body ſhould be ſo diſpoſed after new and differing manners, that it may be ſometimes of one conſiſtence, ſometimes of another; and may in one ſtate be diſpoſed to be mingled with water, and in another not. I could alſo ſhew you, that bodies, from which apart chymiſts cannot obtain any thing, that is combuſtible, may, by being aſſociated together, and by the help of the fire, afford an inflammable ſubſtance. And, that on the other ſide, it is poſſible for a body to be inflammable, from which it would very much puzzle any ordinary chymiſt, and perhaps any other, to ſeparate an inflammable principle or ingredient. Wherefore, ſince the principles of chymiſts may receive their denominations from qualities, which it often exceeds not the power of art, nor always that of the fire to produce; and ſince ſuch qualities may be found in bodies, that differ ſo much in other qualities from one another, that they need not be allowed to agree in that pure and ſimple nature, which principles, to be ſo indeed, muſt have; it may juſtly be ſuſpected, that many productions of the fire, that are ſhewed us by chymiſts, as the principles of the concrete, that afforded them, may be but a new kind of mixts. And to annex, on this occaſion, to theſe arguments taken from the nature of the thing, one of thoſe, which logicians call *ad hominem*, I ſhall deſire you to take notice, that though *Paracelſus* himſelf, and ſome, that are ſo miſtaken, as to think he could not be ſo, have ventured to teach, that not only the bodies here below, but the elements themſelves, and all the other parts of the univerſe, are compoſed of ſalt, ſulphur

* *Oſtendi aliàs, quomodo lib. una aquæ vitæ combibita in ſale tartari ſiccato, vix fiat ſemuncia ſalis, cæterum totum corpus fiat aqua elementalis.* Helmont. in Aura vitali.

ſulphur and mercury; yet the learned *Sennertus*, and all the more wary chymiſts, have rejected that conceit, and do many of them confeſs, that the *tria prima* are each of them made up of the four elements; and others of them make earth and water concur with ſalt, ſulphur and mercury, to the conſtitution of mixt bodies. So that one ſort of theſe Spagyriſts, notwithſtanding the ſpecious titles they give to the productions of the fire, do in effect grant what I contend for. And, of the other ſort I may well demand, to what kind of bodies the phlegm and dead earth, to be met with in chymical reſolutions, are to be referred? For either they muſt ſay, with *Paracelſus*, but againſt their own conceſſions, as well as againſt experience, that theſe are alſo compoſed of the *tria prima*, whereof they cannot ſeparate any one from either of them; or elſe they muſt confeſs, that two of the vaſteſt bodies here below, earth and water, are neither of them compoſed of the *tria prima*; and that conſequently thoſe three are not the univerſal, and adequate ingredients, neither of all ſublunary bodies, nor even of all mixed bodies.

I KNOW, that the chief of theſe chymiſts repreſent, that though the diſtinct ſubſtances into which they divide mixt bodies by the fire, are not pure and homogeneous; yet ſince the four elements, into which the Ariſtotelians pretend to reſolve the like bodies by the ſame agent, are not ſimple neither, as themſelves acknowledge, it is as allowable for the chymiſts to call the one *principles*, as for the Peripateticks to call the other *elements*; ſince in both caſes the impoſition of the name is grounded only upon the predominancy of that element, whoſe name is aſcribed to it. Nor ſhall I deny, that this argument of the chymiſts is no ill one againſt the Ariſtotelians. But what anſwer can it prove to me, who, you know, am diſputing as well againſt the Ariſtotelian elements, as the chymical principles, and muſt not look upon any body as a true principle or element, but as yet compounded, which is not perfectly homogeneous, but is further reſoluble into any number of diſtinct ſubſtances, how ſmall ſoever? And as for the chymiſts calling a body ſalt, or ſulphur, or mercury, upon pretence, that the principle of the ſame name is predominant in it, that itſelf is an acknowledgment of what I contend for; namely, that theſe productions of the fire are yet compounded bodies. And yet whilſt this is granted, it is affirmed, but not proved, that the reputed ſalt, or ſulphur, or mercury, conſiſts mainly of one body, that deſerves the name of a principle of the ſame denomination. For how do chymiſts make it appear, that there are any ſuch primitive and ſimple bodies in thoſe we are ſpeaking of; ſince it is upon the matter confeſſed by the anſwer lately made, that theſe are not ſuch? And if they pretend by reaſon to evince what they affirm, what becomes of their confident boaſts, that the chymiſt (whom they therefore, after *Beguinus*, call a *philoſophus* or *opifex ſenſatus*) can convince our eyes, by manifeſtly ſhewing in any mixt body thoſe ſimple ſubſtances he teaches them to be compoſed of? And indeed, for the chymiſts to have recourſe in this caſe to other proofs than experiments, as it is to wave the grand argument, that has all this while been given out for a demonſtrative one; ſo it releaſes me from the obligation to proſecute a diſpute, wherein I am not engaged to examine any but experimental proofs. I know it may plauſibly enough be repreſented, in favour of the chymiſts, that it being evident, that much the greater part of any thing they call ſalt, or ſulphur, or mercury, is really ſuch; it would be very rigid to deny thoſe ſubſtances the names aſcribed them, only becauſe of ſome ſlight mixture of another body, ſince not only the Peripateticks call particular parcels of matter elementary, though they acknowledge, that elements are not to be any where found pure, at leaſt here below, and ſince eſpecially there is a manifeſt analogy and reſemblance betwixt the bodies obtainable by chymical anatomies, and the principles whoſe names are given them; I have, I ſay, conſidered that theſe things may be repreſented: but as for what is drawn from the cuſtom of the Peripateticks, I have already told you, that though it may be employed againſt them, yet it is not available againſt me, who allow nothing to be an element, that is not perfectly homogeneous. And whereas it is alledged, that the predominant principle ought to give a name to the ſubſtance wherein it abounds; I anſwer, that that might much more reaſonably be ſaid, if either we or the chymiſts had ſeen nature take pure ſalt, pure ſulphur, and pure mercury, and compound of them every ſort of mixt bodies. But, ſince it is to experience that they appeal, we muſt not take it for granted, that the diſtilled oil (for inſtance) of a plant is mainly compoſed of the pure principle called ſulphur, till they have given us an ocular proof, that there is in that ſort of plants ſuch an homogeneous ſulphur. For as for the ſpecious argument, which is drawn from the reſemblance betwixt the productions of the fire, and the reſpective, either Ariſtotelian elements, or chymical principles, by whoſe names they are called; it will appear more plauſible than cogent, if you will but recall to mind the ſtate of the controverſy; which is not, whether or no there be obtained from mixt bodies certain ſubſtances, that agree in outward appearance, or in ſome qualities, with quickſilver or brimſtone, or ſome ſuch obvious or copious body; but whether or no all bodies, confeſſed to be perfectly mixt, were compoſed of, and are reſoluble into a determinate number of primary unmixt bodies. For, if you keep the ſtate of the queſtion in your eye, you will eaſily diſcern, that there is much of what ſhould be demonſtrated, left unproved by thoſe chymical experiments we are examining. But (not to repeat what I have already diſcovered more at large) I ſhall now take notice, that it will not preſently follow, that becauſe a production of the fire has ſome affinity with ſome of the greater maſſes of matter here below, that therefore they are both of the ſame nature, and deſerve the ſame name; for the chymiſts are not content, that flame ſhould be looked upon as a parcel of

the element of fire, though it be hot, dry, and active, becauſe it wants ſome other qualities belonging to the nature of elementary fire. Nor will they let the Peripateticks call aſhes, or quick-lime, earth, notwithſtanding the many likeneſſes between them; becauſe they are not taſteleſs, as elementary earth ought to be: but if you ſhould aſk me, what then it is, that all the chymical anatomies of bodies do prove, if they prove not, that they conſiſt of the three principles into which the fire reſolves them; I anſwer, that their diſſections may be granted to prove, that ſome mixt bodies (for in many it will not hold) are by the fire, when they are included in cloſe veſſels, (for that condition alſo is often requiſite) diſſoluble into ſeveral ſubſtances differing in ſome qualities, but principally in conſiſtence. So that out of moſt of them may be obtained a fixt ſubſtance, partly ſaline, and partly inſipid, an unctuous liquor, and another liquor, or more, that without being unctuous have a manifeſt taſte. Now, if chymiſts will agree to call the dry and ſapid ſubſtance, ſalt; the unctuous liquor, ſulphur; and the other, mercury; I ſhall not much quarrel with them for ſo doing: but if they will tell me, that ſalt, ſulphur, and mercury are ſimple and primary bodies, whereof each mixt body was actually compounded, and which was really in it antecedently to the operation of the fire, they muſt give me leave to doubt, whether (whatever their other arguments may do) their experiments prove all this. And if they will alſo tell me, that the ſubſtances their anatomies are wont to afford them, are pure and ſimilar, as principles ought to be, they muſt give me leave to believe my own ſenſes, and their own confeſſions, before their bare aſſertions. And that you may not (*Eleutherius*) think I deal ſo rigidly with them, becauſe I ſcruple to take theſe productions of the fire for ſuch, as the chymiſts would have them paſs for, upon the account of their having ſome affinity with them; conſider a little with me, that in regard an element or principle ought to be perfectly ſimilar and homogeneous, there is no juſt cauſe, why I ſhould rather give the body propoſed the name of this or that element or principle, becauſe it has a reſemblance to it in ſome obvious quality, rather than deny it that name upon the account of divers other qualities, wherein the propoſed bodies are unlike; and if you do but conſider, what ſlight and eaſily producible qualities they are, that ſuffice, as I have already more than once obſerved, to denominate a chymical principle or an element, you will not, I hope, think my warineſs to be deſtitute either of example, or elſe of reaſon. For we ſee, that the chymiſts will not allow the Ariſtotelians, that the ſalt in aſhes ought to be called earth, though the ſaline and terreſtrial part ſymbolize in weight, in dryneſs, in fixedneſs and fuſibility, only becauſe the one is ſapid and diſſoluble in water, and the other not: beſides, we ſee that ſapidneſs and volatility are wont to denominate the chymiſts mercury or ſpirit; and yet how many bodies, think you, may agree in thoſe qualities, which may yet be of very differing natures, and diſagree in qualities either more numerous, or more conſiderable, or both? For not only ſpirit of nitre, aqua fortis, ſpirit of ſalt, ſpirit of oil of vitriol, ſpirit of alum, ſpirit of vinegar, and all ſaline liquors diſtilled from animal bodies, but all the acetous ſpirits of woods freed from their vinegar; all theſe, I ſay, and many others muſt belong to the chymiſts mercury, though it appear not, why ſome of them ſhould more be comprehended under one denomination than the chymiſts ſulphur, or oil, ſhould likewiſe be; for their diſtilled oils are alſo fluid, volatile, and taſteable, as well as their mercury: nor is it neceſſary, that their ſulphur ſhould be unctuous or diſſoluble in water, ſince they generally refer ſpirit of wine to ſulphurs, although that ſpirit be not unctuous, and will freely mingle with water. So that bare inflammability muſt conſtitute the eſſence of the chymiſts ſulphur; as uninflammableneſs, joined with any taſte, is enough to intitle a diſtilled liquor to be their mercury. Now ſince I can further obſerve to you, that ſpirit of nitre and ſpirit of hartſhorn being poured together will boil and hiſs, and toſs up one another into the air, which the chymiſts make ſigns of great antipathy in the natures of bodies, (as indeed theſe ſpirits differ much both in taſte, ſmell, and operations) ſince I elſewhere tell you of my having made two ſorts of oil out of the ſame man's blood, that would not mingle with one another; and ſince I might tell you divers examples I have met with, of the contrariety of bodies, which according to the chymiſts muſt be huddled up together under one denomination; I leave you to judge, whether ſuch a multitude of ſubſtances, as may agree in theſe ſlight qualities, and yet diſagree in others more conſiderable, are more worthy to be called by the name of a principle (which ought to be pure and homogeneous) than to have appellations given them, that may make them differ, in name too, from the bodies from which they ſo wildly differ in nature. And hence alſo, by the by, you may perceive, that it is not unreaſonable to diſtruſt the chymiſts way of argumentation, when being unable to ſhew us, that ſuch a liquor is (for example) purely ſaline, they prove, that at leaſt ſalt is much the predominant principle, becauſe that the propoſed ſubſtance is ſtrongly taſted, and all taſte proceeds from ſalt; whereas thoſe ſpirits, ſuch as ſpirit of tartar, ſpirit of hartſhorn, and the like, which are reckoned to be the mercuries of the bodies, that afford them, have manifeſtly a ſtrong and piercing taſte, and ſo has (according to what I formerly noted) the ſpirit of box &c. even after the acid liquor that concurred to compoſe it has been ſeparated from it. And indeed, if ſapidneſs belong not to the ſpirit or mercurial principle of vegetables and animals, I ſcarce know how it will be diſcriminated from their phlegm; ſince by the abſence of inflammability it muſt be diſtinguiſhed from their ſulphur: which affords me another example, to prove how unaccurate the chymical doctrine is in our preſent caſe; ſince not only the ſpirit of ve-

getables and animals, but their oils are very ſtrongly taſted, as he, that ſhall but wet his tongue with chymical oil of cinnamon or of cloves, or even turpentine, may quickly find, to his ſmart. And not only I never tried any chymical oils, whoſe taſte was not very manifeſt and ſtrong; but a ſkilful and inquiſitive perſon, who made it his buſineſs by elaborate operations to depurate chymical oils, and reduce them to an elementary ſimplicity, informs us, that he never was able to make them at all taſteleſs: whence I might infer, that the proof chymiſts confidently give us of a body's being ſaline, is ſo far from demonſtrating the predominancy, that it does not clearly evince ſo much as the preſence of the ſaline principle in it. But I will not (purſues *Carneades*) remind you, that the volatile ſalt of hartſhorn, amber, blood *&c.* are exceeding ſtrongly ſcented, notwithſtanding that moſt chymiſts deduce odours from ſulphur, and from them argue the predominancy of that principle in the odorous body; becauſe I muſt not ſo much as add any new examples of the incompetency of this ſort of chymical arguments; ſince having already detained you but too long in thoſe generals, that appertain to my fourth conſideration, it is time, that I proceed to the particulars themſelves, to which I thought fit they ſhould be previous.

THESE generals (continues *Carneades*) being thus premiſed, we might the better ſurvey the unlikeneſs, that an attentive and unprepoſſeſſed obſerver may take notice of in each ſort of bodies, which the chymiſts are wont to call the ſalts of ſulphurs or mercuries of the concretes that yield them, as if they had all a ſimplicity, and identity of nature: whereas ſalts, if they were all elementary, would as little differ as do the drops of pure and ſimple water. It is known, that both chymiſts and phyſicians aſcribe to the fixt ſalts of calcined bodies the virtues of their concretes; and conſequently very differing operations. So we find the alkali of wormwood much commended in diſtempers of the ſtomach; that of eye-bright for thoſe that have a weak ſight; and that of guaiacum (of which a great quantity yields but a very little ſalt) is not only much commended in venereal diſeaſes, but is believed to have a peculiar purgative virtue, which yet I have not had occaſion to try. And though, I confeſs, I have long thought, that theſe alkalizate ſalts are, for the moſt part, very near of kin, and retain very little of the properties of the concretes whence they were ſeparated; yet being minded to obſerve watchfully, whether I could meet with any exceptions to this general obſervation, I obſerved at the glaſs-houſe, that ſometimes the metal (as the workmen call it) or maſs of colliquated ingredients, which by blowing they faſhion into veſſels of divers ſhapes, did ſometimes prove of a very differing colour, and a ſomewhat differing texture, from what was uſual. And having inquired, whether the cauſe of ſuch accidents might not be derived from the peculiar nature of the fixt ſalt employed to bring the ſand to fuſion, I found, that the knowingeſt workmen imputed theſe miſ-adventures to the aſhes of ſome certain kind of wood, as having obſerved the ignobler kind of glaſs I lately mentioned to be frequently produced, when they had employed ſuch ſorts of aſhes, which therefore they ſcruple to make uſe of, if they took notice of them beforehand. I remember alſo, that an induſtrious man of my acquaintance having bought a vaſt quantity of tobacco-ſtalks to make a fixt ſalt with, I had the curioſity to go ſee, whether that exotick plant, which ſo much abounds in volatile ſalt, would afford a peculiar kind of alkali; and I was pleaſed to find, that in the lixivium of it it was not neceſſary, as is uſual, to evaporate all the liquor, that there might be obtained a ſaline calx, conſiſting like lime quenched in the air of a heap of little corpuſcles of unregarded ſhapes; but the fixt ſalt ſhot into figured cryſtal, almoſt as nitre or ſal armoniac and other uncalcined ſalts are wont to do. And I further remember, that I have obſerved, in the fixt ſalt of urine, brought by depuration to be very white, a taſte not ſo unlike to that of common ſalt, and very differing from the wonted cauſtick lixiviate taſte of other ſalts made by incineration. But becauſe the inſtances I have alledged of the difference of alkalizate ſalt are but few, and therefore I am ſtill inclined to think, that moſt chymiſts and many phyſicians do, inconſiderately enough, and without warrant from experience, aſcribe the virtues of the concretes expoſed to calcination, to the ſalts obtained by it; I ſhall rather, to ſhew the diſparity of ſalts, mention in the firſt place the apparent difference betwixt the vegetable fixt ſalts and the animal volatile ones: as (for example) betwixt ſalt of tartar, and ſalt of hartſhorn; whereof the former is ſo fixt, that it will indure the brunt of a violent fire, and ſtand in fuſion like a metal; whereas the other (beſides, that it has a differing taſte and a very differing ſmell) is ſo far from being fixt, that it will fly away in a gentle heat as eaſily as ſpirit of wine itſelf. And to this I ſhall add, in the next place, that even among the volatile ſalts themſelves, there is a conſiderable difference, as appears by the diſtinct properties of (for inſtance) ſalt of amber, ſalt of urine, ſalt of man's ſkull, (ſo much extolled againſt the falling ſickneſs) and divers others, which cannot eſcape an ordinary obſerver. And this diverſity of volatile ſalts I have obſerved to be ſometimes diſcernible even to the eye, in their figures. For the ſalt of hartſhorn I have obſerved to adhere to the receiver, in the form almoſt of a parallelopipedon; and of the volatile ſalt of human blood (long digeſted before diſtillation, with ſpirit of wine) I can ſhew you ſtore of grains of that figure, which geometricians call a rhombus; though I dare not undertake, that the figures of theſe or other ſaline cryſtals (if I may ſo call them) will be always the ſame, whatever degree of fire have been employed to force them up, or how haſtily ſoever they have been made to convene in the ſpirits or liquors, in the lower part of which, I have uſually obſerved them, after a while, to ſhoot. And although, as I lately told you, I ſeldom found any difference, as to medical virtues, in the fixt ſalts of divers vegetables; and accordingly I have ſuſpected

that

that moſt of theſe volatile ſalts, having ſo great a reſemblance in ſmell, in taſte, and fugitiveneſs, differ but little, if at all, in their medicinal properties: as indeed I have found them generally to agree in divers of them (as in their being ſomewhat diaphoretick and very deopilative) yet I remember * *Helmont* ſomewhere informs us, that there is this difference betwixt the ſaline ſpirit of urine and that of man's blood, that the former will not cure the epilepſy, but the latter will. Of the efficacy alſo of the ſalt of common amber againſt the ſame diſeaſe in children, (for in grown perſons it is not a ſpecifick) I may elſewhere have an occaſion to entertain you. And when I conſider, that to the obtaining of theſe volatile ſalts (eſpecially that of urine) there is not requiſite ſuch a deſtructive violence of the fire, as there is to get thoſe ſalts that muſt be made by incineration, I am the more invited to conclude, that they may differ from one another, and conſequently recede from an elementary ſimplicity. And if I could here ſhew you, what Mr. *Boyle* has obſerved, touching the various chymical diſtinctions of ſalts; you would quickly diſcern, not only that chymiſts do give themſelves a ſtrange liberty to cal lconcretes ſalts, that are, according to their own rules, to be looked upon as very compounded bodies; but that among thoſe very ſalts, that ſeem elementary, becauſe produced upon the anatomy of the bodies, that yield them, there is not only a viſible diſparity, but, to ſpeak in the common language, a manifeſt antipathy or contrariety: as is evident in the ebullition and hiſſing, that is wont to enſue, when the acid ſpirit of vitriol, for inſtance, is poured upon pot-aſhes, or ſalt of tartar. And I ſhall beg leave of this gentleman, (ſays *Carneades*) caſting his eyes on me, to let me obſerve to you, out of ſome of his papers, particularly thoſe, wherein he treats of ſome preparations of urine, that not only one and the ſame body may have two ſalts of a contrary nature, as he exemplifies in the ſpirit and alcali of nitre; but that from the ſame body there may, without addition, be obtained three differing and viſible ſalts. For he relates, that he obſerved in urine, not only a volatile and cryſtalline ſalt, and a fixt ſalt, but likewiſe a kind of ſal armoniac, or ſuch a ſalt as would ſublime in the form of a ſalt, and therefore was not fixt, and yet was far from being ſo fugitive as the volatile ſalt; from which it ſeemed alſo otherwiſe to differ. I have indeed ſuſpected, that this may be a ſal armoniac properly enough ſo called, as compounded of the volatile ſalt of urine, and the fixt of the ſame liquor, which, as I noted, is not unlike ſea-ſalt; but that it ſelf argues a manifeſt difference betwixt the ſalts, ſince ſuch a volatile ſalt is not wont to unite thus with an ordinary alkali, but to fly away from it in the heat. And on this occaſion I remember, that to give ſome of my friends an ocular proof of the difference betwixt the fixt and volatile ſalt of (the ſame concrete) wood, I deviſed the following experiment: I took common Venetian ſublimate, and diſſolved as much of it as I well could in fair water; then I took wood-aſhes, and pouring on them warm water, diſſolved their ſalt; and filtrating the water, as ſoon as I found the lixivium ſufficiently ſharp upon the tongue, I reſerved it for uſe. Then on one part of the former ſolution of ſublimate dropping a little of this diſſolved fixt ſalt of wood, the liquors preſently turned of an orange colour; but upon the other part of the clear ſolution of ſublimate putting ſome of the volatile ſalt of wood (which abounds in the ſpirit of ſoot) the liquor immediately turned white, almoſt like milk, and after a while let fall a white ſediment, as the other liquor did a yellow one. To all this that I have ſaid concerning the difference of ſalts, I might add what I formerly told you, concerning the ſimple ſpirit of box, and ſuch like woods, which differ much from the other ſalts hitherto mentioned, and yet would belong to the ſaline principle, if chymiſts did truly teach, that all taſtes proceed from it. And I might alſo annex, what I noted to you out of † *Helmont* concerning bodies, which, though they conſiſt in great part of chymical oils, do yet appear but volatile ſalts: but to inſiſt on theſe things, were to repeat; and therefore I ſhall proceed.

THIS diſparity is alſo highly eminent in the ſeparated ſulphurs or chymical oils of things. For they contain ſo much of the ſcent, and taſte, and vertues, of the bodies, whence they were drawn, that they ſeem to be but the material craſis (if I may ſo ſpeak) of their concretes. Thus the oils of cinnamon, cloves, nutmegs and other ſpices, ſeem to be but the united aromatic parts, that did enoble thoſe bodies. And it is a known thing, that oil of cinnamon, and oil of cloves, (which I have likewiſe obſerved in the oils of ſeveral woods) will ſink to the bottom of water; whereas thoſe of nutmegs and divers other vegetables will ſwim upon it. The oil (abuſively called ſpirit) of roſes ſwims at the top of the water in the form of a white butter, which I remember not to have obſerved in any other oil drawn in any limbeck; yet there is a way (not here to be declared) by which I have ſeen it come over in the form of other aromatic oils, to the delight and wonder of thoſe that beheld it. In oil of aniſeeds, which I drew both with, and without fermentation, I obſerved the whole body of the oil in a cool place to thicken into the conſiſtence and appearance of white butter, which, with the leaſt heat, reſumed its former liquidneſs. In the oil of olive drawn over in a retort, I have likewiſe more than once ſeen a ſpontaneous coagulation in the receiver: and I have of it by me thus congealed; which is of ſuch a ſtrangely penetrating ſcent, as if it would perforate the noſes that approach it. The like pungent odour I alſo obſerved in the diſtilled liquor of common ſoap, which forced over from

* *Error vero per diſtillationem nobis monſtrat etiam ſpiritum ſalinum plane volatilem odore nequicquam ut nec guſtu deſtinguibilem a ſpiritu urinæ; in eo tamen eſſentialiter diverſum, quod ſpiritus talis cruoris curat epilepſiam, non autem ſpiritus ſalis lotii.* Helmont. Aura Vitalis..

† *Aliquando oleum cinnamomi, &c. ſuo ſali alkali miſcetur abſque omni aqua, trium menſium artificioſa occultaque circulatione, totum in ſalem volatilem commutatum eſt.* Helmont. Tria Prima Chymicorum. &c. pag. 412.

from minium, lately afforded an oil of a moſt admirable penetrancy: and he muſt be a great ſtranger, both to the writings and preparations of chymiſts, that ſees not in the oils they diſtill from vegetables and animals, a conſiderable and obvious difference. Nay, I ſhall venture to add, *Eleutherius*, (what perhaps you will think of kin to a paradox) that divers times out of the ſame animal or vegetable, there may be extracted oils of natures obviouſly differing. To which purpoſe I ſhall not inſiſt on the ſwimming and ſinking oils, which I have ſometimes obſerved to float on, and ſubſide under the ſpirit of guaiacum, and that of divers other vegetables diſtilled with a ſtrong and laſting fire; nor ſhall I inſiſt on the obſervation elſewhere mentioned, of the divers and unmingleable oils afforded us by human blood, long fermented and digeſted with ſpirit of wine; becauſe theſe kinds of oils may ſeem chiefly to differ in conſiſtence and weight, being all of them high coloured and aduſt. But the experiment, which I deviſed to make out this difference of the oils of the ſame vegetable, *ad oculum*, (as they ſpeak) was this that follows: I took a pound of aniſeeds, and having groſly beaten them, cauſed them to be put into a very large glaſs retort almoſt filled with fair water; and placing this retort in a ſand-furnace, I cauſed a very gentle heat to be adminiſtered during the firſt day, and a great part of the ſecond, till the water was for the moſt part drawn off, and had brought over with it at leaſt moſt of the volatile and aromatic oil of the ſeeds. And then increaſing the fire, and changing the receiver, I obtained beſides an empyreumatical ſpirit, and a quantity of aduſt oil; whereof a little floated upon the ſpirit, and the reſt was more heavy, and not eaſily ſeparable from it. And whereas theſe oils were very dark, and ſmelled (as the chymiſts ſpeak) ſo ſtrongly of the fire, that their odour did not betray from what vegetables they had been forced; the other aromatic oil was enriched with the genuine ſmell and taſte of the concrete; and ſpontaneouſly coagulating itſelf into white butter, did manifeſt itſelf to be the true oil of aniſeeds: which concrete I therefore choſe to employ about this experiment, that the difference of theſe oils might be more conſpicuous than it would have been, had I, inſtead of it, diſtilled another vegetable.

I HAD almoſt forgot to take notice, that there is another ſort of bodies, which though not obtained from concretes by diſtillation, many chymiſts are wont to call their ſulphur; not only becauſe ſuch ſubſtances are, for the moſt part, high coloured, (whence they are alſo, and that more properly, called tinctures) as diſſolved ſulphurs are wont to be; but eſpecially becauſe they are, for the moſt part, abſtracted and ſeparated from the reſt of the maſs by ſpirit of wine: which liquor thoſe men ſuppoſing to be ſulphureous, they conclude, that what it works upon, and abſtracts, muſt be a ſulphur alſo. And upon this account they preſume, that they can ſequeſter the ſulphur even of minerals and metals; for which it is known, that they cannot by fire alone ſeparate it. To all this I ſhall anſwer, that if theſe ſequeſtered ſubſtances were indeed the ſulphurs of the bodies, whence they are drawn, there would as well be a great diſparity betwixt chymical ſulphurs obtained by ſpirit of wine, as I have already ſhewn there is betwixt thoſe obtained by diſtillation in the form of oils: which will be evident from hence, that not to urge, that themſelves aſcribe diſtinct virtues to mineral tincture, extolling the tincture of gold againſt ſuch and ſuch diſeaſes; the tincture of antimony, or of its glaſs, againſt others; and the tincture of emerald againſt others; it is plain, that in tinctures drawn from vegetables, if the ſuperfluous ſpirit of wine be diſtilled off, it leaves at the bottom that thicker ſubſtance, which chymiſts uſe to call the extract of the vegetable. And that theſe extracts are endowed with very different qualities, according to the nature of the particular bodies, that afforded them (though I fear ſeldom with ſo much of the ſpecifick virtues, as is wont to be imagined) is freely confeſſed both by phyſicians and chymiſts. But, *Eleutherius*, (ſays *Carneades*) we may here take notice, that the chymiſts do as well in this caſe, as in many others, allow themſelves a licence to abuſe words: for not again to argue from the differing properties of tinctures, that they are not exactly pure and elementary ſulphurs; they would eaſily appear not to be ſo much as ſulphurs, although we ſhould allow chymical oils to deſerve that name. For however in ſome mineral tinctures, the natural fixedneſs of the extracted body does not always ſuffer it to be eaſily further reſoluble into differing ſubſtances; yet in very many extracts drawn from vegetables, it may very eaſily be manifeſted, that the ſpirit of wine has not ſequeſtered the ſulphureous ingredient from the ſaline and mercurial ones, but has diſſolved (for I take it to be a ſolution) the finer parts of the concrete (without making any nice diſtinction of their being perfectly ſulphureous or not) and united itſelf with them into a kind of magiſtery, which conſequently muſt contain ingredients or parts of ſeveral ſorts. For we ſee, that the ſtones, that are rich in vitriol, being often drenched with rain-water, the liquor will then extract a fine and tranſparent ſubſtance coagulable into vitriol; and yet though this vitriol be readily diſſoluble in water, it is not a true elementary ſalt, but, as you know, a body reſoluble into very differing parts, whereof one (as I ſhall have occaſion to tell you anon) is yet of a metalline, and conſequently not of an elementary nature. You may conſider alſo, that common ſulphur is readily diſſoluble in oil of turpentine, though notwithſtanding its name it abounds as well, if not as much, in ſalt as in true ſulphur; witneſs the great quantity of ſaline liquor it affords, being ſet to flame away under a glaſs bell. Nay, I have, which perhaps you will think ſtrange, with the ſame oil of turpentine alone eaſily enough diſſolved crude antimony finely powdered into a blood-red balſam, wherewith perhaps conſiderable things may be performed in ſurgery. And if it were now requiſite, I could tell you of ſome other bodies, (ſuch as perhaps

you would not ſuſpect) that I have been able to work upon with certain chymical oils. But inſtead of digreſſing further, I ſhall make this uſe of the example I have named. That it is not unlikely, but that ſpirit of wine, which by its pungent taſte, and by ſome other qualities, that argue it better, (eſpecially its reducibleneſs, according to *Helmont*, into alcali, and water,) ſeems to be as well of a ſaline as of a ſulphureous nature, may well be ſuppoſed capable of diſſolving ſubſtances, that are not merely elementary ſulphurs, though perhaps they may abound with parts, that are of kin thereunto. For I find, that ſpirit of wine will diſſolve gum lacca, benzoin, and the reſinous parts of jallap, and even of guaiacum; whence we may well ſuſpect, that it may from ſpices, herbs, and other leſs compacted vegetables, extract ſubſtances, that are not perfect ſulphurs, but mixt bodies. And to put it paſt diſpute, there is many a vulgar extract drawn with ſpirit of wine, which committed to diſtillation will afford ſuch differing ſubſtances, as will loudly proclaim it to have been a very compounded body. So that we may juſtly ſuſpect, that even in mineral tinctures it will not always follow, that becauſe a red ſubſtance is drawn from the concrete by ſpirit of wine, that ſubſtance is its true and elementary ſulphur. And though ſome of theſe extracts may perhaps be inflammable; yet, beſides that others are not, and beſides that their being reduced to ſuch minuteneſs of parts may much facilitate their taking fire; beſides this, I ſay, we ſee, that common ſulphur, common oil, gum lac, and many unctuous and reſinous bodies, will flame well enough, though they be of very compounded natures: nay, travellers of unſuſpected credit aſſure us, as a known thing, that in ſome northern countries, where fir-trees and pines abound, the poorer ſort of inhabitants uſe long ſplinters of thoſe reſinous woods to burn inſtead of candles. And as for the redneſs wont to be met with in ſuch ſolutions, I could eaſily ſhew, that it is not neceſſary it ſhould proceed from the ſulphur of the concrete, diſſolved by the ſpirit of wine; if I had leiſure to manifeſt, how much chymiſts are wont to delude themſelves and others, by the ignorance of thoſe other cauſes, upon whoſe account ſpirit of wine and other menſtruums may acquire a red or ſome other high colour. But to return to our chymical oils, ſuppoſing that they were exactly pure; yet I hope they would be, as the beſt ſpirit of wine is, but the more inflammable and deflagrable. And therefore, ſince an oil can be by the fire alone immediately turned into flame, which is ſomething of a very differing nature from it; I ſhall demand, how this oil can be a primogeneal and incorruptible body, as moſt chymiſts would have their principles; ſince it is further reſoluble into flame, which, whether or no it be a portion of the element of fire, as an Ariſtotelian would conclude, is certainly ſomething of a very differing nature from a chymical oil, ſince it burns, and ſhines, and mounts ſwiftly upwards; none of which a chymical oil does, whilſt it continues ſuch. And if it ſhould be objected, that the diſſipated parts of this flaming oil may be caught and collected again into oil or ſulphur; I ſhall demand, what chymiſt appears to have ever done it: and without examining, whether it may not hence be as well ſaid, that ſulphur is but compacted fire, as that fire is but diffuſed ſulphur, I ſhall leave you to conſider, whether it may not hence be argued, that neither fire nor ſulphur are primitive and indeſtructible bodies. And I ſhall further obſerve, that at leaſt it will hence appear, that a portion of matter may, without being compounded with new ingredients, by having the texture and motion of its ſmall parts changed, be eaſily, by the means of the fire, endowed with new qualities, more differing from them it had before, than are thoſe, which ſuffice to diſcriminate the chymiſts principles from one another.

WE are next to conſider, whether in the anatomy of mixt bodies, that, which chymiſts call the mercurial part of them, be uncompounded, or no. But to tell you true, though chymiſts do unanimouſly affirm, that their reſolutions diſcover a principle, which they call mercury, yet I find them to give of it deſcriptions ſo differing, and ſo ænigmatical, that I, who am not aſhamed to confeſs, that I cannot underſtand what is not ſenſe, muſt acknowledge to you, that I know not what to make of them. *Paracelſus* himſelf, and therefore, as you will eaſily believe, many of his followers, does ſomewhere call that mercury, which aſcends upon the burning of wood, as the Peripateticks are wont to take the ſame ſmoke for air; and ſo ſeems to define mercury by volatility, or (if I may coin ſuch a word) effumability. But ſince, in this example, both volatile ſalt and ſulphur make part of the ſmoke, which does indeed conſiſt alſo both of phlegmatick and terrene corpuſcles, this notion is not to be admitted; and I find, that the more ſober chymiſts themſelves diſavow it. Yet to ſhew you, how little of clearneſs we are to expect in the accounts even of later Spagyriſts, be pleaſed to take notice, that *Beguinus*, even in his *Tyrocinium Chymicum*, written for the inſtruction of novices, when he comes to tell us what are meant by the *tria prima*, which for their being principles ought to be defined the more accurately and plainly, gives us this deſcription of mercury; *Mercurius* (ſays he) *eſt liquor ille acidus, permeabilis, penetrabilis, æthereus, ac puriſſimus, à quo omnis nutricatio, ſenſus, motus, vires, colores, ſenectutiſque præproperæ retardatio.* Which words are not ſo much a definition of it, as an encomium: and yet *Quercetanus*, in his deſcription of the ſame principle, adds to theſe divers other epithets. But both of them, to ſkip very many other faults, that may be found with their metaphorical deſcriptions, ſpeak incongruouſly to the chymiſts own principles. For if mercury be an acid liquor, either hermetical philoſophy muſt err in aſcribing all taſtes to ſalt, or elſe mercury muſt not be a principle, but compounded of a ſaline ingredient and ſomewhat elſe. *Libavius*, though he finds great fault with the obſcurity of what the chymiſts write concerning their mercurial principle, does yet

Chym. Tyrocin. lib. 1. cap. 2.

but give us ſuch a negative deſcription of it, as *Sennertus*, how favourable ſoever to the *tria prima*, is not ſatisfied with. And this *Sennertus* himſelf, though the learnedeſt champion for the hypoſtatical principles, does almoſt as frequently, as juſtly, complain of the unſatisfactorineſs of what the chymiſts teach concerning their mercury; and yet he himſelf (but with his wonted modeſty) ſubſtitutes inſtead of the deſcription of *Libavius*, another, which many readers, eſpecially if they be not Peripateticks, will not know what to make of. For ſcarce telling us any more, than that in all bodies, that, which is found beſides ſalt and ſulphur, and the elements, or, as they call them, phlegm and dead earth, is that ſpirit, which, in *Ariſtotle*'s language, may be called οὐσία ἀνάλογος τῶν ἁπλῶν στοιχείων· he ſays that, which I confeſs is not at all ſatisfactory to me, who do not love to ſeem to acquieſce in any man's myſtical doctrines, that I may be thought to underſtand them.

IF (ſays *Eleutherius*) I durſt preſume, that the ſame thing would be thought clear by me, and thoſe, that are fond of ſuch cloudy expreſſions, as you juſtly tax the chymiſts for, I ſhould venture to offer to conſideration, whether or no, ſince the mercurial principle, that ariſes from diſtillation, is unanimouſly aſſerted to be diſtinct from the ſalt and ſulphur of the ſame concrete, that may not be called the mercury of a body, which though it aſcend in diſtillation, as do the phlegm and ſulphur, is neither inſipid like the former, nor inflammable like the latter. And therefore I would ſubſtitute to the too much abuſed name of mercury, the more clear and familiar appellation of ſpirit, which is alſo now very much made uſe of, even by the chymiſts themſelves of our times, though they have not given us ſo diſtinct an explication, as were fit, of what may be called the ſpirit of a mixt body.

I SHOULD not perhaps (ſays *Carneades*) much quarrel with your notion of mercury. But as for the chymiſts, what they can mean, with congruity to their own principles, by the mercury of animals and vegetables, it will not be ſo eaſy to find out; for they aſcribe taſtes only to the ſaline principle, and conſequently would be much put to it to ſhew what liquor it is, in the reſolution of bodies, that not being inſipid, for that they call phlegm, neither is inflammable as oil or ſulphur, nor has any taſte; which, according to them, muſt proceed from a mixture, at leaſt, of ſalt. And if we ſhould take ſpirit in the ſenſe of the word received among modern chymiſts and phyſicians, for any diſtilled liquor, that is neither phlegm nor oil, the appellation would yet appear ambiguous enough. For plainly, that, which firſt aſcends in the diſtillation of wine and fermented liquors, is generally as well by chymiſts as others reputed a ſpirit. And yet pure ſpirit of wine being wholly inflammable, ought, according to them, to be reckoned to the ſulphureous, not the mercurial principle. And among the other liquors, that go under the name of ſpirits, there are divers, which ſeem to belong to the family of ſalts; ſuch as are the ſpirit of nitre, vitriol, ſea-ſalt and others, and even the ſpirit of hartſhorn, being as I have tried, in great part, if not totally, reducible into ſalt and phlegm, may be ſuſpected to be but a volatile ſalt diſguiſed by the phlegm mingled with it into the form of a liquor; however, if this be a ſpirit, it manifeſtly differs very much from that of vinegar, the taſte of the one being acid, and the other ſalt; and their mixture, in caſe they be very pure, ſometimes occaſioning an effervescence like that of thoſe liquors the chymiſts account moſt contrary to one another. And even among thoſe liquors, that ſeem to have a better title, than thoſe hitherto mentioned, to the name of ſpirits, there appears a ſenſible diverſity; for ſpirit of oak, for inſtance, differs from that of tartar, and this from that of box, or of guaiacum. And in ſhort, even theſe ſpirits, as well as other diſtilled liquors, manifeſt a great diſparity betwixt themſelves, either in their actions on our ſenſes, or in their other operations.

AND (continues *Carneades*) beſides this diſparity, that is to be met with among thoſe liquors, that the moderns call ſpirits, and take for ſimilar bodies, what I have formerly told you concerning the ſpirit of box-wood, may let you ſee, that ſome of thoſe liquors not only have qualities very differing from others, but may be further reſolved into ſubſtances differing from one another.

AND ſince many modern chymiſts and other naturaliſts are pleaſed to take the mercurial ſpirit of bodies for the ſame principle, under differing names, I muſt invite you to obſerve, with me, the great difference, that is conſpicuous betwixt all the vegetable and animal ſpirits I have mentioned, and running mercury. I ſpeak not of that, which is commonly ſold in ſhops, that many of themſelves will confeſs to be a mixt body; but of that, which is ſeparated from metals, which by ſome chymiſts, that ſeem more philoſophers than the reſt, and eſpecially by the above mentioned *Claveus*, is (for diſtinction-ſake) called *mercurius corporum*. Now this metalline liquor being one of thoſe three principles, of which mineral bodies are, by Spagyriſts, affirmed to be compoſed, and to be reſoluble into them, the many notorious differences betwixt them and the mercuries, as they call them, of vegetables and animals, will allow me to infer, either that minerals and the other two ſorts of mixt bodies conſiſt not of the ſame elements, or that thoſe principles, whereinto minerals are immediately reſolved, which chymiſts with great oſtentation ſhew us as the true principles of them, are but ſecundary principles, or mixts of a peculiar ſort, which muſt be themſelves reduced to a very differing form, to be of the ſame kind with vegetable and animal liquors.

BUT this is not all; for though I formerly told you, how little credit there is to be given to the chymical proceſſes, commonly to be met with, of extracting the mercuries of metals, yet I will now add, that ſuppoſing, that the more judicious of them do not untruly affirm, that they have really drawn true and running

mercury from ſeveral metals, (which I wiſh they had clearly taught us how to do alſo,) yet it may be ſtill doubted, whether ſuch extracted mercuries do not as well differ from common quickſilver, and from one another, as from the mercuries of vegetables and animals. *Claveus* *, in his apology, ſpeaking of ſome experiments, whereby metalline mercuries may be fixt into the nobler metals, adds, that he ſpake of the mercuries drawn from metals; becauſe common quickſilver, by reaſon of its exceſſive coldneſs and moiſture, is unfit for that particular kind of operation; for which, though a few lines before he preſcribes in general the mercuries of metalline bodies, yet he chiefly commends that drawn by art from ſilver. And elſewhere, in the ſame book, he tells us, that he himſelf tried, that by bare coction the quickſilver of tin or pewter (*argentum vivum ex ſtanno prolicitum*) may, by an efficient cauſe, (as he ſpeaks) be turned into pure gold. And the experienced *Alexander van Suchten*, ſomewhere tells us, that by a way he intimates may be made a mercury of copper, not of the ſilver colour of other mercuries, but green; to which I ſhall add, that an eminent perſon, whoſe name his travels and learned writings have made famous, lately aſſured me, that he had more than once ſeen the mercury of lead (which whatever authors promiſe, you will find it very difficult to make, at leaſt in any conſiderable quantity) fixt into perfect gold. And being by me demanded, whether or no any other mercury would not as well have been changed by the ſame operations, he aſſured me of the negative.

AND ſince I am fallen upon the mention of the mercuries of metals, you will, perhaps, expect, (*Eleutherius*) that I ſhould ſay ſomething of their two other principles; but I muſt freely confeſs to you, that what diſparity there may be between the ſalts and ſulphurs of metals or other minerals, I am not myſelf experienced enough in the ſeparations and examens of them, to venture to determine: (for, as for the ſalts of metals, I formerly repreſented it as a thing much to be queſtioned, whether they have any at all.) And for the proceſſes of ſeparation I find in authors, if they were (what many of them are not) ſucceſsfully practicable, as I noted above, yet they are to be performed by the aſſiſtance of other bodies, ſo hardly, if upon any terms at all, ſeparable from them, that it is very difficult to give the ſeparated principles all their due, and no more. But the ſulphur of antimony, which is vehemently vomitive, and the ſtrongly-ſcented anodyne ſulphur of vitriol, inclines me to think, that not only mineral ſulphurs differ from vegetable ones, but alſo from one another, retaining much of the nature of their concretes. The ſalts of metals, and of ſome ſort of minerals, you will eaſily gueſs (by the doubts I formerly expreſſed, whether metals have any ſalt at all) that I have not been ſo happy as yet to ſee, perhaps not for want of curioſity. But if *Paracelſus* did always write ſo conſentaneouſly to himſelf, that his opinion were confidently to be collected from every place of his writings, where he ſeems to expreſs it, I might ſafely take upon me to tell you, that he both countenances in general, what I have delivered in my fourth main conſideration, and in particular warrants me to ſuſpect, that there may be a difference in metalline and mineral ſalts, as well as we find it in thoſe of other bodies. For, *Sulphur* (ſays he) *aliud in auro, aliud in argento, aliud in ferro, aliud in plumbo, ſtanno, &c. ſic aliud in ſaphyro, aliud in ſmaragdo, aliud in rubino, chryſolitho, amethyſto, magnete, &c. item aliud in lapidibus, ſilice, ſalibus, fontibus, &c. Nec vero tot ſulphura tantum, ſed & totidem ſalia; ſal aliud in metallis, aliud in gemmis, aliud in lapidibus, aliud in ſalibus, aliud in vitriolo, aliud in alumine: ſimilis etiam mercurii eſt ratio. Alius in metallis, alius in gemmis, &c. Ita ut unicuique ſpeciei ſuus peculiaris mercurius ſit. Et tamen res ſaltem tres ſunt; una eſſentia eſt ſulphur; una eſt ſal; una eſt mercurius. Addo quod & ſpecialius adhuc ſingula dividantur; aurum enim non unum, ſed multiplex, ut & non unum pyrum, pomum, ſed idem multiplex, totidem etiam ſulphura auri, ſalia auri, mercurii auri; idem competit etiam metallis & gemmis; ut quot ſaphyri præſtantiores, leviores, &c. tot etiam ſaphyrica ſulphura, ſaphyrica ſalia, ſaphyrici mercurii, &c. Idem verum etiam eſt de turconibus & gemmis aliis univerſis.* From which paſſage, *Eleutherius*, I ſuppoſe you will think I might without raſhneſs conclude, either that my opinion is favoured by that of *Paracelſus*, or that *Paracelſus* his opinion was not always the ſame. But becauſe in divers other places of his writings he ſeems to talk at a differing rate of the three principles and the four elements, I ſhall content myſelf to infer from the alledged paſſage, that if his doctrine be not conſiſtent with that part of mine, which it is brought to countenance, it is very difficult to know what his opinion concerning ſalt, ſulphur, and mercury, was; and that conſequently we had reaſon, about the beginning of our conferences, to decline taking upon us, either to examine or oppoſe it.

Paracelſ. de Mineral. Tract. 1. pag. 141.

I KNOW not whether I ſhould on this occaſion add, that thoſe very bodies, the chymiſts call phlegm and earth, do yet recede from an elementary ſimplicity. That common earth and water frequently do ſo, notwithſtanding the received contrary opinion, is not denied by the more wary of the modern Peripateticks themſelves: and certainly moſt earths are much leſs ſimple bodies than is commonly imagined even by chymiſts, who do not ſo conſiderately, to preſcribe and employ earths promiſcuouſly in thoſe diſtillations, that require the mixture of ſome *caput mortuum*, to hinder the flowing together of the matter, and to retain its groſſer parts. For I have found ſome earths to yield, by diſtillation, a liquor very far from being inodorous or inſipid; and it is a known obſervation, that moſt kinds of fat earth kept covered from the rain, and hindered from ſpending themſelves

* *Dixi autem de argento vivo à metallis prolicito, quod vulgare ob nimiam frigiditatem & humiditatem nimium concoctioni eſt contumax, nec ab auro ſolum alteratio coerceri poteſt.* Gaſt. Clave. in Apol.

themſelves in the production of vegetables, will in time become impregnated with ſalt-petre.

BUT I muſt remember, that the water and earths I ought here to ſpeak of, are ſuch as are ſeparated from mixt bodies by the fire; and therefore to reſtrain my diſcourſe to ſuch, I ſhall tell you, that we ſee the phlegm of vitriol (for inſtance) is a very effectual remedy againſt burns; and I know a very famous and experienced phyſician, whoſe unſuſpected ſecret (himſelf confeſſed to me) it is, for the diſcuſſing of hard and obſtinate tumours. The phlegm of vinegar, though drawn exceeding leiſurely in a digeſting furnace, I have purpoſely made trial of; and ſometimes found it able to draw, though ſlowly, a ſaccharine ſweetneſs out of lead; and as I remember, by long digeſtion, I diſſolved corals in it. The phlegm of the ſugar of Saturn is ſaid to have very peculiar properties. Divers eminent chymiſts teach, that it will diſſolve pearls, which being precipitated by the ſpirit of the ſame concrete, are thereby (as they ſay) rendered volatile; which has been confirmed to me, upon his own obſervation, by a perſon of great veracity. The phlegm of wine, and indeed divers other liquors, that are indiſcriminately condemned to be caſt away as phlegm, are endowed with qualities, that make them differ both from meer water, and from each other. And whereas the chymiſts are pleaſed to call the *caput mortuum* of what they have diſtilled (after they have, by affuſion of water, drawn away its ſalt) *terra damnata*, or earth, it may be doubted, whether or no thoſe earths are all of them perfectly alike; and it is ſcarce to be doubted, but that there are ſome of them, which remain yet unreduced to an elementary nature. The aſhes of wood, deprived of all the ſalt, and bone-aſhes, or calcined hartſhorn, which refiners chooſe to make teſts of, as freeſt from ſalt, ſeem unlike: and he that ſhall compare either of theſe inſipid aſhes to lime, and much more to the calx of talc, (though by the affuſion of water they be exquiſitely dulcified) will perhaps ſee cauſe to think them things of a ſomewhat different nature. And it is evident in colcothar, that the exacteſt calcination, followed by an exquiſite dulcification, does not always reduce the remaining body into elementary earth; for after the ſalt or vitriol (if the calcination have been too faint) is drawn out of the colcothar, the reſidue is not earth, but a mixt body, rich in medical virtues (as experience has informed me) and which *Angelus Sala* affirms to be partly reducible into malleable copper: which I judge very probable; for though, when I was making experiments upon colcothar, I was deſtitute of a furnace capable of giving a heat intenſe enough to bring ſuch a calx to fuſion; yet having conjectured, that if colcothar abounded with that metal, aqua fortis would find it out there, I put ſome dulcified colcothar into that menſtruum, and found the liquor, according to my expectation, preſently coloured as highly, as if it had been an ordinary ſolution of copper.

THE SCEPTICAL CHYMIST:

PART V.

HERE *Carneades* making a pauſe, I muſt not deny (ſays his friend to him) that I think you have ſufficiently proved, that theſe diſtinct ſubſtances, which chymiſts are wont to obtain from mixt bodies, by their vulgar diſtillation, are not pure and ſimple enough to deſerve, in rigour of ſpeaking, the name of elements, or principles. But I ſuppoſe you have heard, that there are ſome modern Spagyriſts, who give out, that they can, by further and more ſkilful purifications, ſo reduce the ſeparated ingredients of mixt bodies to an elementary ſimplicity, that the oils (for inſtance) extracted from all mixts ſhall as perfectly reſemble one another, as the drops of water do.

IF you remember (replies *Carneades*) that at the beginning of our conference with *Philoponus*, I declared to him before the reſt of the company, that I would not engage myſelf at preſent to do any more, than examine the uſual proofs alledged by chymiſts, for the vulgar doctrine of their three hypoſtatical principles; you will eaſily perceive, that I am not obliged to make anſwer to what you newly propoſed; and that it rather grants, than diſproves what I have been contending for: ſince by pretending to make ſo great a change in the reputed principles, that diſtillation affords the common Spagyriſts, it is plainly enough pre-ſuppoſed, that before ſuch artificial depurations be made, the ſubſtances to be made more ſimple were not yet ſimple enough to be looked upon as elementary: wherefore in caſe the artiſts you ſpeak of could perform what they give out they can, yet I ſhould not need to be aſhamed of having queſtioned the vulgar opinion touching the *tria prima*. And as to the thing it ſelf, I ſhall freely acknowledge to you, that I love not to be forward in determining things to be impoſſible, till I know and have conſidered the means, by which they are propoſed

to

to be effected. And therefore I ſhall not peremptorily deny, either the poſſibility of what theſe artiſts promiſe, or my aſſent to any juſt inference, however deſtructive to my conjectures, that may be drawn from their performances. But give me leave to tell you withall, that becauſe ſuch promiſes are wont (as experience has more than once informed me) to be much more eaſily made, than made good by chymiſts, I muſt with-hold my belief from their aſſertions, till their experiments exact it; and muſt not be ſo eaſy as to expect before-hand an unlikely thing, upon ſtronger inducements than are yet given me: beſides that I have not yet found by what I have heard of theſe artiſts, that though they pretend to bring the ſeveral ſubſtances, into which the fire has divided the concrete, to an exquiſite ſimplicity, they pretend alſo to be able by the fire to divide all concretes, minerals, and others, into the ſame number of diſtinct ſubſtances. And in the mean time I muſt think it improbable, that they can either truly ſeparate as many differing bodies from gold (for inſtance) or oſtiocolla, as we can do from wine, or vitriol; or that the mercury (for example) of gold or Saturn would be perfectly of the ſame nature with that of hartſhorn; and that the ſulphur of antimony would be but numerically different from the diſtilled butter or oil of roſes.

BUT ſuppoſe (ſays *Eleutherius*) that you ſhould meet with chymiſts, who would allow you to take in earth and water into the number of the principles of mixt bodies; and being alſo content to change the ambiguous name of mercury for that more intelligible one of ſpirit, ſhould conſequently make the principles or compound bodies to be five; would you not think it ſomething hard to reject ſo plauſible an opinion, only becauſe the five ſubſtances, into which the fire divides mixt bodies, are not exactly pure, and homogeneous? For my part (continues *Eleutherius*) I cannot but think it ſomewhat ſtrange, in caſe this opinion be not true, that it ſhould fall out ſo luckily, that ſo great a variety of bodies ſhould be analyzed by the fire into juſt five diſtinct ſubſtances; which ſo little differing from the bodies, that bear thoſe names, may ſo plauſibly be called oil, ſpirit, ſalt, water, and earth.

THE opinion you now propoſe (anſwers *Carneades*) being another than that I was engaged to examine, it is not requiſite for me to debate at this preſent; nor ſhould I have leiſure to do it throughly. Wherefore, I ſhall only tell you in general, that though I think this opinion in ſome reſpects more defenſible than that of the vulgar chymiſts; yet you may eaſily enough learn from the paſt diſcourſe, what may be thought of it: ſince many of the objections made againſt the vulgar doctrine of the chymiſts ſeem, without much alteration, employable againſt this hypotheſis alſo. For, beſides that this doctrine does, as well as the other, take it for granted, (what is not eaſy to be proved) that the fire is the true and adequate analyzer of bodies, and that all the diſtinct ſubſtances obtainable from a mixt body by the fire, were ſo pre-exiſtent in it, that they were but extricated from each other by the analyſis; beſides that this opinion too aſcribes to the productions of the fire an elementary ſimplicity, which I have ſhewn not to belong to them; and beſides that this doctrine is liable to ſome of the other difficulties, wherewith that of the *tria prima* is incumbered: beſides all this, I ſay, this quinary number of elements, (if you pardon the expreſſion) ought at leaſt to have been reſtrained to the generality of animal and vegetable bodies, ſince not only among theſe there are ſome bodies, (as I formerly argued) which, for aught yet has been made to appear, do conſiſt, either of fewer or more ſimilar ſubſtances than preciſely five. But in the mineral kingdom, there is ſcarce one concrete, that has been evinced to be adequately diviſible into ſuch five principles or elements, and neither more nor leſs, as this opinion would have every mixt body to conſiſt of.

AND this very thing (continues *Carneades*) may ſerve to take away or leſſen your wonder, that juſt ſo many bodies as five ſhould be found upon the reſolution of concretes. For ſince we find not, that the fire can make any ſuch analyſis (into five elements) of metals and other mineral bodies, whoſe texture is more ſtrong and permanent, it remains, that the five ſubſtances under conſideration be obtained from vegetable and animal bodies, which (probably by reaſon of their looſer contexture) are capable of being diſtilled. And as to ſuch bodies, it is natural enough, that, whether we ſuppoſe, that there are, or are not, preciſely five elements, there ſhould ordinarily occur in the diſſipated parts, a five-fold diverſity of ſcheme, (if I may ſo ſpeak.) For, if the parts do not remain all fixed, as in gold, calcined talc, *&c.* nor all aſcend, as in the ſublimation of brimſtone, camphire, *&c.* but after their diſſipation do aſſociate themſelves into new ſchemes of matter; it is very likely, that they will, by the fire, be divided into fixed and volatile; (I mean, in reference to that degree of heat, by which they are diſtilled) and thoſe volatile parts will, for the moſt part, aſcend either in a dry form, which chymiſts are pleaſed to call, if they be taſteleſs, flowers; if ſapid, volatile ſalt; or in a liquid form. And this liquor muſt be either inflammable, and ſo paſs for oil; or not inflammable, and yet ſubtile and pungent, which may be called ſpirit; or elſe ſtrengthleſs or inſipid, which may be named phlegm, or water. And as for the ſixth part, or *caput mortuum*, it will moſt commonly conſiſt of corpuſcles, partly ſoluble in water, or ſapid, (eſpecially if the ſaline parts were not ſo volatile, as to fly away before) which make up its fixt ſalt; and partly inſoluble and inſipid, which therefore ſeems to challenge the name of earth. But although upon this ground one might eaſily enough have foretold, that the differing ſubſtances obtained from a perfectly mixt body by the fire would for the moſt part be reducible to the five newly-mentioned ſtates of matter; yet it will not preſently follow, that theſe five diſtinct ſubſtances were ſimple and

primogeneal bodies, ſo pre-exiſtent in the concrete, that the fire does but take them aſunder. Beſides that it does not appear, that all mixt bodies, (witneſs, gold, ſilver, mercury, *&c.*) nay, nor perhaps all vegetables, which may appear by what we ſaid above of camphire, benzoin, *&c.* are reſoluble by fire into juſt ſuch differing ſchemes of matter. Nor will the experiments, formerly alledged, permit us to look upon theſe ſeparated ſubſtances as elementary or uncompounded. Neither will it be a ſufficient argument of their being bodies, that deſerve the names, which chymiſts are pleaſed to give them, that they have an analogy in point of conſiſtence, or either volatility or fixedneſs, or elſe ſome other obvious quality, with the ſuppoſed principles, whoſe names are aſcribed to them. For, as I told you above, notwithſtanding this reſemblance in ſome one quality, there may be ſuch a diſparity in others, as may be more fit to give them differing appellations, than the reſemblance is to give them one and the ſame. And indeed it ſeems but ſomewhat a groſs way of judging of the nature of bodies, to conclude without ſcruple, that thoſe muſt be of the ſame nature, that agree in ſome ſuch general quality, as fluidity, dryneſs, volatility, and the like: ſince each of thoſe qualities, or ſtates of matter, may comprehend a great variety of bodies, otherwiſe of a very differing nature; as we may ſee in the calxes of gold, of vitriol, and of Venetian talc, compared with common aſhes; which yet are very dry, and fixed by the vehemence of the fire, as well as they. And as we may likewiſe gather from what I have formerly obſerved, touching the ſpirit of box-wood, which though a volatile, ſapid, and not inflammable liquor, as well as the ſpirits of hartſhorn, of blood and others, (and therefore has been hitherto called the ſpirit, and eſteemed for one of the principles of the wood that affords it) may yet, as I told you, be ſubdivided into two liquors, differing from one another, and one of them at leaſt, from the generality of other chymical ſpirits.

BUT you may your ſelf, if you pleaſe, (purſues *Carneades*) accommodate to the hypotheſis you propoſed, what other particulars you ſhall think applicable to it in the foregoing diſcourſe. For I think it unſeaſonable for me to meddle now any further with a controverſy, which, ſince it does not now belong to me, leaves me at liberty to take my own time to declare my ſelf about it.

ELEUTHERIUS perceiving, that *Carneades* was ſomewhat unwilling to ſpend any more time upon the debate of this opinion, and having perhaps ſome thoughts of taking hence a riſe to make him diſcourſe it more fully another time, thought not fit as then to make any further mention to him of the propoſed opinion; but told him,

I PRESUME I need not mind you, *Carneades*, that both the patrons of the ternary number of principles, and thoſe that would have five elements, endeavour to back their experiments with a ſpecious reaſon or two; and eſpecially ſome of thoſe embracers of the opinion laſt named (whom I have converſed with, and found them learned men) aſſign this reaſon of the neceſſity of five diſtinct elements; that otherwiſe mixt bodies could not be ſo compounded and tempered, as to obtain a due conſiſtence and competent duration. For ſalt (ſay they) is the baſis of ſolidity, and permanency in compound bodies, without which the other four elements might indeed be variouſly and looſely blended together, but would remain incompacted; but that ſalt might be diſſolved into minute parts, and conveyed to the other ſubſtances to be compacted by it; and with it, there is a neceſſity of water. And that the mixture may not be too hard and brittle, a ſulphureous or oily principle muſt intervene, to make the maſs more tenacious: to this a mercurial ſpirit muſt be ſuperadded; which by its activity may for a while permeate, and, as it were, leaven the whole maſs, and thereby promote the more exquiſite mixture and incorporation of the ingredients. To all which, laſtly, a portion of earth muſt be added, which by its dryneſs and poroſity may ſoak up part of that water, wherein the ſalt was diſſolved, and eminently concur with the other ingredients to give the whole body the requiſite conſiſtence.

I PERCEIVE (ſays *Carneades* ſmiling) that if it be true, as it was lately noted from the proverb, *That good wits have bad memories*, you have that title, as well as a better, to a place among the good wits. For you have already more than once forgot, that I declared to you, that I would at this conference examine only the experiments of my adverſaries, not their ſpeculative reaſons. Yet it is not (ſubjoins *Carneades*) for fear of meddling with the argument you have propoſed, that I decline the examining it at preſent. For if when we are more at leiſure, you ſhall have a mind, that we may ſolemnly conſider of it together; I am confident we ſhall ſcarce find it inſoluble. And in the mean time we may obſerve, that ſuch a way of arguing may, it ſeems, be ſpeciouſly accommodated to differing hypotheſes. For I find, that *Beguinus*, and other aſſertors of the *tria prima*, pretend to make out by ſuch a way the requiſiteneſs of their ſalt, ſulphur and mercury, to conſtitute mixt bodies, without taking notice of any neceſſity of an addition of water and earth.

AND indeed neither ſort of chymiſts ſeem to have duly conſidered, how great variety there is in the textures and conſiſtences of compound bodies; and how little the conſiſtence and duration of many of them ſeem to accommodate and be explicable by the propoſed notion. And not to mention thoſe almoſt incorruptible ſubſtances obtainable by the fire, which I have proved to be ſomewhat compounded, and which the chymiſts will readily grant not to be perfectly mixt bodies; (not to mention theſe, I ſay) if you will but recall to mind ſome of thoſe experiments, whereby I ſhewed you, that out of common water only mixt bodies (and even living ones) of very differing conſiſtences, and reſoluble by fire into as many principles as other bodies acknowledged to be perfectly mixt, may be produced; if you do

this, I ſay, you will not, I ſuppoſe, be averſe from believing, that nature, by a convenient diſpoſition of the minute parts of a portion of matter, may contrive bodies durable enough, and of this, or that, or the other conſiſtence, without being obliged to make uſe of all, much leſs of any determinate quantity of each of the five elements, or of the three principles to compound ſuch bodies of. And I have (purſues *Carneades*) ſomething wondered, chymiſts ſhould not conſider, that there is ſcarce any body in nature ſo permanent and indiſſoluble as glaſs; which yet themſelves teach us may be made of bare aſhes, brought to fuſion by the meer violence of the fire; ſo that, ſince aſhes are granted to conſiſt but of pure ſalt and ſimple earth, ſequeſtered from all the other principles or elements, they muſt acknowledge, that even art it ſelf can of two elements only, or if you pleaſe, one principle and one element, compound a body more durable than almoſt any in the world. Which being undeniable, how will they prove, that nature cannot compound mixt bodies, and even durable ones, under all the five elements or material principles?

BUT to inſiſt any longer on this occaſional diſquiſition, touching their opinion, that would eſtabliſh five elements, were to remember as little as you did before, that the debate of this matter is no part of my firſt undertaking; and conſequently, that I have already ſpent time enough in what I look back upon but as a digreſſion, or at beſt an excurſion.

AND thus, *Eleutherius*, (ſays *Carneades*) having at length gone through the four conſiderations I propoſed to diſcourſe unto you, I hold it not unfit, for fear my having inſiſted ſo long on each of them may have made you forget their ſeries, briefly to repeat them by telling you, that

SINCE, in the firſt place, it may juſtly be doubted, whether or no the fire be, as chymiſts ſuppoſe it, the genuine and univerſal reſolver of mixt bodies;

SINCE we may doubt, in the next place, whether or no all the diſtinct ſubſtances, that may be obtained from a mixt body by the fire, were pre-exiſtent there, in the forms, in which they were ſeparated from it;

SINCE alſo, though we ſhould grant the ſubſtances ſeparable from mixt bodies by the fire, to have been their component ingredients, yet the number of ſuch ſubſtances does not appear the ſame in all mixt bodies; ſome of them being reſoluble into more differing ſubſtances than three, and others not being reſoluble into ſo many as three;

AND ſince, laſtly, thoſe very ſubſtances, that are thus ſeparated, are not, for the moſt part, pure and elementary bodies, but new kinds of mixts;

SINCE, I ſay, theſe things are ſo, I hope you will allow me to infer, that the vulgar experiments (I might perchance have added, the arguments too) wont to be alledged by chymiſts to prove, that their three hypoſtatical principles do adequately compoſe all mixt bodies, are not ſo demonſtrative, as to induce a wary perſon to acquieſce in their doctrine, which, till they explain and prove it better, will, by its perplexing darkneſs, be more apt to puzzle than ſatisfy conſidering men, and will to them appear incumbered with no ſmall difficulties.

AND from what has been hitherto deduced (continues *Carneades*) we may learn, what to judge of the common practice of thoſe chymiſts, who, becauſe they have found, that divers compound bodies (for it will not hold in all) can be reſolved into, or rather can be brought to afford two or three differing ſubſtances more than the foot and aſhes, whereinto the naked fire commonly divides them in our chimneys, cry up their own ſect for the invention of a new philoſophy; ſome of them, as *Helmont*, *&c.* ſtyling themſelves philoſophers by the fire; and the moſt part not only aſcribing, but, as far as in them lies, engroſſing to thoſe of their ſect the title of Philoſophers.

BUT alas, how narrow is this philoſophy, that reaches but to ſome of thoſe compound bodies, which we find but upon, or in the cruſt or outſide of our terreſtrial globe, which is it ſelf but a point in compariſon of the vaſt extended univerſe, of whoſe other and greater parts the doctrine of the *tria prima* does not give us an account! For what does it teach us, either of the nature of the ſun, which aſtronomers affirm to be eight-ſcore and odd times bigger than the whole earth? or of that of thoſe numerous fixt ſtars, which, for aught we know, would very few, if any of them, appear inferiour in bulk and brightneſs to the ſun, if they were as near us as he? What does the knowing that ſalt, ſulphur and mercury, are the principles of mixt bodies, inform us of the nature of that vaſt, fluid, and ætherial ſubſtance, that ſeems to make up the interſtellar, and conſequently much the greateſt part of the world? For as for the opinion commonly aſcribed to *Paracelſus*, as if he would have not only the four Peripatetick elements, but even the celeſtial parts of the univerſe, to conſiſt of his three principles, ſince the modern chymiſts themſelves have not thought ſo groundleſs a conceit worth their owning, I ſhall not think it worth my confuting.

BUT I ſhould, perchance, forgive the hypotheſis I have been all this while examining, if, though it reaches but to a very little part of the world, it did at leaſt give us a ſatisfactory account of thoſe things, to which it is ſaid to reach. But I find not, that it gives us any other than a very imperfect information even about mixt bodies themſelves: for how will the knowledge of the *tria prima* diſcover to us the reaſon, why the load-ſtone draws a needle, and diſpoſes it to reſpect the poles, and yet ſeldom preciſely points at them? How will this hypotheſis teach us, how a chick is formed in the egg, or how the ſeminal principles of mint, pompions, and other vegetables, that I mentioned to you above, can faſhion water into various plants, each of them endowed with its peculiar and determinate ſhape, and with divers ſpecifick and diſcriminating qualities? How does this hypotheſis ſhew us, how much ſalt, how much ſulphur,

and

and how much mercury muſt be taken to make a chick or a pompion? And if we know that, what principle is it, that manages theſe ingredients, and contrives (for inſtance) ſuch liquors, as the white and yolk of an egg into ſuch a variety of textures, as is requiſite to faſhion the bones, veins, arteries, nerves, tendons, feathers, blood, and other parts of a chick? and not only to faſhion each limb, but to connect them all together, after that manner, that is moſt congruous to the perfection of the animal, which is to conſiſt of them? For to ſay, that ſome more fine and ſubtile part of either, or all the hypoſtatical principles is the director in all this buſineſs, and the architect of all this elaborate ſtructure, is to give one occaſion to demand again, what proportion and way of mixture of the *tria prima* afforded this architectonick ſpirit, and what agent made ſo ſkilful and happy a mixture? And the anſwer to this queſtion, if the chymiſts will keep themſelves within their three principles, will be liable to the ſame inconvenience, that the anſwer to the former was. And if it were not to intrench upon the theme of a friend of ours here preſent, I could eaſily proſecute the imperfections of the vulgar chymiſts philoſophy, and ſhew you, that by going about to explicate by their three principles, I ſay not, all the abſtruſe properties of mixt bodies, but even ſuch obvious and more familiar phænomena as fluidity and firmneſs, the colours and figures of ſtones, minerals, and other compound bodies, the nutrition of either plants or animals, the gravity of gold or quickſilver compared with wine or ſpirit of wine; by attempting, I ſay, to render a reaſon of theſe (to omit a thouſand others as difficult to account for) from any proportion of the three ſimple ingredients, chymiſts will be much more likely to diſcredit themſelves and their hypotheſis, than ſatisfy an intelligent inquirer after truth.

BUT (interpoſes *Eleutherius*) this objection ſeems no more than may be made againſt the four Peripatetick elements; and indeed almoſt againſt any other hypotheſis, that pretends by any determinate number of material ingredients to render a reaſon of the phænomena of nature. And as for the uſe of the chymical doctrine of the three principles, I ſuppoſe you need not be told by me, that the great champion of it, the learned *Sennertus*, aſſigns this noble uſe of the *tria prima*, that from them, as the neareſt and moſt proper principles, may be deduced and demonſtrated the properties, which are in mixt bodies, and which cannot be proximately (as they ſpeak) deduced from the elements. And this, ſays he, is chiefly apparent, when we inquire into the properties and faculties of medicines. And I know (continues *Eleutherius*) that the perſon you have aſſumed, of an opponent of the hermetick doctrine, will not ſo far prevail againſt your native and wonted equity, as to keep you from acknowledging, that philoſophy is much beholden to the notions and diſcoveries of chymiſts.

Senn. *de Conſ. & Diſſen.* p. 165.

IF the chymiſts you ſpeak of (replies *Carneades*) had been ſo modeſt, or ſo diſcreet, as to propoſe their opinion of the *tria prima*, but as a notion uſeful among others, to increaſe human knowledge, they had deſerved more of our thanks, and leſs of our oppoſition: but ſince the thing, that they pretend, is not ſo much to contribute a notion toward the improvement of philoſophy, as to make this notion (attended by a few leſs conſiderable ones) paſs for a new philoſophy itſelf; nay, ſince they boaſt ſo much of this fancy of theirs, that the famous *Quercetanus* ſcruples not to write, that if his moſt certain doctrine of the three principles were ſufficiently learned, examined, and cultivated, it would eaſily diſpel all the darkneſs, that benights our minds, and bring in a clear light, that would remove all difficulties; this ſchool affording theorems and axioms irrefragable, and to be admitted without diſpute by impartial judges, and ſo uſeful withal, as to exempt us from the neceſſity of having recourſe, for want of the knowledge of cauſes, to that ſanctuary of the ignorant, occult qualities: ſince I ſay, this domeſtick notion of the chymiſts is ſo much overvalued by them, I cannot think it unfit, they ſhould be made ſenſible of their miſtake; and be admoniſhed to take in more fruitful and comprehenſive principles, if they mean to give us an account of the phænomena of nature; and not confine themſelves, and (as far as they can) others, to ſuch narrow principles, as I fear will ſcarce enable them to give an account (I mean an intelligible one) of the tenth part (I ſay not) of all the phænomena of nature; but even of all ſuch, as by the Leucippian, or ſome of the other ſorts of principles, may be plauſibly enough explicated. And though I be not unwilling to grant, that the incompetency I impute to the chymical hypotheſis is but the ſame, which may be objected againſt that of the four elements, and divers other doctrines that have been maintained by learned men; yet ſince it is the chymical hypotheſis only, which I am now examining, I ſee not why, if what I impute to it be a real inconvenience, either it ſhould ceaſe to be ſo, or I ſhould ſcruple to object it, becauſe other theories are liable thereunto, as well as the hermetical. For I know not, why a truth ſhould be thought leſs a truth for the being fit to overthrow variety of errors.

I AM obliged to you (continues *Carneades*, a little ſmiling) for the favourable opinion you are pleaſed to expreſs of my equity, if there be no deſign in it. But I need not be tempted by an artifice, or invited by a compliment, to acknowledge the great ſervice, that the labours of chymiſts have done the lovers of uſeful learning; nor even, on this occaſion, ſhall their arrogance hinder my gratitude. But ſince we are as well examining the truth of their doctrine, as the merit of their induſtry, I muſt, in order to the inveſtigation of the firſt, continue a reply, to talk at the rate of the part I have aſſumed; and tell you, that when I acknowledge the uſefulneſs of the labours of Spagyriſts to natural philoſophy, I do it upon the ſcore of their experiments, not upon that of their ſpeculations; for it ſeems to me, that their writings, as their furnaces, afford as well

ſmoke

ſmoke as light; and do little leſs obſcure ſome ſubjects, than they illuſtrate others. And though I am unwilling to deny, that it is difficult for a man to be an accompliſhed naturaliſt, that is a ſtranger to chymiſtry; yet I look upon the common operations and practices of chymiſts, almoſt as I do on the letters of the alphabet, without whoſe knowledge it is very hard for a man to become a philoſopher; and yet that knowledge is very far from being ſufficient to make him one.

BUT (ſays *Carneades*, reſuming a more ſerious look) to conſider a little more particularly what you alledge in favour of the chymical doctrine of the *tria prima*, though I ſhall readily acknowledge it not to be unuſeful, and that the deviſers and embracers of it have done the commonwealth of learning ſome ſervice, by helping to deſtroy that exceſſive eſteem, or rather veneration, wherewith the doctrine of the four elements was almoſt as generally, as undeſervedly entertained; yet what has been alledged concerning the uſefulneſs of the *tria prima*, ſeems to me liable to no contemptible difficulties.

AND firſt, as for the very way of probation, which the more learned and more ſober champions of the chymical cauſe employed to evince the chymical principles in mixt bodies, it ſeems to me to be far enough from being convincing. This grand and leading argument, your *Sennertus* himſelf, who lays great weight upon it, and tells us, that the moſt learned philoſophers employ this way of reaſoning to prove the moſt important things, propoſes thus: *Ubicunque* (ſays he) *pluribus eædem affectiones & qualitates inſunt, per commune quoddam principium inſint neceſſe eſt, ſicut omnia ſunt gravia propter terram, calida propter ignem. At colores, odores, ſapores, eſſe φλογιςὸν, & ſimilia alia, mineralibus, metallis, gemmis, lapidibus, plantis, animalibus inſunt. Ergo per commune aliquod principium & ſubjectum inſunt. At tale principium non ſunt elementa. Nullam enim habent ad tales qualitates producendas potentiam. Ergo alia principia, unde fluant, inquirenda ſunt.*

IN the recital of this argument, (ſays *Carneades*) I therefore thought fit to retain the language, wherein the author propoſes it, that I might alſo retain the propriety of ſome Latin terms, to which I do not readily remember any that fully anſwer in Engliſh. But as for the argumentation itſelf, it is built upon a precarious ſuppoſition, that ſeems to me neither demonſtrable nor true; for how does it appear, that where the ſame quality is to be met with in many bodies, it muſt belong to them upon the account of ſome one body whereof they all partake? (for that the major of our author's argument is to be underſtood of the material ingredients of bodies, appears by the inſtances of earth and fire he annexes to explain it.) For to begin with that very example, which he is pleaſed to alledge for himſelf; how can he prove, that the gravity of all bodies proceeds from what they participate of the element of earth, ſince we ſee, that not only common water, but the more pure diſtilled rain-water is heavy; and quickſilver is much heavier than earth itſelf, though none of my adverſaries has yet proved, that it contains any of that element. And I the rather make uſe of this example of quickſilver, becauſe I ſee not how the aſſertors of the elements will give any better account of it than the chymiſts. For if it be demanded, how it comes to be fluid, they will anſwer, that it participates much of the nature of water. And indeed, according to them, water may be the predominant element in it, ſince we ſee, that ſeveral bodies, which by diſtillation afford liquors, that weigh more than their *caput mortuum*, do not yet conſiſt of liquor enough to be fluid. Yet if it be demanded, how quickſilver comes to be ſo heavy, then it is replied, that it is by reaſon of the earth, that abounds in it; but ſince, according to them, it muſt conſiſt alſo of air, and partly of fire, which they affirm to be light elements, how comes it, that it ſhould be ſo much heavier than earth of the ſame bulk, though to fill up the poroſities and other cavities it be made up into a maſs or paſte with water, which it ſelf they allow to be a heavy element. But to return to our Spagyriſts, we ſee, that chymical oils and fixt ſalts, though never ſo exquiſitely purified and freed from terreſtrial parts, do yet remain ponderous enough. And experience has informed me, that a pound, (for inſtance) of ſome of the heavieſt woods, as guaiacum, that will ſink in water, being burnt to aſhes will yield a much leſs weight of them (whereof I found but a ſmall part to be alkalizate) than much lighter vegetables: as alſo that the black charcoal of it will not ſink as did the wood, but ſwim; which argues, that the differing gravity of bodies proceeds chiefly from the particular texture, as is manifeſt in gold, the cloſeſt and compacteſt of bodies, which is many times heavier than we can poſſiby make any parcel of earth of the ſame bulk. I will not examine, what may be argued touching the gravity, or quality analogous thereunto, of even celeſtial bodies, from the motion of the ſpots about the ſun, and from the appearing equality of the ſuppoſed ſeas in the moon; nor conſider, how little thoſe phænomena would agree with what *Sennertus* preſumes concerning gravity. But further to invalidate his ſuppoſition, I ſhall demand, upon what chymical principle fluidity depends? And yet fluidity is, two or three perhaps excepted, the moſt diffuſed quality of the univerſe, and far more general than almoſt any other of thoſe, that are to be met with in any of the chymical principles, or Ariſtotelian elements; ſince not only the air, but that vaſt expanſion we call heaven, in compariſon of which, our terreſtrial globe (ſuppoſing it were all ſolid) is but a point, and perhaps too, the ſun and the fixt ſtars, are fluid bodies. I demand alſo, from which of the chymical principles, motion flows; which yet is an affection of matter much more general than any, that can be deduced from any of the three chymical principles. I might aſk the like queſtion concerning light, which is not only to be found in the kindled ſulphur of mixt bodies, but (not to mention thoſe ſorts of rotten woods, and rotten fiſh, that ſhine in the dark) in the tails of

living glow-worms, and in the vaſt bodies of the ſun and ſtars. I would gladly alſo know, in which of the three principles, the quality, we call ſound, reſides as in its proper ſubject; ſince either oil falling upon oil, or ſpirit upon ſpirit, or ſalt upon ſalt, in a great quantity, and from a conſiderable height, will make a noiſe, or, if you pleaſe, create a ſound, and (that the objection may reach the Ariſtotelians) ſo will alſo water upon water, and earth upon earth. And I could name other qualities to be met with in divers bodies, of which I ſuppoſe my adverſaries will not in haſte aſſign any ſubject, upon whoſe account it muſt needs be, that the quality belongs to all the other ſeveral bodies.

AND, before I proceed any further, I muſt here invite you to compare the ſuppoſition we are examining, with ſome other of the chymical tenets. For firſt they do in effect teach, that more than one quality may belong to, and be deduced from, one principle. For, they aſcribe to ſalt, taſtes, and the power of coagulation; to ſulphur, as well odours as inflammableneſs; and ſome of them aſcribe to mercury, colours; as all of them do effumability, as they ſpeak. And on the other ſide, it is evident, that volatility belongs in common to all the three principles, and to water too. For it is manifeſt, that chymical oils are volatile; that alſo divers ſalts, emerging upon the analyſis of many concretes, are very volatile, is plain from the fugitiveneſs of ſalt, of hartſhorn, fleſh, *&c.* aſcending in the diſtillation of thoſe bodies. How eaſily water may be made to aſcend in vapours, there is ſcarce any body, that has not obſerved. And as for what they call the mercurial principle of bodies, that is ſo apt to be raiſed in the form of ſteam, that *Paracelſus* and others define it by that aptneſs to fly up; ſo that (to draw that inference by the way) it ſeems not, that chymiſts have been accurate in their doctrine of qualities, and their reſpective principles, ſince they both derive ſeveral qualities from the ſame principle, and muſt aſcribe the ſame quality to almoſt all their principles and other bodies beſides. And thus much for the firſt thing taken for granted, without ſufficient proof, by your *Sennertus:* and to add that upon the by (continues *Carneades*) we may hence learn, what to judge of the way of argumentation, which that fierce champion of the Ariſtotelians againſt the chymiſts, *Anthoninus Guntherus Billichius* employs, where he pretends to prove againſt *Beguinus*, that not only the four elements do immediately concur to conſtitute every mixt body, and are both preſent in it, and obtainable from it, upon its diſſolution; but that in the *tria prima* themſelves, whereinto chymiſts are wont to reſolve mixt bodies, each of them clearly diſcovers itſelf to conſiſt of four elements. The ratiocination itſelf (purſues *Carneades*) being ſomewhat unuſual, I did the other day tranſcribe it, and (ſays he, pulling a paper out of his pocket) it is this: *Ordinamur, cum Beguino, à ligno viridi, quod ſi concremetur, videbis in ſudore aquam, in fumo aërem, in flamma & prunis ignem, terram in cineribus: quod ſi Beguino placuerit ex eo colligere humidum aquoſum, cohibere humidum oleaginoſum, extrahere ex cineribus ſalem; ego ipſi in unoquoque horum ſeorſim quatuor elementa ad oculum demonſtrabo, eodem artificio, quo in ligno viridi ea demonſtravi. Humorem aquoſum admovebo igni. Ipſe aquam ebullire videbit, in vapore aërem conſpiciet, ignem ſentiet in æſtu, plus minus terræ in ſedimento apparebit. Humor porro oleaginoſus aquam humiditate & fluiditate per ſe, accenſus vero ignem flamma prodit, fumo aërem, fuligine, nidore, & amurca terram. Salem denique ipſe Beguinus ſiccum vocat & terreſtrem, qui tamen nec fuſus aquam, nec cauſtica vi ignem celare poteſt; ignis vero violentia in halitus verſus nec ab aëre ſe alienum eſſe demonſtrat; idem de lacte, de ovis, de ſemine lini, de garyophillis, de nitro, de ſale marino, denique de antimonio, quod fuit de ligno viridi judicium; eadem de illorum partibus, quas Beguinus adducit, ſententia, quæ de viridis ligni humore aquoſo, quæ de liquore ejuſdem oleoſo, quæ de ſale fuit.*

In Theſſalo reſtiviva, cap. 10. pag. 73, 74.

THIS bold diſcourſe (reſumes *Carneades*, putting up again his paper) I think it were not very difficult to confute, if his arguments were as conſiderable, as our time will probably prove ſhort for the remaining and more neceſſary part of my diſcourſe: wherefore referring you for an anſwer to what was ſaid concerning the diſſipated parts of a burnt piece of green wood, to what I told *Themiſtius* on the like occaſion, I might eaſily ſhew you, how ſlightly and ſuperficially our *Guntherus* talks of the dividing the flame of green wood into his four elements; when he makes that vapour to be air, which being caught in glaſſes and condenſed, preſently diſcovers it ſelf to have been but an aggregate of innumerable very minute drops of liquor: and when he would prove the phlegm's being compoſed of fire, by that heat, which is adventitious to the liquors, and ceaſes upon the abſence of what produced it, (whether that be an agitation proceeding from the motion of the external fire, or the preſence of a multitude of igneous atoms pervading the pores of the veſſel, and nimbly permeating the whole body of the water) I might, I ſay, urge theſe and divers other weakneſſes of his diſcourſe. But I will rather take notice of what is more pertinent to the occaſion of this digreſſion; namely, that taking it for granted, that fluidity (with which he unwarily ſeems to confound humidity) muſt proceed from the element of water, he makes a chymical oil to conſiſt of that elementary liquor; and yet in the very next words proves, that it conſiſts alſo of fire, by its inflammability; not remembering, that exquiſitely pure ſpirit of wine is both more fluid than water itſelf, and yet will flame all away, without leaving the leaſt aqueous moiſture behind it, and without ſuch an amurca and ſoot as he would deduce the preſence of earth from. So that the ſame liquor may, according to his doctrine, be concluded by its great fluidity to be almoſt all water; and, by its burning all away, to be all diſguiſed fire. And by the like way of probation our author would ſhew, that the fixt ſalt of wood is compounded of the four elements. For (ſays he) being turned by the violence of the fire

into ſteams, it ſhews it ſelf to be of kin to air; whereas I doubt, whether he ever ſaw a true fixt ſalt (which to become ſo, muſt have already endured the violence of an incinerating fire) brought by the fire alone to aſcend in the form of exhalations; but I do not doubt, that if he did, and had caught thoſe exhalations in convenient veſſels, he would have found them as well as the ſteams of common ſalt, *&c.* of a ſaline, and not an aëreal nature. And whereas our author takes it alſo for granted,, that the fuſibility of ſalt muſt be deduced from water, it is indeed ſo much the effect of heat variouſly agitating the minute parts of a body, without regard to water, that gold (which by its being the heavieſt and fixedeſt of bodies, ſhould be the moſt earthy) will be brought to fuſion by a ſtrong fire, which ſure is more likely to drive away, than increaſe its aqueous ingredient, if it have any. And on the other ſide, for want of a ſufficient agitation of its minute parts, ice is not fluid, but ſolid; though he preſumes alſo, that the mordicant quality of bodies muſt proceed from a fiery ingredient: whereas, not to urge, that the light and inflammable parts, which are the moſt likely to belong to the element of fire, muſt probably be driven away by that time the violence of the fire has reduced the body to aſhes; not to urge this, I ſay, nor that oil of vitriol, which quenches fire, burns the tongue and fleſh of thoſe, that unwarily taſte or apply it, as a cauſtick doth, it is precarious to prove the preſence of fire in fixt ſalts from their cauſtick power, unleſs it were firſt ſhewn, that all the qualities aſcribed to ſalts muſt be deduced from thoſe of the elements; which, had I time, I could eaſily manifeſt to be no eaſy taſk. And not to mention, that our author makes a body, as homogeneous, as any he can produce for elementary, belong both to water and fire, though it be neither fluid nor inſipid, like water; nor light and volatile, like fire; he ſeems to omit in this anatomy the element of earth, ſave that he intimates, that the ſalt may paſs for that: but ſince a few lines before, he takes aſhes for earth, I ſee not how he will avoid an inconſiſtency either betwixt the parts of his diſcourſe, or betwixt ſome of them and his doctrine. For ſince there is a manifeſt difference betwixt the ſaline and the inſipid parts of aſhes, I ſee not how ſubſtances, that diſagree in ſuch notable qualities, can be both ſaid to be portions of an element, whoſe nature requires that it be homogeneous, eſpecially in this caſe where an analyſis by the fire is ſuppoſed to have ſeparated it from the admixture of other elements, which are confeſſed by moſt Ariſtotelians to be generally found in common earth, and to render it impure. And ſure, if when we have conſidered, for how little a diſparity's ſake the Peripateticks make theſe ſymbolizing bodies, air and fire, to be two diſtinct elements, we ſhall alſo conſider, that the ſaline part of aſhes is very ſtrongly taſted, and eaſily ſoluble in water; whereas the other part of the ſame aſhes is inſipid and indiſſoluble in the ſame liquor: not to add, that the one ſubſtance is opacous, and the other ſomewhat diaphanous, nor that they differ in divers other particulars; if we conſider thoſe things, I ſay, we ſhall hardly think, that both theſe ſubſtances are elementary earth. And as to what is ſometimes objected, that their ſaline taſte is only an effect of incineration and aduſtion, it has been elſewhere fully replied to, when propoſed by *Themiſtius*, and where it has been proved againſt him, that however inſipid earth may perhaps, by additaments, be turned into ſalt, yet it is not like it ſhould be ſo by the fire alone; for we ſee, that when we refine gold and ſilver, the violenteſt fires we can employ on them give them not the leaſt reliſh of ſaltneſs. And I think *Philoponus* has rightly obſerved, that the aſhes of ſome concretes contain very little ſalt, if any at all; for refiners ſuppoſe, that bone-aſhes are free from it, and therefore make uſe of them for teſts and cupels; which ought to be deſtitute of ſalt, leſt the violence of the fire ſhould bring them to vitrification. And having purpoſely and heedfully taſted a cupel made of only bone-aſhes and fair water, which I had cauſed to be expoſed to a very violent fire, acuated by the blaſt of a large pair of double bellows, I could not perceive, that the force of the fire had imparted to it the leaſt ſaltneſs, or ſo much as made it leſs inſipid.

BUT (ſays *Carneades*) ſince neither you nor I love repetitions, I ſhall not now make any of what elſe was urged againſt *Themiſtius*, but rather invite you to take notice with me, that when our author, though a learned man, and one that pretends ſkill enough in chymiſtry to reform the whole art, comes to make good his confident undertaking, to give us an ocular demonſtration of the immediate preſence of the four elements in the reſolution of green wood, he is fain to ſay things, that agree very little with one another. For about the beginning of that paſſage of his, lately recited to you, he makes the ſweat, as he call it, of the green wood, to be water; the ſmoke, air; the ſhining matter, fire; and the aſhes, earth: whereas a few lines after, he will, in each of theſe, nay (as I juſt now noted) in one diſtinct part of the aſhes, ſhew the four elements. So that either the former analyſis muſt be incompetent to prove that number of elements, ſince by it, the burnt concrete is not reduced into elementary bodies, but into ſuch as are yet each of them compounded of the four elements; or elſe theſe qualities, from which he endeavours to deduce the preſence of all the elements in the fixt ſalt, and each of the other ſeparated ſubſtances, will be but a precarious way of probation; eſpecially if you conſider, that the extracted alkali of wood, being, for aught appears, at leaſt as ſimilar a body, as any that the Peripateticks can ſhew us, if its differing qualities muſt argue the preſence of diſtinct elements, it will ſcarce be poſſible for them, by any way they know of employing the fire upon any body, to ſhew, that any body is a portion of a true element. And this recalls to my mind, that I am now but in an occaſional excurſion, which aiming only to ſhew, that the Peripateticks, as well as the chymiſts, take, in our preſent controverſy, ſomething for granted, which they ought

to

to prove, I ſhall return to my exceptions, where I ended the firſt of them, and further tell you, that neither is that the only precarious thing, that I take notice of in *Sennertus* his argumentation: for when he infers, that becauſe the qualities he mentions, as colours, ſmells, and the like, belong not to the elements, they therefore muſt to the chymical principles, he takes that for granted, which will not in haſte be proved; as I might here manifeſt, but that I may by and by have a fitter opportunity to take notice of it. And thus much at preſent may ſuffice to have diſcourſed againſt the ſuppoſition, that almoſt every quality muſt have ſome ἐκτικὸν πρῶτον, as they ſpeak, ſome native receptacle, wherein, as in its proper ſubject of inheſion, it peculiarly reſides; and on whoſe account that quality belongs to the other bodies, wherein, it is to be met with. Now this fundamental ſuppoſition being once deſtroyed, whatſoever is built upon it, muſt fall to ruin of it ſelf.

BUT I conſider further, that chymiſts are (for aught I have found) far from being able to explicate by any of the *tria prima*, thoſe qualities, which they pretend to belong primarily unto it, and in mixt bodies to deduce from it. It is true indeed, that ſuch qualities are not explicable by the four elements; but it will not therefore follow, that they are ſo by the three Hermetical principles: and this is it, that ſeems to have deceived the chymiſts, and is indeed a very common miſtake amongſt moſt diſputants, who argue, as if there could be but two opinions concerning the difficulty about which they contend; and conſequently they infer, that if their adverſaries opinion be erroneous, their's muſt needs be the truth; whereas many queſtions, and eſpecially in matters phyſiological, may admit of ſo many differing hypotheſes, that it will be very inconſiderate and fallacious to conclude (except where the opinions are preciſely contradictory) the truth of one from the falſity of another. And in our particular caſe it is no way neceſſary, that the properties of mixt bodies muſt be explicable either by the Hermetical, or the Ariſtotelian hypotheſis; there being divers other and more plauſible ways of explaining them, and eſpecially that, which deduces qualities from the motion, figure, and contrivance of the ſmall parts of bodies; as I think might be ſhewn, if the attempt were as ſeaſonable, as I fear it would be tedious.

I WILL allow then, that the chymiſts do not cauſeleſly accuſe the doctrine of the four elements of incompetency to explain the properties of compound bodies. And for this rejection of a vulgar error, they ought not to be denied what praiſe men may deſerve for exploding a doctrine, whoſe imperfections are ſo conſpicuous, that men needed but not to ſhut their eyes, to diſcover them. But I am miſtaken, if our hermetical philoſophers themſelves need not, as well as the Peripateticks, have recourſe to more fruitful and comprehenſive principles than the *tria prima*, to make out the properties of the bodies they converſe with. Not to accumulate examples to this purpoſe, becauſe I hope for a fitter opportunity to proſecute this ſubject, let us at preſent only point at colour, that you may gueſs by what they ſay of ſo obvious and familiar a quality, how little inſtruction we are to expect from the *tria prima* in thoſe more abſtruſe ones, which they, with the Ariſtotelians, ſtyle occult. For about colours, neither do they at all agree among themſelves, nor have I met with any one, of which of the three perſuaſions ſoever, that does intelligibly explicate them. The vulgar chymiſts are wont to aſcribe colours to mercury; *Paracelſus* in divers places attributes them to ſalt; and *Sennertus*, having recited their differing opinions, diſſents from both; and refers colours rather unto ſulphur. But how colours do, nay, how they may, ariſe from either of theſe principles, I think you will ſcarce ſay, that any has yet intelligibly explicated. And if Mr. *Boyle* will allow me to ſhew you the experiments, which he has collected about colours, you will, I doubt not, confeſs, that bodies exhibit colours, not upon the account of the predominancy of this or that principle in them, but upon that of their texture, and eſpecially the diſpoſition of their ſuperficial parts; whereby the light rebounding thence to the eye is ſo modified, as by differing impreſſions variouſly to affect the organs of ſight. I might here take notice of the pleaſing variety of colours exhibited by the triangular glaſs (as it is wont to be called) and demand, what addition or decrement of either ſalt, ſulphur, or mercury, befalls the body of the glaſs by being priſmatically figured; and yet it is known, that without that ſhape it would not afford thoſe colours as it does. But becauſe it may be objected, that theſe are not real, but apparent colours; that I may not loſe time in examining the diſtinction, I will alledge againſt the chymiſts a couple of examples of real and permanent colours drawn from metalline bodies; and repreſent, that without the addition of any extraneous body, quickſilver may by the fire alone, and that in glaſs-veſſels, be deprived of its ſilver-like colour, and be turned into a red body; and from this red body without addition likewiſe may be obtained a mercury bright and ſpecular as it was before. So that I have here a laſting colour generated and deſtroyed (as I have ſeen) at pleaſure, without adding or taking away either mercury, ſalt, or ſulphur. And if you take a clean and ſlender piece of hardened ſteel, and apply to it the flame of a candle at ſome little diſtance ſhort of the point, you ſhall not have held the ſteel long in the flame, but you ſhall perceive divers colours, as yellow, red and blue, to appear upon the ſurface of the metal, and, as it were, run along in chaſe of one another towards the point; ſo that the ſame body, and that in one and the ſame part, may not only have a new colour produced in it, but exhibit ſucceſſively divers colours within a minute of an hour, or thereabouts; and any of theſe colours may, by removing the ſteel from the fire, become permanent, and laſt many years. And this production and variety of colours cannot reaſonably be ſuppoſed to

De Conſ. & Diſſen. cap. 11. p. 186.

proceed from the acceſſion of any of the three principles, to which of them ſoever chymiſts will be pleaſed to aſcribe colours; eſpecially conſidering, that if you but ſuddenly refrigerate that iron, firſt made red-hot, it will be hardened and colourleſs again; and not only by the flame of a candle, but by any other equivalent heat conveniently applied, the like colours will again be made to appear and ſucceed one another, as at the firſt. But I muſt not any further proſecute an occaſional diſcourſe, though that were not ſo difficult for me to do, as I fear it would be for the chymiſts to give a better account of the other qualities, by their principles, than they have done of colours. And your *Sennertus* himſelf (though an author I much value) would I fear have been exceedingly puzzled to reſolve, by the *tria prima*, half that catalogue of problems, which he challenges the vulgar Peripateticks to explicate by their four elements. And ſuppoſing it were true, that ſalt or ſulphur were the principle, to which this or that quality may be peculiarly referred, yet though he, that teaches us this, teaches us ſomething concerning that quality, yet he teaches us but ſomething. For indeed he does not teach us that, which can in any tolerablemea ſure ſatisfy an inquiſitive ſearcher after truth. For what is it to me to know, that ſuch a quality reſides in ſuch a principle or element, whilſt I remain altogether ignorant of the cauſe of that quality, and the manner of its production and operation? How little do I know more than any ordinary man of gravity, if I know but that the heavineſs of mixt bodies proceeds from that of the earth they are compoſed of, if I know not the reaſon, why the earth is heavy? and how little does the chymiſt teach the philoſopher of the nature of purgation, if he only tells him, that the purgative virtue of medicines reſides in their ſalt? For, beſides that this muſt not be conceded without limitation, ſince the purging parts of many vegetables extracted by the water, wherein they are infuſed, are at moſt but ſuch compounded ſalts, (I mean mingled with oil, and ſpirit, and earth, as tartar and divers other ſubjects of the vegetable kingdom afford;) and ſince too that quickſilver precipitated either with gold, or without addition, into a powder, is wont to be ſtrongly enough cathartical, though the chymiſts have not yet proved, that either gold or mercury have any ſalt at all, much leſs any that is purgative; beſides this, I ſay, how little is it to me, to know, that it is the ſalt of the rhubarb (for inſtance) that purges, if I find, that it does not purge as ſalt; ſince ſcarce any elementary ſalt is in ſmall quantity cathartical; and if I know not how purgation in general is effected in a human body? In a word, as it is one thing to know a man's lodging, and another, to be acquainted with him; ſo it may be one thing to know the ſubject, wherein a quality principally reſides, and another thing to have a right notion and knowledge of the quality itſelf. Now that, which I take to be the reaſon of this chymical deficiency, is the ſame, upon whoſe account I think the Ariſtotelian and divers other theories incompetent to explicate the origin of qualities.

Senn. *de Conſ & Diſſen* p. 165, 166.

For I am apt to think, that men will never be able to explain the phænomena of nature, while they endeavour to deduce them only from the preſence and proportion of ſuch or ſuch material ingredients, and conſider ſuch ingredients or elements as bodies in a ſtate of reſt; whereas indeed the greateſt part of the affections of matter, and conſequently of the phænomena of nature, ſeems to depend upon the motion and the contrivance of the ſmall parts of bodies. For it is by motion, that one part of matter acts upon another; and it is, for the moſt part, the texture of the body, upon which the moving parts ſtrike, that modifies the motion or impreſſion, and concurs with it to the production of thoſe effects, which make up the chief part of the naturaliſt's theme.

BUT (ſays *Eleutherius*) methinks for all this, you have left ſome part of what I alledged, in behalf of the three principles, unanſwered. For all that you have ſaid will not keep this from being a uſeful diſcovery, that ſince in the ſalt of one concrete, in the ſulphur of another, and the mercury of a third, the medicinal virtue of it reſides; that principle ought to be ſeparated from the reſt, and there the deſired faculty muſt be ſought for.

I NEVER denied (replies *Carneades*) that the notion of the *tria prima* may be of ſome uſe; but (continues he, laughing) by what you now alledge for it, it will but appear, that it is uſeful to apothecaries, rather than to philoſophers; the being able to make things operative being ſufficient to thoſe, whereas the knowledge of cauſes is the thing looked after by theſe. And let me tell you, *Eleutherius*, even this itſelf will need to be entertained with ſome caution.

FOR firſt, it will not preſently follow, that if the purgative or other virtue of a ſimple may be eaſily extracted by water or ſpirit of wine, it reſides in the ſalt or ſulphur of the concrete; ſince unleſs the body hath before been reſolved by the fire, or ſome other powerful agent, it will, for the moſt part, afford in the liquors I have named, rather the finer compounded parts of itſelf, than the elementary ones. As I noted before, that water will diſſolve not only pure ſalts, but cryſtals of tartar, gum arabick, myrrh and other compound bodies. As alſo ſpirit of wine will diſſolve not only the pure ſulphur of concretes, but likewiſe the whole ſubſtance of divers reſinous bodies, as benzoin, the gummous parts of jalap, gum lacca, and other bodies, that are counted perfectly mixt. And we ſee, that the extracts made either with water or ſpirit of wine are not of a ſimple and elementary nature, but maſſes conſiſting of the looſer corpuſcles, and finer parts of the concretes whence they are drawn; ſince by diſtillation they may be divided into more elementary ſubſtances.

NEXT, we may conſider, that even when there intervenes a chymical reſolution by the fire, it is ſeldom in the ſaline or ſulphureous principle, as ſuch, that the deſired faculty of the concrete reſides; but as that titular ſalt or ſulphur is yet a mixt body, though the ſaline or ſulphureous nature be predominant in

it. For, if in chymical reſolutions, the ſeparated ſubſtances were pure and ſimple bodies, and of a perfect elementary nature; no one would be indued with more ſpecifick virtues, than another; and their qualities would differ as little as do thoſe of water. And let me add this upon the by, that even eminent chymiſts have ſuffered themſelves to be reprehended by me for their over-great diligence in purifying ſome of the things they obtain by fire from mixt bodies. For though ſuch compleatly purified ingredients of bodies might perhaps be more ſatisfactory to our underſtanding, yet others are often more uſeful to our lives; the efficacy of ſuch chymical productions depending moſt upon what they retain of the bodies, whence they are ſeparated, or gain by the new aſſociations of the diſſipated among themſelves; whereas, if they were meerly elementary, their uſes would be comparatively very ſmall; and the virtues of ſulphurs, ſalts, or other ſuch ſubſtances of one denomination, would be the very ſame.

AND by the way, *Eleutherius*, I am inclined upon this ground to think, that the artificial reſolution of compound bodies by fire does not ſo much enrich mankind, as it divides them into their ſuppoſed principles; as upon the ſcore of its making new compounds by new combinations of the diſſipated parts of the reſolved body. For by this means the number of mixt bodies is conſiderably increaſed; and many of thoſe new productions are endowed with uſeful qualities; divers of which they owe not to the body, from which they were obtained, but to their newly-acquired texture.

BUT thirdly, that, which is principally to be noted, is this, that as there are divers concretes, whoſe faculties reſide in ſome one or other of thoſe differing ſubſtances, that chymiſts call their ſulphurs, ſalts, and mercuries; and conſequently may be beſt obtained, by analyzing the concrete, whereby the deſired principles may be had ſever'd or freed from the reſt; ſo there are others, wherein the nobleſt properties lodge not in the ſalt, or ſulphur, or mercury, but depend immediately upon the form, or (if you will) reſult from the determinate ſtructure of the whole concrete; and conſequently they, that go about to extract the virtues of ſuch bodies, by expoſing them to the violence of the fire, do exceedingly miſtake, and take the way to deſtroy what they would obtain.

I REMEMBER that *Helmont* himſelf ſomewhere confeſſes, that as the fire betters ſome things, and improves their virtues, ſo it ſpoils others, and makes them degenerate. And elſewhere he judiciouſly affirms, that there may be ſometimes greater virtue in a ſimple, ſuch as nature has made it, than in any thing, that can by the fire be ſeparated from it. And leſt you ſhould doubt, whether he means by the virtues of things thoſe, that are medical; he has in one place this ingenuous confeſſion; *Valde abſurdum eſt* (ſays he) *ex omnibus rebus extracta facere, ſalia, quintas eſſentias; præſertim ex ſubſtantiis per ſe planè vel ſubtilibus vel homogeneis, quales ſunt uniones, corallia, moſcus, ambra, &c.* Conſonantly whereunto he alſo tells us, (and vouches the famous *Platerus*, for having candidly given the ſame advertiſement to his auditors,) that ſome things have greater virtues, and better ſuited to our human nature, when unprepared, than when they have paſt the chymiſts fire: as we ſee, ſays my author, in pepper; of which ſome grains ſwallowed perform more towards the relief of a diſtempered ſtomach, than a great quantity of the oil of the ſame ſpice. *Vide* Jer. ad Beguin. Lib. 1. Cap. 17.

IT has been (purſues *Carneades*) by our friend here preſent obſerved concerning ſalt-petre, that none of the ſubſtances, into which the fire is wont to divide it, retains either the taſte, the cooling virtue, or ſome other of the properties of the concrete; and that each of thoſe ſubſtances acquires new qualities not to be found in ſalt-petre it ſelf. The ſhining property of the tails of glow-worms does ſurvive but ſo ſhort a time the little animal made conſpicuous by it, that inquiſitive men have not ſcrupled publickly to deride *Baptiſta Porta* and others; who, deluded perhaps with ſome chymical ſurmiſes, have ventured to preſcribe the diſtillation of a water from the tails of glow-worms, as a ſure way to obtain a liquor ſhining in the dark. To which I ſhall now add no other example than that afforded us by amber; which, whilſt it remains an intire body, is endowed with an electrical faculty of drawing to it ſelf feathers, ſtraws, and ſuch like bodies; which I never could obſerve either in its ſalt, its ſpirit, its oil, or in the body I remember I once made by the re-union of its divided elements; none of theſe having ſuch a texture as the intire concrete. And however chymiſts boldly deduce ſuch and ſuch properties from this or that proportion of their component principles; yet in concretes, that abound with this or that ingredient, it is not always ſo much by virtue of its preſence, nor its plenty, that the concrete is qualified to perform ſuch and ſuch effects; as upon the account of the particular texture of that and the other ingredients, aſſociated after a determinate manner into one concrete: though poſſibly ſuch a proportion of that ingredient may be more convenient than another, for the conſtituting of ſuch a body. Thus in a clock, the hand is moved upon the dial, the bell is ſtruck, and the other actions belonging to the engine are performed, not becauſe the wheels are of braſs or iron, or part of one metal and part of another, or becauſe the weights are of lead; but by virtue of the ſize, ſhape, bigneſs, and coaptation of the ſeveral parts; which would perform the ſame things, though the wheels were of ſilver, or lead, or wood, and the weights of ſtone or clay, provided the fabrick or contrivance of the engine were the ſame: though it be not to be denied, that braſs and ſteel are more convenient materials to make clock-wheels of, than lead, or wood. And to let you ſee, *Eleutherius*, that it is ſometimes at leaſt,

Helmont. *Pharm. & Dijpen. Nov.* pag. 498. *Credo* (ſays he) *ſimplicia in ſua ſimplicitate eſſe ſufficientia pro ſanatione omnium morborum.* Nay, *Barthius*, even in a comment upon *Beguinus*, ſcruples not to make this acknowledgment;

leaſt, upon the texture of the ſmall parts of a body, and not always upon the preſence, or receſs, or increaſe, or decrement of any one of its principles, that it may loſe ſome ſuch qualities, and acquire ſome ſuch others, as are thought very ſtrongly inherent to the bodies they reſide in; I will add to what may, from my paſt diſcourſe, be referred to this purpoſe, this notable example, from my own experience; that lead may, without any additament, and only by various applications of the fire, loſe its colour; and acquire ſometimes a grey, ſometimes a yellowiſh, ſometimes a red, ſometimes an amethyſtine colour; and after having paſt through theſe, and perhaps divers others, again recover its leaden colour, and be made a bright body. That alſo this lead, which is ſo flexible a metal, may be made as brittle as glaſs, and preſently be brought to be again flexible and malleable as before. And beſides that the ſame lead, which I find by microſcopes to be one of the moſt opacous bodies in the world, may be reduced to a fine tranſparent glaſs; whence yet it may return to an opacous nature again; and all this, as I ſaid, without the addition of any extraneous body, and meerly by the manner and method of expoſing it to the fire.

BUT (ſays *Carneades*) after having already put you to ſo prolix a trouble, it is time for me to relieve you with a promiſe of putting ſpeedily a period to it; and to make good that promiſe, I ſhall, from all that I have hitherto diſcourſed with you, deduce but this one propoſition by way of corollary: *That it may as yet be doubted, whether or no there be any determinate number of elements*; *or, if you pleaſe, whether or no all compound bodies do conſiſt of the ſame number of elementary ingredients or material principles.*

THIS being but an inference from the foregoing diſcourſe, it will not be requiſite to inſiſt at large on the proofs of it; but only to point at the chief of them, and refer you for particulars to what has been already delivered.

IN the firſt place then, from what has been ſo largely diſcourſed, it may appear, that the experiments wont to be brought, whether by the common Peripateticks, or by the vulgar chymiſts, to demonſtrate, that all mixt bodies are made up preciſely either of the four elements, or the three hypoſtatical principles, do not evince what they are alledged to prove. And as for the other common arguments, pretended to be drawn from reaſon in favour of the Ariſtotelian hypotheſis, (for the chymiſts are wont to rely almoſt altogether upon experiments;) they are commonly grounded upon ſuch unreaſonable or precarious ſuppoſitions, that it is altogether as eaſy and as juſt for any man to reject them, as for thoſe, that take them for granted, to aſſert them, being indeed all of them as indemonſtrable as the concluſion to be inferred from them; and ſome of them ſo manifeſtly weak and prooffleſs, that he muſt be a very courteous adverſary, that can be willing to grant them; and as unſkilful a one, that can be compelled to do ſo.

IN the next place, it may be conſidered, if what thoſe patriarchs of the Spagyriſts, *Paracelſus* and *Helmont*, do on divers occaſions poſitively deliver, be true; namely, that the alkaheſt does reſolve all mixt bodies into other principles than the fire, it muſt be decided, which of the two reſolutions (that made by the alkaheſt, or that made by the fire) ſhall determine the number of the elements, before we can be certain how many there are.

AND in the mean time, we may take notice in the laſt place, that as the diſtinct ſubſtances, whereinto the alkaheſt divides bodies, are affirmed to be differing in nature from thoſe, whereunto they are wont to be reduced by fire, and * to be obtained from ſome bodies more in number than from ſome others; ſince he tells us, he could totally reduce all ſorts of ſtones into ſalt only, whereas of a coal he had two diſtinct liquors: ſo, although we ſhould acquieſce in that reſolution which is made by fire, we find not, that all mixt bodies are thereby divided into the ſame number of elements and principles; ſome concretes affording more of them than others do; nay, and ſometimes this or that body affording a greater number of differing ſubſtances by one way of management, than the ſame yields by another. And they, that out of gold, or mercury, or *Muſcovy*-glaſs, will draw me as many diſtinct ſubſtances, as I can ſeparate from vitriol, or from the juice of grapes variouſly ordered, may teach me that, which I ſhall very thankfully learn. Nor does it appear more congruous to that variety, that ſo much conduceth to the perfection of the univerſe, that all elemented bodies be compounded of the ſame number of elements, than it would be for a language, that all its words ſhould conſiſt of the ſame number of letters.

* *Novi ſaxum & lapides omnes in merum ſalem ſuo ſaxo aut lapidi & æquiponderantem reducere abſque omni prorſus ſulphure aut mercurio.* Helmont. pag. 490.

THE SCEPTICAL CHYMIST:

OR,

A Paradoxical Appendix to the foregoing Treatiſe.

PART VI.

HERE *Carneades* having diſpatched what he thought requiſite to oppoſe againſt what the chymiſts are wont to alledge for proof of their three principles, pauſed a while, and looked about him to diſcover, whether it were time for him and his friend to rejoin the reſt of the company. But *Eleutherius* perceiving nothing yet to forbid them to proſecute their diſcourſe a little further, ſaid to his friend, (who had likewiſe taken notice of the ſame thing) I half expected, *Carneades*, that after you had ſo freely declared your doubting, whether there be any determinate number of elements, you would have proceeded to queſtion, whether there be any elements at all. And I confeſs it will be a trouble to me, if you defeat me of my expectation; eſpecially ſince you ſee the leiſure we have allowed us may probably ſuffice to examine that paradox; becauſe you have ſo largely deduced already many things pertinent to it, that you need but intimate how you would have them applied, and what you would infer from them.

CARNEADES having in vain repreſented, that their leiſure could be but very ſhort, that he had already prated very long, that he was unprepared to maintain ſo great and ſo invidious a paradox, was at length prevailed with to tell his friend; Since, *Eleutherius*, you will have me diſcourſe *extempore* of the paradox you mention, I am content, (though more perhaps to expreſs my obedience, than my opinion) to tell you, that (ſuppoſing the truth of *Helmont*'s and *Paracelſus*'s alkaheſtical experiments, if I may ſo call them) though it may ſeem extravagant, yet it is not abſurd to doubt, whether, for aught has been proved, there be a neceſſity to admit any elements, or hypoſtatical principles, at all.

AND, as formerly, ſo now, to avoid the needleſs trouble of diſputing ſeverally with the Ariſtotelians and the chymiſts, I will addreſs my ſelf to oppoſe them I have laſt named, becauſe their doctrine about the elements is more applauded by the moderns, as pretending highly to be grounded upon experience. And, to deal not only fairly, but favourably with them, I will allow them to take in earth and water to their other principles. Which I conſent to the rather, that my diſcourſe may the better reach the tenets of the Peripateticks; who cannot plead for any ſo probably, as for thoſe two elements; that of fire above the air being generally by judicious men exploded as an imaginary thing; and the air not concurring to compoſe mixt bodies as one of their elements, but only lodging in their pores, or rather repleniſhing, by reaſon of its weight and fluidity, all thoſe cavities of bodies here below, whether compounded or not, that are big enough to admit it, and are not filled up with any groſſer ſubſtance.

AND, to prevent miſtakes, I muſt advertiſe you, that I now mean by elements, as thoſe chymiſts, that ſpeak plaineſt, do by their principles, certain primitive and ſimple, or perfectly unmingled bodies; which not being made of any other bodies, or of one another, are the ingredients, of which all thoſe called perfectly mixt bodies are immediately compounded, and into which they are ultimately reſolved: now whether there be any one ſuch body to be conſtantly met with in all, and each, of thoſe, that are ſaid to be elemented bodies, is the thing I now queſtion.

BY this ſtate of the controverſy you will, I ſuppoſe, gueſs, that I need not be ſo abſurd, as to deny, that there are ſuch bodies as earth and water, and quickſilver and ſulphur: but I look upon earth and water, as component parts of the univerſe, or rather of the terreſtrial globe, not of all mixt bodies. And though I will not peremptorily deny, that there may ſometimes either a running mercury, or a combuſtible ſubſtance be obtained from a mineral, or even a metal; yet I need not concede either of them to be an element in the ſenſe above declared; as I ſhall have occaſion to ſhew you by and by.

To give you then a brief account of the grounds I intend to proceed upon, I muſt tell you, that in matters of philoſophy, this ſeems to me a ſufficient reaſon to doubt of a known and important propoſition, that the truth of it is not yet by any competent proof made to appear. And congruouſly hereunto, if I ſhew, that the grounds, upon which men are perſuaded, that there are elements, are unable to ſatisfy a conſidering man, I ſuppoſe my doubts will appear rational.

Now the conſiderations, that induce men to think, that there are elements, may be conveniently enough referred to two heads: namely, the one, that it is neceſſary, that nature make uſe of elements to conſtitute the bodies that are reputed mixt. And the other, that the reſolution of ſuch bodies manifeſts, that nature had compounded them of elementary ones.

IN reference to the former of theſe conſiderations, there are two or three things, that I have to repreſent. And I will begin with reminding you of the experiments I not long ſince related to you concerning the growth of pompions, mint, and other vegetables out of fair water. For by thoſe experiments it ſeems evident, that water may be tranſmuted into all the

other

other elements; from whence it may be inferred, both, that it is not every thing chymiſts will call ſalt, ſulphur, or ſpirit, that needs always be a primordiate and ingenerable body; and that nature may contex a plant (though that be a perfectly mixt concrete) without having all the elements previouſly preſented to her to compound it of. And, if you will allow the relation I mentioned out of Monſieur *de Rochas* to be true; then may not only plants, but animals and minerals too, be produced out of water. And however there is little doubt to be made, but that the plants my trials afforded me, as they were like in ſo many other reſpects to the reſt of the plants of the ſame denomination; ſo they would, in caſe I had reduced them to putrefaction, have likewiſe produced worms or other inſects, as well as the reſembling vegetables are wont to do: ſo that water may, by various ſeminal principles, be ſucceſſively tranſmuted into both plants and animals. And if we conſider, that not only men, but even ſucking children are, but too often, tormented with ſolid ſtones; and that divers ſorts of beaſts themſelves, (whatever *Helmont* againſt experience thinks to the contrary) may be troubled with great and heavy ſtones in their kidneys and bladders, though they feed but upon graſs and other vegetables, that are perhaps but diſguiſed water; it will not ſeem improbable, that even ſome concretes of a mineral nature may likewiſe be formed of water.

WE may further take notice, that as a plant may be nouriſhed, and conſequently may conſiſt of common water; ſo may both plants and animals, (perhaps even from their ſeminal rudiments) conſiſt of compound bodies, without having any thing merely elementary brought them by nature to be compounded by them: this is evident in divers men, who whilſt they were infants were fed only with milk, afterwards live altogether upon fleſh, fiſh, wine, and other perfectly mixt bodies. It may be ſeen alſo in ſheep, who, on ſome of our Engliſh downs or plains, grow very fat by feeding upon the graſs, without ſcarce drinking at all; and yet more manifeſtly in the maggots, that breed and grow up to their full bigneſs within the pulps of apples, pears, or the like fruit. We ſee alſo, that dungs, that abound with a mixt ſalt, give a much more ſpeedy increment to corn and other vegetables, than water alone would do: and it hath been aſſured me by a man experienced in ſuch matters, that ſometimes, when, to bring up roots very early, the mould they were planted in was made overrich, the very ſubſtance of the plant has taſted of the dung. And let us alſo conſider a graft of one kind of fruit upon the upper bough of a tree of another kind; as (for inſtance) the ſcion of a pear upon a white-thorn; for there the aſcending liquor is already altered, either by the root, or in its aſcent by the bark, or both ways, and becomes a new mixt body: as may appear by the differing qualities to be met with in the ſaps of ſeveral trees; as particularly, the medicinal virtue of birch-water, which I have ſometimes drunk upon *Helmont*'s great and not undeſerved commendation. Now the graft, being faſtened to the ſtock, muſt neceſſarily nouriſh itſelf, and produce its fruit, only out of this compound juice prepared for it by the ſtock, being unable to come at any other aliment. And if we conſider, how much of the vegetable he feeds upon may (as we noted above) remain in an animal; we may eaſily ſuppoſe, that the blood of that animal, who feeds upon this, though it be a well-conſtituted liquor, and have all the differing corpuſcles, that make it up, kept in order by one preſiding form, may be a ſtrangely decompounded body, many of its parts being themſelves decompounded. So little is it neceſſary, that even in the mixtures, which nature her ſelf makes in animal and vegetable bodies, ſhe ſhould have pure elements at hand to make her compoſitions of.

HAVING ſaid thus much touching the conſtitution of plants and animals, I might perhaps be able to ſay as much touching that of minerals, and even metals, if it were as eaſy for us to make experiment in order to the production of theſe, as of thoſe. But the growth or increment of minerals being uſually a work of exceſſively long time, and for the moſt part performed in the bowels of the earth, where we cannot ſee it, I muſt inſtead of experiments make uſe, on this occaſion, of obſervations.

THAT ſtones were not all made at once, but that ſome of them are now-a-days generated, may (though it be denied by ſome) be fully proved by ſeveral examples, of which I ſhall now ſcarce alledge any other, than that famous place in *France* known by the name of *Les Caves Goutieres*, where the water falling from the upper parts of the cave to the ground, does preſently there condenſe into little ſtones, of ſuch figures, as the drops, falling either ſeverally or upon one another, and coagulating preſently into ſtone, chance to exhibit. Of theſe ſtones ſome ingenious friends of ours, that went a while ſince to viſit that place, did me the favour to preſent me with ſome, that they brought thence. And I remember, that both that ſober relator of his voyages, *Van Linſchoten*, and another good author, inform us, that in the diamond mines (as they call them) in the *Eaſt-Indies*, when having digged the earth, though to no great depth, they find diamonds, and take them quite away; yet in a very few years they find in the ſame place new diamonds produced there ſince. From both which relations, eſpecially the firſt, it ſeems probable, that nature does not always ſtay for divers elementary bodies, when ſhe is to produce ſtones. And as for metals themſelves, authors of good note aſſure us, that even they were not in the beginning produced at once altogether, but have been obſerved to grow; ſo that what was not a mineral or metal before, became one afterwards. Of this it were eaſy to alledge many teſtimonies of profeſſed chymiſts. But that they may have the greater authority, I ſhall rather preſent you with a few borrowed from more unſuſpected writers: *Sulphuris mineram* (as the inquiſitive *P. Fallopius* notes) *quæ nutrix eſt caloris ſubterranei fabri ſeu archæi fontium & mineralium, infra terram citiſſimè renaſci teſtantur hiſtoriæ metallicæ.*

metallicæ. Sunt enim loca, è quibus ſi hoc anno ſulphur effoſſum fuerit, intermiſſa foſſione per quadriennium, redeunt foſſores, & omnia ſulphure, ut antea, rurſus inveniunt plena. Pliny relates, *in Italiæ inſula Ilva, gigni ferri metallum.* Strabo *multo expreſſius; effoſſum ibi metallum ſemper regenerari. Nam ſi effoſſio ſpatio centum annorum intermittebatur, & iterum illuc revertebantur, foſſores reperiſſe maximam copiam ferri regeneratam.* Which hiſtory not only is countenanced by *Fallopius*, from the income, which the iron of that iſland yielded the duke of *Florence* in his time; but is mentioned more expreſsly to our purpoſe by the learned *Ceſalpinus: Vena* (ſays he) *ferri copioſiſſima eſt in Italia; ob eam nobilitata Ilva Tyrrheni maris inſula incredibili copia etiam noſtris temporibus eam gignens: Nam terra, quæ eruitur, dum vena effoditur tota, procedente tempore in venam convertitur.* Which laſt clauſe is therefore very notable, becauſe from thence we may deduce, that earth, by a metalline plaſtick principle latent in it, may be in proceſs of time changed into a metal. And even * *Agricola* himſelf, though the chymiſts complain of him as their adverſary, acknowledges thus much and more; by telling us, that at a town called *Saga* in *Germany*, they dig up iron in the fields, by ſinking ditches two foot deep; and adding, that within the ſpace of ten years the ditches are digged again for iron ſince produced, as the ſame metal is wont to be obtained in *Ilva*. Alſo concerning lead, not to mention what even *Galen* notes, that it will increaſe both in bulk and weight, if it be long kept in vaults or cellars, where the air is groſs and thick, as he collects from the ſwelling of thoſe pieces of lead, that were imployed to faſten together the parts of old ſtatues. Not to mention this, I ſay, *Boccacius Certaldus*, as I find him quoted by a diligent writer, has this paſſage touching the growth of lead: *Feſſularum mons* (ſays he) *in Hetruria, Florentiæ civitati imminens, lapides plumbarios habet; qui ſi excidantur, brevi temporis ſpatio, novis incrementis inſtaurantur; ut* (annexes my author) *tradit Boccacius Certaldus, qui id compertiſſimum eſſe ſcribit. Nihil hoc novi eſt; ſed de eodem Plinius, lib. 34. Hiſt. Natur. cap. 17. dudum prodidit, inquiens, mirum in his ſolis plumbi metallis, quod derelicta fertilius reviviſcunt. In plumbariis ſecundo lapide ab Amberga dictis ad aſylum recrementa congeſta in cumulos, expoſita ſolibus pluviiſque paucis annis, reddunt ſuum metallum cum fœnore.* I might add to theſe (continues *Carneades*) many things, that I have met with concerning the generation of gold and ſilver. But for fear of wanting time, I ſhall mention but two or three narratives. The firſt you may find recorded by *Gerhardus* the phyſick profeſſor, in theſe words: *In valle* (ſays he) *Joachimica argentum graminis modo & more è lapidibus mineræ velut è radice excreviſſe digiti longitudine, teſtis eſt Dr. Schreterus, qui ejuſmodi venas aſpectu jucundas & admirabiles domi ſuæ aliis ſæpe monſtravit & donavit. Item aqua cærulea inventa eſt Annebergæ, ubi argentum erat adhuc in primo ente, quæ coagulata redacta eſt in calcem fixi & boni argenti.*

THE other two relations I have not met with in Latin authors, and yet they are both very memorable in themſelves, and pertinent to our preſent purpoſe.

THE firſt I meet with in the commentary of *Johannes Valebius* upon the *Kleine Baur*, in which that induſtrious chymiſt relates, with many circumſtances, that at a mine-town (if I may ſo Engliſh the German *Bergſtat*) eight miles or leagues diſtant from *Straſburg* called *Mariakirch*, a workman came to the overſeer, and deſired employment; but he telling him, that there was not any of the beſt ſort at preſent for him, added, that till he could be preferred to ſome ſuch, he might in the mean time, to avoid idleneſs, work in a grove or mine-pit thereabouts, which at that time was little eſteemed. This workman, after ſome weeks labour, had by a crack appearing in the ſtone upon a ſtroke given near the wall, an invitation given him to work his way through; which as ſoon as he had done, his eyes were ſaluted by a mighty ſtone or lump, which ſtood in the middle of the cleft (that had a hollow place behind it) upright, and in ſhew like an armed man; but conſiſted of pure fine ſilver having no vein or ore by it, or any other additament, but ſtood there free, having only under-foot ſomething like a burnt matter; and yet this one lump held in weight above 1000 marks, which, according to the Dutch account, makes 500 pound weight of fine ſilver. From which and other circumſtances my author gathers, that by the warmth of the place, the noble metalline ſpirits, (ſulphureous and mercurial) were carried from the neighbouring galleries or vaults, through other ſmaller cracks and clefts into that cavity, and there collected as in a cloſe chamber or cellar; whereinto when they were gotten, they did in proceſs of time ſettle into the fore-mentioned precious maſs of metal.

THE other German relation is of that great traveller and laborious chymiſt *Joannes* (not *Georgius*) *Agricola*; who, in his notes upon what *Poppius* has written of antimony, relates, that when he was among the Hungarian mines in the deep groves, he obſerved, that there would often ariſe in them a warm ſteam, (not of that malignant ſort, which the Germans call *Shwadt*, which, ſays he, is a mere poiſon, and often ſuffocates the diggers) which faſtened itſelf to the walls; and that coming again to review it after a couple of days, he diſcerned, that it was all very faſt, and gliſtering: whereupon, having collected it and diſtilled it *per retortam*, he obtained from it a fine ſpirit; adding, that the mine-men informed him, that this ſteam, or damp (as the Engliſhmen alſo call it, retaining the Dutch term) would at laſt have become a metal, as gold or ſilver.

I refer (ſays *Carneades*) to another occaſion, the uſe, that may be made of theſe narratives towards the explicating the nature of metals; and that of fixedneſs, malleableneſs, and ſome other

* *In Lygiis, ad Sagam oppidum, in pratis eruitur ferrum, foſſis ad altitudinem bipedaneam actis. Id decennio renatum, denuo foditur, non aliter ac Ilvæ ferrum.*

other qualities conſpicuous in them. And in the mean time, this I may at preſent deduce from theſe obſervations; that it is not very probable, that whenſoever a mineral, or even a metal, is to be generated in the bowels of the earth, nature needs to have at hand both ſalt and ſulphur, and mercury to compound it of: for, not to urge, that the two laſt relations ſeem leſs to favour the chymiſts than *Ariſtotle*, who would have metals generated of certain halitus or ſteams, the fore-mentioned obſervations together make it ſeem more likely, that the mineral earths, or thoſe metalline ſteams (wherewith probably ſuch earths are plentifully imbued) do contain in them ſome ſeminal rudiment, or ſomething equivalent thereunto; by whoſe plaſtick power the reſt of the matter, though perhaps terreſtrial and heavy, is, in tract of time, faſhioned into this or that metalline ore; almoſt (as I formerly noted) as that fair water was by the ſeminal principle of mint, pompions, and other vegetables, contrived into bodies anſwerable to ſuch ſeeds. And that ſuch alterations of terreſtrial matter are not impoſſible, ſeems evident from that notable practice of the boilers of ſalt-petre, who unanimouſly obſerve, as well here in *England* as in other countries, that if an earth pregnant with nitre be deprived, by the affuſion of water, of all its true and diſſoluble ſalt, yet the earth will, after ſome years, yield them ſalt-petre again: for which reaſon, ſome of the eminent and ſkilfulleſt of them keep it in heaps as a perpetual mine of ſalt-petre. Whence it may appear, that the ſeminal principle of nitre, latent in the earth, does, by degrees, transform the neighbouring matter into a nitrous body: for though I deny, that ſome volatile nitre may, by ſuch earths, be attracted (as they ſpeak) out of the air, yet that the innermoſt parts of ſuch great heaps, that lie ſo remote from the air, ſhould borrow from it all the nitre they abound with, is not probable, for other reaſons beſides the remoteneſs of the air, though I have not the leiſure to mention them.

AND I remember, that a perſon of great credit, and well acquainted with the ways of making vitriol, affirmed to me, that he had obſerved, that a kind of mineral, which abounds in that ſalt, being kept within doors, and not expoſed (as is uſual) to the free air and rains, did of it ſelf in no very long time turn into vitriol, not only in the outward or ſuperficial, but even in the internal and moſt central parts.

And I alſo remember, that I met with a certain kind of marchaſite, that lay together in great quantities under ground, which did, even in my chamber, in ſo few hours begin of it ſelf to turn into vitriol, that we need not diſtruſt the newly recited narrative. But to return to what I was ſaying of nitre; as nature made this ſalt-petre out of the once almoſt inodorous earth it was bred in, and did not find a very ſtinking and corroſive acid liquor, and a ſharp alcalizate ſalt to compound it of, though theſe be the bodies, into which the fire diſſolves it; ſo it were not neceſſary, that nature ſhould make up all metals and other minerals of pre-exiſtent ſalt, and ſulphur, and mercury, though ſuch bodies might by fire be obtained from it. Which one conſideration duly weighed is very conſiderable in the preſent controverſy: and to this agree well the relations of our two German chymiſts; for beſides that it cannot be convincingly proved, it is not ſo much as likely, that ſo languid and moderate a heat, as that within the mines, ſhould carry up to ſo great a height, though in the form of fumes, ſalt, ſulphur, and mercury; ſince we find in our diſtillations, that it requires a conſiderable degree of fire to raiſe, ſo much as to the height of one foot, not only ſalt, but even mercury it ſelf in cloſe veſſels. And if it be objected, that it ſeems by the ſtink, that is ſometimes obſerved, when lightning falls down here below, that ſulphureous ſteams may aſcend very high without any extraordinary degree of heat; it may be anſwered, among other things, that the ſulphur of ſilver is by chymiſts ſaid to be a fixt ſulphur, though not altogether ſo well digeſted as that of gold.

BUT, (proceeds *Carneades*) if it had not been to afford you ſome hints concerning the origin of metals, I need not have deduced any thing from theſe obſervations; it not being neceſſary to the validity of my argument, that my deductions from them ſhould be irrefragable, becauſe my adverſaries the Ariſtotelians and vulgar chymiſts do not, I preſume, know any better than I, *à priori*, of what ingredients Nature compounds metals and minerals. For their argument to prove, that thoſe bodies are made up of ſuch principles, is drawn *à poſteriori*; I mean from this, that upon the analyſis of mineral bodies they are reſolved into thoſe differing ſubſtances. That we may therefore examine this argument, let us proceed to conſider, what can be alledged in behalf of the elements from the reſolutions of bodies by the fire; which you remember was the ſecond topick, whence I told you the arguments of my adverſaries were deſumed.

AND that I may firſt diſpatch what I have to ſay concerning minerals, I will begin the remaining part of my diſcourſe with conſidering how the fire divides them.

AND firſt, I have partly noted above, that though chymiſts pretend from ſome to draw ſalt, from others running mercury, and from others a ſulphur; yet they have not hitherto taught us, by any way in uſe among them, to ſeparate any one principle, whether ſalt, ſulphur, or mercury, from all ſorts of minerals without exception. And thence I may be allowed to conclude, that there is not any of the elements, that is an ingredient of all bodies, ſince there are ſome, of which it is not ſo.

IN the next place, ſuppoſing, that either ſulphur or mercury were obtainable from all ſorts of minerals; yet ſtill this ſulphur or mercury would be but a compounded, not an elementary body, as I told you already on another occaſion. And certainly he, that takes notice of the wonderful operations of quickſilver, whether it be common, or drawn from mineral bodies, can ſcarce be ſo inconſiderate

as to think it of the very ſame nature with that immature and fugitive ſubſtance, which in vegetables and animals chymiſts have been pleaſed to call their mercury. So that when mercury is got by the help of the fire out of a metal or other mineral body, if we will not ſuppoſe, that it was not pre-exiſtent in it, but produced by the action of the fire upon the concrete, we may at leaſt ſuppoſe this quick-ſilver to have been a perfect body of its own kind (though perhaps leſs heterogeneous than more ſecondary mixts) which happened to be mingled *per minima*, and coagulated with the other ſubſtances, whereof the metal or mineral conſiſted. As may be exemplified, partly by native vermilion, wherein the quickſilver and ſulphur being exquiſitely blended both with one another, and that other coarſe mineral ſtuff (whatever it be) that harbours them, make up a red body differing enough from both; and yet from which part of quickſilver, and of the ſulphur, may be eaſily enough obtained; partly by thoſe mines, wherein nature has ſo curiouſly incorporated ſilver with lead, that it is extremely difficult, and yet poſſible to ſeparate the former out of the latter; and partly too by native vitriol, wherein the metalline corpuſcles are by ſkill and induſtry ſeparable from the ſaline ones, though they be ſo con-coagulated with them, that the whole concrete is reckoned among ſalts.

AND here I further obſerve, that I never could ſee any earth or water, properly ſo called, ſeparated from either gold or ſilver, (to name now no other metalline bodies;) and therefore to retort the argument upon my adverſaries, I may conclude, that ſince there are ſome bodies, in which, for aught appears, there is neither earth nor water; I may be allowed to conclude, that neither of thoſe two is an univerſal ingredient of all thoſe bodies, that are counted perfectly mixt, which I deſire you would remember againſt anon.

IT may indeed be objected, that the reaſon, why from gold or ſilver we cannot ſeparate any moiſture, is, becauſe that when it is melted out of the ore, the vehement fire requiſite to its fuſion forced away all the aqueous and fugitive moiſture; and the like fire may do from the materials of glaſs. To which I ſhall anſwer, that I remember I read not long ſince in the learned *Joſephus Acoſta**, who relates it upon his own obſervation, that in *America* (where he long lived) there is a kind of ſilver, which the Indians call *papas*, and ſometimes (ſays he) they find pieces very fine and pure like to ſmall round roots, the which is rare in that metal, but uſual in gold; concerning which metal he tells us, that beſides this they find ſome, which they call gold in grains, which he tells us are ſmall morſels of gold, that they find whole without mixture of any other metal, which hath no need of melting or refining in the fire.

I REMEMBER, that a very ſkilful and credible perſon affirmed to me, that being in the Hungarian mines he had the good fortune to ſee a mineral, that was there digged up, wherein pieces of gold of the length, and alſo almoſt of the bigneſs of a human finger, grew in the ore, as if they had been parts and branches of trees.

AND I have my ſelf ſeen a lump of whitiſh mineral, that was brought as a rarity to a great and knowing prince, wherein there grew here and there in the ſtone, which looked like a kind of ſpar, divers little lumps of fine gold, (for ſuch I was aſſured that trial had manifeſted it to be) ſome of them ſeeming to be about the bigneſs of peas.

BUT that is nothing to what our *Acoſta* † ſubjoins, which is indeed very memorable; namely, that of the morſels of native and pure gold, which we lately heard him mentioning, he had now and then ſeen ſome weighed many pounds: to which I ſhall add, that I my ſelf have ſeen a lump of ore not long ſince digged up, in whoſe ſtony part there grew, almoſt like trees, divers parcels, though not of gold, yet of (what perhaps mineraliſts will more wonder at) another metal, which ſeemed to be very pure or unmixt with any heterogeneous ſubſtances, and were ſome of them as big as my finger, if not bigger. But upon obſervations of this kind, though perhaps I could, yet I muſt not at preſent, dwell any longer.

TO proceed therefore now (ſays *Carneades*) to the conſideration of the analyſis of vegetables, although my trials give me no cauſe to doubt, but that out of moſt of them five differing ſubſtances may be obtained by the fire, yet I think it will not be ſo eaſily demonſtrated, that theſe deſerve to be called elements in the notion above explained.

AND before I deſcend to particulars, I ſhall repeat and premiſe this general conſideration, that theſe differing ſubſtances, that are called elements or principles, differ not from each other as metals, plants, and animals, or as ſuch creatures as are immediately produced each by its peculiar ſeed, and conſtitutes a diſtinct propagable ſort of creatures in the univerſe; but theſe are only various ſchemes of matter or ſubſtances, that differ from each other, but in conſiſtence (as running mercury and the ſame metal congealed by the vapour of lead) and ſome very few other accidents, as taſte, or ſmell, or inflammability, or the want of them. So that by a change of texture, not impoſſible to be wrought by the fire and other agents, that have the faculty, not only to diſſociate the ſmall parts of bodies, but afterwards to connect them after a new manner, the ſame parcel of matter may acquire or loſe ſuch accidents, as may ſuffice to denominate it ſalt, or ſulphur, or earth. If I were fully to clear to you my apprehenſions concerning this matter, I ſhould perhaps be obliged to acquaint you with divers of the conjectures (for I muſt yet call them no more) I have had concerning the principles of things purely corporeal: for though, becauſe I ſeem not ſatisfied with the vulgar doctrines, either of the Peripatetick or Paracelſian ſchools, many of thoſe, that know me, (and perhaps, among

* *Acoſta*'s Natural and Moral Hiſtory of the *Indies*, *L.* 3. *c.* 5. *p.* 212.
† See *Acoſta* in the fore-cited place, and the paſſage of *Pliny* quoted by him.

among them, *Eleutherius* himſelf) have thought me wedded to the Epicurean hypotheſis, (as others have miſtaken me for an Helmontian) yet if you knew how little converſant I have been with Epicurean authors, and how great a part of *Lucretius* himſelf I never yet had the curioſity to read, you would perchance be of another mind; eſpecially if I were to entertain you at large, I ſay not with my preſent notions, but with my former thoughts concerning the principles of things. But, as I ſaid above, fully to clear my apprehenſions would require a longer diſcourſe than we can now have.

FOR I ſhould tell you, that I have ſometimes thought it not unfit, that to the principles, which may be aſſigned to things, as the world is now conſtituted, we ſhould, if we conſider the great maſs of matter, as it was whilſt the univerſe was in making, add another, which may conveniently enough be called an architectonick principle or power; by which I mean thoſe various determinations, and that ſkilful guidance of the motions of the ſmall parts of the univerſal matter by the moſt wiſe author of things, which were neceſſary at the beginning to turn that confuſed chaos into this orderly and beautiful world; and eſpecially to contrive the bodies of animals and plants, and the ſeeds of thoſe things, whoſe kinds were to be propagated. For I confeſs I cannot well conceive, how from matter, barely put into motion, and then left to itſelf, there could emerge ſuch curious fabricks, as the bodies of men and perfect animals, and ſuch yet more admirably contrived parcels of matter, as the ſeeds of living creatures.

I SHOULD likewiſe tell you upon what grounds, and in what ſenſe, I ſuſpected the principles of the world, as it now is, to be three, matter, motion and reſt: I ſay, as the world now is, becauſe the preſent fabrick of the univerſe, and eſpecially the ſeeds of things, together with the eſtabliſhed courſe of nature, is a requiſite or condition, upon whoſe account divers things may be made out by our three principles, which otherwiſe would be very hard, if poſſible, to explicate.

I SHOULD moreover declare in general (for I pretend not to be able to do it otherwiſe) not only why I conceive that colours, odours, taſtes, fluidneſs and ſolidity, and thoſe other qualities, that diverſify and denominate bodies, may intelligibly be deduced from theſe three; but how two of the three Epicurean principles (which, I need not tell you, are magnitude, figure, and weight) are themſelves deducible from matter and motion; ſince the latter of theſe variouſly agitating, and, as it were, diſtracting the former, muſt needs disjoin its parts; which being actually ſeparated, muſt each of them neceſſarily both be of ſome ſize, and obtain ſome ſhape or other. Nor did I add to our principles the Ariſtotelian privation, partly for other reaſons, which I muſt not now ſtay to inſiſt on; and partly, becauſe it ſeems to be rather an antecedent, or a *terminus à quo*, than a true principle, as the ſtarting-poſt is none of the horſe's legs or limbs.

I SHOULD alſo explain, why and how I made reſt to be, though not ſo conſiderable a principle of things, as motion, yet a principle of them; partly, becauſe it is (for aught we know) as ancient at leaſt as it, and depends not upon motion, nor any other quality of matter; and partly, becauſe it may enable the body, in which it happens to be, both to continue in a ſtate of reſt, till ſome external force put it out of that ſtate, and to concur to the productions of divers changes in the bodies, that hit againſt it, by either quite ſtopping or leſſening their motion, (whilſt the body formerly at reſt receives all or part of it into itſelf) or elſe by giving a new byaſs, or ſome other modification, to motion, that is, to the grand and primary inſtrument, whereby nature produces all the changes and other qualities, that are to be met with in the world.

I SHOULD likewiſe, after all this, explain to you how, although matter, motion, and reſt, ſeemed to me to be the catholick principles of the univerſe, I thought the principles of particular bodies might be commodiouſly enough reduced to two; namely matter, and (what comprehends the two other, and their effects) the reſult, or aggregate, or complex of thoſe accidents, which are the motion or reſt, (for in ſome bodies both are not to be found) the bigneſs, figure, texture, and the thence reſulting qualities of the ſmall parts, which are neceſſary to intitle the body, whereto they belong, to this or that peculiar denomination; and diſcriminating it from others, to appropriate it to a determinate kind of things, (as yellowneſs, fixedneſs, ſuch a degree of weight, and of ductility, do make the portion of matter wherein they concur, to be reckoned among perfect metals, and obtain the name of gold;) this aggregate or reſult of accidents you may, if you pleaſe, call either ſtructure, or texture, (though indeed that do not ſo properly comprehend the motion of the conſtituent parts, eſpecially in caſe ſome of them be fluid) or what other appellation ſhall appear moſt expreſſive. Or if, retaining the vulgar term, you will call it the form of the thing it denominates, I ſhall not much oppoſe it; provided the word be interpreted to mean but what I have expreſſed, and not a ſcholaſtick ſubſtantial form, which ſo many intelligent men profeſs to be to them altogether unintelligible.

BUT (ſays *Carneades*) if you remember, that it is a ſceptick ſpeaks to you, and that it is not ſo much my preſent talk to make aſſertions as to ſuggeſt doubts, I hope you will look upon what I have propoſed, rather as a narrative of my former conjectures touching the principles of things, than as a reſolute declaration of my preſent opinions of them; eſpecially ſince although they cannot but appear very much to their diſadvantage, if you conſider them as they are propoſed, without thoſe reaſons and explanations, by which I could perhaps make them appear much leſs extravagant; yet I want time to offer you what may be alledged to clear and countenance theſe notions; my deſign in mentioning them unto you at preſent being, partly, to bring ſome light and confirmation to divers paſſages of my diſcourſe to

you; partly, to ſhew you, that I do not (as you ſeem to have ſuſpected) embrace all *Epicurus*'s principles, but diſſent from him in ſome main things, as well as from *Ariſtotle* and the chymiſts, in others; and partly alſo, or rather chiefly, to intimate to you the grounds, upon which I likewiſe differ from *Helmont* in this, that whereas he aſcribes almoſt all things, and even diſeaſes themſelves, to their determinate ſeeds, I am of opinion, that beſides the peculiar fabricks of the bodies of plants and animals (and perhaps alſo of ſome metals and minerals) which I take to be effects of ſeminal principles, there are many other bodies in nature, which have and deſerve diſtinct and proper names, but yet do but reſult from ſuch contextures of the matter they are made of, as may without determinate ſeeds be effected by heat, cold, artificial mixtures and compoſitions, and divers other cauſes, which ſometimes nature imploys of her own accord, and oftentimes man by his power and ſkill makes uſe of, to faſhion the matter according to his intentions. This may be exemplified both in the productions of nature, and in thoſe of art: of the firſt ſort I might name multitudes; but to ſhew how ſlight a variation of textures, without addition of new ingredients, may procure a parcel of matter divers names, and make it be lookt upon as different things;

I SHALL invite you to obſerve with me, that clouds, rain, hail, ſnow, froſt, and ice, may be but water, having its parts varied as to their ſize and diſtance in reſpect of each other, and as to motion and reſt. And among artificial productions we may take notice (to ſkip the cryſtals of tartar) of glaſs, regulus martis ſtellatus, and particularly of the ſugar of lead; which, though made of that inſipid metal and ſour ſalt of vinegar, has in it a ſweetneſs ſurpaſſing that of common ſugar, and divers other qualities, which being not to be found in either of its two ingredients, muſt be confeſſed to belong to the concrete itſelf, upon the account of its texture.

THIS conſideration premiſed, it will be, I hope, the more eaſy to perſuade you, that the fire may as well produce ſome new textures in a parcel of matter, as deſtroy the old.

WHEREFORE hoping, that you have not forgot the arguments formerly imployed againſt the doctrine of the *tria prima*; namely, that the ſalt, ſulphur, and mercury, into which the fire ſeems to reſolve vegetable and animal bodies, are yet compounded, not ſimple and elementary ſubſtances; and that (as appeared by the experiment of pompions) the *tria prima* may be made out of water; hoping, I ſay, that you remember theſe, and the other things, that I formerly repreſented to the ſame purpoſe, I ſhall now add only, that if we doubt not the truth of ſome of *Helmont's* relations, we may well doubt, whether any of theſe heterogeneities be (I ſay, not pre-exiſtent, ſo as to convene together, when a plant or animal is to be conſtituted, but) ſo much as in-exiſtent in the concrete, whence they are obtained, when the chymiſt firſt goes about to reſolve it. For, not to inſiſt upon the un-inflammable ſpirit of ſuch concretes, becauſe that may be pretended to be but a mixture of phlegm and ſalt, the oil or ſulphur of vegetables or animals is, according to him, reducible by the help of lixiviate ſalts into ſoap; as that ſoap is by the help of repeated diſtillations from a *caput mortuum* of chalk into inſipid water. And as for the ſaline ſubſtance, that ſeems ſeparable from mixt bodies, the ſame* *Helmont*'s trials give us cauſe to think, that it may be a production of the fire, which, by tranſporting and otherwiſe altering the particles of the matter, does bring it to a ſaline nature.

FOR I know (ſays he, in the place formerly alledged to another purpoſe) a way to reduce all ſtones into a mere ſalt of equal weight with the ſtone, whence it was produced, and that without any of the leaſt either ſulphur or mercury; which aſſeveration of my author would perhaps ſeem leſs incredible to you, if I durſt acquaint you with all I could ſay upon that ſubject. And hence by the way you may alſo conclude, that the ſulphur and mercury, as they call them, that chymiſts are wont to obtain from compound bodies by the fire, may poſſibly in many caſes be the productions of it; ſince if the ſame bodies had been wrought upon by the agents employed by *Helmont*, they would have yielded neither ſulphur nor mercury; and thoſe portions of them, which the fire would have preſented us in the form of ſulphureous and mercurial bodies, would have, by *Helmont*'s method, been exhibited to us in the form of ſalt.

BUT though (ſays *Eleutherius*) you have alledged very plauſible arguments againſt the *tria prima*, yet I ſee not how it will be poſſible for you to avoid acknowledging, that earth and water are elementary ingredients, though not of mineral concretes, yet of all animal and vegetable bodies; ſince if any of theſe, of what ſort ſoever, be committed to diſtillation, there is regularly and conſtantly ſeparated from it a phlegm or aqueous part, and a *caput mortuum* or earth.

I READILY acknowledge (anſwers *Carneades*) it is not ſo eaſy to reject water and earth (and eſpecially the former) as it is to reject the *tria prima*, from being the elements of mixt bodies; but it is not every difficult thing, that is impoſſible.

I CONSIDER then, as to water, that the chief qualities, which make men give that name to any viſible ſubſtance, are, that it is fluid or liquid, and that it is inſipid and inodorous. Now, as for the taſte of theſe qualities, I think you have never ſeen any of thoſe ſeparated ſubſtances, that the chymiſts call phlegm, which was perfectly devoid both of taſte and ſmell: and if you object, that yet it may be reaſonably ſuppoſed, that ſince the whole body is liquid, the maſs is nothing but elementary water faintly imbued with ſome of the ſaline or ſulphureous parts of the ſame concrete, which it retained with it upon its ſeparation from the other

* *Omne autem alcali addita pinguedine in aqueum liquorem, qui tandem mera & ſimplex aqua fit, reducitur, (ut videre eſt in ſapone, lazurio lapide, &c.) quoties per adjuncta fixa ſemen pinguedinis deponit.* Helmont.

other ingredients: To this I anſwer, that this objection would not appear ſo ſtrong as it is plauſible, if chymiſts underſtood the nature of fluidity and compactneſs; and that, as I formerly obſerved, to a body's being fluid there is nothing neceſſary, but that it be divided into parts ſmall enough; and that theſe parts be put into ſuch a motion among themſelves, as to glide ſome this way, and ſome that way, along each other's ſurfaces. So that although a concrete were never ſo dry, and had not any water or other liquor in-exiſtent in it, yet ſuch a comminution of its parts may be made, by the fire or other agents, as to turn a great portion of them into liquor. Of this truth I will give an inſtance, employed by our friend here preſent, as one of the moſt conducive of his experiments to illuſtrate the nature of ſalts. If you take, then, ſea-ſalt, and melt it in the fire, to free it from the aqueous parts, and afterwards diſtil it with a vehement fire from burnt clay, or any other, as dry a *caput mortuum* as you pleaſe, you will, as chymiſts confeſs by teaching it, drive over a good part of the ſalt in the form of a liquor. And to ſatisfy ſome ingenious men, that a great part of this liquor was ſtill true ſea-ſalt, brought by the operation of the fire into corpuſcles ſo ſmall, and perhaps ſo advantageouſly ſhaped, as to be capable of the form of a fluid body, he did in my preſence pour to ſuch ſpiritual ſalts a due proportion of the ſpirit (or ſalt and phlegm) of urine, whereby having evaporated the ſuperfluous moiſture, he ſoon obtained ſuch another concrete, both as to taſte and ſmell, and eaſy ſublimableneſs, as common ſalt armoniack, which you know is made up of groſs and undiſtilled ſea-ſalt, united with the ſalts of urine and of ſoot, which too are very near of kin to each other. And further, to manifeſt, that the corpuſcles of ſea-ſalt and the ſaline ones of the urine retain their ſeveral natures in this concrete, he mixt it with a convenient quantity of ſalt of tartar, and committing it to diſtillation, ſoon regained his ſpirit of urine in a liquid form by itſelf, the ſea-ſalt ſtaying behind with the ſalt of tartar. Wherefore it is very poſſible, that dry bodies may by the fire be reduced to liquors without any ſeparation of elements, but barely by a certain kind of diſſipation and comminution of the matter, whereby its parts are brought into a new ſtate. And if it be ſtill objected, that the phlegm of mixt bodies muſt be reputed water, becauſe ſo weak a taſte needs but a very ſmall proportion of ſalt to impart it; it may be replied, that, for aught appears, common ſalt and divers other bodies, though they be diſtilled never ſo dry, and in never ſo cloſe veſſels, will yield each of them pretty ſtore of a liquor, wherein though (as I lately noted) ſaline corpuſcles abound, yet there is beſides a large proportion of phlegm, as may eaſily be diſcovered by coagulating the ſaline corpuſcles with any convenient body; as I lately told you, our friend coagulated part of the ſpirit of ſalt with ſpirit of urine; and as I have divers times ſeparated a ſalt from oil of vitriol itſelf (though a very ponderous liquor, and drawn from a ſaline body) by boiling it with a juſt quantity of mercury, and then waſhing the newly coagulated ſalt from the precipitate with fair water. Now to what can we more probably aſcribe this plenty of aqueous ſubſtance afforded us by the diſtillation of ſuch bodies, than unto this, that among the various operations of the fire upon the matter of a concrete, divers particles of that matter are reduced to ſuch a ſhape and bigneſs, as is requiſite to compoſe ſuch a liquor, as chymiſts are wont to call phlegm or water? How I conjecture this change may be effected, it is neither neceſſary for me to tell you, nor poſſible to do ſo without a much longer diſcourſe than were now ſeaſonable. But I deſire you would, with me, reflect upon what I formerly told you, concerning the change of quick-ſilver into water; for that water having but a very faint taſte, if any whit more than divers of thoſe liquors, that chymiſts refer to phlegm, by that experiment it ſeems evident, that even a metalline body, and therefore much more ſuch as are but vegetable or animal, may by a ſimple operation of the fire be turned in great part into water. And ſince thoſe I diſpute with are not yet able out of gold, or ſilver, or divers other concretes, to ſeparate any thing like water; I hope I may be allowed to conclude againſt them, that water itſelf is not an univerſal and pre-exiſtent ingredient of mixt bodies.

BUT as for thoſe chymiſts, that, ſuppoſing with me the truth of what *Helmont* relates of the alkaheſt's wonderful effects, have a right to preſs me with his authority concerning them, and to alledge, that he could tranſmute all reputed mixt bodies into inſipid and mere water; to thoſe I ſhall repreſent, that though his affirmations conclude ſtrongly againſt the vulgar chymiſts (againſt whom I have not therefore ſcrupled to employ them) ſince they evince, that the commonly reputed principles or ingredients of things are not permanent and indeſtructible, ſince they may be further reduced into inſipid phlegm differing from them all; yet till we can be allowed to examine this liquor, I think it not unreaſonable to doubt whether it be not ſomething elſe than mere water. For I find not any other reaſon given by *Helmont* of his pronouncing it ſo, than that it is inſipid. Now ſapour being an accident or an affection of matter, that relates to our tongue, palate, and other organs of taſte, it may very poſſibly be, that the ſmall parts of a body may be of ſuch a ſize and ſhape, as either by their extreme littleneſs, or by their ſlenderneſs, or by their figure, to be unable to pierce into and make perceptible impreſſion upon the nerves or membranous parts of the organs of taſte, and yet may be fit to work otherwiſe upon divers other bodies than mere water can, and conſequently to diſcloſe itſelf to be of a nature far enough from elementary. In ſilk dyed red or of any other colour, whilſt many contiguous threads make up a ſkein, the colour of the ſilk is conſpicuous; but if only a very few of them be looked upon, the colour will appear much fainter than before. But if you take out one ſimple thread, you ſhall not eaſily be able to

diſcern any colour at all; ſo ſubtile an object having not the force to make upon the optick nerve an impreſſion great enough to be taken notice of. It is alſo obſerved, that the beſt ſort of oil-olive is almoſt taſteleſs; and yet I need not tell you how exceedingly diſtant in nature oil is from water. The liquor, into which I told you, upon the relation of *Lully* an eye-witneſs, that mercury might be tranſmuted, has ſometimes but a very languid, if any taſte; and yet its operations, even upon ſome mineral bodies, are very peculiar. Quickſilver itſelf alſo, though the corpuſcles it conſiſts of be ſo very ſmall, as to get into the pores of that cloſeſt and compacteſt of bodies, gold, is yet (you know) altogether taſteleſs. And our *Helmont* ſeveral times tells us, that fair water, wherein a little quantity of quickſilver has lain for ſome time, though it acquire no certain taſte or other ſenſible quality from the quick-ſilver; yet it has a power to deſtroy worms in human bodies; which he does much, but not cauſeleſsly extol. And I remember, a great lady, that had been eminent for her beauty in divers courts, confeſſed to me, that this inſipid liquor was of all innocent waſhes for the face the beſt, that ſhe ever met with.

AND here let me conclude my diſcourſe, concerning ſuch waters or liquors as I have hitherto been examining, with theſe two conſiderations. Whereof the firſt is, that by reaſon of our being wont to drink nothing but wine, beer, cyder, or other ſtrongly taſted liquors, there may be in ſeveral of thoſe liquors, that are wont to paſs for inſipid phlegm, very peculiar and diſtinct taſtes, though unheeded (and perhaps not to be perceived) by us. For to omit what naturaliſts affirm of apes, (and which probably may be true of divers other animals) that they have a more exquiſite palate than men; among men themſelves, thoſe, that are wont to drink nothing but water, may (as I have tried in my ſelf) diſcern very ſenſibly a great difference of taſtes in ſeveral waters, which one unaccuſtomed to drink water would take to be all alike inſipid. And this is the firſt of my two conſiderations. The other is, that it is not impoſſible, that the corpuſcles, into which a body is diſſipated by the fire, may by the operation of the ſame fire have their figures ſo altered, or may be by aſſociations with one another brought into little maſſes of ſuch a ſize and ſhape, as not to be fit to make ſenſible impreſſions on the tongue. And that you may not think ſuch alterations impoſſible, be pleaſed to conſider with me, that not only the ſharpeſt ſpirit of vinegar having diſſolved as much coral as it can, will coagulate with it into a ſubſtance, which, though ſoluble in water like ſalt, is incomparably leſs ſtrongly taſted than the vinegar was before; but (what is more conſiderable) though the acid ſalts, that are carried up with quickſilver, in the preparation of common ſublimate, are ſo ſharp, that being moiſtened with water it will corrode ſome of the metals themſelves; yet this corroſive ſublimate being twice or thrice re-ſublimed with a full proportion of inſipid quickſilver, conſtitutes (as you know) that factitious concrete, which the chymiſts call *mercurius dulcis*; not becauſe it is ſweet, but becauſe the ſharpneſs of the corroſive ſalts is ſo taken away by their combination with the mercurial corpuſcles, that the whole mixture, when it is prepared, is judged to be inſipid.

AND thus (continues *Carneades*) having given you ſome reaſons, why I refuſe to admit elementary water for a conſtant ingredient of mixt bodies, it will be eaſy for me to give you an account, why I alſo reject earth.

FOR firſt, it may well be ſuſpected, that many ſubſtances paſs among chymiſts under the name of earth, becauſe, like it, they are dry, and heavy, and fixt; which yet are very far from an elementary nature. This you will not think improbable, if you recall to mind what I formerly told you concerning what chymiſts call the dead earth of things, and eſpecially touching the copper to be drawn from the *caput mortuum* of vitriol; and if alſo you allow me to ſubjoin a caſual, but memorable experiment, made by *Joannes Agricola* upon the *terra damnata* of brimſtone. Our author then tells us (in his notes upon *Popius*) that in the year 1621 he made an oil of ſulphur; the remaining fæces he reverberated in a moderate fire fourteen days; afterwards he put them well luted up in a wind oven, and gave them a ſtrong fire for ſix hours, purpoſing to calcine the fæces to a perfect whiteneſs, that he might make ſomething elſe out of them. But coming to break the pot, he found above but very little fæces, and thoſe grey and not white; but beneath there lay a fine red regulus, which he firſt marvelled at, and knew not what to make of, being well aſſured, that not the leaſt thing, beſides the fæces of the ſulphur, came into the pot; and that the ſulphur it ſelf had only been diſſolved in linſeed-oil. This regulus he found heavy and malleable almoſt as lead; having cauſed a goldſmith to draw him a wire of it, he found it to be of the faireſt copper, and ſo rightly coloured, that a Jew of *Prague* offered him a great price for it. And of this metal he ſays he had twelve *loth* (or ſix ounces) out of one pound of aſhes or fæces. And this ſtory may well incline us to ſuſpect, that ſince the *caput mortuum* of the ſulphur was kept ſo long in the fire, before it was found to be any thing elſe than a *terra damnata*, there may be divers other reſidences of bodies, which are wont to paſs only for the terreſtrial fæces of things, and therefore to be thrown away, as ſoon as the diſtillation or calcination of the body that yielded them is ended; which yet, if they were long and ſkilfully examined by the fire, would appear to be differing from elementary earth. And I have taken notice of the unwarrantable forwardneſs of common chymiſts to pronounce things uſeleſs fæces, by obſerving how often they reject the *caput mortuum* of verdigreaſe; which is yet ſo far from deſerving that name, that not only by ſtrong fires, and convenient additaments, it may in ſome hours be reduced into copper, but with a certain flux powder I ſometimes make for recreation, I have in two or three minutes obtained that metal from it. To which

I may add, that having for trial's ſake kept Venetian talc in no leſs a heat than that of a glaſs-furnace, I found, after all the brunt of the fire it had indured, the remaining body, though brittle and diſcoloured, had not loſt very much of its former bulk, and ſeemed ſtill to be nearer of kin to talc, than to meer earth. And I remember too, that a candid mineraliſt, famous for his ſkill in trying of ores, requeſting me one day to procure him a certain American mineral earth of a virtuoſo, who, he thought, would not refuſe me; I inquired of him, why he ſeemed ſo greedy of it: he confeſſed to me, that this gentleman having brought that earth to the publick ſay-maſters; and upon their being unable by any means to bring it to fuſion, or make it fly away, he (the relator) had procured a little of it; and having tried it with a peculiar flux, ſeparated from it near a third part of pure gold; ſo great miſtakes may be committed in haſtily concluding things to be uſeleſs earth.

NEXT, it may be ſuppoſed, that as in the reſolution of bodies by the fire, ſome of the diſſipated parts may, by their various occurſion occaſioned by the heat, be brought to ſtick together ſo cloſely, as to conſtitute corpuſcles too heavy for the fire to carry away; the aggregate of which corpuſcles is wont to be called aſhes of earth; ſo other agents may reſolve the concrete into minute parts after ſo differing a manner, as not to produce any *caput mortuum*, or dry and heavy body. As you may remember *Helmont* above informed us, that with his great diſſolvent he divided a coal into two liquid and volatile bodies equiponderant to the coal, without any dry or fixt reſidence at all.

AND indeed, I ſee not, why it ſhould be neceſſary, that all agents, that reſolve bodies into portions of differing qualified matter, muſt work on them the ſame way, and divide them into juſt ſuch parts, both for nature and number, as the fire diſſipates them into. For ſince, (as I noted before) the bulk and ſhape of the ſmall parts of bodies, together with their fitneſs and unfitneſs to be eaſily put into motion, may make the liquors, or other ſubſtances ſuch corpuſcles compoſe, as much to differ from each other, as do ſome of the chymical principles: why may not ſomething happen in this caſe, not unlike what is uſual in the groſſer diviſions of bodies by mechanical inſtruments? where we ſee, that ſome tools reduce wood, for inſtance, into parts of ſeveral ſhapes, bigneſs, and other qualities, as hatchets and wedges divide it into groſſer parts; ſome more long and ſlender, as ſplinters; and ſome more thick and irregular, as chips; but all of conſiderable bulk: but files and ſaws make a comminution of it into duſt; which, as all the others, is of the more ſolid ſort of parts; whereas others divide it into long and broad, but thin and flexible parts, as do planes. And of this kind of parts it ſelf there is alſo a variety, according to the difference of the tools employed to work on the wood; the ſhavings made by the plane being in ſome things differing from thoſe ſhives or thin and flexible pieces of wood, that are obtained by borers, and theſe from ſome others obtainable by other tools. Some chymical examples applicable to this purpoſe I have elſewhere given you. To which I may add, that whereas, in a mixture of ſulphur and ſalt of tartar well melted and incorporated together, the action of pure ſpirit of wine digeſted on it is to ſeparate the ſulphureous from the alcalizate parts, by diſſolving the former, and leaving the latter, the action of wine (probably upon the ſcore of its copious phlegm) upon the ſame mixture, is to divide it into corpuſcles conſiſting of both alcalizate and ſulphureous parts united. And if it be objected, that this is but a factitious concrete; I anſwer, that however the inſtance may ſerve to illuſtrate what I propoſed, if not to prove it; and that nature her ſelf doth in the bowels of the earth make decompounded bodies, as we ſee in vitriol, cinnabar, and even in ſulphur it ſelf; I will not urge, that the fire divides new milk into five differing ſubſtances; but rennet and acid liquors divide it into a coagulated matter and a thin whey: and on the other ſide, churning divides it into butter and butter-milk, which may either of them yet be reduced to other ſubſtances differing from the former. I will not preſs this, I ſay, nor other inſtances of this nature, becauſe I cannot in few words anſwer what may be objected, that theſe concretes ſequeſtered without the help of the fire may by it be further divided into hypoſtatical principles. But I will rather repreſent, that whereas the ſame ſpirit of wine will diſſociate the parts of camphire, and make them one liquor with it ſelf; aqua fortis will alſo disjoin them, and put them into motion; but ſo as to keep them together, and yet alter their texture into the form of an oil. I know alſo an uncompounded liquor, that an extraordinary chymiſt would not allow to be ſo much as ſaline, which doth (as I have tried) from coral it ſelf (as fixt as divers judicious writers aſſert that concrete to be) not only obtain a noble tincture, without the intervention of nitre or other ſalts, but will carry over the tincture in diſtillation. And if ſome reaſons did not forbid me, I could now tell you of a menſtruum I make my ſelf, that doth more oddly diſſociate the parts of minerals very fixt in the fire. So that it ſeems not incredible, that there may be ſome agent or way of operation found, whereby this or that concrete, if not all firm bodies, may be reſolved into parts ſo very minute and ſo apt to ſtick cloſe to one another, that none of them may be fixt enough to ſtay behind in a ſtrong fire, and to be incapable of diſtillation; nor conſequently to be looked upon as earth. But to return to *Helmont*, the ſame author ſomewhere ſupplies me with another argument againſt the earth's being ſuch an element, as my adverſaries would have it. For he ſomewhere affirms, that he can reduce all the terreſtrial parts of mixt bodies into inſipid water; whence we may argue againſt the earth's being one of their elements, even from that notion of elements, which you may remember *Philoponus* recited out of *Ariſtotle* himſelf, when he lately diſputed for his chy-

miſts againſt *Themiſtius*. And here we may on this occaſion conſider, that ſince a body, from which the fire hath driven away its looſer parts, is wont to be looked upon as earth, upon the account of its being endowed with both theſe qualities, taſtleſſneſs and fixedneſs, (for ſalt of tartar, though fixed, paſſes not among the chymiſts for earth, becauſe it is ſtrongly taſted) if it be in the power of natural agents to deprive the *caput mortuum* of a body of either of thoſe two qualities, or to give them both to a portion of matter, that had them not both before, the chymiſts will not eaſily define what part of a reſolved concrete is earth, and make out, that that earth is a primary, ſimple, and indeſtructible body. Now there are ſome caſes, wherein the more ſkilful of the vulgar chymiſts themſelves pretend to be able, by repeated cohobations, and other fit operations, to make the diſtilled parts of a concrete bring its own *caput mortuum* over the helm, in the form of a liquor; in which ſtate being both fluid and volatile, you will eaſily believe it would not be taken for earth. And indeed by a ſkilful, but not vulgar, way of managing ſome concretes, there may be more effected in this kind, than you perhaps would eaſily think. And on the other ſide, that either earth may be generated, or at leaſt bodies, that did not before appear to be near totally earth, may be ſo altered as to paſs for it, ſeems very poſſible, if * *Helmont* have done that by art, which he mentions in ſeveral places; eſpecially where he ſays, that he knows ways, whereby ſulphur once diſſolved is all of it fixed into a terreſtrial powder, and the whole body of ſalt-petre may be turned into earth: which laſt he elſewhere ſays is done by the odour only of a certain ſulphureous fire. And in another place he mentions one way of doing this, which I cannot give you an account of; becauſe the materials I had prepared for trying it, were by a ſervant's miſtake unhappily thrown away.

AND, theſe laſt arguments may be confirmed by the experiment I have often had occaſion to mention, concerning the mint I produced out of water. And partly by an obſervation of *Rondeletius* concerning the growth of animals alſo, nouriſhed but by water, which I remembered not to mention, when I diſcourſed to you about the production of things out of water. This diligent writer then, in his inſtructive book of fiſhes, affirms that his wife kept a fiſh in a glaſs of water without any other food for three years; in which ſpace it was conſtantly augmented, till at laſt it could not come out of the place, at which it was put in, and at length was too big for the glaſs it ſelf, though that were of a large capacity. And becauſe there is no juſt reaſon to doubt, that this fiſh, if diſtilled, would have yielded the like differing ſubſtances with other animals; and however, becauſe the mint, which I had out of water, afforded me upon diſtillation a good quantity of charcoal; I think I may from thence infer, that earth it ſelf may be produced out of water; or if you pleaſe, that water may be tranſmuted into earth: and conſequently, that though it could be proved, that earth is an ingredient actually in-exiſtent in the vegetable and animal bodies, whence it may be obtained by fire; yet it would not neceſſarily follow, that earth, as a pre-exiſtent element, does with other principles convene to make up thoſe bodies, whence it ſeems to have been ſeparated.

Lib. 1. cap. 2.

AFTER all is ſaid (ſays *Eleutherius*) I have yet ſomething to object, that I cannot but think conſiderable, ſince *Carneades* himſelf alledged it as ſuch; for, (continues *Eleutherius* ſmiling) I muſt make bold to try, whether you can as luckily anſwer your own arguments, as thoſe of your antagoniſts; I mean (purſues he) that part of your conceſſions, wherein you cannot but remember, that you ſupplied your adverſaries with an example to prove, that there may be elementary bodies, by taking notice, that gold may be an ingredient in a multitude of differing mixtures, and yet retain its nature, notwithſtanding all that the chymiſts by their fires and corroſive waters are able to do to deſtroy it.

I SUFFICIENTLY intimated to you at that time (replies *Carneades*) that I propoſed this example, chiefly to ſhew you, how nature may be conceived to have made elements, not to prove, that ſhe actually has made any; and you know, that *à poſſe ad eſſe* the inference will not hold. But (continues *Carneades*) to anſwer more directly to the objection drawn from gold, I muſt tell you, that though I know very well, that divers of the more ſober chymiſts have complained of the vulgar chymiſts, as of mountebanks or cheats, for pretending ſo vainly, as hitherto they have done, to deſtroy gold; yet I know a certain menſtruum (which our friend has made, and intends ſhortly to communicate to the ingenious) of ſo piercing and powerful a quality; that if notwithſtanding much care, and ſome ſkill, I did not much deceive my ſelf, I have with it really deſtroyed even refined gold, and brought it into a metalline body of another colour and nature, as I found by trials purpoſely made. And if ſome juſt conſiderations did not for the preſent forbid it, I could perchance here ſhew you by another experiment or two of my own trying, that ſuch menſtruums may be made, as to entice away and retain divers parts from bodies, which even the more judicious and experienced Spagyriſts have pronounced irreſoluble by the fire; though (which I deſire you would mark) in neither of theſe inſtances, the gold or precious ſtones be analyſed into any of the *tria prima*, but only reduced to new concretes. And indeed there is a great diſparity betwixt the operations of the ſeveral agents, whereby the parts of a body come to be diſſipated. As if (for inſtance) you diſſolve the purer ſort of vitriol in common water, the liquor will ſwallow up the mineral, and ſo diſſociate its corpuſcles, that they will ſeem to make up but one liquor with thoſe of the water; and yet each of theſe corpuſcles retains its nature

* *Novi item modos, quibus totum ſal-petræ in terram convertitur, totumque ſulphur ſemel diſſolutum fixetur in pulverem terreum.* Helmont. in Compl. atque Miſt. Elementor. ſect. 24.

nature and texture, and remains a vitriolate and compounded body. But if the ſame vitriol be expoſed to a ſtrong fire, it will then be divided, not only, as before, into ſmaller parts, but into heterogeneous ſubſtances, each of the vitriolate corpuſcles, that remained entire in the water, being it ſelf upon the deſtruction of its former texture diſſipated or divided into new particles of differing qualities. But inſtances more fitly applicable to this purpoſe I have already given you. Wherefore to return to what I told you about the deſtruction of gold; that experiment invites me to repreſent to you, that though there were either ſaline, or ſulphureous, or terreſtrial portions of matter, whoſe parts were ſo ſmall, ſo firmly united together, or of a figure ſo fit to make them cohere to one another, (as we ſee, that in quickſilver, broken into little globes, the parts brought to touch one another do immediately re-imbody) that neither the fire, nor the uſual agents, employed by chymiſts, are piercing enough to divide their parts, ſo as to deſtroy the texture of the ſingle corpuſcles; yet it would not neceſſarily follow, that ſuch permanent bodies were elementary; ſince it is poſſible, there may be agents found in nature, ſome of whoſe parts may be of ſuch a ſize and figure, as to take better hold of ſome parts of theſe ſeemingly elementary corpuſcles, than theſe parts do of the reſt; and conſequently may carry away ſuch parts with them, and ſo diſſolve the texture of the corpuſcle by pulling its parts aſunder. And if it be ſaid, that at leaſt we may this way diſcover the elementary ingredients of things, by obſerving into what ſubſtances theſe corpuſcles, that were reputed pure, are divided; I anſwer, that it is not neceſſary, that ſuch a diſcovery ſhould be practicable. For if the particles of the diſſolvent do take ſuch firm hold of thoſe of the diſſolved body, they muſt conſtitute together new bodies, as well as deſtroy the old; and the ſtrict union, which, according to this hypotheſis, may well be ſuppoſed betwixt the parts of the emergent bodies will make it as little to be expected, that they ſhould be pulled aſunder, but by little parts of matter, that to divide them, aſſociate themſelves, and ſtick extremely cloſe to thoſe of them, which they ſever from their former adherents. Beſides that it is not impoſſible, that a corpuſcle, ſuppoſed to be elementary, may have its nature changed, without ſuffering a divorce of its parts, barely by a new texture effected by ſome powerful agent; as I formerly told you, the ſame portion of matter may eaſily, by the operation of the fire, be turned at pleaſure into the form of a brittle and tranſparent, or an opacous and malleable body.

AND indeed, if you conſider how far the bare change of texture, whether made by art or nature (or rather by nature with or without the aſſiſtance of man) can go in producing ſuch new qualities in the ſame parcel of matter, and how many inanimate bodies (ſuch as are all the chymical productions of the fire) we know are denominated and diſtinguiſhed, not ſo much by any imaginary ſubſtantial form, as by the aggregate of theſe qualities; if you conſider theſe things, I ſay, and that the varying of either figure, or the ſize, or the motion, or the ſituation, or connexion of the corpuſcles whereof any of theſe bodies is compoſed, may alter the fabrick of it, you will poſſibly be invited to ſuſpect with me, that there is no great need, that nature ſhould always have elements before-hand, whereof to make ſuch bodies as we call mixts. And that it is not ſo eaſy as chymiſts and others have hitherto imagined, to diſcern, among the many differing ſubſtances, that may without any extraordinary ſkill be obtained from the ſame portion of matter, which ought to be eſteemed, excluſively to all the reſt, its in-exiſtent elementary ingredients, much leſs to determine, what primogeneal and ſimple bodies convened together to compoſe it. To exemplify this, I ſhall add, to what I have already on ſeveral occaſions repreſented, but this ſingle inſtance:

YOU may remember (*Eleutherius*) that I formerly intimated to you, that beſides mint and pompions, I produced divers other vegetables of very differing natures out of water. Wherefore you will not, I preſume, think it incongruous to ſuppoſe, that when a ſlender vine-ſlip is ſet into the ground, and takes root there, it may likewiſe receive its nutriment from the water attracted out of the earth by its roots, or impelled by the warmth of the ſun, or preſſure of the ambient air into the pores of them. And this you will the more eaſily believe, if you ever obſerved, what a ſtrange quantity of water will drop out of a wound given to the vine, in a convenient place, at a ſeaſonable time in the ſpring; and how little of taſte or ſmell this aqua vita, as phyſicians call it, is endowed with, notwithſtanding what concoction or alteration it may receive in its paſſage through the vine, to diſcriminate it from common water. Suppoſing then this liquor, at its firſt entrance into the roots of the vine, to be common water; let us a little conſider, how many various ſubſtances may be obtained from it; though, to do ſo, I muſt repeat ſomewhat, that I had a former occaſion to touch upon. And firſt, this liquor being digeſted in the plant, and aſſimilated by the ſeveral parts of it, is turned into the wood, bark, pith, leaves, *&c.* of the vine; the ſame liquor may be further dried, and faſhioned into vine-buds, and theſe a while after are advanced unto four grapes, which expreſſed yield verjuice, a liquor very differing in ſeveral qualities both from wine and other liquors obtainable from the vine: theſe four grapes, being by the heat of the ſun concocted and ripened, turn to well taſted grapes; theſe, if dried in the ſun and diſtilled, afford a fœtid oil and a piercing empyreumatical ſpirit, but not a vinous ſpirit; theſe dried grapes or raiſins, boiled in a convenient proportion of water, make a ſweet liquor, which, being betimes diſtilled, afford an oil and ſpirit much like thoſe of the raiſins themſelves; if the juice of the grapes be ſqueezed out, and put to ferment, it firſt becomes a ſweet and turbid liquor, then grows leſs ſweet and more clear, and then affords

affords in common diſtillations not an oil, but a ſpirit, which, though inflammable like oil, differs much from it, in that it is not fat, and that it will readily mingle with water. I have likewiſe without addition obtained in proceſs of time (and by an eaſy way, which I am ready to teach you) from one of the nobleſt ſorts of wine, pretty ſtore of pure and curiouſly figured cryſtals of ſalt, together with a great proportion of a liquor as ſweet almoſt as honey; and theſe I obtained not from muſt, but true and ſprightly wine; beſides the vinous liquor, the fermented juice of grapes is partly turned into liquid drops or lees, and partly into that cruſt or dry feculency, that is commonly called tartar; and this tartar may by the fire be caſily divided into five differing ſubſtances; four of which are not acid, and the other not ſo manifeſtly acid as the tarter it ſelf. The ſame vinous juice, after ſome time, eſpecially if it be carefully kept, degenerates into that very ſour liquor called vinegar; from which you may obtain by the fire a ſpirit and a cryſtalline ſalt, differing enough from the ſpirit and lixiviate ſalt of tartar. And if you pour the dephlegmed ſpirit of the vinegar upon the ſalt of tartar, there will be produced ſuch a conflict or ebullition, as if there were ſcarce two more contrary bodies in nature; and oftentimes in this vinegar you may obſerve part of the matter to be turned into an innumerable company of ſwimming animals; which our friend having divers years ago obſerved, hath in one of his papers taught us, how to diſcover clearly without the help of a miſcroſcope.

INTO all theſe various ſchemes of matter, or differingly-qualified bodies, beſides divers others, that I purpoſely forbear to mention, may the water, that is imbibed by the roots of the vine, be brought; partly by the formative power of the plant, and partly by ſupervenient agents or cauſes, without the viſible concurrence of any extraneous ingredient. But if we be allowed to add to the productions of this tranſmuted water a few other ſubſtances, we may much increaſe the variety of ſuch bodies; although in this ſecond ſort of productions, the vinous parts ſeem ſcarce to retain any thing of the much more fixed bodies, wherewith they were mingled, but only to have, by their mixture with them, acquired ſuch a diſpoſition, that in their receſs, occaſioned by the fire, they came to be altered as to ſhape, or bigneſs, or both, and aſſociated after a new manner. Thus, as I formerly told you, I did, by the addition of a *caput mortuum* of antimony, and ſome other bodies unfit for diſtillation, obtain from crude tartar ſtore of a very volatile and cryſtalline ſalt, differing very much in ſmell and other qualities from the uſual ſalts of tartar.

BUT (ſays *Eleutherius*, interrupting him at theſe words) if you have no reſtraint upon you, I would very gladly, before you go any further, be more particularly informed, how you make this volatile ſalt; becauſe, you know, that ſuch multitudes of chymiſts have, by a ſcarce imaginable variety of ways, attempted in vain the volatilization of the ſalt of tartar, that divers learned Spagyriſts ſpeak, as if it were impoſſible to make any thing out of tartar, that ſhall be volatile in a ſaline form, or, as ſome of them expreſs it, *in forma ſicca*. I am very far from thinking (anſwers *Carneades*) that the ſalt I have mentioned is that, which *Paracelſus* and *Helmont* mean, when they ſpeak of *ſal tartari volatile*, and aſcribe ſuch great things to it. For the ſalt I ſpeak of falls extremely ſhort of thoſe virtues, not ſeeming in its taſte, ſmell, and other obvious qualities, to differ very much (though ſomething it does differ) from ſalt of hartſhorn, and other volatile ſalts drawn from the diſtilled parts of animals. Nor have I yet made trials enough to be ſure, that it is a pure ſalt of tartar, without participating any thing at all of the nitre, or antimony. But becauſe it ſeems more likely to proceed from the tartar, than from any of the other ingredients, and becauſe the experiment is in itſelf not ignoble, and luciferous enough, (as ſhewing a new way to produce a volatile ſalt, contrary to acid ſalts, from bodies, that otherwiſe are obſerved to yield no ſuch liquor, but either only, or chiefly, acid ones;) I ſhall, to ſatisfy you, acquaint you, before any of my other friends, with the way I now uſe (for I have formerly uſed ſome others) to make it.

TAKE then, of good antimony, ſalt-petre, and tartar, of each an equal weight, and of quick-lime half the weight of any one of them; let theſe be powdered and well mingled. This done, you muſt have in readineſs a long neck or retort of earth, which muſt be placed in a furnace for a naked fire, and have at the top of it a hole of a convenient bigneſs, at which you may caſt in the mixture, and preſently ſtop it up again. This veſſel being fitted with a large receiver, muſt have fire made under it, till the bottom of the ſides be red hot, and then you muſt caſt in the above prepared mixture, by about half a ſpoonful (more or leſs) at a time, at the hole made for that purpoſe; which being nimbly ſtopt, the fumes will paſs into the receiver, and condenſe there into a liquor, that being rectified will be of a pure golden colour, and carry up that colour to a great height. This ſpirit abounds in the ſalt I told you of, part of which may eaſily enough be ſeparated by the way I uſe in ſuch caſes, which is, to put the liquor into a glaſs egg, or bolt-head with a long and narrow neck. For if this be placed a little inclining in hot ſand, there will ſublime up a fine ſalt, which, as I told you, I find to be much of kin to the volatile ſalts of animals: for like them it has a ſaltiſh, not an acid ſalt; it hiſſes upon the affuſion of ſpirit of nitre, or oil of vitriol; it precipitates corals diſſolved in ſpirit of vinegar; it turns the blue ſyrup of violets immediately green; it preſently turns the ſolution of ſublimate into a milky whiteneſs; and in ſum, has divers operations like thoſe, that I have obſerved in that ſort of ſalts, to which I have reſembled it; and is ſo volatile, that, for diſtinction-ſake, I call it *ſal tartari fugitivus*. What virtues it may have in phyſick, I have not yet had the opportunity to try; but I am apt to think they will not be deſpicable. And beſides that, a very

very ingenious friend of mine tells me, he hath done great matters againſt the ſtone with a preparation not very much differing from ours; a very experienced German chymiſt finding, that I was unacquainted with the ways of making this ſalt, told me, that in a great city in his country, a noted chymiſt prizes it ſo highly, that he had a while ſince procured a privilege from the magiſtrates, that none but he, or by his licence, ſhould vend a ſpirit made almoſt after the ſame way with mine, ſave that he leaves out one of the ingredients, namely the quick-lime. But (continues *Carneades*) to reſume my former diſcourſe, where your curioſity interrupted it;

IT is alſo a common practice in *France* to bury thin plates of copper in the marc (as the French call it) or huſks of grapes, whence the juice hath been ſqueezed out in the vine-preſs; and by this means the more ſaline parts of thoſe huſks, working by little and little upon the copper, coagulate themſelves with it into that blueiſh green ſubſtance we in Engliſh call verdigreaſe. Of which I therefore take notice, becauſe having diſtilled it in a naked fire, I found, as I expected, that by the aſſociation of the ſaline with the metalline parts, the former were ſo altered, that the diſtilled liquor, even without rectification, ſeemed by ſmell and taſte, ſtrong almoſt like aqua fortis, and very much ſurpaſſed the pureſt and moſt rectified ſpirit of vinegar, that ever I made. And this ſpirit I therefore aſcribe to the ſalt of the huſks altered by their co-mixture with the copper (though the fire afterwards divorce and tranſmute them) becauſe I found this latter in the bottom of the retort in the form of a crocus or reddiſh powder; and becauſe copper is of too ſluggiſh a nature to be forced over in cloſe veſſels by no ſtronger a heat. And that, which is alſo ſomewhat remarkable in the diſtillation of good verdigreaſe, (or at leaſt of that ſort that I uſed) is this, that I never could obſerve, that it yielded me any oil, (unleſs a little black ſlime, which was ſeparated in rectification may paſs for oil) though both tartar and vinegar (eſpecially the former) will by diſtillation yeld a moderate proportion of it. If likewiſe you pour ſpirit of vinegar upon calcined lead, the acid ſalt of the liquor will by its commixture with the metalline parts, though inſipid, acquire in few hours a more than ſaccharine ſweetneſs; and theſe ſaline parts being by a ſtrong fire diſtilled from the lead, wherewith they were imbodied, will, as I formerly alſo noted to a different purpoſe, leave the metal behind them altered in ſome qualities from what it was, and will themſelves aſcend, partly in the form of an unctuous body or oil, partly in that of phlegm, but for the greateſt part in the form of a ſubtile ſpirit, indowed, beſides divers new qualities, which I am not now willing to take notice of, with a ſtrong ſmell very much other than that of vinegar, and a piercing taſte quite differing both from the ſourneſs of the ſpirit of vinegar, and the ſweetneſs of the ſugar of lead.

TO be ſhort, as the difference of bodies may depend meerly upon that of the ſchemes, whereinto their common matter is put; ſo the ſeeds of things, the fire and the other agents are able to alter the minute parts of a body (either by breaking them into ſmaller ones of differing ſhapes, or by uniting together theſe fragments with the unbroken corpuſcles, or ſuch corpuſcles among themſelves) and the ſame agents, partly by altering the ſhape or bigneſs of the conſtituent corpuſcles of a body, partly by driving away ſome of them, partly by blending others with them, and partly by ſome new manner of connecting them, may give the whole portion of matter a new texture of its minute parts, and thereby make it deſerve a new and diſtinct name. So that, according as the ſmall parts of matter recede from each other, or work upon each other, or are connected together after this or that determinate manner, a body of this or that denomination is produced, as ſome other body happens thereby to be altered or deſtroyed.

SINCE then thoſe things, which chymiſts produce by the help of the fire, are but inanimate bodies; ſince ſuch fruits of the chymiſts ſkill differ from one another but in ſo few qualities, that we ſee plainly, that by fire, and other agents we can employ, we can eaſily enough work as great alterations upon matter, as thoſe, that are requiſite to change one of theſe chymical productions into another; ſince the ſame portion of matter may, without being compounded with any extraneous body, or at leaſt element, be made to put on ſuch a variety of forms, and conſequently to be (ſucceſſively) turned into ſo many differing bodies; and ſince the matter, cloathed with ſo many differing forms, was originally but water, and that in its paſſage through ſo many transformations, it was never reduced into any of thoſe ſubſtances, which are reputed to be the principles or elements of mixt bodies, except the violence of the fire, which it ſelf divides not bodies into perfectly ſimple or elementary ſubſtances, but into new compounds; ſince, I ſay, theſe things are ſo, I ſee not, why we muſt needs believe, that there are any primogeneal and ſimple bodies, of which, as of pre-exiſtent elements, nature is obliged to compound all others. Nor do I ſee, why we may not conceive, that ſhe may produce the bodies accounted mixt out of one another, by variouſly altering and contriving their minute parts, without reſolving the matter into any ſuch ſimple or homogeneous ſubſtances, as are pretended. Neither, to diſpatch, do I ſee, why it ſhould be counted abſurd to think, that when a body is reſolved by the fire into its ſuppoſed ſimple ingredients, thoſe ſubſtances, are not true and proper elements, but rather were, as it were, accidentally produced by the fire, which by diſſipating a body into minute parts does, if thoſe parts be ſhut up in cloſe veſſels, for the moſt part neceſſarily bring them to aſſociate themſelves after another manner than before, and ſo bring them into bodies of ſuch different conſiſtences, as the former texture of the body and concurrent circumſtances make ſuch diſbanded particles apt to conſtitute; as experience ſhews us (and I have both noted it, and proved

it already) that as there are ſome concretes whoſe parts, when diſſipated by fire, are fitted to be put into ſuch ſchemes of matter as we call oil, and ſalt, and ſpirit; ſo there are others, ſuch as are eſpecially the greateſt part of minerals, whoſe corpuſcles being of another ſize or figure, or perhaps contrived another way, will not in the fire yield bodies of the like conſiſtencies, but rather others of differing textures; not to mention, that from gold and ſome other bodies, we ſee not, that the fire ſeparates any diſtinct ſubſtances at all; nor that even thoſe ſimilar parts of bodies, which the chymiſts obtain by the fire, are the elements, whoſe names they bear, but compound bodies, upon which, for their reſemblance to them in conſiſtence, or ſome other obvious quality, chymiſts have been pleaſed to beſtow ſuch appellations.

The CONCLUSION.

THESE laſt words of *Carneades* being ſoon after followed by a noiſe, which ſeemed to come from the place, where the reſt of the company was, he took it for a warning, that it was time for him to conclude or break off his diſcourſe; and told his friend, By this time, I hope, you ſee, *Eleutherius*, that if *Helmont*'s experiments be true, it is no abſurdity to queſtion, whether that doctrine be one, that doth not aſſert any elements in the ſenſe before explained. But becauſe that as divers of my arguments ſuppoſe the marvellous power of the alkaheſt in the analyzing of bodies, ſo the effects aſcribed to that power are ſo unparallelled and ſtupendous, that though I am not ſure, but that there may be ſuch an agent, yet little leſs than αὐτοψία ſeems requiſite to make a man ſure there is. And conſequently I leave it to you to judge, how far thoſe of my arguments, that are built upon alkaheſtical operations, are weakened by that liquor's being matchleſs; and ſhall therefore deſire you not to think, that I propoſe this paradox, that rejects all elements, as an opinion equally probable with the former part of my diſcourſe. For by that, I hope, you are ſatisfied, that the arguments, wont to be brought by chymiſts to prove, that all bodies conſiſt of either three principles, or five, are far from being ſo ſtrong as thoſe, that I have employed to prove, that there is not any certain and determinate number of ſuch principles or elements to be met with univerſally in all mixt bodies. And, I ſuppoſe, I need not tell you, that theſe anti-chymical paradoxes might have been managed more to their advantage; but that having not confined my curioſity to chymical experiments, I, who am but a young man, and younger chymiſt, can yet be but ſlenderly furniſhed with them, in reference to ſo great and difficult a taſk as you impoſed upon me: beſides that, to tell you the truth, I durſt not employ ſome even of the beſt experiments I am acquainted with, becauſe I muſt not yet diſcloſe them. But however, I think I may preſume, that what I have hitherto diſcourſed, will induce you to think, that chymiſts have been much more happy in finding experiments than the cauſes of them; or in aſſigning the principles, by which they may beſt be explained. And indeed, when in the writings of *Paracelſus* I meet with ſuch phantaſtick and unintelligible diſcourſes, as that writer often puzzles and tires his reader with, fathered upon ſuch excellent experiments, as though he ſeldom clearly teaches, I often find he knew; methinks the chymiſts, in their ſearches after truth, are not unlike the navigators of *Solomon*'s *Tarſhiſh* fleet, who brought home from their long and tedious voyages, not only gold, and ſilver, and ivory, but apes and peacocks too: for ſo the writings of ſeveral (for I ſay not, all) of your hermetick philoſophers preſent us, together with divers ſubſtantial and noble experiments, theories, which either like peacocks feathers make a great ſhew, but are neither ſolid nor uſeful; or elſe like apes, if they have ſome appearance of being rational, are blemiſhed with ſome abſurdity or other, that, when they are attentively conſidered, make them appear ridiculous.

CARNEADES having thus finiſhed his diſcourſe againſt the received doctrines of the elements, *Eleutherius* judging he ſhould not have time to ſay much to him before their ſeparation, made ſome haſte to tell him; I confeſs, *Carneades*, that you have ſaid more in favour of your paradoxes than I expected. For though divers of the experiments you have mentioned are no ſecrets, and were not unknown to me; yet beſides that you have added many of your own unto them, you have laid them together in ſuch a way, and applied them to ſuch purpoſes, and made ſuch deductions from them, as I have not hitherto met with.

BUT though I be therefore inclined to think, that *Philoponus*, had he heard you, would ſcarce have been able in all points to defend the chymical hypotheſis againſt the arguments, wherewith you have oppoſed it; yet methinks, that however your objections ſeem to evince a great part of what they pretend to, yet they evince it not all; and the numerous trials of thoſe you call the vulgar chymiſts, may be allowed to prove ſomething too.

WHEREFORE, if it be granted you, that you have made it probable;

FIRST, that the differing ſubſtances, into which mixt bodies are wont to be reſolved by the fire, are not of a pure and an elementary nature, eſpecially for this reaſon, that they yet retain ſo much of the nature of the concrete that afforded them, as to appear to be yet ſomewhat compounded, and oftentimes to differ in one concrete from principles of the ſame denomination in another:

NEXT,

NEXT, that as to the number of theſe differing ſubſtances, neither is it preciſely three, becauſe in moſt vegetable and animal bodies earth and phlegm are alſo to be found among their ingredients; nor is there any one determinate number, into which the fire (as it is wont to be employed) does preciſely and univerſally reſolve all compound bodies whatſoever, as well minerals as others, that are reputed perfectly mixt:

LASTLY, that there are divers qualities, which cannot well be referred to any of theſe ſubſtances, as if they primarily reſided in it and belonged to it; and ſome other qualities, which, though they ſeem to have their chief and moſt ordinary reſidence in ſome one of theſe principles or elements of mixt bodies, are not yet ſo deducible from it, but that alſo ſome more general principles muſt be taken in, to explicate them:

IF, I ſay, the chymiſts (continues *Eleutherius*) be ſo liberal as to make you theſe three conceſſions, I hope you will, on your part, be ſo civil and equitable, as to grant them theſe three other propoſitions, namely;

FIRST, that divers mineral bodies, and therefore probably all the reſt, may be reſolved into a ſaline, a ſulphureous, and a mercurial part; and that almoſt all vegetable and animal concretes may, if not by the fire alone, yet by a ſkilful artiſt employing the fire as his chief inſtrument, be divided into five differing ſubſtances, ſalt, ſpirit, oil, phlegm and earth; of which the three former, by reaſon of their being ſo much more operative than the two latter, deſerve to be looked upon as the three active principles, and by way of eminence to be called the three principles of mixt bodies.

NEXT, that theſe principles, though they be not perfectly devoid of all mixture, yet may without inconvenience be ſtyled the elements of compounded bodies, and bear the names of thoſe ſubſtances, which they moſt reſemble, and which are manifeſtly predominant in them; and that eſpecially for this reaſon, that none of theſe elements is diviſible by the fire into four or five differing ſubſtances, like the concrete, whence it was ſeparated.

LASTLY, that divers of the qualities of a mixt body, and eſpecially the medical virtues, do for the moſt part lodge in ſome one or other of its principles, and may therefore uſefully be ſought for in that principle ſever'd from the others.

AND in this alſo (purſues *Eleutherius*) methinks both you and the chymiſts may eaſily agree, that the ſureſt way is to learn by particular experiments, what differing parts particular bodies do conſiſt of, and by what ways (either actual or potential fire) they may beſt and moſt conveniently be ſeparated, as without relying too much upon the fire alone, for the reſolving of bodies, ſo without fruitleſsly contending to force them into more elements than nature made them up of, or ſtrip the ſever'd principles ſo naked, as by making them exquiſitely elementary, to make them almoſt uſeleſs.

THESE things (ſubjoins *Eleutherius*) I propoſe, without deſpairing to ſee them granted by you; not only becauſe I know, that you ſo much prefer the reputation of candour before that of ſubtilty, that your having once ſuppoſed a truth would not hinder you from imbracing it, when clearly made out to you; but becauſe, upon the preſent occaſion, it will be no diſparagement to you to recede from ſome of your paradoxes, ſince the nature and occaſion of your paſt diſcourſe did not oblige you to declare your own opinions, but only to perſonate an antagoniſt of the chymiſts. So that (concludes he, with a ſmile) you may now, by granting what I propoſe, add the reputation of loving the truth ſincerely to that of having been able to oppoſe it ſubtilely.

CARNEADES's haſte forbidding him to anſwer this crafty piece of flattery; Till I ſhall (ſays he) have an opportunity to acquaint you with my own opinions about the controverſies I have been diſcourſing of, you will not, I hope, expect I ſhould declare my own ſenſe of the argument I have employed. Wherefore I ſhall only tell you thus much at preſent; that though not only an acute naturaliſt, but even I my ſelf could take plauſible exceptions at ſome of them; yet divers of them too are ſuch as will not perhaps be readily anſwered, and will reduce my adverſaries, at leaſt, to alter and reform their hypotheſis. I perceive I need not mind you, that the objections I made againſt the quaternary of elements and ternary of principles, needed not to be oppoſed ſo much againſt the doctrines themſelves; either of which, eſpecially the latter, may be much more probably maintained than hitherto it ſeems to have been, by thoſe writers for it (I have met with) as againſt the unaccurateneſs and the unconcludingneſs of the analytical experiments vulgarly relied on to demonſtrate them.

AND therefore, if either of the two examined opinions, or any other theory of elements, ſhall, upon rational and experimental grounds, be clearly made out to me; it is obliging, but not irrational, in you to expect, that I ſhall not be ſo far in love with my diſquieting doubts, as not to be content to change them for undoubted truths. And (concludes *Carneades* ſmiling) it were no great diſparagement for a ſceptick to confeſs to you, that as unſatisfied as the paſt diſcourſe may have made you think me with the doctrines of the Peripateticks, and the chymiſts, about the elements and principles, I can yet ſo little diſcover what to acquieſce in, that perchance the enquiries of others have ſcarce been more unſatisfactory to me, than my own have been to my ſelf.

EXPERIMENTS AND NOTES ABOUT THE Produciblenefs of Chymical Principles;

Being Parts of an Appendix, deſigned to be added to the SCEPTICAL CHYMIST.

The Author's Preface.

HAVING long ſince obſerved, that a great part of the erroneous reaſonings and concluſions of learned men, as well about phyſical, as other ſubjects, proceeds not ſo much from their making bad illations, as from their aſſuming falſe or uncertain principles, to draw their conſequences from; I thought, I could ſcarce miſ-ſpend the time I allowed my ſelf for chymical ſtudies, if I employed ſome part of it, in examining the doctrine about the principles of natural bodies. Upon this account I did, in the year 1661, venture abroad my *Sceptical Chymiſt*, to acquaint the inquiſitive with my doubts, and excite them to a more thorough diſquiſition of a ſubject, ſo conſiderable, as well to natural philoſophy, as to phyſick. This diſcourſe being once publiſhed in Engliſh, and ſoon after in Latin; I thought fit to wait a while, that I might learn what judgment would be made of it, and whether any of the chymiſts would return an anſwer to it: and in the mean while, to gratify thoſe, that appeared deſirous of having it ſoon reprinted, I gathered divers notes, (ſome of them conſiderable for bulk) to be inſerted here and there, as inlargements in the next edition, whoſe volume I was not unwilling ſomewhat to increaſe, not only becauſe I thought truth in general, a thing worthy, that the lovers of it ſhould take pains to diſcover, and eſtabliſh it, but becauſe I looked upon the truth inquired after in the *Sceptical Chymiſt*, as of no mean importance; eſpecially ſince the miſtakes, that very many have made about it, have, I fear, not only been prejudicial to natural philoſophy, but have, by ſeveral men, as well learned as ignorant, been adopted both into the ſpeculations, and practice of phyſicians; whoſe art being converſant about the health and life of man, doctrinal errors in it cannot but be dangerous, and therefore fit, as much as is poſſible, to be ſolicitouſly avoided, or removed. Theſe inconveniencies I hoped might in ſome meaſure be obviated, if it were further made appear by experiments as well as reaſonings, that the vulgar doctrine of the *tria prima* is, at leaſt, very queſtionable, or uncertain and very narrow. For the contrary perſuaſions about theſe principles have miſ-led divers learned men to give, and take up with precarious and ſuperficial accounts of divers phænomena of nature; by which means they have been diverted from employing their wits (wherein divers of them are happy) in the inveſtigation of the true and fundamental cauſes, the diſcovery whereof would have enabled them, inſtead of dark and ſuperficial, to give intelligible and particular explications of thoſe phænomena, and many others. The difference between the accounts given of the ſame phænomena, by the hypoſtatical and by the mechanical principles, may be ſeen exemplified by particular inſtances in other papers; wherefore, I ſhall proceed to obſerve as to phyſick, that beſides the miſtakes, which, I doubt, divers learned men have, by another valuation of the doctrine of the *tria prima*, been led into, in relation to the cauſes of divers things, that occur to human bodies, and even in chymical operations; beſides this, I ſay, I fear, that the too confident opinion of the doctrine I queſtion has made divers practitioners of phyſick make wrong eſtimates of medicines. But after I had waited a competent time, I perceived no author vouchſafed the *Sceptical Chymiſt* an anſwer; but a very ingenious man, from whom I chiefly expected it, told me, that he had indeed deſigned to write one, but was hindered by conſidering, that I had ſo ſtated the caſe, that an anſwer could not confute that book by any mere juſtification of the chymiſts principles, ſince he would be obliged alſo to defend the chymical doctrine, as it is generally taught by the vulgar chymiſts; and make good the arguments, by which they are wont to maintain it. Since it is only that doctrine and theſe arguments, that I declare my ſelf in that diſcourſe to queſtion; and he himſelf did not think them ſound and valid. By theſe encouragements I was induced to comply with

with the earneſt ſolicitations of the printer for another edition; but he dying ſoon after, and the perſon, to whom the right to diſpoſe of the Engliſh copy legally came, having left *England*, and continued out of it, for divers years, the diſpute between the Stationers that pretended to it, and treated about it, laſted ſo long, that a traveller, who paſſed this way, told an acquaintance of mine, that he had then (which was two or three years ago) ſeen nine ſeveral Latin impreſſions of it; ſince when another has been brought me made at *Geneva*. This number of editions (in none of which I have added or altered a word) and the numerous citations I have met with of it, in favourable writers, made me unwilling to confound, or trouble readers, by interweaving additional notes with the body of the diſcourſe; and ſo by obliging thoſe that ſhould hereafter vouchſafe to mention any of the inſerted paſſages of it, to cite the edition as well as the book. And therefore I was eaſily inclined, by want of health and leiſure, to peruſe again deliberately the whole treatiſe, to ſuppreſs all thoſe notes, that I could not readily and conveniently refer to three or four of the chief heads, I intended to enlarge upon; and without altering the form of the book, wherein it has proved ſo fortunate, to leave it intire, and publiſh my additions alſo by themſelves by way of appendix. This in my intention was to conſiſt of four heads, The *Producibleneſs of chymical Principles*; The *Uncertainty of the vulgar Analyſes made by diſtillation*; The *various Effects of the Fire according to the differing ways of employing it*; and *Doubts whether there be any Elements, or material Principles of mixt bodies, one or more, in the ſenſe vulgarly received.* But finding by the Stationer's eſtimate, that the notes referred to the three laſt titles, are not near ſo large as thoſe, that belong to the firſt; yet they would make the book, to which they ſhould be added, and which is already printed, of too great a thickneſs in proportion to its other dimenſions; I thought fit to reſerve the other papers for another opportunity, and at this time annex nothing, but what concerns *the Producibleneſs of the chymical Principles.*

BUT yet becauſe there are ſome general advertiſements that do ſomewhat more belong to this part of our deſigned Appendix, that now comes forth, than to any of the reſt, I muſt not deny them a room in this preface, which I ſhall conclude with them.

I MIGHT juſtly enough alledge, in excuſe of incoherence of ſome of the particulars, that follow next after one another in the ſubſequent diſcourſe, that this being confuſedly but a collection (or if you pleaſe a rhapſody) of looſe notes, it is more pardonable, than ſtrange, that ſome of them ſhould want apt connections, and the ſtyle of the diſcourſe they compoſe ſhould want uniformity. But it is not ſo much my preſent work to make apologies, as to give advertiſements; and therefore I ſhall proceed to tell you in the firſt place, that though the following diſcourſe have in ſome places a ſomewhat dogmatical dreſs, yet it is chiefly meant (as becomes an appendix to a ſceptical book) to excite and aſſiſt a further inquiry; and accordingly the reader may perceive it to have been my care, not ſo much to play the part of a logical opponent, as to take occaſion to ſet down variety of experiments and obſervations, that whatever hypotheſis about the material principles of mixed bodies ſhall prove fit to be pitched upon, it may be founded on a leſs inſufficient hiſtory of matters of fact (relating to that ſubject) than chymiſts have been wont to take in; and may be ſo framed, as not to be liable to thoſe objections and difficulties, that will be here met with, and yet perhaps were not thought of, or at leaſt were not duly taken into conſideration, when the vulgar hypotheſis of the *tria prima* was eſtabliſhed. Upon this account I am not without hope, that the following experiments and conſiderations, though propoſed by way of objections, may do ſome ſervice to the inquirers into the material principles of things; by obliging the chymiſts, at leaſt, to reform their doctrine about them, and build it more cautiouſly, and that upon a larger, as well as more ſolid foundation of natural hiſtory.

THE ſecond thing, whereof I am to advertiſe the reader, is, that I would not have him infer from any thing, that (prompted by the exigencies of my deſign) I have ſaid in the following papers, that I either do undervalue, or would decry chymiſtry, or chymiſts themſelves indiſcriminately. For I have a very differing eſteem of the notional and of the practical part of chymiſtry. For divers of the opinions maintained by Spagyriſts, without excepting their grand hypotheſis of the three principles, I have been inclined to queſtion, not only as a naturaliſt, but as a chymiſt; as ſeeing great cauſe to doubt, whether they be agreeable, either to the true grounds of philoſophy, or the exploring experiments of the fire. But as for chymical operations, ſuch as diſtillation, ſolution, ſublimation, precipitation, and the reſt; eſpecially thoſe ſeldom ſufficiently valued ones, digeſtion and cohobation; I take them to be excellent tools in the hands of a natural philoſopher, and to be by him applicable to many other, and perhaps ſome nobler uſes, than they are wont to be put to, in laboratories; ſince if they be ſkilfully employed, they may be ſucceſsfully ſo, as well to diſcover nature, as to correct, to imitate, and, in ſome caſes, to out-do her. Nor do I only thus diſtinguiſh between the ſpeculative and operative part of chymiſtry, but I make a great difference between the avowed cultivators of that art; and look not with the ſame eyes on the opinions and performances of vulgar chymiſts, and chymical philoſophers. For we are told, that there lives concealed in the world a ſett of Spagyriſts of a much higher order than thoſe, that are wont to write courſes of chymiſtry or other books of that nature; being able to tranſmute baſer metals into perfect ones, and do ſome other things, that the generality of chymiſts confeſs to be extremely difficult, and divers of the more judicious, even among the Spagyriſts themſelves, have judged impoſſible. The declaration of what I think of theſe latent philo-

ſophers, belongs to another paper. Yet in this, I ſhall not deny, but that what I have heard from divers very credible eye-witneſſes, and perhaps ſome more immediate arguments, ſtrongly incline me to think, that there may have been, and may yet be, ſome ſuch men: and whatever be to be thought of what they call the philoſopher's ſtone, I confeſs my ſelf convinced by what I have ſeen, that there are in the world as difficult arcana as divers of thoſe, which have been (perhaps not all of them juſtly) derided under the name of chymical *non-entia*. Now if there be really ſuch adept philoſophers as we are told of; I am apt to think, that among their other arcana, they are maſters of extremely potent menſtruums (which may, as far as I can gueſs, be ſome of their chiefeſt tools) and may by the help of theſe and other means peculiar to themſelves, of working upon bodies, be able to produce in them ſuch alterations, as we have no examples of, and ſo obtain from them ſuch ſimilar ſubſtances, as either for number, or quality, or both, may be very different from the vulgar *tria prima*, or thoſe ſubſtances chymiſts are wont to obtain, (for that word I chuſe to employ rather than the word ſeparate or extract) by the common ways of what they call analyſis. For if a man have an inſtrument, which other men have not, and much more, if it be an excellent one, he may be able with it to perform other things, than they can without it. The Europeans by the help of ſo ſlight an engine as a mill, aſſiſted by a far ſlighter inſtrument a ſieve, can eaſily divide corn into bran, and meal, and flour, which even thoſe Americans, for want of thoſe helps, were not able to do, who could do other things, that are thought far more difficult. And he, that has a file and a good turning lath with its appurtenances, may obtain from a piece of iron both filings, and ſhavings, and concave hemiſpheres, and ellipſes, and globes, and cylinders, and other ſorts of bodies, which could not be obtained from that iron, even by good artificers, that were not furniſhed (as till of late very few were) with thoſe inſtruments. And he, that firſt found the uſe of aqua fortis in diſſolving ſilver, and that though it were mixt with gold, had, by his menſtruum, an eaſy way of ſeparating thoſe two metals, though ancienter mineraliſts, nor chymiſts themſelves had no liquor that would perform that work. But *Helmont*'s writings will ſupply me with a far nobler inſtance to my preſent purpoſe, if the truth of all that he delivers concerning the effects of his alkaheſt be admitted; about the poſſibility of which ſtrange ſolvent, having elſewhere written a ſhort enquiry, I ſhall forbear to ſay any thing of it here, but rather intimate, that if there be ſuch adept philoſophers as ſome ſpeak of, (which I think not incredible) and if they have (which, ſuppoſing there be ſuch, I think not unlikely) among other rare things, ſome alkaheſtical or other extraordinarily potent menſtruum, or way of penetrating and working upon mixt bodies; they may, for aught I know, be able to obtain ſuch ſubſtances from them, as may induce me, and perhaps the chymiſts too, to entertain other thoughts about the conſtitution of compounded bodies (as they are wont to be called) than either I, or they now have. And therefore, though as to natural philoſophy in general, I do not expect to ſee any principles propoſed more comprehenſive and intelligible than the corpuſcularian or mechanical; yet as to the ſubordinate theory of mixt bodies in particular, I, that have diſputed only againſt the vulgar hypotheſis of the chymiſts, can eaſily retain a diſpoſition to receive further light in this matter, when thoſe, that are the beſt able to afford it us, and from whom it will be no diſparagement for much greater proficients than I, to learn, ſhall think fit to oblige us by doing ſo. In the mean time, to end this advertiſement as I begun it; I ſhould not need to ſay much to ſatisfy chymiſts, that I neither hate nor deſpiſe their art, even in its preſent ſtate, if ſome things, and chiefly want of leiſure, would permit me to publiſh an eſſay that I wrote many years ſince, *Of the Uſefulneſs of Chymiſtry to the Empire of Man.* Nor is it only to the practical part of natural philoſophy, that I take chymiſtry, as it may be managed, to be highly uſeful, but I confeſs, I think alſo, that being ordered by a ſkilful naturaliſt, it may far more conduce, than thoſe, that are ſtrangers to it are wont to think, to the ſpeculative part of phyſicks; and that as the Bolonian ſtone, without being chymically prepared, would never be made luminous, but being ſo prepared is brought to ſhine; ſo, many other natural bodies never afford much light to philoſophy, till chymical operations have qualified them to do ſo.

THE laſt advertiſement I deſire to give the reader, concerns the intention, with which I call in queſtion the hypotheſis of the *tria prima*, and ſome other of the chymiſts doctrines. For though ſometimes I have had occaſion to diſcourſe like a Sceptick, yet I am far from being one of that ſect; which I take to have been little leſs prejudicial to natural philoſophy than to divinity itſelf. I do not with the true Scepticks propoſe doubts to perſuade men, that all things are doubtful and will ever remain ſo, (at leaſt) to human underſtandings; but I propoſe doubts not only with deſign, but with hope, of being at length freed from them by the attainment of undoubted truth; which I ſeek, that I may find it; though if I miſs of it in one opinion, I proceed to ſearch after it in the oppoſite, or in any other where it ſeems more likely I ſhould meet with it. And to declare my mind to the diſciples of the fire, by a ſimilitude not aliene from their profeſſion; ſuppoſe a man, more rich than ſkilful, ſhould bequeath me a purſe of guineas, and that I ſhould have ſtrong preſumptions, that ſome of them are counterfeit, what in this caſe would a chymiſt have me do? To take them all for good, in ſpite of contrary preſumptions againſt ſome of them, were very imprudent. On the other ſide, to throw them all away, becauſe it is probable ſome may prove counterfeit, were downright folly. That then, which common prudence would direct me, would be to take them all out, and examine them one by one, firſt with the touch-

touch-ſtone, and then, if need be, by the cupel, and by aqua fortis too: and this I ſhould do with deſire to find all the pieces true, having alſo care not only to preſerve and put back into the purſe thoſe, that prove right; but if any be but partly adulterated, to preſerve the good portion by purifying it, (by the cupel or ſome other fit way) from the falſifying alloy, by whoſe admixture it had been imbaſed. The application of this I leave to be made by chymiſts. And having, in another paper, purpoſely diſcourſed of the cautions and limitations, without which I diſallow ſcepticiſm, I ſhall only in general profeſs, that I more willingly embrace the truths taught by the chymiſts, than I endeavour to diſprove their errors. For I look upon truth, as one of the chief of thoſe goods, that God has of all others laid the moſt in common; ſince truth does not only, like deſert iſlands in *America*, belong to him, that firſt finds it and ſeizes on it; but even, when another has lighted on it, and is in poſſeſſion of it, any man may, without treſpaſs or injury, make himſelf a ſharer in it. To conclude; I am glad to find truth in the doctrines of the chymiſts; but when I cannot diſcern it there, I chuſe rather to ſeek it elſewhere, than ſit down without it. And if I any where ſeem to be ſomewhat too indulgent to ſuſpicions againſt their hypotheſis, or arguments, I hope the uſual confidence, to be met with among moſt of them, conſidered, it will be looked upon but as a compliance with the advice of *Ariſtotle*, of bending a crooked ſtick the contrary way, to reduce it at length to ſtraitneſs. And I did, with the leſs ſcruple, allow my ſelf this way of writing, becauſe experience having taught me, that ſome Spagyriſts (for I ſpeak not of all) that keep their beſt things cloſe, will do more to vindicate their art, or oppoſe their antagoniſts, than to gratify the curious, or benefit mankind; I thought the rouſing ſtyle, I ſometimes wrote in, might prove no unhopeful way to procure ſomewhat conſiderable from thoſe great maſters, and orders of chymical arcana, that muſt be provoked, before they will come out with them; as the ſea is obſerved not to give us one of its precioueſt treaſures, ambergreaſe, till it have been agitated by winds and ſtorms.

The Publiſher's Advertiſement to the Reader.

I SHALL not entertain the reader with any thoughts of my own, about the following Appendix, which, without deſiring to prepoſſeſs him, I ſhall willingly (and I think may ſafely) leave to ſpeak for itſelf. But yet I think it may not be amiſs, if I premiſe ſomething to the reader, about the publication of theſe notes, as having been particularly concerned in it

By the opportunity I had of ſeeing ſome papers of the honourable author of the enſuing Appendix; I perceived, that the notes, which he deſigned it ſhould conſiſt of, were indeed moſt of them laid together in ſome (though but a careleſs) order, and ſo were without much difficulty fitted for the preſs: but others of them lay ſcattered up and down amongſt many others, about differing ſubjects in his philoſophical memorials, which particulars not being ready at hand, when the enſuing Notes were ſent to *Oxford* to the printer, they could not be publiſhed with the reſt, but muſt expect ſome other opportunity to appear abroad, either alone, or in their company.

Perhaps the reader will not need to be told, that beſides the application of ſome of the experiments contained in the following Notes, moſt of the experiments themſelves are new. But ſo many years are paſt betwixt the firſt edition of the *Sceptical Chymiſt*, and the ſecond, that now comes forth; that it may be requiſite (though otherwiſe it would be improper) to advertiſe this reader, that he is not to think, that the author has borrowed from others thoſe experiments and notions, that may be met with in books written in later years, as well as in the *Sceptical Chymiſt*. For the firſt Engliſh edition having been put forth in the year 1661, and never ſince by the author at all enlarged, or altered; it will ſufficiently ſhew, that this book could not borrow from thoſe, that never were ſeen till after, and perhaps long after his was publiſhed. Which advertiſment may be particularly applied to the late learned treatiſe, intitled *Philoſophia Vetus & Nova*, wherein in one long chapter may be met with an abridgment of a great part of the notions, experiments, and ratiocinations of the *Sceptical Chymiſt*, without any mention there made, either of the great and famous author's name, or his book, in which they firſt appear; though the Latin verſion of that treatiſe was publiſhed many years ago, and reprinted many times ſince. And though this be not the only writer, that hath thought fit to make uſe of conſiderable portions of the *Sceptical Chymiſt*, without owning it, I thought, what he has been pleaſed to do, required to have particular notice taken of it, becauſe, though his modeſty hath perſuaded him to conceal his name, his learned book hath made him ſo juſtly famous, that if the reader were not advertiſed, he might eaſily ſuſpect, that Mr. *Boyle* had not lent to, but borrowed of an author, who appears ſo capable of enriching the curious with excellent things of his own. And upon the ſame grounds I think it neceſſary to obſerve, that the experiments to be met with in Mr. *Boyle's Hiſtory of Colours* having been publiſhed many years ago, could not be borrowed from that moſt ingenious treatiſe, though in that chapter of it, which treats *de coloribus*, between 20 and 30 experiments, (if I meſremember not the number) will be found the ſame with the like number of Mr. *Boyle's*; whoſe

whoſe name, though elſewhere very civilly taken notice of on ſome other occaſion, is in that whole chapter left unmentioned.

I MIGHT here inform the reader, that the *Sceptical Chymiſt* having been many years out of print, it chanced, that when the notes, that make up the following Appendix, were drawn together for the preſs, this author had not a book at hand, by comparing whereof with the particulars of his deſigned Appendix, he might be ſure to avoid, (what he now but hopes he hath,) the ſuffering any thing to paſs in the latter, that is truly coincident with what was already extant in the former: (I mean, to the ſame purpoſe, and on the ſame occaſion; for otherwiſe an experiment or notion may be more than once employed without meer repetition.)

AND laſtly I dare not omit to let the reader know, that ſince the Appendix was printed, it appears, that by an overſight, ſome leaves were left behind, that treating of the difference of common mercuries themſelves, ſhould have been annexed, as a kind of appendix to the laſt of the three mercurial tracts, to be met with among the following papers: from whoſe peruſal the reader ſhall no longer be detained by

His Humble Servant,
I. M.

The Introduction to the following NOTES.

THOUGH the pompous title of *Hypoſtatical Principles*, which chymiſts have beſtowed upon the ingredients they would have mixt bodies to conſiſt of, has perhaps ſerved to procure them a veneration from vulgar heads, that are wont to eſteem things the more becauſe they underſtand them leſs; yet the main thing, that has recommended the chymical principles to more diſcerning men, ſeems to be, that by the help of a few ſimple ingredients (whereof nature is ſuppoſed to have laid up great magazines at the beginning of things) aſſociated in differing proportions, all mixt bodies may be compounded; and ſo men may acquaint themſelves with the natures of a multitude of bodies, by firſt knowing the natures but of a few. He therefore, that acknowledges he does not acquieſce in the chymical hypotheſis of the *tria prima*, or their's, that add to them water and earth, can ſcarce imploy a more proper argument to ſhake it, than, upon good ground, to call in queſtion what they teach when they affirm, that their principles are ingenerable and incorruptible; and that nature does only compound and diſſociate them, without either producing or deſtroying any of them. It will be therefore very well worth while to examine, what evidence there is in an aſſertion, which, in ſo many of the chymiſts reaſonings and explications, is either manifeſtly imployed, or not obſcurely ſuppoſed. And indeed this tenet of theirs is ſo principal a pillar of their hypotheſis, that, in caſe it fail them, the whole ſtructure will be in danger of ruin. For if the bodies they call principles be produced *de novo*, how will it be demonſtrable, that nature was obliged to take thoſe principles made ready to her hand, when ſhe was to compound a mixt body? and how will it appear in every analyſis made by fire, that the ſalt (for inſtance) thereby obtained, was not produced by the chymical operations, but was pre-exiſtent in the body in minute parts, which, by the action of the fire, were only extricated and ſeparated from the other principles or ingredients, and afterwards brought together? Since, in caſe the chymical ſuppoſition be erroneous, not only the obtained ſalt may be in part due to a new production or tranſmutation, but part of that, which was really ſalt, if any ſuch thing there were antecedently to the analyſis, might be either deſtroyed by the operation, or made to appear under ſome other form.

OF THE

Produciblenes of Chymical Principles.

PART I.

Of the Produciblenes of ſalt.

AMONG the ſubſtances, upon which chymiſts have conferred the title of principles, ſalt ſeems in their eſtimate to have had the precedency, ſince they are wont to name it firſt in the enumeration of their *tria prima*. And it is generally granted, that ſalts are wont to be the moſt conſiderable and active parts obtained by chymiſts from mixt bodies. And yet perhaps the inviſible particles, that compoſe the viſible portions of a ſalt, may be ſuch, and ſo contrived, as to be fit to make, and to have perhaps actually made, other portions of matter endowed with thoſe qualities, for which chymiſts are wont to call

a body ſulphureous or mercurial, as may be inſtanced in the inflammability of nitre. Wherefore it may deſerve a greater meaſure of curioſity, than ſeems to have been employed, or even deſigned, by vulgar chymiſts, to enquire, whether ſalt, indefinitely ſpeaking, may be produced *de novo*, (as they phraſe it) or deſtroyed; and whether at leaſt the particular, and much differing ſpecies of ſalts may be changed into one another, and thereby, after a manner, be produced in reference to the acquired ſpecies of ſalt, and deſtroyed in relation to that, which the ſame portion of matter belonged to before.

To premiſe ſomewhat in general, to render it probable, that ſalts may be produced *de novo*, I ſhall briefly repreſent two things; the firſt is, that ſince ſalts differ much in ſeveral other attributes, ſome being fixt, ſome volatile, ſome acid, ſome urinous, *&c.* the two qualities, wherein they agree, and which therefore make up the common and moſt received notion of ſalt in general, are, that it is eaſily diſſoluble in water, and that it affects the palate with a ſapor, whether good or evil: and the other thing is, that, whether we allow the Epicurean hypotheſis, or the Carteſian, the firſt ſaline concretions, that were produced by nature, muſt be confeſſed to have been made of atoms, or of particles, that before their conjunction, were not ſaline. And therefore there appears no abſurdity in conceiving, that by the action of the fire or other fit agents, ſmall portions of matter may be ſo broken into minute parts, and theſe fragments may be ſo ſhaped and connected, as, when they are duely aſſociated, to compoſe a body capable of being diſſolved in water, and of affecting the organs of taſte

THAT a diſpoſition to be diſſoluble in this or that liquor may be acquired by mixture, and the new texture of parts, is not without example; for, as I elſewere obſerve, though powdered ſulphur will lie in well rectified ſpirit of wine, ſome weeks or months, without being at all viſibly diſſolved in it; and though the ſame liquor will for as long a time ſwim upon ſalt of tartar, without making a ſolution of it; yet if this ſalt and ſulphur be mixt together, ſpirit of wine will in leſs than an hour, and ſometimes in leſs than a quarter of that time, diſſolve enough of this matter to be richly colourd by it, and this without the help of external heat. And I ſee not, why it ſhould be impoſſible, that the action of the fire may reduce the corpuſcles of bodies to ſuch a minuteneſs, and aſſociate them either among themſelves, or with the corpuſcles of other bodies, which, without preparation, will not diſſolve in water, that the pores intercepted between them may be entered, and their looſe texture diſſolved by that menſtruum. Of which conjecture though we have not a perfect inſtance, yet we have a probable one in that, which I ſhall hereafter deliver concerning the making of fixt nitre. For though the cryſtals of well purified ſalt-petre may be kept many weeks or months in an ordinary lodging-chamber (for I had not occaſion to try it in a cellar) without relenting by the moiſture of the air; yet if without the addition of any body diſſoluble in water, or moiſt air, it be in great part reduced, as perhaps it may be almoſt in a trice, to a fixt alkali, this ſalt will be eaſily enough penetrable by the vapours, that rove up and down in the air; and will by that moiſture, in no long time, be brought to relent, and at length will be reſolved into a liquor very analogous to that, which the chymiſts make of ſalt of tartar left in moiſt cellars to deliquate.

As for the ſapor, which is the ſecond qualification to be conſidered in the vulgar notion of a ſaline body, I doubt, whether the neceſſity of it be agreeable to another principle of theirs, and to experience. For it is plain, that chymicall oils, even thoſe pure ones they call *eſſential*, or even ethereal ones, are highly ſapid: and yet theſe not diſſolving in water, it ſeems there is no ſtrict connection betwixt being ſaporous, and being ſoluble in that liquor; and that, if bodies be reduced into a multitude of parts minute and ſharp enough, it is very poſſible, that ſome of theſe, either in part, or in conjunction with others, may acquire a ſize and ſhape, that fits them ſenſibly to affect the organ of taſte, though perhaps the bodies themſelves, or perhaps thoſe bodies, that afforded them, are more of ſome other nature than of a ſaline. This may be illuſtrated by theſe groſs examples; that a ball of glaſs, for inſtance though, whilſt it is entire, it will not prick and hurt the ſkin, yet if it be broken and beaten, the little fragments will, not as they are glaſs, but as they have points or edges. And ſo, though a ſtick, being graſped in a man's hand, will not pierce the ſkin, or put him to pain; yet if it be cut into tooth-picks or reduced to ſplinters, their ſharpneſs and ſtiffneſs gives them a power to wound, that they had not before. Something analogous to what we, in theſe examples, ſee to be done upon the organs of touch, may be conceived to be done upon the organs of taſte (which is a kind of touch) of which an almoſt full inſtance may be given in purified ſalt-petre. For though this concrete have but a faint and languid taſte, yet if it be carefully diſtilled with ſome additament, that is not diſſoluble in water, and is inſipid, the parts of it being, by the action of the fire, either broken aſunder, or cleft, or rubbed, or ground againſt one another, till they are reduced to edged and pointed corpuſcles; ſalt-petre, I ſay, thus treated will be reſolved into differing ſubſtances, each of which has an extremely ſtrong and penetrant taſte, which, whence it ſhould proceed but from ſome ſuch mechanical change, as we have been deſcribing, is not eaſy to declare: and perhaps alſo the phlegmatick liquor, that is wont to come over in this analyſis, may, at leaſt as to part of it, be produced by the operation of the fire, and ſo the phlegm being inſipid, the taſte, I mean as much as was in the unanalyzed nitre, may be as well deſtroyed, as thoſe of the ſpirit and alkali are generated by the operation of the fire. But perhaps there needs no other argument, that the ſame parts of matter, according to its differing ſtates, may have the

qualities, that chymiſts would have to be proper to this or that principle, than what we have took notice of in chymical oils, which do more ſtrongly affect the taſte, than the moſt of ſalts themſelves are found to do. And to confirm our doctrine of the producibleneſs of ſalts by the authority of *Helmont*, which is very great, at leaſt with the chymiſts of his own ſect, I ſhall obſerve, that he aſſures us, that by *Paracelſus*'s *ſal circulatum* ſolid bodies, among which he particularly, and in the firſt place, inſtances ſtones, may be tranſmuted into actual ſalt equiponderant to the body whereof it was made. So that upon the chymiſts ſuppoſition, that in theſe mixt bodies there is both ſulphur and mercury, beſides a *terra damnata*, the ſame portions of matter, that pre-exiſted in the form of either of thoſe ſimple ingredients, muſt, by the operation of the fire, and an anomalous menſtruum, have been turned into ſalt; and if the Helmontian experiment be allowed of, whatever becomes of the chymical ſuppoſition, we may ſafely conclude, that ſalt may be made of matter, that was not ſalt before, and conſequently that ſalt may be *de novo* produced. And thus much of the poſſible origination of ſalts in general, which I thought fit to premiſe to what I am going to offer about the production of the particular ſorts of ſalt. Though I have elſewhere enumerated and diſtinguiſhed ſeveral kinds of theſe bodies, whereto chymiſts have given the title of ſalts; yet thoſe, that more properly deſerve that name, and more directly appertain to our preſent diſquiſition, ſeem to be chiefly theſe three: the acid, ſuch as vinegar, ſpirit of ſalt, *&c.* the alcalizate or fixed lixiviate ſalts, made by burning, ſuch as ſalt of tartar, and of wormword, barillia, pot-aſhes, *&c.* and the volatile and urinous ſalts, ſuch as ſalt of hartſhorn, of urine, of blood, of ſoot, *&c.* which taſte and ſmell like that of urine. Wherefore, if we can ſhew, that theſe may be produced *de novo*, or (which we have intimated to be equivalent for our purpoſe) tranſmuted into one another, we ſhall, I hope, be thought to have ſucceeded in our preſent attempt.

Vide Helmontium in tractatu dicto Elementa, N° 11. *& alibi.*

SECT. I.

Of the production of acid ſalts.

AND to begin with acid ſalts, we ſee, that even ſweet wines will but too often, without addition, degenerate into ſour vinegar, which will diſſolve coral and divers ſtones, calcined lead, and ſeveral other minerals. The rain-water, that is imbibed by the roots of trees, is in thoſe, that bear limons and barberries changed into liquors, abounding with ſaline corpuſcles, that enable them to affect the taſte, and act on powdered pearls, and ſeveral other bodies, as acids are wont to do. Alſo guaiacum and divers other woods, that do not at all taſte ſour, will, being diſtilled in retorts, afford ſpirits, that are furniſhed with ſtore of acid particles, which, as I have tried, will hiſs upon alcalies, and will diſſolve coral, and even lead itſelf calcined into minium, and make *ſaccharum Saturni* of it. Many other vegetable bodies alſo do, without addition, afford the like acetous liquors. And if it be objected, that theſe were pre-exiſtent in the bodies, whence they were obtained, and were only extricated by the operation of the fire; it will concern thoſe, that affirm this, to prove it, (which no body, that I have met with, hath yet done:) and I ſhall the rather require it, becauſe I find, that the ſweeteſt bodies, and thoſe of differing kinds, as (to omit raiſins of the ſun) ſugar and honey themſelves, afford ſuch a ſort of ſpirits, which the trials, I elſewhere mention, ſhew to be ſharp and piercing enough. To which may be added, that in divers caſes, where we are ſure, that acid ſpirits were plentiful ingredients of a compoſition, as in *ſaccharum Saturni*, and that magiſtery, which the chymiſts call ſalt of coral, (which are not the only mixtures I have made trial of,) experience witneſſeth, that the liquor, which comes over by diſtillation in retorts, is not acid, but quite of another kind. I would not, by what has been ſaid, be concluded to deny, that acid ſalts may, in ſome mixt bodies, be ſo aſſociated with others, and obſcured by them, as not to be diſcernible by the taſte, till they be ſeparated by the operation of the fire. But to ſhew, that ſuch acid ſalts were *de facto* pre-exiſtent, as acid ones in the body, that affords them, there muſt be ſome poſitive proof, other than the liquors diſtilled from them, ſince they, as we have already argued, may be not barely extricated, but may have their acidity produced by the operation of the fire. And we ſee, that ſalt-petre, though it have no acid taſte, may be made to afford, by (a certain way of) diſtillation, above three quarters of its weight of a highly acid liquor; and yet it appears not, that ſuch a great proportion of acid particles, or poſſibly any conſiderable proportion at all, was employed by nature in the compoſition of ſalt-petre. At leaſt, having diſtilled earth, that I cauſed in my own preſence to be dug out of a pigeon-houſe below the dung; I had from it a ſalt indeed, and ſome little ſaline liquor, but of a nature, as far as I obſerved, very differing from that of the acid ſpirit of nitre. (But this experiment I mention occaſionally, without building upon it.)

NOR do I think, it ought to ſeem incredible, that acid ſalts, as well as others, ſhould be producible by the various ſplittings, attritions, coalitions, and changes of texture, which may be cauſed ſeveral ways, and eſpecially by the operations of the fire; which moſt active agent, making a vehement and various agitation of all the minute parts, that a body conſiſts of, may, conſonantly to what hath above been intimated, ſplit or break ſome of them, and as it were grind others againſt one another; and in ſhort, ſo alter their bulk, figure and motions, as to make them fit to ſtab or cut the tongue, and the other bodies, that they work on, after the manner of thoſe bodies we call acid. But of this you may find more in our notes about the mechanical origin of taſtes; wherefore I now proceed to the ſecond part of my taſk.

SECT.

SECT. II.

Of the production of volatile ſalts.

AS to the production of volatile ſalts, we have an eminent inſtance of it in the ſalt obtainable by diſtillation from ſoot; for though the woods we burn in our chimneys ſeem not to have any thing of the taſte or ſmell of urinous ſalt, nor have the diſſolutions of the ſaline parts of ſuch woods communicated to water by their infuſion in it, been obſerved (that I know of) to be of affinity in taſte or odour with the ſalt of ſoot; yet when wood is firſt burnt in the fire, and then the ſoot afforded by it is duely diſtilled and rectified in fitly ſhaped veſſels, there is obtained a ſpirit and a white volatile ſalt, that in ſmell, taſte, and divers operations, by which we have examined them, appear to be of great affinity with thoſe of human blood, or urine, and may be eaſily enough miſtaken for them.

BUT this double operation of the fire is not always neceſſary to the production of volatile ſalts out of vegetables. For, though by their diſtillation in retorts we generally obtain from them no dry ſalt at all, but a ſouriſh ſpirit, with which I have diſſolved coral, lead, and other hard bodies, that urinous ſpirits have not been obſerved to work on; and they will, being put upon urinous ſalts, make ſuch an hiſſing and conflict, as are looked upon as great tokens of antipathy: yet I remember, that ſeveral years ago, I did from muſtard-ſeed, that had been kept for a convenient time, obtain by diſtillation a volatile ſalt, that faſtened itſelf in prettily figured grains to the upper part of the receiver, and this at the very firſt diſtillation; ſo that there was no need of rectifying the diſtilled matter, to ſeparate that ſalt. And to enforce this proof by ſomething more conſiderable than itſelf, I ſhall add, that by an eaſy way by word of mouth communicated to me by a very ingenious perſon (Dr. *D. E.*) one may, out of very many vegetables firſt duely prepared, without adding any thing to them, by bare diſtillations in retorts, obtain good ſtore of volatile ſpirits and ſalts, which by their fugacity, colour, ſmell, taſte, and divers experiments, that I purpoſely made to examine them, were ſo like the ſalt and ſpirit of urine, ſoot, *&c.* that one, that knew nothing of the way they were made by, would readily have concluded they belonged to one or other of the newly named ſorts of bodies.

I REMEMBER, that I have alſo ſometimes produced a volatile ſalt, that one would readily have pronounced urinous, of a mineral itſelf; nor was that the only foſſile, from which experience perſuaded me, that ſalt of this kind might be obtained.

SOME other particulars relating to the production of volatile ſalts, I think fit to reſerve, till I ſhall have occaſion to mention them in another ſection, (as inſtances of the production of urinous ſpirits.) Only there is one thing, that I think not fit here to pretermit, becauſe I have not met with it in any chymical writer, the contrary being rather generally taken for granted. I ſhall add then, that it is not univerſally true, that ſaline ſubſtances, that are volatile and aſcend in the form of ſalt, are of an urinous nature, and enemies to acids. For I have had from verdigreaſe, diſtilled *per ſe* with a ſtrong fire, a very acid ſpirit; which being warily rectified, afforded firſt a ſour phlegm, and then a penetrant ſpirit ſharper than it, leaving behind it in the veſſel ſome few ſpoonfuls of a dark-coloured liquor, which being ſet aſide, and ſuffered to reſt, did in a great part ſhoot into tranſparent cryſtals, large but thin, almoſt like thoſe of ſilver diſſolved in aqua fortis. They appeared prettily figured at the edges, but were ſo oddly connected among themſelves, that I was not able to refer them to any of the known geometrical figures; and their brittleneſs made them the leſs tractable, but their ſmell, which was ſtrangely piercing and not inoffenſive, argued them to be of the ſame nature with the acid ſpirit, which had come over with them.

BUT there is a more conſtant and eaſy way of producing ſuch a volatile ſalt, as my obſervation mentions. For if amber be gradually and warily diſtilled, it will afford, beſides the phlegm, ſpirit and oil, a dry ſubſtance, which, though the chymiſts call the volatile ſalt of amber, I found to be really of an acid nature, by ſeveral of thoſe trials, by which we are wont to diſcern, that a body belongs to the family of acids.

SECT. III.

Of the production of alkalies or lixiviate ſalts.

THE third and laſt ſort of ſalts, which we are to endeavour to ſhew to be producible, are the alkalies or fixt ſalts; which ſeem to have an antipathy with acid ones, by making a conflict with them, and exerciſing divers operations contrary to their's, (as I have in another diſcourſe more fully declared.)

As for the origin of theſe fixt ſalts of burnt bodies, the Spagyriſts are not of the ſame mind about it. For, the almoſt univerſal opinion of the chymiſts, that preceded *Helmont*, and the more common opinion even of later chymiſts, ſeem to have been, that theſe fixt alkalies are pre-exiſtent in mixt bodies; and that the fire does but ſeparate or extricate them from the other parts of the compounded body. But *Helmont* (followed in that by ſeveral chymiſts, that diſſent from him in other points) has ingeniouſly conjectured, that theſe lixivial ſalts do not pre-exiſt in their alcalizate form in the bodies, that afford them, but are productions of the fire, by whoſe violent action a part of the ſalt, which, in the concrete, is naturally all volatile, lays hold of ſome parts of the ſulphur of the ſame body, and both together are colliquated and fixt into an alkali; which fixation he ſomewhere exemplifies by that, which happens, when ſalt-petre and arſenick, that are both volatile, being expoſed to the fire, are by its operation fluxt and made to fix one another. But though this account be ingenious, yet I doubt, whether it be ſo clear and ſatisfactory, eſpecially ſince it is applied to all fixt alkalies, as the embracers of it think it. For beſides,

Vide Helmontium in Blas humano, N° 38, & 43.

that it may be queſtioned, whether it have yet been well proved (what *Helmont* teaches) that all the ſalt of mixt bodies before their combuſtion is volatile, it is not declared, what volatile ſalt is meant; though it be plain, that ſome bodies, that afford a fixt ſalt, do abound in acid ſpirits, as oak, box, and many other vegetables; and others, as hartſhorn, blood, urine, *&c.* abound with urinous ſalts, that exerciſe hoſtility with acids: and I have found, that from ſome bodies I could obtain both acid ſpirits, and ſuch as are wont to be called urinous. It is not eaſy to explain, how the volatile ſalt comes to unite it ſelf ſo intimately with the oil (or ſulphur;) and though it be alſo volatile it ſelf, to compoſe with it a body capable of enduring the violence of the fire, ſince we have more than once tried, that the volatile ſalt of urine, or of hartſhorn, and a chymical oil, as of turpentine or any ſuch, being put together, the ſalt will indeed aſſociate to it ſelf ſome particles of the oil, but will nevertheleſs in their company ſublime in the form of a ſalt, with a very gentle fire. And the example, that *Helmont* ſomewhere gives of arſenick and nitre, does not ſatisfy me, becauſe that when I made equal parts of thoſe two bodies to be mingled, and in a ſtrong crucible fulminated together, a great part of the mixture was driven away by the fire, ſo little altered, that it is very dangerous to be too bold with the fumes, and a good part of what remained was fixt only, in compariſon of the crude arſenick, but not comparably to ſalt of tartar, or ſome ſuch other true alkali: and the conſtancy of the part, that was more fixt, may probably be aſcribed to the ſalt-petre, which we know will, without the help of arſenick, afford a great deal of fixt ſalt, if about half of it be burnt away, by the help of powdered charcoal, or ſome other convenient additament. It may alſo ſerve to weaken this inſtance of *Helmont*'s, that there are other inſtances, in which we may obſerve, that no ſuch thing happens, as his hypotheſis may make one expect. For common ſulphur is by chymiſts ſaid to abound in an oily part, upon whoſe account it is very inflammable, inſomuch that they would have other inflammable bodies to be ſo, by their participating of ſulphur. That this concrete alſo abounds in ſalt, is evident, according to their principles, by the acid menſtruum afforded by it, that goes under the abuſive name of *oleum ſulphuris per campanam.* And yet theſe ingredients, combined by nature, make up a concrete, which is ſo volatile, that both in cloſe veſſels and the open fire, it is almoſt totally volatile. And in that mixture of highly dephlegmed ſpirits of wine and urine, that *Helmont* calls the *Offa alba*, though the urinous ſalts do manifeſtly combine themſelves with the ſpirit of wine, which being totally inflammable, the chymiſts refer to their oil, or ſulphur; yet the coagulated mixture does not, by this aſſociation of ingredients, grow fixt, but proves very volatile. I will not here urge, in favour of the common opinion of the chymiſts of the pre-exiſtence of alkalies in mixt bodies, that a corpuſcularian may ſay two not inconſiderable things; whereof the firſt is, That there is no need of ſuppoſing a colliquation of ſalts with ſulphurs, oils or any thing elſe to produce fixt ſalts; ſince, beſides that that ſuppoſition does not explain, how two volatile bodies come to compoſe one that is fixt, it is plain, that a body yet more fixt may be made without any aſſociation of differing principles. For the earth, that together with the alkali remains in the aſhes of a burnt body, is more fixt than the alkali it ſelf, and yet derives not its fixity from any combination of elements, or principles, but from the groſſneſs, ſolidity, or weight, and unfitneſs for avolation of the corpuſcles it conſiſts of. And the corpuſcularian may add in the ſecond place, that whereas ſome inſtances are alledged, wherein there is ſuppoſed a leſſening of the quantity of the fixt alkali of the concrete, by operations, that are ſaid to carry off the volatile ſalt, before the body comes to be incinerated; it may be anſwered, that perhaps thoſe very operations did but rarefy and volatilize part of the pre-exiſtent alkali, and ſo left the leſs of it to be recovered by burning; as the chymiſts tell us, that fermentation rarifies the oily parts of the juice of grapes, and ſubtilizes them into vinous ſpirits, and ſo does much leſſen the quantity of the oil. And when wood is burnt in a chimney, it is not in the form of an acid ſalt, which is the only, that is commonly obſerved to be driven away by diſtillation in cloſe veſſels, but in that of an urinous ſalt, (which is a-kin to alkalies, and an enemy to acids) that the ſaline part of the wood is made to aſcend; as may appear by the diſtillation of ſoot. Such arguments as theſe a corpuſcular philoſopher might, as I was ſaying, urge in favour of the more received ſpagyrical opinions. But inſtead of inſiſting on them, I ſhall only invite you to take notice of what I obſerve in ſalt-petre. For, though by diſtillation, or any other way, that we yet know, there is no oil to be ſeparated from it; yet above *half* the body of it may be eaſily and quickly turned into a fixt ſalt, in colour, taſte, and operation, much like that of tartar, and other incinerated vegetables. And ſuch an alkali I have made without the help of injected coals, or any other body, furniſhed with a combuſtible ſulphur: ſo that it ſeems not, at leaſt univerſally, true that to the production of an alkali there is neceſſary to be at hand an oil, or ſulphur, to be laid hold on by the volatile ſalt, and fixt together with it. But this experiment is far more congruous to our doctrine, which derives all thoſe ſalts from the ſize, ſhape, and ſolidity or weight of the ſaline corpuſcles; ſince the ſame ſalt-petre, whoſe greater portion may, by the operations newly mentioned, be reduced to a fixt alkali, may, by being diſtilled with a convenient bolus, have its greater portion brought over in the form of an acid ſpirit or ſalt, which it ſelf may afterwards be made materially to concur to the production of an alkali. I might add, that even from one of * *Helmont*'s own experiments, my concluſion may

Vide Blas humanum, N° 41.

Vide Helmontium Complex. atque Miſt. &c

* *Cin's proprio ſuo alkali fit ſal mercum, complex. atque miſt.* N° 12. *Idem Helmontius in Blas humano,* N° 39 *videatur*

may be inferred, ſince he ſomewhere, and, if I miſtake not, in more places than one, affirms, that by the addition of more alcalizate ſalt and the operation of the fire, the earth it ſelf, that is in the aſhes, may be turned into ſalt; which, if true, argues, that a fixt ſalt may be made of that, which was not before, either of ſaline, or of an oleous nature; and conſequently without any ſuch combination of ſalt and oil, or ſulphur, as his hypotheſis ſuppoſes. From which experiment I may alſo infer the poſſible origination of alkalies, by the mechanical changes, that, without the addition of oil or ſulphur, the operations of the fire may produce in the part of a mixt body; ſince earth (excepting water) ſeems the moſt indiſpoſed of any part of the concrete to be turned into fixt ſalt.

I MUST not here pretermit an obſervation, that I have made, which ſeems to overthrow the opinion of thoſe learned chymiſts, who will have the violence of the fire to be always a neceſſary agent, as I allow it to be ordinarily, to the production of a fixt or lixivial alkali. I ſaid ſeems to overthow, becauſe I had not the opportunity to repeat my trials, and am not ſure, that the ſalt I employed was altogether genuine, in regard I cannot here in *London* meet with it, at any rate; but I have great cauſe to think it was right, both for other reaſons, and becauſe it was ſent with other things, for a preſent out of the Eaſt, to an inquiſitive nobleman, who had been lately ambaſſador for his Britiſh Majeſty, at the Ottoman Court, and who was pleaſed as a rarity to preſent it me.

THIS ſalt was affirmed to be the true Egyptian nitre, mentioned ſo much by ancient writers: and indeed I found it to agree much better with the notion, that books had given me of it, than with that ſort, to which chymiſts generally give the name of nitre, and which is indeed the only nitre to be uſually met with in our European ſhops; where it is beſt known by the vulgarly received name of ſalt-petre. But to ſay ſomething of our Egyptian nitre, though it be not pertinent to mention here all that I obſerved about it, yet I muſt not here omit two things, that I made trial of, with that little, which eſcaped the misfortune that loſt me all the reſt, that ſeem conſiderable in the preſent occaſion.

THE firſt whereof is, that this Nilotick ſalt was very apt to imbibe the moiſt air, as calcined tartar and other fixt alkalies are wont to be; to which reſolution we do not find our ſalt-petre, if it be unmixed, diſpoſed. But the other and more important thing I obſerved, was this, that having upon this Egyptian nitre, crude as it was, poured ſpirit of ſalt, this acid liquor did preſently, even in the cold, work briſkly upon it, as if it were a fixed alkali, or at leaſt abounded with ſuch a lixivial ſalt. And here, upon the by, give me leave to take notice of a text of the holy Scripture, that has ſometimes puzzled not only me, but far better criticks in the Hebrew tongue than I. And it is a paſſage to be found in the 25th chap. of *Solomon*'s Proverbs, where, to illuſtrate things very incongruous to one another, the diſagreement of vinegar and nitre is mentioned; for ſuppoſing the words to be rightly tranſlated, as beſides the authority of I know not how many verſions, the very ſound of the Hebrew word *næter* or *næthar* argues it to be, it ſeems very hard to find, what ſhow of antipathy there is between vinegar and the ſalt-petre, that is commonly ſold in our ſhops for nitre. Wherefore ſtrongly preſuming, that *Solomon*, who reigned in *Judæa*, a country near to *Egypt*, and had much commerce with the Egyptians, whoſe King's daughter he had married, made uſe of Egyptian nitre as the beſt known, if not the only in his time and country; and might have found in this nitre ſome quality very differing from any we find in our ſalt-petre; as I remember, that in the Prophet *Jeremy* nitre is mentioned as a very abſterſive thing, and fit to cleanſe women's ſkins, which is a known virtue of our fixed alkalies, but not obſerved in pure ſalt-petre: wherefore when once I received the nitre, that I have mentioned, and ſaw in it ſigns of an alkalizate nature, I quickly poured upon it ſome ſtrong vinegar, and found, as I expected, that there preſently enſued a manifeſt conflict, with noiſe, and ſtore of bubbles; with which experiment I afterwards acquainted ſome criticks, and other learned men, who were not ill pleaſed with it. But this theological uſe of the alkalizate nature of nitre not being that, which I chiefly mentioned it for, I ſhall now make the philoſophical uſe I intended, by taking notice, that Egyptian nitre being acknowledged to be a native ſalt, and made only by the evaporation of the ſuperfluous water of the *Nile*, (or ſome other ſuch liquor) is yet of a lixiviate nature, or at leaſt abounds with particles that are ſo: though, as I freſhly intimated, it was produced without any precedent incineration, and the matter of it ſuffered not, or at leaſt needed not ſuffer any violence of the fire to make it afford an alkali. Jer. ii. 22.

I HAVE repreſented theſe things, not for that I pretend to be ſure, that alkalies may not be produced in multitudes of mixt bodies, eſpecially in a good number of vegetables, after the way propoſed by *Helmont*, or by ſome ſuch like; but partly, becauſe it ſeems not always neceſſary to the exiſtence of an alkali in nature, and to be the only way it can be produced by; and partly, becauſe I would give you and your chymical friends occaſion to clear (as far as they can) and confirm the doctrine I have queſtioned. It is true, that being a far greater friend to truth, than an enemy to the chymical hypotheſis, I would not ſtifle what may ſerve to advance that, in favour of *Helmont*'s doctrine, though this would never ſo well accommodate my preſent argument. But I have no great temptation to ſurmount in this caſe, for it concerns very little the main ſcope of this diſcourſe, whether *Helmont*'s way, or any other, of the production of alkalies be embraced; ſince it will ſuffice for my purpoſe, if ſome bodies belonging to this family, or kind of ſalts, may be produced: I ſay ſome, becauſe (as I have already intimated) I will not peremptorily aſſert, that all fixed alkalies are productions of

the fire, or made by the help of it; though I do not readily remember, that I have met with any (except Egyptian nitre) that are not. But I ſhall wave that queſtion, becauſe my intended brevity calls upon me to proceed to the mention of ſome particular inſtances, fit to perſuade us, of the producibleneſs of ſome alkalizate ſalts.

IT is known, that chymiſts generally look upon ſpirit of nitre and aqua fortis, as liquors containing not alkalies, but acid ſalts; which they conclude not only from the taſte, but from the great ebullition, that is made, when thoſe liquors are poured on the ſalt of tartar, fixed nitre, pot-aſhes, or other ſuch unqueſtioned alkalies. That ſea-ſalt likewiſe does not contain alkalies, is generally taken notice of, the ſpirit of it being juſtly reckoned among the acid ones; and when I purpoſely examined that concrete by diſtillation, the remaining ſalt, though the fire had been violent, was very differing from alkalies: and yet my conjectures inclining me to ſuſpect what the event would prove, I ſeveral times made the following experiment upon ſea-ſalt, that yet retained all its acid ſpirit in it.

UPON well dried and powdered ſea-ſalt we put into a retort ſometimes an equal, and ſometimes (which I prefer) a double weight of good ſpirit of nitre, or aqua fortis, and leiſurely diſtilling all that would come over, we took out the dry ſalt remaining at the bottom, which we found much changed both as to colour, (a good part of it being uſually very reddiſh) and as to taſte, which was differing enough from what it had been before, and might probably have been made much more ſo, if freſh ſpirit of nitre had been once or twice more abſtracted from it. This ſalt being again powdered (for it was in a lump when taken out) and put into a crucible, placed in a convenient fire, was by the repeated injection of fragments and well kindled charcoal made to flaſh divers times almoſt like melted nitre; and when it would flaſh no longer, the remaining matter being taken out, did, in great part, appear to be brought to an alcalizate nature, for it had a fiery taſte upon the tongue: if ſpirit of nitre or aqua fortis were poured on it, it would make an ebullition, it would turn ſyrup of violets green, and, in ſhort, exhibit divers phænomena of alkalizate ſalts.

ANOTHER way there is like that mentioned of making an alkali out of nitre, which is thus done; pour upon it an equal weight, or half the weight of ſtrong oil of vitriol; and having diluted the mixture with a convenient proportion of fair water, diſtil it by degrees, till there remain a ſubſtance very dry. Powder this, and mix it well with about an eighth part of beaten charcoal; keep them in fuſion in a ſtrong and covered crucible, till the maſs grow very black, and a little of it being taken out with a wire, taſte fiery upon the tongue, (which may happen in about half an hour or an hour, according to the quantity of matter, and degree of fire:) then take out the blackeſt or deeply red mixture, which will very eaſily imbibe the moiſture of the air, and you may find it, at leaſt while it is hot and dry, of a more fiery lixivial taſte than ſalt of tartar itſelf. It will make an ebullition with acid ſpirits, and precipitate divers ſolutions made with them; it will turn ſyrup of violets green, and in ſhort diſcover itſelf many ways to be of an alkalizate nature, though it be aſſociated with a ſulphur, that may, by divers methods, be made appear to be contained plentifully in it.

IT is alſo conſiderable on this occaſion, how the ſame body, without the addition of any other ſalt, may by the various manner of the fire's application to it be made to afford, either little elſe than acid ſalts, or a leſſer or greater quantity of alkali: for if fine ſalt-petre be dexterouſly diſtilled with about thrice its weight of ſome fit earth, (but not, as is uſual, with powdered bricks) it will ſometimes afford very near as much ſpirit of nitre as the ſalt weighed; and though this, like other liquors, be not without phlegmatick parts, yet beſides that it may be doubted, whether moſt or many of them were not produced by the tranſmuting operation of the fire, we may ſuppoſe, that five parts of ſix, or ſix of ſeven have been diſtilled into dephlegmed ſpirit.

BUT if, according to the way I have elſewhere * circumſtantially delivered, (which is by frequent injecting into fluxed ſalt-petre ſmall pieces of kindled charcoal, till one can make it flaſh no more at all,) you make fixed nitre, you may obtain from nitre thus handled half its weight, and perhaps better, of an alkalizate ſalt, that many would, by its taſte and operations, gueſs to be ſalt of tartar.

BUT to ſhew yet further, how much the production of this alkali depends upon the operation of the fire, which, as it is variouſly applied, may vary the texture of the ſalt-petre, my conjectures led me to try the following experiment, which I did with ſucceſs from the beginning. We took a pound of good ſalt-petre, which was but groſly beaten (for it ſhould not be finely powdered) and having laid it on a conical heap upon a flat tile, that the air might on all ſides have acceſs to it, we cauſed the upper part of it to be kindled by a little fragment of burning coal, (which may be afterward thrown away.) Then we cauſed the laborant with an iron rod dexterouſly to ſtir the kindled part of the nitre, that the ignition might be preſently communicated to as many parts of the ſalt, as was poſſible; and this nimble ſtirring of the maſs, that the fire might be more diffuſed, and more parts might be obverted to the air, we cauſed him to continue to the end of the operation: by which method, within few minutes, we obtained, more than once, out of ſixteen ounces of ſalt-petre, about ten ounces or better of fixed nitre, very lixivial in taſte and operation; and for the colour, it was of a pleaſant greeniſh blue, and deeper than ſalt of tartar will uſually be brought to, by being (in a crucible) kept twenty times as long, in a good fire.

THE other ſcopes and uſes deſigned in this new and quick way of making the alkali of nitre

* In the *Eſſay of the differing Parts and Reintegration of Nitre.*

nitre belong to another diſcourſe, the experiment, which will ſcarce ſucceed without a dextrous management, being here mentioned to ſhew, what quantity of alkalizate ſalt may by a differing operation of the fire be obtained from nitre; which (crude nitre) in diſtillation ſkilfully made for the purpoſe may be in great part driven over, in the form of acid ſpirit, and phlegm, and leaves ſo little true alkali behind it, that I have wondered at it, being ſometimes ſcarce able to find any at all, though I purpoſely tried to ſeparate it from the tobacco-pipe clay, which the petre had been mixed with after a diſtillation, wherein not half of the ſalt had been driven into the receiver, in the form of ſpirit.

AND to ſhew, that to make the fixed ſalt of nitre, the actual inflammation of it, in the open air, is not neceſſary, as very learned men have ſuppoſed; and that it is poſſible, whatever is preſumed to the contrary, to make an alkali nitre, though charcoal, or ſome other combuſtible body be not added to it, to kindle the corpuſcles of the nitre by its ſulphur, and by the aſſociation of ſome part of the ſame ſulphur with the ſaline parts of the nitre, to compoſe an alkali; to ſhew this, I ſay, I more than once made the following experiment: With a convenient quantity of good ſalt-petre we carefully mingled about an eighth part of tobacco-pipe clay; and putting the mixture into a crucible cloſely luted at the top, we kept it by a fitly graduated fire in fuſion for ſome hours, and found, as we expected, that the remaining ſalt, (for part would get through the lute, or commiſſures in the form of fumes) was turned into an alkali, of a fair blue colour, like the better ſort of that fixed nitre, which is made with charcoal. This experiment, and that formerly made with tobacco-pipe clay, ſeem plainly to argue, that to the making of fixed nitre, which is confeſſed to be an alkali, a congruous change of texture may ſuffice; whether that change be attempted to be made in open veſſels, or in cloſe ones, with, or without the addition of the ſulphur of charcoal, or any other ſuch combuſtible body. Upon the ſame ground, that I had for trying the former experiment, I attempted, and not without ſucceſs, to make an alkali of ſalt-petre, by colliquating moderate quantities of it, ſeveral ways, (and keeping it in fuſion) with ſome metals: I ſay, moderate quantities of nitre, becauſe an ingenious gentleman, to whom I communicated this practice, could not make it ſucceed in any conſiderable quantities. And to obviate the ſuſpicion, though perhaps groundleſs, that ſome chymiſts might have of the material concurrence of a good portion of the combuſtible ſulphur, preſumed to be in the ignobler metals to the production of the nitrous alkali; I ſhall add, that our experiment ſucceeded, when we tried it more than once, with more than ordinarily fine ſilver, whoſe ſulphur, if it have any, is granted to be fixt or incombuſtible. And I remember the laſt trials afforded us a bluiſh alkali, though there were employed but a fifth part of ſilver, in reference to the nitre; and though the fire (which was continued for ſome hours) was ſo moderate, that the metal, though thinly laminated, was not melted; and of an ounce, that was put in, there wanted but four grains, which ſmall loſs might eaſily be imputed to divers accidents.

AFTER what is ſaid of the production of lixiviate ſalts and alkalies, it will not be impertinent to add, that as they may, by the operation of the fire, be produced; ſo by the operation of the fire they may be deſtroyed or deſpoiled of their alkalizate form, and turned into a ſubſtance of a nobler nature. This I am induced to think very probable by ſome experiments, amongſt which, that which ſeemed the moſt conſiderable, was this: we took a pretty quantity of good ſalt of tartar, that had been purified by ſolution and coagulation, and having put it into a clean crucible, we kept it in a ſtrong fire (that made the crucible red-hot) for a good while; then giving it at length a ſtronger fire, we poured it or (afterwards) took it out of the pot, and diſſolved again as much of it as we could in cold water, which being ſet to run through cap-paper, there appeared, as I foreſaw, in the filtre a pretty deal of matter, that would not (as the whole ſalt had done at firſt) be diſſolved in the water, but was turned into a kind of earthy ſubſtance. Then coagulating again the ſolution, that had paſſed through the filtre, into dry ſalt; we expoſed it again in the crucible to a ſtrong fire, and putting it again into water, we perceived it would not totally diſſolve, but left in the filtre a ſlime or mud. And in this manner we proceeded to ignite, diſſolve, filtre, and coagulate the ſame ſalt of tartar many times; for, if I much miſtake not, it was ſixteen times, and ſtill found ſuch an earthy ſubſtance as has been ſpoken of, remaining in the filtre; and the reſt of the ſalt of tartar ſo little altered, that being ſomewhat tired, and other ways diverted, I deſiſted from proſecuting the operation to the uttermoſt; concluding it highly probable, that the remaining ſalt might, by the ſame way of management, be brought to yield more and more of that ſame ſubſtance, which either was earth, or of kin to it, being at leaſt ſomewhat, that was of a nature very differing from ſalt of tartar, ſince it was not like it, fiery on the tongue, and was indiſſoluble in water, as earth, but not ſalt of tartar, is known to be.

SECT. IV.

IT may bring ſome illuſtration, and add ſome probability to what has been diſcourſed about the producibleneſs of ſalts, if we conſider what happens in the compoſitions and decompoſitions of ſaline particles, and their operations on other bodies, and on one another. For if it appear, that, by theſe manifeſt and mechanical ways, ſuch alterations may be made, and ſuch qualities produced, as are either altogether, or very near as conſiderable, as thoſe, which diſcriminate the ſeveral families of ſalts, formerly ſpoken of, from one another, and from this or that chymical principle; it will, I preſume, be judged the more credible, that theſe families

lies of ſalts may be either tranſmuted into one another, or otherwiſe produced; and ſo may not be primordial and immutable beings, in the ſenſe, wherein the chymiſts would have them to be ſuch. I have elſewhere taken notice of the production of vitriols, ſal armoniac, borax *, and divers other factitious ſalts; for which reaſon; I ſhall not inſiſt on them here the rather, becauſe it may ſuffice for my preſent purpoſe to take notice of two ſalts, whereof the one is meerly factitious, and the other ſuch in great part; and yet each of theſe, by a very ſlight and eaſy way of ordering it, afforded me differing ſaline concretions, ſome of which reſembled a ſalt, which many judge the moſt ſimple and natural, that we yet know of.

To ſhew then, that common ſalt itſelf, that ſeems the moſt primitive and ſimple amongſt groſs and viſible ſalts, may be produced by a change of texture made in bodies very differing from common ſalt, I ſhall recite an experiment, which though it have ſometimes failed me, yet it has divers times anſwered my deſire, though I ſhall now relate but that ſingle one of my laſt trials, that ſucceeded beſt.

THAT, which our Engliſh glaſſmen call *fandever*, and the French, of whom probably the name was borrowed, *ſuindever*, and is, you know, that recrement, that is made, when the materials of glaſs, namely ſand and a fixt lixiviate alkali, having been firſt baked together, and then kept long in fuſion, the mixture caſts up the ſuperfluous ſalt, which the workmen afterwards take off with ladles, and lay by as little worth; this ſalt ſeldom uſed by mineraliſts, and ſcarce wont to be mentioned by the writers of courſes of chymiſtry, I have thought fit to employ about ſeveral purpoſes, invited thereto by conſidering the uſual way, wherein it is produced. For in ſandever we have a ſalt, which was once altogether lixiviate, but which having been kept long melted in a ſtrong fire with ſand (or flints or pebbles) muſt have had its ſaline corpuſcles variouſly and forcibly ground or rubbed againſt another, and againſt the particles of the ſand, ſome of which it may alſo have diſſolved and retained with it; by which rude juſtlings and mutual attritions, I thought it very probable, that the alkali muſt not only have been conſiderably altered, but variouſly too, ſome parts being changed more and after a differing manner than others, by which means ſandever may conſiſt of portions differingly qualified both in reference to the lixiviate ſalt, that was at firſt employed, and to one another.

WE took a pretty quantity of good ſandever, and having diſſolved it in fair water, and filtred it, we ſet it to evaporate in a digeſtive furnace, till a ſaline cruſt, as if it were a thin plate of ice, ſpread it ſelf upon the top of the liquor; then ſuffering it to cool and cryſtallize, we broke the mentioned cover, to come at the cryſtals, and ſet the liquor we had poured off from them to evaporate further and ſhoot again: and in this method we proceeded, whilſt we judged worth while to do ſo. By this means we obtained good ſtore of cryſtals, whoſe figures were not the ſame, but many of them differing enough, though moſt of them tranſparent and prettily ſhaped, as if nature had at once affected variety in their figuration, and yet confined her ſelf to geometrize. But the chief thing, for which I mention this experiment, is, by this way of proceeding, I more than once obtained (not on the very ſurface of the water, as is uſual in the concretion of ſea-ſalt) but in other parts, and chiefly beneath the ſurface of the ſaline plate formerly mentioned, a conſiderable number of grains of ſalt, that better anſwered to the deſcription of common ſalt, than diſſolved and filtered ſea-ſalt it ſelf is wont to do: for theſe grains, that were of no deſpicable bigneſs, were as like little cubes or dice, as if they had been made by a ſkilful jeweller; and their ſurfaces had a ſmoothneſs and gloſſineſs much ſurpaſſing whatever I had obſerved in marine or common ſalt.

I MAY confirm the difference, I have mentioned to be between ſandever and common alkalies, if I here add, that ſome while ago having ſet a good quantity of filtered ſolution of ſandever to coagulate in a cool place, and thereby brought a great part of the ſalt to coagulate into cryſtals, almoſt like thoſe of nitre, but ſo very diaphanous, that divers them were clear as rock cryſtal it ſelf; I did not obſerve them to relent by the moiſture of the air in a long time, though the glaſs they were kept in were negligently enough covered with paper only; which argues their texture to have been remote enough from that, which is proper to alkalies: and to ſhew, that they were alſo ſalts of a peculiar nature, I ſhall further obſerve, that if they were expoſed, though but to a gentle heat, they would in no long time loſe their tranſparency, and be reduced to a white and fine calx; which being weighed and re-diſſolved in water, and made again to cryſtallize, would be diaphanous, and concoagulate with it ſelf ſo much of the water, as ſufficed to give a very notable increaſe of the weight.

SANDEVER, which afforded me the firſt of the two inſtances I promiſed you of the production of ſalts, is one of thoſe bodies, that many would reckon amongſt thoſe, that are almoſt meerly artificial. I ſhall now mention a ſecond inſtance of a body, wherein art ſeems to have little to do, ſave the eaſy extrication of its particles from thoſe, wherewith nature had blended it in a human body. If then man's urine, after having been kept ſome weeks in a cloſed veſſel, be expoſed to a moderate fire, firſt it will yield a ſpirit and a volatile ſalt, and then a very copious phlegm, which being totally exhaled, there will remain a dry *caput mortuum*; and this being warily calcined, diſſolved in water, and coagulated, if the experiment ſucceed with you, as it did with me, you will find the ſalt very different from a common lixiviate alkali, rather you will find ſaline concretions of differing forms, if not kinds: for I obſerved ſome to be oblong, and to look like ſmall cryſtals of nitre; others, to be of figures reſembling thoſe, that geometricians call *Rhombus's* or *Rhomboides*; and one of the faireſt of theſe

* In the *Eſſay of the Uſefulneſs of Chymiſtry to the Empire of Man.*

theſe lozenges, I remember, for trial-ſake, I kept for many days expoſed to the air, and that in winter, without finding it run *per deliquium*, as a piece of common alkali of that bigneſs would have done in a little part of that time. But beſides thoſe numerous ſaline concretions, that I could not eaſily reduce to any known figure, there was (which I chiefly expected, and would have you take notice of) a conſiderable number of fine grains, that looked like common ſalt, and were indeed more exactly cubical in their figure, than the grains of ſea-ſalt themſelves are wont to be. And I have the leſs cauſe to doubt, that the ſea-ſalt abounding in our *caput mortuum* was not a common lixiviate alkali, but conſiſted of parts of other natures, eſpecially of ſuch as compoſed ſea-ſalt; becauſe I obſerved, that the *caput mortuum*, when expoſed to calcination, began early to melt in the fire, before it was near calcined, as not an alkali, but ſea-ſalt, would have done; alſo becauſe the taſte was much nearer to that of brine, than to that of lixivium; and becauſe, laſtly, it would make no conflict with the ſpirit of ſalt, as an alkali would have done, but did make of a ſolution of ſilver in aqua fortis a white precipitate, like that we make of that metal with ſea-ſalt, but not with alkalies.

AND becauſe a miſchance unſeaſonably deprived me of the *caput mortuum* of domeſtick urine, prepared in my own laboratory, I was fain to procure a ſupply of fixt ſalt of urine made by a diligent Spagyriſt of my acquaintance, who had wrought much upon that liquor, and having diſſolved and filtered a pretty quantity of this ſalt, and ſuffered the ſolution to evaporate ſlowly, till it began to have a ſkin, I found the cryſtals it afforded in a cool place to be ſome of them an inch or two long, and ſhaped almoſt like cryſtals of nitre, ſave that they were ſharper at both ends, and to many of them were faſtened ſtore of minute and oblong cryſtals prettily ſhaped, which were placed almoſt perpendicularly upon the greater portions of ſalt, which by this means obtained a ſhape, not much unlike that, which the *French* engineers call *cheval de friſe:* theſe cryſtals, as they did not reſemble common alkalies in their figures, ſo they were unlike to them in divers other reſpects. For though ſome oil of tartar *per deliquium* being poured upon ſome of them, there enſued no manifeſt commotion, as is wont to be produced, when that liquor is mixt with a ſalt, where an acid is predominant, yet being beaten and mixt with an acid ſpirit, as that of common ſalt, they made not the leaſt ebullition or conflict, though they were ſtirred up and down to excite it; nor did aqua fortis, good enough to be worthy of that name, produce any hiſſing noiſe or froth, when it was put upon the ſalt of urine, though at length it diſſolved a good proportion of it. And though ſtrong oil of vitriol being put upon ſome of the forementioned cryſtals, did readily work upon them, and in corroding them excite a good number of bubbles, yet that did not ſurpriſe me, nor make me conclude the ſalt to be alcalizate, becauſe I have obſerved oil of vitriol (tho' not ſpirit of ſalt or aqua fortis) to work after the like manner upon common ſalt, of which that the fixt ſalt of urine did participate, I judge very probable, partly upon the account of the phænomenon newly recited, partly becauſe I found, that by impregnating good aqua fortis with a competent quantity of the fixt ſalt, inſtead of diſſolving in it ſea-ſalt, I could make it capable of corroding foliated gold, even in the cold; and partly alſo, becauſe that ſome part of the ſolution of our fixt ſalt, that was more ſlowly coagulable, being mixt with oil of tartar, preſently grew thick and muddy, and ſoon after let fall a precipitate copious enough: and another part of the ſame ſolution did readily precipitate ſilver diſſolved in aqua fortis, but would not ſo much as diſcolour a ſtrong ſolution of ſublimate, (made in fair water) from which a common lixiviate alkali would have immediately ſtruck down an orange-coloured powder.

A LIGHT ſuſpicion I once had, that the common ſalt, that moſt men eat to ſeaſon their aliments, may in ſome degree impregnate men's urine, gave me the curioſity to examine that of horſes, which I found to require rather a ſhorter than a longer putrefaction than human urine, to make it fit for diſtillation; but the *caput mortuum* of this alſo, I was by an accident hindered to examine ſufficiently: but by the ſpirit and volatile ſalt the liquor after putrefaction eaſily afforded, it ſeemed probable enough, that the fixt ſalt would have been not unlike that of men's urine. Of which laſt named olid and deſpicable liquor I choſe to make an inſtance in this place, becauſe chymiſts are not wont to care for extracting the fixt ſalt of it, (which is therefore commonly preſumed to be like other alkalies;) but as ſoon as they have diſtilled the ſaline ſpirits, throw away all the reſt as nothing worth. Which practice, as general as it is, I cannot commend; for though I am not altogether of *Helmont*'s mind, where he ſays, that *Wiſdom deſpiſes thoſe, that deſpiſe the indagation of urine, and refuſe by the fire to ſearch out its contents*; yet I think, that thoſe, who underſtand the myſtical writings of ſome of the beſt chymical philoſophers of former times, will look upon it as a more tolerable hyperbole, than other men or even vulgar chymiſts imagine it to be.

OF THE PRODUCIBLENESS OF SPIRITS.

PART II.

SECT. I.

Of the production of vinous ſpirits.

AS for what the chymiſts call ſpirit, they apply the name to ſo many differing things, that this various and ambiguous uſe of the word ſeems to me no mean proof, that they have no clear and ſettled notion of the thing. Moſt of them are indeed wont, in the general, to give the name of ſpirit to any diſtilled volatile liquor, that is not inſipid, as is phlegm, or inflammable, as oil. But under this general term they comprehend liquors, that are not only of a differing, but muſt be, according to their principles, of a quite contrary nature; ſome of them being acid, as ſpirit of nitre, of ſalt, and of vinegar itſelf; and ſome of them urinous, or, as ſome would have it, volatile alkalies, which are ſuch enemies to the former, that, as ſoon as they are put together in due proportions, they tumultuate and grow hot, and uſually continue to fight, till they have diſarmed or mortified each other. Beſides theſe two hoſtile families of ſpirits, there is a third ſort, which they call vinous or inflammable, which though very ſubtile and penetrant, is not manifeſtly either acid, or alkalizate; I ſay, manifeſtly, becauſe the taſte and ſmell of this ſort of ſpirit is differing from both the ſorts laſt named; and yet is referred to one, or the other of them, by ſome learned Spagyriſts; with whom I neither need, nor deſire to diſpute about this matter; ſince it may ſuffice for my purpoſe, if it can be made out, that all the three ſorts of ſpirits above mentioned, the vinous or inflammable, the urinous or alkalizate, and the acid, may be produced, and conſequently may be other than primeval bodies.

AND to begin with the firſt named, theſe vinous ſpirits are ſo producible by art, that we ſeldom find them produced by nature alone, which does indeed make the juice of grapes, but does not make wine, nor the ſpirit of wine, unleſs, by the help of man, that juice be preſſed out, and fermented. And the caſe is yet more plain in the ardent ſpirits made of ale, beer, and in the like vinous ſpirits made by the decocting and fermenting the ſeeds and other parts of vegetables. And it is obſervable to our purpoſe, that muſt (or the juice of grapes newly preſſed out) does not in diſtillation yield a vinous and inflammable ſpirit. And I remember, I had once the pleaſure to laugh at a man, otherwiſe very ingenious, who, to catch the ſubtile vinous ſpirit, that he would have me think was loſt in the common way of handling wort, made it work in a huge copper limbeck, to catch the ſpirituous parts, that he thought would otherwiſe fly away; by which means, inſtead of the ardent ſpirit he expected, he got nothing in his receiver but a nauſeous phlegm. I have alſo found by trial, that raiſins (which we know are but dryed grapes) being diſtilled alone, afforded an acid and empyreumatical, but not a vinous ſpirit; whereas, when I carefully fermented them with a due proportion of water, they would afford me in diſtillation an ardent ſpirit like that of wine.

IF it be objected, as I preſume it will, that the vinous and inflammable ſpirit, that is by fermentation obtained from bodies, was actually in them before, and is only extricated by fermentation; I anſwer, that this is *gratis dictum*, and is therefore not to be admitted till it be proved; ſince raiſins, and ſuch other fermentable bodies do not, upon the ſuppoſed analyſis made by diſtillation, afford a vinous ſpirit, but one that is very differing from it. And I ſee not, why the change of texture may not turn ſome part of the juice of grapes into a vinous and inflammable liquor, ſince a little further change is able to turn the ſame juice into a liquor, that is acid, and neither vinous nor inflammable, as it was before. And I have found by trial, that even this vinegar, crude as it is, being ſatiated with calx of lead made *per ſe*, would afford a ſpirit not acid, but of a very differing taſte, and inflammable, like the ſpirituous parts of wine. And if it ſhould be further objected, that theſe inflammable ſpirits were not produced by theſe operations, but pre-exiſting in the newly expreſſed juice of grapes, were only extricated by fermentation, and being afterwards covered or diſguiſed by the acid particles of the vinegar, were again extricated by diſtillation, the acid ſalts having fixt themſelves upon the lead they corroded, and thereby given the ſpirits leave to forſake them: if I ſay, this be objected, I might refer you to a more full anſwer, that I have elſewhere given. And at preſent it may ſerve the turn, that I put you in mind again, that the objection alledges no phænomena to make appear the actual pre-exiſtence of vinous ſpirits, either in the juice of grapes, or in the ſolution of lead.

AND though I need but deny what is barely affirmed, not proved; yet to examine this matter further than I had found others to have done, I did (as I elſewhere mention) make a *ſaccharum Saturni* with an acid liquor made without fermentation, or the addition of any liquor from wood itſelf; and then, diſtilling it alſo without any additament, I had, (as I expected) a ſpirit, that readily took fire and burnt away in a blue flame, like that of ſpirit of wine. I know another objection may be framed from the doctrine of ſome chymiſts, who would have ſpirit of wine to conſiſt of the oily parts of the juice of grapes rarefied and ſubtilized. But with theſe learned men (for ſuch I know ſome of them to be) I have not here any need to enter into a diſpute; ſince, without

without examining, whether their opinion be true or no, if it be admitted, it will be conſiſtent enough with mine. For to ſay, that by ſubtiliation, rarefaction, a peculiar kind of commixture with the phlegm, or the like means, the oil contained in the juice of grapes, (and ſeparable from it, in the form of oil, if it be diſtilled before it be fermented,) becomes ſpirit of wine, is but to aſſign the modus, whereby vinous ſpirits are produced, but not to deny their production. And all that my purpoſe requires, is, that it be proved or granted, that inflammable ſpirits are really produced, by what way ſoever they come to be ſo. I ſhall add, that though experience witneſſes, that honey being ſkilfully fermented with a due proportion of water, will yield a greater plenty of inflammable ſpirit than the wine itſelf, that is made in divers countries; yet when we have carefully diſtilled honey before fermentation, it afforded us a great proportion of conſiderably acid ſpirit, that would diſſolve ſome metals, but ſo little oil, that the paucity ſeemed ſtrange, and made it appear unlikely enough, that ſo inconſiderable a proportion of that liquor ſhould be rarefiable into ſo much ardent ſpirit, as may be obtained from well fermented honey.

SECT. II.

Of the production of urinous ſpirits.

I PROCEED now to the other ſort of ſpirits, as thoſe of hartſhorn, blood, ſal-armoniac, ſoot of wood, *&c.* that we have formerly called urinous, becauſe of their great affinity in many qualities to the more familiarly known liquor, ſpirit of urine. But as for theſe, I know not, whether it will be neceſſary to treat of their origin apart; ſince, for aught experience has yet aſſured me, theſe ſpirits are not ſimple, but compounded bodies, conſiſting of the volatile ſalt of the concrete, that afforded them, diſſolved in the phlegm, and for the moſt part accompanied with ſome little oil, at firſt undiſcerned by the eye, though afterwards it grow viſible. The preſence of this oil in moſt ſpirits, belonging to this family, may be probably argued from the deep tincture, that in proceſs of time, ſpirit of hartſhorn, of blood, and divers other ſubjects, will acquire by ſtanding, though preſently after their diſtillation, and firſt or ſecond rectification, they were clear, and colourleſs as water; the oily portion, which, whilſt it was in very minute particles, lay concealed in the mixture, becoming diſcoverable in proceſs of time by their extricating themſelves a little, and aſſociating, though not ſo far as to emerge and float, yet far enough to diſcloſe themſelves by the colour they give the liquor. But in ſpirit drawn by the help of an alkali from ſal armoniac, a concrete not abounding in oily parts, like hartſhorn, blood, *&c.* kept not only for many months, but divers years, I obſerved no ſuch diſcolouration; which was one inducement to make me, in ſpeaking of the oleaginouſneſs of urinous ſpirits, to employ the word *moſt* rather than the word *all*.

HAVING therefore hitherto by rectifications and digeſtions obſerved nothing in theſe urinous ſpirits but a cryſtalline volatile ſalt, moſt commonly ſeparable in a dry form, and the phlegm it was diſſolved in, beſides ſome oleaginous particles, that had (though at firſt unperceivedly) aſſociated themſelves to it; I ſee no great need to trouble you with particular inſtances about this ſort of ſpirituous liquors; what has been ſaid, making it allowable for me to refer you to what I deliver about the production of ſalts, where that of volatile ones is mentioned.

SECT. III.

Of the production of acid ſpirits.

AS for acid ſpirits, that ſome of them may be generated or produced *de novo*, ſeems probably deducible, partly from what has been already delivered (in the firſt part of theſe notes) concerning the production of acid ſalts; and partly from what will be ere long recited of acid, as well as of urinous and of vinous ſpirits, obtained by diſtillation from one and the ſame body. And if we take the word acid, as I uſually do in theſe notes, in a familiar ſenſe, without cryptically diſtinguiſhing it, from thoſe ſapors, that are a-kin to it, perhaps the ſpirit of ſea-ſalt and that of nitre may be fitly enough propoſed, as inſtances of the production of acid ſpirits. For though ſea-ſalt and its diſtilled liquor have upon ſome bodies the like operations, as either of them will precipitate ſilver out of aqua fortis, yet not only the taſte of the ſpirit of ſalt (eſpecially that which riſes laſt in diſtillation) is exceeding different from that of crude ſalt, not only in ſtrength and penetrancy, but in this, that the ſpirit is highly acid. Whereas the crude ſalt has a taſte not properly acid, but that, which by a diſtinct name is in Latin commonly called *ſalſus*, ſuch as that, which predominates in brine; and it does not appear, that this acid ſpirit did as ſuch pre-exiſt in the ſalt, whence it was obtained, ſo that we may ſuppoſe it to have been made rather by tranſmutation than extrication. And the like, I think, may (and that with greater probability) be ſaid of the ſpirit of nitre; for though this be highly acid, yet the nitre, that afforded it, is not at all ſenſibly acid: and this new vehement taſte of the ſpirituous parts, as well as their great efficacy in diſſolving metals, and divers other bodies, ſeems to have been produced by the violent action of the fire, (agreeably to what I formerly noted) which by cleaving the nitrous *Part I.* corpuſcles, or by rubbing them one againſt another, or by both theſe ways, and perhaps by ſome others, makes a comminution of them into fragments or particles, which both becauſe of their ſmallneſs and lightneſs may be elevated by the action of the fire, and becauſe of the ſame minuteneſs and their ſharp and pointed figures may get into the pores of many other bodies, and divide their parts. I know, that chymiſts may object, that all the acid ſpirit, that can be diſtilled from nitre, was really pre-exiſtent in it, and only clogged and diſguiſed by the alkalizate ingredient, wherewith it was aſſociated, as may appear by what I my ſelf relate of the ſpeedy way of making

ſalt-petre, by putting a due proportion of the ſpirit of nitre to the alkali, or fixt part of nitre, that remains after the ſalt-petre has been fulminated or burned. But to this I anſwer, that this proves indeed, (what I readily grant) that ſalt-petre may be artificially compounded of a nitrous ſpirit and a fixt alkali, but does not prove, that nature does always, or ſo much as ordinarily produce nitre by the ſame ways, that is, by compounding it of the ſame ingredients. For it does not appear, that where-ever ſalt-petre is generated in the earth, nature has before-hand laid in a proviſion of lixiviate ſalt, which (at leaſt, in theſe countries) is not wont to be made without the violence of an incinerating fire and of corroſive ſpirits, to obtain which, or either of them, artiſts are fain to employ vehement fires; whereas it ſeems, that ſalt-petre is ſlowly generated in the earth by gradual or ſucceſſive alterations of ſome idoneous matter, wherein, for aught I have obſerved, not an acid, but an urinous ſalt is predominant; as may be made probable by what I have formerly related about earth, that had long lain covered with pigeons-dung in a dove-houſe, which I found in diſtillation to yield a volatile ſpirit and ſalt, much like thoſe of urine. Therefore I will not affirm, that nature does never employ fixt alkalies and acid ſpirits to make ſalt-petre; yet I ſee not, that chymiſts have hitherto given us, or perhaps offered us any cogent proof, that ſhe muſt neceſſarily do ſo. I further obſerve this more conſiderable argument, that, according to what I formerly noted, ſalt-petre diſtilled in cloſe veſſels afforded us but an inconſiderable quantity of fixt ſalt, and that too was but a very imperfect alkali; though the quantity of nitrous ſpirit was great enough to perſuade us, that not any thing near ſo much as was wanting of the entire weight of the ſalt-petre had paſſed into the receiver. And elſewhere I relate, that a friend of mine, with the help of a peculiar clay, obtained near a pound of ſpirit of nitre from a pound of ſalt-petre; whereas, on the other ſide, by a differing way of managing it, and without additament, I obtained, as I there relate, about ten ounces of fixt nitre from a pound of ſalt-petre. Whence it ſeems probable, that the ſame ſubſtance, that in crude nitre is almoſt inſipid, may by an operation of the fire be diſtilled into a highly acid ſpirit, as well as, by another operation and way of management, be brought into the nature of a fixt and cauſtick alkali. It may alſo be worth conſidering, whether the ſpirits of nitre themſelves, when after being made *ſui juris* they compoſe a diſtinct liquor, and are ſpecificated, may not be deprived of their acid nature, and may become, or at leaſt materially concur to make up, a fixt alkali. For if ſea-ſalt, which chymiſts do not pretend to contain any ſuch alkali, be thoroughly diſſolved in a ſufficient quantity of ſpirit of nitre, and impregnated, this compounded ſalt will, as I have formerly noted, yield a conſiderable proportion of fixt alkali like that of ſalt-petre, which is as likely to proceed from the nitrous, as from the marine part of ihe reſulting ſalt; and if it do, it will make it the more probable, that it is not neceſſary, that the ſaline corpuſcles of ſpirit of nitre ſhould be primordial bodies, ſince they may be deſtroyed or turned into other ſalts; which is not leſs repugnant to the nature of a principle, than it is to be *de novo* producible from a body, that was not acid before.

SECT. IV.

IT may add much probability to what has been above diſcourſed, concerning the producibleneſs of the differing ſorts of ſpirits, if it ſhall appear, that the ſame body, meerly by different ways of ordering it, may be eaſily enough brought to afford, either acid, or inflammable, or volatile, commonly called urinous ſpirits, as the ſkilful artiſt pleaſes.

AN inſtance of this may be afforded us by ſome legumens, as peas, or beans; which if they be newly gathered and diſtilled in a retort, it will, I preſume, be eaſily granted, that they will, like many other green vegetables, afford, beſides a great deal of phlegm, an acid ſpirit; and if I much miſ-remember not, I had ſuch a ſpirit from either peas, or beans, or both, after they had been kept long enough to loſe their verdure. But if theſe ſeeds be at a fit time duely fermented with common water, I think it will not be doubted, but that they, as well as other mealy ſeeds, will yield an ardent ſpirit; but it will not ſo eaſily be ſuſpected, much leſs believed, that without adding any thing to them, or meddling with them, barely by keeping them in a dry place, for a certain number of months, they will yield a ſpirit, that by one, that did not know, whence it proceeded, would be judged near of kin to the ſpirit of urine, or of hartſhorn, and to other ſaline liquors drawn from animal ſubſtances. For having diſtilled theſe legumens by themſelves, without any additament, and without ſo much as breaking them, they afforded me ſpirits, not only far more like in ſmell to thoſe, I have compared them to, than they were either to acid, or vinous ſpirits, but very like them, in more intimate qualities; ſince they would, as the ſpirit of urine and hartſhorn, make a conflict with acid ſpirits, turn ſyrup of violets green, diſſolve copper blue, precipitate a ſolution of ſublimate into a white ſubſtance; and in a word, perform thoſe things, which I many years ago delivered in the tract about colours, and ſeveral ingenious writers have ſince embraced, as the diſtinguiſhing marks of volatile and urinous ſalts, or ſpirits. I ſay ſalts or ſpirits, becauſe I found that theſe drawn from vegetables, as well as thoſe afforded by animals, may eaſily by a dexterous ſublimation be brought to exhibit many of their nobler parts in the form of a dry ſalt, as well as in that of a ſpirituous liquor.

ANOTHER inſtance I ſhall take from the juice of grapes, though chymiſts will perhaps think it ſtrange, that I ſhould undertake to accommodate it to my preſent purpoſe; but there is no great myſtery in the buſineſs: for the freſh juice of grapes or muſt, though ſweet in taſte, will, if it be timely diſtilled to the conſiſtence

conſiſtence almoſt of a ſyrup, yield a copious phlegm, but not an ardent ſpirit: if the ſuperfluous moiſture be ſkilfully evaporated, there will remain a kind of rob or ſapa of a pleaſant tartneſs, which I have known uſed in ſome places, (as eſpecially in, or near *Switzerland*,) for an excellent ingredient of ſauces, and alſo, to be ſpread upon bread to be eaten inſtead of butter.

BUT if this raiſinee or ſapa were preſently diſtilled, I ſuppoſe it would yield no vinous, but an acid ſpirit: I ſaid, I ſuppoſe, becauſe for want of vineyards in *England*, I could not examine any liquor taken out of great veſſels of muſt, and therefore cannot ſay preciſely and experimentally, what diſtilled liquors it would afford; ſince I know not certainly, whether the great quantity of the ſweet liquor, and its continuance for ſome time (though not a long one) in the ſtate of what they call muſt, may not ſomewhat alter its productions, but if, as it is probable, that diverſity be not conſiderable, I may ſafely ſuppoſe, that the vinous ſpirit afforded by the juice of grapes, after fermentation has turned it into wine, is a produced thing, and was not in that form pre-exiſtent in the juice; for having purpoſely cauſed ripe grapes to be moderately preſſed, that their juice may, without much dreggy matter, be ſqueezed out, we put this liquor into a glaſs-head and body, and diſtilling it with a gentle fire, we obtained a ſcarce credible proportion of phlegm: and then transferring the ſomewhat inſpiſſated remainder into a retort, after having kept ſome of it (which had a grateful mixture of ſweetneſs and acidity) for raiſinee, we proſecuted the diſtillation with a ſtronger fire, and obtained not a vinous, but an acid ſpirit, as we found, not only by its ſmell and taſte, but by its corroding fragments of coral, even in the cold, by its growing ſweet upon minium, *&c.* Agreeably to which experiment, I found by trial, that raiſins, which conſiſt chiefly of the juice of grapes, inſpiſſated in the ſkins or huſks by the avolition of the ſuperfluous moiſture through their pores, being diſtilled in a retort, did not afford any vinous, but rather an acetous ſpirit, that, as an acid liquor, would work upon divers bodies, as ſpirit of vinegar would have done, and yet, as it was formerly noted, it is known, that raiſins being in a due proportion fermented with common water, will, after a certain time, afford a vinous and inebriating liquor; and though this time in the better ſort of the known ways, of making artificial wines, is wont to amount to many months, yet I have practiſed a way (which conſiſts chiefly in a determinate proportion of the water to the raiſins,) by the help of which, the liquor in very few weeks becomes fit to drink, and conſequently to afford by diſtillation a vinous ſpirit; but this only upon the by.

I SHALL now add, which probably you will think ſomewhat ſtrange, that from the juice of grapes even after it has been duely fermented, there may be obtained a diſtilled liquor, which having not found mentioned in authors, I thought, that I might take the liberty to name, and upon the account of its taſte, and ſome other qualities, to call it the acid ſpirit of wine: to ſatisfy you therefore, that there is ſuch a liquor, I will not make uſe of Rheniſh wine or other wines, that are thought to reliſh of acidity, but I will acquaint you with an experiment, that I choſe to make upon ſack, as a wine fully ripe, and more remote from an acid and tartarous nature, than thoſe are wont to be, that are made in leſs hot climates. We took then ſome good ſack, and having a digeſtive furnace, and in a glaſs-head and body ſlowly drawn off the ardent ſpirit firſt, and then the phlegm, (which even in this generous wine was copious) till there remained a liquor of the conſiſtence of a ſomewhat thin ſyrup, we removed it into a retort, and diſtilled it by degrees of fire, whereby we obtained, beſides a ſouriſh phlegm, that came firſt over, a true acid ſpirit, as appeared not only by the taſte, but by the hiſſing noiſe and numerous bubbles, that were produced, when we poured it upon a lixiviate ſalt; as alſo by this, that having put it upon poudered corals, it began briſkly to diſſolve them, even in the cold: we likewiſe made it corrode ſome metalline, and mineral bodies, of which it is not here neceſſary to give you an account, no more than of the black ſubſtance, that remained after the diſtillation: only two things I will here intimate about them: The one, that as this acid ſpirit of wine has its origination differing from that of other known acid ſpirits, and even from ſpirit of vinegar, ſo I thought it not irrational to conjecture, that it might have ſome peculiar qualities, whoſe diſcovery I leave you (if you think it worth the while) to proſecute: only by way of encouragement, as well as hint, I ſhall tell you, that having put ſome of it, for a certain reaſon, upon filings of copper, in ſuch manner, that ſome of them, after being wetted with the ſpirit, ſhould remain expoſed to the air, and others lie beneath the liquor, I found, though the trials were made in the cold, that in a day or two the expoſed filings had gained a fine blueiſh-green colour, but the ſpirit, that ſwam upon the other filings, did in few hours acquire a fine redneſs, which afterwards in two or three days degenerated into a colour like that of the expoſed filings. The other thing I will note, relates to the *caput mortuum* of the diſtilled wine, which I found a more fixt body than one would have expected, and it is, that though probably the finer part belonging as to other vegetable mixts, ſo to the juice of grapes, being attenuated and ſubtilized, was changed into an ardent ſpirit, and therefore appeared not in the diſtillation, in the form of oil, yet it is not unlikely, that the coarſer part of the oleaginous ſubſtance remained ſtill in the *caput mortuum*: for holding it in the flame of a candle, I obſerved, that it would partly exhale in thick ſmoke, partly melt, and as it were fry, and partly burn with an actual flame, which was not only continued, while the flame of the candle cheriſhed it, but would after it was re-

moved from the candle, continue a pretty while to flame upon its own account, and a parcel of it being caſt upon quick (but not upon flaming) coals, burned with a blaze, almoſt as if it had been amber, or bitumen. I could here tell you of fine cryſtals of wine, that I many years ſince made by a peculiar way, of the above mentioned extract of ſack; but this may be elſewhere more fitly mentioned.

To return therefore to our juice of grapes, we ſee, that meerly by a ſeemingly ſlight difference in the management of it, it may be made to afford either a vinous, or acid ſpirit; and I ſhall now add, that it may alſo be brought to yield a volatile or urinous one; for it is known, that in proceſs of time, wine affords tartar; and though chymiſts ſuppoſe the ſpirit of tartar to be of a quite differing nature from that of urine and of ſoot, and though I have elſewhere ſhewn, that tartar diſtilled the common way affords a double ſpirit, namely, an acid, and another, that I thought fit to call anonymous; yet I elſewhere ſhow, that by a peculiar and ſlow way of operating, I have been able to obtain (though perhaps not conſtantly) from crude tartar, without any additament, a ſpirituous ſubſtance, that in taſte, ſmell, and divers manifeſt operations, much more reſembled the volatile ſpirit of urine, or rather that of ſoot, obtained as mine of tartar was, by meer diſtillation, than an acid ſpirit: with which (ſo little did they agree) it was diſpoſed to make a conflict as ſoon as they were put together. But ſuch a kind of volatile ſubſtance may be far more eaſily obtained from the lees of wine, than from tartar; for having been accidentally informed, that an expert chymiſt in *Germany* had found the way to get ſtore of volatile ſalt from lees of wine, I reſolved to try, whether it might not be done without any addition; and having procured ſome of the beſt lees (I could get) of Rheniſh wine, I cauſed them to be expoſed in broad veſſels to the ſun, and the free air, (which circumſtance yet I am not ſure is neceſſary) that they might leiſurely be dried, if not alſo be impregnated, in order to the volatility of their ſaline parts. Then theſe dried fæces being carefully diſtilled in a retort by degrees of fire, the liquor was ſlowly rectified, by which means there aſcended before the phlegm a ſpirituous part, which would turn ſyrup of violets green, precipitate diſſolved ſublimate into a white powder, ſoon colour itſelf upon copper with a deep blue, and in ſhort do ſeveral things, by the performance of which we have elſewhere diſtinguiſhed volatile ſalts and ſpirits from acid and from vinous ones. By all ſuch trials upon the juice of grapes, we may infer the truth, we intended to prove by them, namely, that the ſame matter, as it is differingly managed, may be made to afford an acid (beſides one, that is truly acetous) a vinous, and a volatile ſpirit: beſides that, *ex abundanti*, it may alſo be made to yield, as I have noted in mentioning the diſtillation of tartar, another ſort of ſpirituous ſubſtance, as yet anonymous.

New obſervations about the adiaphorous ſpirits of Woods and divers other bodies.

AND now having fallen upon the mentioning of this ſort of ſpirits, that I have called anonymous, ſince I remember not that the notice I gave the publick of them * has engaged any writer to examine them; I am content on this occaſion to touch upon ſome of the more quick and eaſy trials, that I have made about this kind of liquors, that I may both excite and ſomewhat aſſiſt the curioſity of thoſe enquirers, that ſhall attempt to make a farther diſcovery of the nature of theſe ſpirits; which when I firſt ſeparated from the acid ſpirits, wherewith chymiſts had before confounded them, as ſtyling them, and taking them to be meerly the acid ſpirits of tartar, wood, *&c.* their properties were ſo little known to me, that I contented myſelf to ſtyle them anonymous ſpirits: but ſince having found them to differ in divers qualities, both from vinous, from acid, and from urinous ones, and having not ſufficiently diſcovered their poſitive properties, I was wont to give them a negative appellation, and call each of them the neutral or adiaphorous ſpirit of the body, that affords it, (whether it be tartar, wood, or any other like concrete.)

BUT before I deſcend to particulars, it will not be improper to premiſe in general three or four things not unfit to make way for the obſervations, that are to follow them.

1. I KNOW not, whether it will be requiſite to repeat in the firſt place, that our adiaphorous ſpirit may be obtained by diſtilling the liquor, that is afforded by woods and divers other bodies; by diſtilling this liquor, I ſay, from corals, or calcined lead; for by this means the acid corpuſcles of the menſtruum will work upon the coral or the lead, and ſo faſten themſelves to what they corrode, that they will eaſily enough part with the adiaphorous ſpirits, which by this means are permitted to aſcend by themſelves and fall into the receiver, in the form of a liquor. This, as I was ſaying, I know not, whether it be neceſſary to inſiſt on in this place, becauſe I have already mentioned it in another paper: but I think it may be very pertinent to relate here, that I endeavoured to try, whether there was not a difference in gravity or fixedneſs between the acid and neutral ſpirit of wood, without mortifying the firſt; and whether by the help of this gravity and fixedneſs, I might not be able to ſeparate, at leaſt in great part, the acid from the other, and ſo preſerve it in its diſtinct nature.

IN order to this, I cauſed a pretty quantity of the rectified ſpirit of box to be ſlowly diſtilled in a glaſs body and head, placed in a ſand cupel with the flame of a lamp, as that, which would give a more gentle and regular heat than charcoal; as indeed in the firſt twenty-four hours or thereabouts, this furnace afforded but about two ſpoonfuls of liquor; and though the menſtruum firſt put in ſcarce exceeded, by our gueſs, one pint or pound (if it were ſo much) yet it was divers days and nights in drawing over.

* This was done in the *Sceptical Chymiſt*.

over. And in this operation the moſt obſervable circumſtances were theſe two: Firſt, that the liquor, that firſt aſcended, was not phlegm, but had a very penetrant taſte, yet without any manifeſt acidity, diſcoverable by the tongue, though by putting it upon fine powder of coral (whether crude or calcined I remember not) it had ſome operation, that made me think it not altogether devoid of acid particles. Secondly, having often ſhifted the receiver, the better to judge, whether the portions of the aſcending ſpirit were conſiderably different in quantity, I found that, towards the latter end, the liquor, that came over, was ſharper than before; and having, at length, diſtilled all I could make to ariſe, we found the laſt parcel of liquor (which was copious enough) to be of a good yellow colour (though thoſe that preceded it were limpid enough) and both to ſmell ſtrong of vinegar, and to taſte more acid upon the tongue than ſpirit of common vinegar itſelf: ſo that if I had not known, how it was obtained, I had ſuſpected it to be what the chymiſts call *acetum radicatum*; and accordingly I found it to be a very active menſtruum in the diſſolution of ſome bodies, that, for trial-ſake, were put into it. All which ſeems to argue, that the acid portion of ſuch diſtilled liquors, as I have been ſpeaking of, is more ponderous, or more fixt, than the adiaphorous ſpirit, which, upon this account, may be in great part ſeparated from it by bare diſtillation, if it be warily enough made.

My ſecond general remark ſhall be, that I have obſerved theſe neutral ſpirits to be not all of them, in all things, of the ſame nature; ſince though they agree in ſome general attributes, which ſuffice to entitle them to the ſame ſpecies or denomination, yet they ſometimes differ from one another in particular qualities: which advertiſement I thought it neceſſary to premiſe, that it may not ſeem ſtrange, and that I may not be blamed, though ſome of the trials I ſhall ſet down do not punctually ſucceed in their hands, that ſhall not make uſe of the anonymous ſpirit of box, which I employed; not becauſe I think it better than any other, but becauſe amongſt divers, that I have made uſe of, I had then a greater quantity of it at hand. But though for this reaſon, when I ſhall ſpeak what I have obſerved in an adiaphorous ſpirit, without naming it, I would be underſtood of the ſpirit of box, which I had freed from its acid mixture by diſtilling it from calcined coral; yet I ſhall not ſo confine my ſelf to this, as not to mention, now and then, ſome other ſpirit of the ſame family.

The third general obſervation, that I ſhall make about our adiaphorous ſpirits, is, that though the few chymiſts, that have taken any notice of the diſtilled liquors, for example, of woods, were wont, by reaſon of their acid taſtes to look upon them, as of a meerly acetous nature, and having accordingly called them the vinegars or acetous ſpirits of wood, yet really the acid portion of theſe diſtilled liquors is far from being the greateſt: for beſides what other trials I have purpoſely made, I remember I took eight ounces of the rectified ſpirit of box, wherein the acetous and neutral ſpirit remained confounded, as they had been in the firſt diſtillation; and having poured this upon a quantity of of calcined coral, ſufficient to ſatiate the acid corpuſcles, (which quickly fell to corrode it with noiſe and bubbles) we gently diſtilled it to a dryneſs in a glaſs head and body, by which means we obtained of adiaphorous ſpirit but eight grains leſs than ſeven ounces and an half, and ſome of the menſtruum having been waſted in the operation, the acid corpuſcles remaining in the bottom, with the coral they had corroded, weighed but between two and three drachms; which ſhews, that notwithſtanding the not contemptible quantity of ſtrong ſpirit of vinegar, that by our lately recited obſervation the diſtilled liquors of box does contain, the corpuſcles, that make it ſo acid, being concentred, take up but a little room. And ſince it was rational to ſuſpect, that the acetous corpuſcles being made without fermentation, might have ſomething peculiar in their nature, I cauſed them to be gradually diſtilled with a ſtrong fire from the coral, and thereby obtained a very red ſpirit, of which, though many chymiſts would take it for a volatile tincture of coral, I ſhall only obſerve, that its ſmell was very ſtrong, and its taſte exceeding penetrant, but very differing from that of acid liquors.

Whether our adiaphorous ſpirit may (as I ſometimes ſuſpected it may) be generated, by a commixture of the finer parts of the oil of the wood reduced to an extraordinary ſmallneſs, and thereby capable of being exquiſitely mixt with the phlegm, and ſtrictly aſſociated with its particles, I ſhall ſtay, till I be better furniſhed with experiments, before I venture to determine.

Having premiſed the foregoing general obſervations, I ſhall proceed to particular ones, as ſoon as I ſhall have advertiſed you, that for the better diſcerning the phænomena to be produced, I choſe to make almoſt all the following trials in cylindrical glaſſes of about an inch in diameter.

To the phænomenon I am about to take notice of, I therefore give the firſt place, amongſt thoſe produced by the help of our adiaphorous ſpirit, becauſe it is uncommon, and not unpleaſant: for though we have many experiments of the ſudden tranſmutation of colours, whereby we change one into another; yet we have very few of the production of colours *de novo*, in bodies, that were colourleſs before. And I remember not, that the writers I have ſince met with, have added any experiments of this kind to thoſe three or four, that I have mentioned in the hiſtory of colours.

1. I Shall begin then with obſerving, that having into our adiaphorous ſpirit of box dropt a convenient quantity of ſtrong and tranſparent oil of vitriol, and ſhaking the liquor together, there preſently emerged a rich and lovely red colour; which at firſt was diaphanous, but afterwards grew ſo deep, that it was opacous, though by ſhaking the glaſs, the thin liquor, that would ſlowly glide down the inſide of the glaſs, being held againſt the light, manifeſted,

that

that the colour was ſtill red, though much more dark and muſcadine-like than before.

2. SOME common aqua fortis being put to our neutral ſpirit, and ſhaken a little with it, preſently gave it a rich amber or high yellow colour, but not a true red: but if the liquors were not mingled by agitation, the ſpirit did but ſlowly and gradually obtain the above mentioned colour, which was ſomewhat deeper than that of ſack: after this change the liquor continued tranſparent, and (which is a circumſtance not to be omitted) the change at firſt was wrought without any manifeſt precipitation, though afterwards, when the mixture had reſted a good while, there appeared ſome little and light fæculency at the bottom of the glaſs, and the inſide of it, as far as the liquor reached, was ſullied with a cloudineſs not eaſy to be waſhed off. One circumſtance more of this trial I muſt not omit, which is, that notwithſtanding the ſtrong and offenſive ſmell, that is wont to be juſtly complained of in aqua fortis, in our mixture it was either none, or but very faint, being concealed (if I may ſo ſpeak) or ſuppreſſed, and partly perhaps diſguiſed by the predominant odour of the adiaphorous ſpirit.

3. SOME ſpirit of ſalt being mingled with our ſpirit of box, the mixture became much leſs diaphanous than the liquors had been before their conjunction, and for a day or two was only whitiſh; but when we removed it into a digeſtive furnace, and kept it there for many hours, it acquired a colour high enough, partaking of brown and yellow, and appeared to have let fall ſome little ſediment to the bottom of the glaſs.

4. HAVING put ſome of our adiaphorous liquor on ſalt of tartar, it had not any ſenſible operation on it that we took notice of, ſave that it diſſolved the ſalt; and, after ſome digeſtion, appeared of a yellow colour tending to brown, and faſtened to the inſide of the phial in many little grains of ſalt, that ſeemed to have been firſt diſſolved, and then coagulated again in newly-emergent figures.

5. OUR adiaphorous liquor being confounded with high rectified ſpirit of wine, neither of them appeared to change colour much (for ſome change there was towards yellowneſs) or be opacated by their conjunction, even after ſome days digeſting; but the vinous ſpirit did not hinder the other from being turned red by the action of ſome potent acid, when it was poured on the mixture.

6. RECTIFIED ſpirit of urine being put to our adiaphorous liquor did not make any conflict with it, but joined with it quietly, as the above mentioned ſpirits had done, and did not manifeſtly change the colour of either of the liquors, whilſt they were kept many hours in the cold; but being transferred into a digeſtive furnace, and kept there a night or two, the liquor acquired a high colour, which was almoſt orange-brown, and there appeared ſome little fæces at the bottom. Having made theſe trials upon our ſpirit with ſimple liquors, I thought fit to make ſome with ſuch compounded liquors, as the ſolution of metals are, to ſee if our ſpirit, though neither manifeſtly of an acid, or an urinous, or a lixiviate nature, would procure precipitations of any part of the diſſolved metals.

7. IN proſecuting this enquiry, I dropt into ſome of our ſpirit a little ſolution of refined gold, which at firſt imparted thereto its own colour, (perhaps ſomewhat heightened) but the mixture quickly loſt its tranſparency and grew muddy, and, after a while, let fall a conſiderable quantity of ſediment or precipitate, the ſupernatant liquor having acquired a browniſh colour.

8. HAVING mixt our ſpirit with a good ſolution of crude lead, made with an appropriated menſtruum, that diſſolves it readily and clear, almoſt as aqua fortis does common ſilver, the mixture preſently grew muddy, and at length, after ſome days, let fall a copious ſediment, over which ſwam a liquor between brown and red.

9. WE put to our ſpirit of box ſome fine ceruleous tincture or ſolution of copper, made with an urinous ſpirit, (as of putrified urine, or ſal armoniac,) and ſoon perceived the mixture to grow troubled, which afforded us, though but very ſlowly, a copious reſidence.

10. WE mingled with our ſpirit a convenient quantity of ſtrong infuſion of ſublimate made in fair water, but found not any manifeſt re-action betwen thoſe liquors, no more than we did between dry and undiſſolved ſublimate and the ſame ſpirit, when we kept them together in this ſame phial.

11. MIXING our ſpirit with oil of tartar *per deliquium*, there did not ſuddenly appear any manifeſt change; but having digeſted the mixture for ſeveral days, there precipitated a light fæculency; and the ſupernatant liquor, which was tranſparent, appeared of a colour inclinable to red.

12. WE alſo mingled with ſome of our ſpirit a convenient quantity of vitriol of copper diſſolved in fair water, till the liquor ſeemed ſatiated with the vitriol; but I remember not that in ſome days, but the ſolution grew manifeſtly opacous or diſcoloured.

13. WE put to our ſpirit a ſolution of tin, made in a menſtruum, that diſſolves it clear, and found very little alteration to enſue, though we left the liquors many hours together.

14. BUT when I put to our ſpirit a convenient quantity of the ſolution of mercury, made in aqua fortis, the colour of the mixture became firſt deeply yellow, and in a minute or two intenſely red; and being digeſted for ſome days, I found at the bottom of the phial a white precipitate, much more copious than I expected, and the tranſparent liquor, that ſwam above it, was of a rich golden colour. Whether phyſicians or ſurgeons ſhould think fit to employ this precipitate, or this tinged liquor for medicinal purpoſes, I ſhall leave them to conſider.

15. SEVERAL of the foregoing experiments were tried with the ſpirits of other woods than box, and in particular with thoſe of oak and guaiacum, the phænomena of which experiments were not always the ſame with thoſe above

above recited, which may probably argue ſome difference in the nature of ſuch ſpirits, as well as there is in the conſtitution of the woods, that afforded them; nor for certain reaſons have I thought fit to recount here all the trials I have made with the adiaphorous ſpirit of box it ſelf, of which ſort I ſhall for example-ſake name only two, which I remember as having been the lateſt I made; whereof the firſt was, that having put ſome of our neutral ſpirit upon ſome pieces of fine red coral, and kept them there many days, the liquor did not appear to have extracted any tincture from them, though the upper part of the higheſt fragments ſeemed to be turned white. And the other was, that having taken a parcel of ſpirit, that came over by rectification in a lamp furnace, long before the more fixt acetous ſpirit came to aſcend, and having purpoſely expoſed a phial ſcarce half full of it, in a very ſharp froſty night, in a garden covered with ſnow and ice, it was taken up the next morning, not at all frozen, but leſs limpid than before, and this little opacity did (ſomewhat to our wonder) remain more or leſs for ſome weaks after.

ABOUT THE

PRODUCIBLENESS OF SULPHURS.

PART III.

THOSE ſubſtances, that chymiſts are wont to call the ſulphurs of the mixt bodies, that, by the help of the fire, are brought to afford them, are not of ſo uniform a nature, as might be expected in the portions of the ſame principle. For as, on the one ſide, chymiſts make inflammability to be the conſtituent character of ſulphur, ſo on the other ſide, it is obvious enough to thoſe, that are any thing verſed in ſpagyrical operations, that there are at leaſt three ſubſtances manifeſtly differing in conſiſtence, texture, or both, that, according to the notion lately aſſigned, ought to be referred to ſulphur. For ſometimes the inflammable ſubſtance, that is obtained from a mixt body, by the intervention of the fire, appears in the form of an oil, that will not mingle with water; ſometimes in the form of an ardent ſpirit, that will readily unite with that liquor; and ſometimes alſo in the form of a conſiſtent body, almoſt like common ſulphur.

NOTWITHSTANDING theſe various forms, in which it appears, it is not impoſſible, but that in many mixt bodies, not to ſay in all, what is called ſulphur may be no primordial ingredient, but rather a generated or reſulting thing. For that, which is common to theſe differing bodies, that paſs under the name of ſulphurs, and which is the conſtituent quality (if I may ſo call it) that diſcriminates them from the other material principles of mixt bodies, muſt be confeſſed, if we will ſpeak intelligibly, to be inflammability, or, if you pleaſe a diſpoſition to be turned into fire, and uſually alſo into flame. Which being being premiſtd I conſider here, that ſulphur it ſelf is made of the ſame univerſal matter, whereof other bodies conſiſt, and is but a coalition of certain particles thereof, whoſe aggregate, by having ſuch a contexture, motion, *&c.* acquires thoſe properties, for which a body is called ſulphur. And therefore if the like contexture happen to be found in other portions of matter, or (to expreſs my ſelf more fully) if art, or chance can frame and bring together particles of matter, and give them ſuch a contexture as is apt and ſufficient to diſpoſe them to be kindled and flame or burn away; theſe qualifications of ſuch an aggregate of corpuſcles will ſuffice to confer on it the nature of a ſulphur, whether this portion of matter do, or do not conſiſt, or copiouſly participate, of the chymiſts primeval ſulphur. For it is not by virtue of the long preceding duration of a thing, but by that of the eſſential qualities belonging to it, that a body deſerves this or that denomination. As the ſnow, that fell yeſterday, and was generated in a trice, is as true ſnow, as that, which has lain, perhaps for many years, on thoſe *Alps*, that are always covered with ſnow, or on the higheſt mountains of the frigid zone. And in the judgment of the chymiſts themſelves, a pound of quickſilver recently tranſmuted by a grain or two of their elixir into gold becomes as true gold, as that, which was coeval with the mountains, where nature has formed the ancienteſt mines of that metal.

SECT. I.

Of the production of oils.

THAT it is not neceſſary, the oils, or ſulphurs obtained by the fire from mixt bodies, ſhould be a primeval element or principle, may be probably argued from the experiment mentioned in the *Sceptical Chymiſt* about the growth of plants nouriſhed by meer water, which nevertheleſs, by diſtillation, afforded an oil. And we ſee, that in almond trees, walnut trees, and divers others, the rain water, that inſinuates it ſelf into their roots, is, by ſucceſſive changes of texture, reduced into the oil, which the fruit by expreſſion ſo plentifully affords. And to confirm our experiment from the growth of plants by tranſmuted or aſſimilated water, to obviate the ſuſpicion of common water's being im-

nated with the groſſer juices of the earth, I employed diſtilled water. About which experiment I find this ſhort memorial among my *adverſaria*.

[A SPRIG of mint put into rain-water diſtilled, and fed almoſt wholly with rediſtilled rain-water, weighed *July* 15. gr. 3. and was taken out *Auguſt* the 14th, and being well dryed with paper and a cloth, weighed 10 grains and about a quarter: ſo that within leſs than a month it grew to be three times as heavy, as when it was firſt put in. Another put in, and taken out at the ſame time with the former, had attained within leſs than a month to near four times its firſt weight, and had ſhot out a ſecond ſprig much higher than the firſt, and ſtore of roots, ſome of them near as long again as the whole plant, when it was firſt put in.]

IF we conſider, what a great quantity of oil is afforded by an olive-yard, whoſe trees are probably, as well as thoſe that bear apples, cherries, and other kinds of aqueous fruits, nouriſhed chiefly by rain-water, that being imbibed by the roots is by various digeſtions, or preparatory changes, turned into oil in the olive, it will not appear unlikely, that oil may be produced of other ſubſtances; ſince in our inſtance it ſeems to have been made by tranſmutation of water, though this be generally reputed to be of all liquors the moſt contrary to it, and is evidently of a nature exceeding diſtant from it.

AND here I ſhall relate an experiment, by which I attempted to produce it, out of only two diſtilled liquors, that according to the common eſtimation of chymiſts are uncompounded bodies; and, whether they be really ſo or not, are each of them readily diſſolvable in water, and in one another. Take then of oil of vitriol, and of ſuch ſpirit of wine, as is totally inflammable, an equal weight; mix them together by degrees, leſt the heat they will produce ſhould breed ſome inconvenience, and having digeſted them a good while (which yet is not abſolutely neceſſary) with a very wary management of the fire (for elſe the experiment will eaſily miſcarry) draw off what will come over; and if you go to work, as I have ſeveral times done, you ſhall obtain, beſides a ſubtile and odoriferous ſpirit of wine and an acid ſulphureous liquor, a conſiderable quantity of chymical oil, which I have had ſometimes deeply coloured, ſometimes clear like fair water: and this oil you will perchance look on as an odd liquor, when I tell you, that I have had it, ſometimes exceeding fragrant, and (though the oil of vitriol be ſo highly corroſive) without any acidity at all, the taſte of it being very ſubtile and penetrant, but no way like that of any ſaline liquor, that we know. This hath ſometimes inticed me to doubt, whether it hath been made of the ſpirit of wine, or of the oil of vitriol. The circumſtances laſt mentioned ſeem to perſuade the former; eſpecially if I add to them, that I found by trial purpoſely made, that this oil would readily mix with good ſpirit of wine, that had never had to do with oil of vitriol; but on the other ſide it ſeemed conſiderable, that the oil of vitriol by this operation was much weakened and changed, and it appeared not, whence the ſpirit of wine ſhould have ſo great a fragrancy; which conſiderations were backed by this more weighty argument, that this oil was ſo ponderous, as to ſink not only in common water, which is yet a far more heavy liquor than pure ſpirit of wine, but in the acid ſpirit itſelf, which ſeemed to be the remains of the altered oil of vitriol, which, by reaſon of its abounding in ſalt, you will eaſily grant to be far heavier than common water. But I need not much trouble my ſelf, to determine, which it is of the two liquors, that affords this ſtrong oil; for it may well be (though not equally) compoſed of both, by their mutual action, and the operation of the fire, united in the form of oil. And if it be objected, as probably it will, that this inflammable ſubſtance is made but by extrication of the parts, that lay concealed in the liquors before they were brought together, it may be anſwered, that this ſhould not be ſuppoſed, but proved; which till it be, our cauſe will be favoured by our experiment, wherein there appears nothing ſo likely as a change of texture; to which may be aſcribed the production of our anomalous chymical oil, ſince this plainly ſeems to reſult from two bodies, whereof neither was a true oil before. For each of them would readily mingle with water, whereas this produced oil of ours, being ſhaken with water, would break, like common oils, into numerous little globules; which would preſently after ſink to the bottom, and re-unite there into a liquor, which for trial-ſake I have kept divers weeks in the water, and found it at laſt undiſſolved by it. Some odd properties of this oil make it ſeem likely to participate of ſome of the nobler parts of vitriol, and the ſulphur of that metal having extraordinary virtues aſcribed to it, by ſome of the famouſeſt and intelligenteſt Spagyriſts, (as *Baſilius Valentius*, *Helmont*, &c.) I kept ſome quantity of this oil by me for ſeveral years, to obſerve, as I did with pleaſure, the alterations, that time would produce in it, and afterwards I imparted either ſome of the medicine itſelf, (whereof the firſt trial proved very ſucceſsful) or the ways of preparing it, or both, to ſome ingenious men, who (I am told) did not all of them remember me in the free mention they made of it.

BUT this concerns not our argument, upon occaſion whereof I ſhall obſerve upon the by, that though chymiſts ſhould be able to prove, that our oil was but ſeparated from the ſpirit of wine, or the oil of vitriol, in which it was latent before, yet ſtill the experiment would afford me a conſiderable reaſon for queſtioning a main point in the doctrine of the vulgar chymiſts, who confidently pretend to prove from the number of ſimilar ſubſtances (as they ſuppoſe them) obtained from a mixt body, that it was actually compounded of juſt ſo many diſtinct and true material principles, and ſuch a quantity of each. For if from a diſtilled liquor, as the oil or rather ponderous and acid ſpirit of vitriol, or from alcohol of wine, which is commonly reputed to be uncompounded, a liquor of quite another

another kind may be (not made but) ſeparated, how little reaſon have we, to take it for granted with the chymiſts, that every diſtilled liquor, that they look upon as one of the component principles of the body, that afforded it, is a homogeneous ſubſtance not further diviſible into differing parts?

SECT. II.

Of the production of inflammable ſpirits.

AFTER what has been hitherto delivered concerning the production of oils, I ſhould now proceed to that of another ſort of liquors, referred by the chymiſts to the principle they call ſulphur; though better known to others by the name of inflammable ſpirits. But of theſe I ſhall purpoſely forbear to diſcourſe in this place, and rather refer to what I have ſaid to them in another, where I thought it more proper to conſider them; namely, in one of the ſections of that part of theſe notes, that treats of the producibleneſs of vinous ſpirits.

SECT. III.

Of the production of conſiſtent ſulphur.

IF you ſhould here tell me, as perhaps you will do, that what I have been hitherto ſaying relates but to inflammable liquors, whereas ſulphur, in its moſt proper and primary acception, ſignifies a mineral body; I ſhall anſwer, that, as I formerly intimated, the chymiſts uſe the term ſulphur ſo ambiguouſly, and ſo uncertainly, that they have made it difficult for other men's diſcourſes to avoid all appearance of participating of the confuſedneſs, they ſeem to have affected in theirs. But becauſe the moſt intelligible, and leaſt indefinite notion their writings ſuggeſt of ſulphur, is, that it is a combuſtible and inflammable principle; I have hitherto treated of it as ſuch. And as for that ſulphur, that is commonly known by that name, and bought in ſhops, though I know there are ſome chymiſts, that have affirmed, that from vegetables and animals they can ſeparate ſuch a ſulphur; yet ſince they are not wont to teach us the way of doing it, nor give us any proofs, beſides their own word, of their having ever done it themſelves, the thing has ſeemed ſo improbable, that I find few or none of the more judicious of their own party, that look upon it, as other than a brag: only a follower of *Glauber* I find to have undertaken, by his maſter's directions, to produce a real ſulphur, like the mineral, out of vegetable charcoal, by a way, which, becauſe it has deceived more than him, and is ſpecious enough to impoſe upon thoſe, that either are not chymiſts, or, if they be chymiſts, are not cautious men, I ſhall here ſet down, and examine, as after the author I made it.

WE took then equal quantities (ſuppoſe a pound of each) of good oil of vitriol and of common ſea-ſalt, diſſolved in as much water as was requiſite: this mixture was ſlowly diſtilled, till the bottom was throughly dry, (which it will not be ſo ſoon as it begins to look white, or appear coagulated;) then ſetting aſide the liquor, (whereof the firſt part that came over was phlegm, and the other part ſpirit of ſalt) we took out the *caput mortuum*, (which, if one pleaſes, may be purified by being diſſolved and philtered) and having beat it to powder with about one fourth or one eighth part of its weight of charcoal, we put it in a ſtong crucible, and kept the mixture melted in a vehement fire, till it grew of a dark reddiſh colour, for by that time ſuch a change was made in the maſs, that it both ſmelt and taſted rankly enough of ſulphur; and if ſpirit of ſal armoniac were ſeaſonably diſtilled from it, with a competent, but not over-haſty fire, the aſcending ſpirit would be manifeſtly impregnated with ſulphur not difficultly ſeparable, which may alſo be divers other ways obtained from the ſame fixt *caput mortuum*,

BUT for all this ſpecious operation, I do not take the ſulphur, thus produced, to have been the vegetable ſulphur of charcoal, but a mineral ſulphur, that lay concealed in a liquid form among the ſaline parts of the oil of vitriol.

FOR, firſt, it is not likely, that ſo ſmall a quantity of charcoal, as was employed in this experiment, and much leſs that ſo ſmall a quantity, as may ſuffice to make it, could contain ſo much ſulphur, as may this way be obtained.

NEXT, that common vitriol is not deſtitute of mineral ſulphur, may be eaſily conjectured by the ſulphureouſneſs of the marchaſites, whereof it is wont to be made. In ſo much that in divers countries, as about *Liege*, and in ſome parts of *Italy*, from the ſame ſubſtance, that affords them vitriol, they obtain by ſublimation great quantities of common ſulphur, which is ſold for ſuch into divers other countries. And I have found by trial, and do not at all think my ſelf in that ſingular, that one may obtain from vitriol an oil, and a *caput mortuum*, which being put together, afforded a ſmell of common ſulphur ſo ſtrong, that I was ſcarce able to indure it.

AND to come yet more cloſe to our experiment, I have (as I have elſewhere mentioned) purpoſely tried, more than once or twice, that by diſtilling together common oil of turpentine and common oil of vitriol, the former of thoſe liquors would make a ſeparation of ſome of the ſulphur, that lay concealed in the latter, and as it were extricate and extract it: ſo that beſides an exceedingly ſulphureous liquor, which ſometimes was made white by the copiouſly diſſolved (and partly precipitated) ſulphur, that paſſed into the receiver, we had in the neck of the retort a yellowiſh conſiſtent body, which being put upon a quick coal, would, after a little yellow flame (probably proceeding from ſome adhering parts of turpentine) afford good ſtore of blueiſh flame, like that of common ſulphur, which it alſo emulated in its ſmell. And ſuch a kind of ſulphur I have alſo ſeen, in tract of time, ſettle itſelf, in no inconſiderable quantity, at the bottom of the liquor, diſtilled from the mixture of the two above mentioned oils. Nor are theſe the only ways, by which I have obtained from oil of vitriol manifeſt

proofs of its containing a mineral ſulphur very like to common ſulphur.

AND in particular it now comes into my mind, that I once put into a retort, together with one part of running mercury, four parts of oil of vitriol, and having diſtilled off the menſtruum, by degrees of fire, there remained at the bottom of the glaſs a very white powder. This calx, being afterwards gradually preſt with a ſtronger fire, afforded in the upper part of the retort a great many ſmall bodies, that looked like half beads of amber, and ſeemed to be of very fine ſulphur, (but were afterwards confounded with many other aſcending corpuſcles.) This amber-like body (which was ſomewhat copious, and, as to ſome portions of it, whitiſh) by its readineſs to be melted, by its ſmell, and by the blueiſh flame it afforded, when it burned, appeared to be a kind of ſulphur, which you will eaſily grant to be far more unlikely to have proceeded from ſo homogeneous a body, as the quickſilver, than from the oil of vitriol, which we have already ſhewn to conſiſt of divers ſulphureous as well as many acid corpuſcles. And on this occaſion I remember, that, whereas upon mingling the oils of turpentine and of vitriol in a due proportion, I have conſtantly obſerved, that they incorporated into a mixture, that was deeply red, (and this may eaſily be tried by letting fall two or three drops of oil of vitriol upon ſome drops of that of turpentine, and mixing them in a concave veſſel, or even in a hollowed piece of paper) whereas, I ſay, I obſerved this, I was thereby induced to ſuſpect the chymical (for I ſay not, the optical) cauſe of that phænomenon might be, that the terebinthinate oil had made a ſolution of divers ſulphureous particles it met with in the oil of vitriol, and by that means acquired ſuch a redneſs, as we ſee that common flower of ſulphur gives to the oil of turpentine, when it is diſſolved in it. And to examine this conjecture, I found, that divers other chymical oils, and oil of aniſeeds it ſelf, as remote as it is from redneſs, would preſently acquire that colour, being carefully incorporated with a due quantity of oil of vitriol. But this conjecture is propoſed only upon the by.

AS for the ſulphur of minerals and metals, I confeſs, I have not yet found enough, either in chymiſts books, or in my own experience, to make me willing to ſpeak dogmatically about them. And this the rather, becauſe firſt, as to the ſulphurs, that are ſometimes obtainable from ſome of the minerals, I think it may be doubted, whether they belonged to thoſe minerals as eſſential ingredients, or were only corpuſcles of common ſulphur, perhaps a little altered, that were mingled in the bowels of the earth, with other parts, that are eſſential to the nature of the mineral. As we ſee, that in native cinnabar the mercury, which, according to chymiſts, is a complete metal by it ſelf, is ſo mixt with another body, as not to be diſtinctly diſcernible, till it be ſeparated by the fire. And this cinnabar affords me an inſtance, the more fit for my preſent purpoſe, becauſe I have ſometimes by an eaſy way obtained a ſulphur alſo from it: and ſince we have lately noted, that the vitriolate marchaſites afford great ſtore of common ſulphur, by a groſs way of ſeparation, it ſhould not ſeem irrational to ſuſpect, that ſome common ſulphur may remain more cloſely mixt with the ſaline and metalline parts of the vitriol afforded by the ſame marchaſites; from which latent corpuſcles of ſulphur may in part proceed the ſulphureous ſmell, and other like things, that we have lately taken notice of in vitriol, and its oil. And perhaps by the ſame conſideration one may account for the ſulphureous qualities; that are ſometimes to be met with in the liquors, that paſs for the vinegars of mineral bodies, and particularly antimony; to which may now and then be added ſome metalline ores: ſince, I remember, I have had ſuch a ſulphureous liquor from good lead-ore, that I had ordered to be purpoſely digged out of the mine at *Minedeep*, and being put in cloſe veſſels ſpeedily conveyed to me. And that nature her ſelf may blend an imperfect mineral with lead, I have had occaſion to obſerve by an ore, whereof the owner found a mine, but not being able to diſcover what it was, deſired me to inform him. For this gave me occaſion to conſider the ore (whereof I have yet a lump by me) and to obſerve, that it was ſo differing from the other ores of that country, that I did but diffidently gueſs, that it was a mixture, that nature had made of lead and antimony, till particular trials had juſtified my ſuſpicions.

BUT this is not all I had to ſay about the ſulphurs of foſſils: for though I know, that chymiſts pretend to teach us ways of extracting the true ſulphurs of minerals and metals; and experience aſſures me, that a real combuſtible ſulphur may be in a pretty quantity obtained from antimony; yet there are two ſcruples, that ſuffer me not fully to acquieſce in what they teach. The firſt is this, that chymiſts oftentimes deceive others and themſelves too, by miſtaking thoſe things for the true ſulphurs of minerals and metals, that really are not ſo: of which I ſhall give a plain inſtance in the preparation, that many Spagyriſts deliver of the ſulphur of antimony.

FOR when they have boiled that mineral in a ſtrong lixivium of pot-aſhes, they ſuppoſe, that, as by the ſame operation, common ſulphur is diſſolved, ſo the menſtruum ſeeks out, and takes up, only the ſulphureous parts of the antimony: and as common ſulphur is precipitated out of the lixivium, wherein it is diſſolved, by ſprinkling on it vinegar, or ſome other acid; ſo they preſume, that what is ſtruck down the ſame way from the ſolution of antimony, made in the ſame menſtruum, muſt be the true ſulphur of that mineral; in which they are confirmed by the colour: and yet in reality, not only the ſulphur (ſuppoſing that there is one) but the other parts of the antimony will be diſſolved by a ſtrong lixivium, and the yellow powder, that is precipitated, is but a kind of crocus, which will ſometimes after a while (at leaſt in part) ſubſide of it ſelf, without the help of an acid. Nor does it convince me, that ſuch a body obtained from a mineral,

mineral, or metal, is its true ſulphur, that it may be made to burn; for unleſs the colour and ſmell of the flame concur, I ſhall be prone to ſuſpect, that the inflammability may be apt to riſe, partly from the great comminution made of the prepared body, and partly from the additament employed in preparing it. For theſe two, and perhaps even one of them, may contribute ſo much to the inflammable diſpoſition of a body, that little, or no true ſulphur will be neceſſary to make it burn. Of this I elſewhere give an inſtance in plates of copper; from which an equal weight of ſublimate has been diſtilled: for the remaining maſs will melt and burn at the flame of a candle, almoſt as readily as ſealing-wax. And of theſe inſtances I mention more in another paper, where I endeavour to ſhew, that combuſtible and inflammable bodies may be made up of parts or ingredients, that ſingly had not ſuch qualities. And yet the contrary of this is ſuppoſed in the chymical argument, that infers from theſe qualities the preſence of ſulphur in all thoſe mineral preparations, wherein they are found. Yet by this diſcourſe I would not be thought to derogate from the medical virtues, or other utilities of ſuch ſuppoſed ſulphurs. For they may be very uſeful concretes, though they be not true principles; the finer parts of the mineral being in ſome of theſe preparations extracted, and further divided, and perhaps very luckily aſſociated with the finer parts of the body, employed to act on them. By which means there may emerge new concretes of great virtue and uſe. And therefore I intend not to derogate from thoſe metalline ſulphurs, which ſome few maſters of chymical arcana reſerve with great care among the chiefeſt they are proud of. And that you may the better examine theſe fine crocus's, as I am apt to think moſt of them, and try both what they are, and what they do; if I can light on the proceſs, (for I dare not truſt my memory) I will at the end of this Appendix impart to you a way of preparing ſome of thoſe, that are made of metals, thoſe being accounted the moſt difficult as well as noble. And thus much I now remember of the trials I made according to this way; that I employed not any acid menſtruum, or liquor made of any particular ſalt, but a neutral or compounded ſalt; which, whilſt it was in actual fuſion, would diſſolve or corrode the very thinly laminated metal.

Of the Producibleneſs of Inflammability.

I Do no not look upon theſe ſubſtances as the true ſulphurs of the metals, that afford them, but rather (as I lately intimated) ſuſpect them to be a ſort of fine crocus's, and perhaps magiſteries; which by reaſon of the ſubtilty, and ſometimes fixtneſs of their parts, may prove uſeful to conſiderable purpoſes both in alchymy and phyſick.

BUT there is another ſort of bodies obtained from ſome minerals, and perhaps ſome metals too, that has a greater reſemblance to mineral ſulphur, than the newly-mentioned crocus's have.

TO this purpoſe I remember, that by putting aqua fortis, in a certain proportion, upon crude antimony, and, after it was almoſt totally diſtilled off, increaſing the fire till a dry ſubſtance began to ſublime, we had in the upper part of the retort a yellow and brittle ſubſtance, which being carefully ſeparated from the dark-coloured antimonial powder, that was alſo elevated by the force of the fire, appeared not only by its own colour, but that of its flame, and ſome other ſigns, to be much of the nature of common ſulphur. Nor is this the only way, whereby we have obtained ſuch a ſubſtance from crude antimony, from which (if I much miſ-remember not) I have had a yellow and combuſtible ſulphur, even without the help of a menſtruum.

PARACELSUS pretends to have a way of drawing ſulphurs from all metals; of which proceſs becauſe I have found little or no notice taken by chymiſts, I ſhall, for the oddneſs of it, and the reputation of the author (whom I look upon as a man of great experience in metalline affairs) ſubjoin it, as I find it among ſome of his looſe papers or fragments.

Sulphur Metallorum Theophraſti.

SULPHUR *metallorum eſt oleitas ex ipſis extracta, prædita virtutibus pro hominis ſalute. Sulphur aliud ex metallis, antequam ignem ſunt paſſa, elicitur, ut ex marchaſitis aureis, aut argenteis, &c. ſecundum nobilitatem mineræ, etiam nobile & præſtans:* ' & paucis interjectis, (ex-' tractio ſulphuris ex mineris metallicis.)' *Etiam fieri poteſt per lixivium acre & depuratiſſimum: ſed* (vel potius illa) *alia ſulphura pro intrinſeco corporis uſu minus ſunt commoda propter alkali cinerum, ex quo clavellatum conficimus erodens, & propter calcem, ex quibus talia fiunt lixivia. Sulphur ſic extractum poteſt ablui aqua dulci, & præcipitari. Digeſtio duplum requirit temporis. Debet & rectificari lixivium per ipſius ſublimationem ab omni reſidentia terreſtri, ne cum ipſo incorporentur talia ſulphura, & fiant corroſiva, ad perniciem ægrotorum: quod ne fiat dicta, debet fieri ſeparatio. (Tantum de crudis.)*

SED *jam fuſis & depuratis elicies ipſorum ſulphur: certa nobilior meliorque via non dabitur, quàm per aquam ſalis ſeu oleum ipſius præparatum, eo modo, quem in alchymia luculenter deſcripſi. Talis quippe aqua fundaliter & radicitus extrahit omnibus corporibus metallicis liquorem ipſorum naturalem, ſeu ſulphur & crocum præſtantiſſimum, tam pro operibus medicis, quàm pro chymicis. Reſolvit & frangit unumquodlibet metallum, ex natura ipſius metallica deducens in aliam pro varia intentione & induſtria laborantis.*

THUS far *Paracelſus*'s proceſs; but as I know not whether it be true, becauſe I am not able to reduce it to practice; ſo, becauſe I do not clearly underſtand his meaning, and what is the true nature of the inſtruments he would have us employ, I will not take upon me to determine, whether or no the ſulphurs, he teaches us to be obtainable by this method, be genuine ones, and fit to decide the queſtion we are now conſidering.

BUT whatever become of this obſcure Paracelſian proceſs, what I was ſaying about a

ſort of bodies leſs remote than the formerly deſcribed crocus's from the true ſulphurs of metals (if they have any ſuch) may well ſubſiſt. For I remember we have ſometimes (though the experiment did not always ſucceed) by cementing very thin plates of a certain metal with burnt allum, and afterwards dexterouſly elevating the more diſpoſed parts with ſal armoniac, obtained a ſublimate, from whence we ſeparated, by ablution with fair water, that diſſolved the ſalt, a ſubſtance, which, by its inflammability, appeared a kind of metalline ſulphur.

AND this may ſuffice touching the firſt ſcruple I thought fit to propoſe, concerning the factitious ſulphurs of metals and minerals. To proceed therefore now to my ſecond ſcruple, it may, I think, be ſuſpected, that even this ſort of bodies, which I have mentioned to have been drawn from a metal and from antimony, may not be the effects of a bare ſeparation of pre-exiſtent ſulphur, from the other ingredients of the bodies, that yielded them, but new concretes produced by the operation of the fire on thoſe bodies, and by the combination of ſome of their parts with thoſe of the additament, employed to obtain the ſulphurs. For, as far as I have yet ſeen, either ſalt-petre, crude or diſtilled, or menſtruums made of it, or of other ſalts, or elſe oleaginous liquors, are wont to be made uſe of on theſe occaſions. And it is very poſſible, that ſome of the more diſpoſed parts of theſe additaments may aſſociate themſelves with thoſe of the mineral or metal to be wrought upon; and ſo, from this combination of the ingredients, there may reſult a body of a new texture, which texture may diſpoſe it to be combuſtible, or inflammable, whether the ingredients in their ſeparate condition were ſo or not. As I remember I have elſewhere ſhown, that though aqua fortis be not inflammable, nor a piece of crude copper inflammable or combuſtible in a common moderate fire, yet the metal being diſſolved in aqua fortis, and the ſuperfluous moiſture warily exhaled, there will remain a fuſible concrete, wherein the copper being much comminuted, and its ſmall parts fitly aſſociated with the ſaline ones of the menſtruum, compoſe a kind of vitriol, that being held to the flame of a candle, or even of a piece of paper, will readily burn away in a flame finely coloured; and which may, if one pleaſe, be kept in a flame diſtinct from the other.

TO conclude what I have to ſay about my ſecond ſcruple; it ſeems not improbable, that if any of the metals be, by a fit menſtruum, or ſome other congruous additaments, reduced to parts minute enough, and that theſe parts be fitly aſſociated with ſome of thoſe of the menſtruum; the metal may thereby be brought to burn or flame, as I have ſucceſsfully tried, by a way elſewhere declared, upon gold it ſelf, whoſe ſulphur the chymiſts would have us look upon, as (what ſeems not very agreeable to the nature of ſulphur) incombuſtible; ſo that, for aught yet appears, it is allowable to ſuſpect, that the ſulphur obtained from this or that metal is not ſo much an elementary or hypoſtatical principle barely extracted, as it is a magiſtery, or ſome other new compound, made by the combination of the metalline particles with all, or ſome of the body, that works on them. But if a chymiſt will have metalline preparations of this kind to be ſulphurs; I may be allowed to make them ſerve for inſtances of the producibleneſs of ſulphurs.

YET theſe doubts concerning the ſulphurs of metals I propoſe but as ſuſpicions, to draw on further and more accurate trials; by which perchance they may be happily removed. And ſpeaking of the ſulphureous principle of mixt bodies, in that general notion of it, wherein the chymiſts often uſe it, and indeed muſt employ it; we may be thought to have ſaid enough to our preſent purpoſe, though we had left mineral ſulphurs untouch'd; ſince we have ſhewn, that inflammable parts of mixt bodies may be produced, and therefore cannot be ſafely affirmed to have all been pre-exiſtent in them,

---

OF THE

PRODUCTION OF MERCURY.

PART IV.

THE complaint I have divers times had occaſion to make, of the darkneſs and ambiguity, that chymiſts have allowed themſelves, if not affected, in treating of their three principles, is applicable to nothing more juſtly, than what they have written about that, which they call mercury. For when they would ſeem to tell us, what they mean by that principle, they are wont to do it in terms ſo looſe and ſo ambiguous, that the repreſentations they make of it, are more like to panegyricks, and ſometimes to riddles, than to clear definitions, or ſo much as good deſcriptions. Since then they have given us no ſettled notion of what they call mercury, but have left us to gueſs what they mean by it; I hope a miſtake about it (if I ſhould run into any) would appear pardonable. That which is agreed on by the moſt of chymiſts, when they ſpeak ſomewhat intelligibly of the principle they call mercury, is, that it is a crude ſubſtance, and that it is a volatile liquor;

liquor; which, by being ſo, may be diſtinguiſhed from the ſaline principles, eſpecially from the alkalizate or fixed ſalt; as it may alſo be from the oil or ſulphur, by its not being inflammable. But theſe marks will not diſcriminate it from phlegm, which is alſo a fugitive and uninflammable liquor; and therefore to make difference, they muſt add ſome other quality, ſuch as ſapor, (which yet agrees not to quickſilver itſelf) that is wanting to phlegm. So that, according to this doctrine, the nature of a chymical mercury or ſpirit will conſiſt in its being a liquor volatile, not inflammable like oil or ſulphur, nor yet inſipid like phlegm. How odd a principle this muſt be, that compriſes ſuch differing bodies, as are acid ſpirits, thoſe of nitre and vitriol; urinous, as thoſe of blood, hartſhorn, *&c.* and anonymous ones, as thoſe of guaiacum, honey, raiſins, *&c.* forced from their acidity; and the running mercuries of minerals and metals, as cinnabar, antimony, and lead; under one principle, which, to deſerve that name, ought to have all the portions of matter belonging to it homogeneous; I may ſafely leave any conſidering naturaliſt to judge. And therefore inſtead of taking further notice of this, it may ſuffice for my preſent purpoſe to mind you, that as for the mercuries or uninflammable ſpirits of vegetables and animals, I have endeavoured to ſhow their production, where I diſcourſe of that of ſpirits and volatile ſalts. And therefore I need but ſay ſomething of the production of mercury more properly ſo called, that is, running mercury: about which perhaps it will not be leſs acceptable to you, and I am ſure it will be leſs troubleſome to me, if I leave you to gather my opinion out of three papers, that were written for differing virtuoſi, at ſeveral times, and on diſtinct occaſions; upon which account, beſides thoſe particulars that relate to our preſent argument, you will perchance find ſome things, that you have not elſewhere met with.

Whether Mercury may be obtained from metals and minerals, or (to ſpeak chymically) An dentur mercurii corporum?

THAT there may be extracted or obtained from metals and minerals a fluid ſubſtance, in the form of running mercury, is the common opinion of chymiſts; in whoſe bodies we may meet with many proceſſes, to make theſe mercuries: which becauſe they are ſaid to be afforded by mineral, and eſpecially metalline bodies, theſe writers affect to call (how aptly I now examine not) *mercurios corporum.*

BUT notwithſtanding all this, divers of the more learned of the Spagyriſts themſelves have looked upon the pretenſion of other chymiſts to the art of making theſe mercuries as but a chymical brag; and ſome judicious modern writers, applauded therein by moſt of the mechanical philoſophers, have proceeded ſo far, as to explode all theſe mercuries of bodies as mere *non-entia chymica*; nay, ſome of them have not ſcrupled to cenſure all thoſe, who pretend to have ſeen or made any of them, as credulous or impoſtors.

IN the management of this controverſy, I confeſs I am not ſatisfied with either of the contending parties; and therefore I ſhall not refuſe to comply with your curioſity to receive in a few lines my thoughts, whether there are or may be any ſuch mercuries, as are diſputed of; yet I deſire leave to premiſe ſuch a ſtate of the controverſy, as I think will avoid ſome verbal janglings, and at leaſt acquaint you clearly with the ſenſe, wherein I deſire to have my opinion underſtood.

WAVING then, in the preſent inquiry, the queſtion, that may occur, 'whether or no 'the mercury ſaid to be obtained from metals 'and minerals are primitive ingredients, or 'hypoſtatical principles only extracted or ſepa-'rated from the bodies, that afforded them?' I ſhall propoſe the queſtion in theſe terms: 'Whether or no from a metal or mineral body 'there may, without the addition of any body, 'that we may be ſure has any common quick-'ſilver in it, be obtained, by the help of art, 'a ſubſtance reſembling common quickſilver, 'by being ponderous, fluid when actually cold, 'amalgamable with gold and ſome other me-'tals, and indiſpoſed to wet or ſtick to one's 'hand, or to bodies not of a metalline nature.'

TO give you now my preſent thoughts about this queſtion, I ſhall offer them to your conſideration, in the following propoſitions.

There are divers proceſſes of making the mercuries of bodies, that are ſo darkly delivered, that the generality of chymiſts cannot ſufficiently underſtand them, to be able to try them. For ſome of theſe proceſſes are ſo unknown in terms of art, which, for their great darkneſs or ambiguity, are not to be underſtood but by the authors themſelves, or thoſe, who are verſed in the more myſterious parts of hermetick philoſophy. And others there are of theſe proceſſes, that require ſome menſtruum, ſalts, or other inſtruments, that it is not in the power of ordinary chymiſts to procure. Inſtances of this kind may be frequently enough met with by thoſe, that have the curioſity to peruſe heedfully the writings of thoſe, that paſs for the adept philoſophers. And for a ſpecimen of ſuch proceſſes, I am content to annex to the cloſe of this paper the way delivered by *Lullius* of making mercury of ſilver, *Helmont*'s way of preparing mercury of lead, and *Paracelſus*'s way of extracting the mercuries of all metals. Prop. I.

There are divers proceſſes to make mercuries of bodies, that are either falſe, or accompanied with circumſtances, that make them unfit to be truſted. For there are of theſe proceſſes, that having been curiouſly tried by thoſe, that had a great deſire to find them true, have not been found to ſucceed at all in practice. Hence we have ſo many complaints of chymiſts, that have loſt their labour in indeavouring to make, according to *Beguinus*'s directions in his *Tyrocinium Chymicum*, the mercury of ſilver, though I do not take that to be one of the difficulteſt to be prepared; and he, that converſes much among thoſe, that have made attempts to make the mercuries of other bodies, as gold, antimony, *&c.* according to the vulgar proceſſes extant in chymical books, will (if I miſtake not) Prop. II.

not) find by their confeſſions, how little the events of their endeavours anſwer their labours and expectations. Nor do all the manuſcript proceſſes, that are communicated to private friends, as great arcana, much excel thoſe I have been ſpeaking of; as ſeveral of my acquaintance have complained to me, that they have found to their coſt. And here not to mention my own experience (which by the help of good principles made me timely deſiſt from unlikely attempts) amongſt many chymiſts I have known, I remember not to have found above three or four credible perſons, that would affirm to me, that they made, or ſaw made, the mercury of any metal or mineral (except of native cinnabar, which is the natural ore of quickſilver) in a conſtant way, by any proceſs he had found in printed books: ſo that ſo many of theſe proceſſes having been upon trial found falſe, wary men may be excuſed, if they do not think fit to believe other proceſſes of mercurification; which, though not yet tried, ſeemed not more probable, than thoſe, that have been already found ſo unſucceſsful, that not only many learned modern naturaliſts, but *Angelus Sala*, and divers others, eminent chymiſts themſelves, have publiſhed to the world, that theſe mercuries are to be found no where, but in the bragging chymiſts books and promiſes; and ſome have, as has been already intimated, gone ſo far as to brand all thoſe for cheats, that pretend they can make ſuch mercuries, and thoſe for credulous, that believe they can be made. But what I think of th[illegible]vere opinion, I ſhall quickly have occaſi[illegible] declare.

Prop. III. THERE *are ſome proceſſes, wherein it is thought, that the mercury of a metal or mineral is obtained; when indeed the obtained ſubſtance is miſnamed, or the true mercury, that is ſaid to be extracted, was put in, though in a diſguiſed form, by the operator.*

I WILL not here give inſtances of the ſubtle cheats, that may be put upon the ignorant and unwary, and ſometimes too upon the ſkilful, if they be not alſo cautious; but ſhall content my ſelf to illuſtrate the propoſition by a few known, and therefore innocent, inſtances. And firſt there are ſome, who finding themſelves unable to make the true mercuries of metals or minerals, make bold to aſcribe the name of mercuries to productions, whoſe qualities are very remote from thoſe, that are agreed to be eſſential to quickſilver. Thus *Glauberus* ſpeaks much of his mercury of Luna, which yet is far from being running mercury, or having the ponderoſity and other properties of true quickſilver. So *Angelus Sala* himſelf, in his anatomy of antimony, would have us to look upon the reguline parts of that mineral, as its mercury: becauſe he takes it for granted, it muſt contain mercury, and is pleaſed to fancy no other can be obtained from it. But the difference of the reguline part of antimony, and running mercury in point of conſiſtence, gravity, and other qualities, will, I preſume, indiſpoſe men to confound them. And therefore, I will proceed to confirm the ſecond part of our propoſition, by ſhewing, that the mercury obtained by ſome proceſſes, that may ſucceed, made part of the additament employed by the artiſt in the operations, and ſo was not properly extracted from the metal, but only recovered from the body, compounded of the metal and the additament. Of this, I remember, I have elſewhere given an eaſy inſtance, in a deluding experiment, that I long ſince ſhewed ſome virtuoſi, in whoſe preſence having mingled the filings of copper with a certain ſalt, and put them in a conveniently ſhaped veſſel of glaſs, I warily held it over a competent fire of well kindled charcoal, till the ſalt was thoroughly melted, and in part ſublimed: by which operation the copper ſeemed to be quite changed, eſpecially in colour, and was really become inflammable; and there remained in the lower part of the glaſs a pretty deal of running mercury, ſo that they would have gone away perſuaded, that they did ſee me make the mercury of Venus, if I had not been careful to undeceive them; which I did by telling them, that this quickſilver was only the common mercury, that lay diſguiſed in the compounded ſublimate I had imployed, together with the copper, which ſet the mercury at liberty from the corroſive ſalts it lay concealed in before, by preſenting them a metal more diſpoſed to be wrought on by them, than quickſilver is.

Prop. IV. IT *is poſſible to obtain, at leaſt from ſome metals and minerals, true running mercury, that cannot be juſtly thought to come merely from the additament.* This propoſition a chymiſt might more compendiouſly expreſs by turning it into this ſhort aſſertion, *Dantur mercurii corporum*; but I thought the words I have imployed would expreſs my ſenſe more warily and clearly; and yet, *ex abundanti*, I ſhall add this further explication, that though the propoſition ſpeaks affirmatively but of ſome metals and minerals; yet it does not deny, either that more minerals, or that all metals, may afford true running mercury: by which I underſtand (according to what I formerly noted) a mineral body fluid, opacous, exceeding ponderous, amalgamable with gold, and not apt to wet or ſtick to one's fingers, or any other bodies, beſides ſome metalline and mineral ones.

THAT ſuch a mercury may be obtained without the help of additaments, whereof quickſilver is an ingredient, I have been perſuaded to believe by the following obſervations.

I REMEMBER, that many years ago, having had an occaſion to diſtil copper with certain ſaline ſubſtances, I was not a little ſurpriſed to find in the veſſels (that had been luted together) ſome globules of running mercury, which I could not reaſonably ſuſpect to come from the additament, which was not ſublimate, nor any thing I could judge to contain quickſilver. And though the indiſpoſition I had to admit the mercuries of bodies, that ſo many learned men looked upon as non-entities, made me ſomewhat diffident of the genuineneſs of the mercury I had obtained, (whereof I had not quantity enough to make juſt trials) yet afterwards, when I found that accidents of the like

like nature had happened to ſeveral of my friends, I began to think, that what I had kept only for a few days as a queſtionable rarity, might really have been venereal mercury.

A LABORIOUS chymiſt of my acquaintance coming to viſit me once, when I was not well, was very earneſt with me to communicate to him the way of making the mercury of antimony and of Saturn; and when I told him, that I had no ſuch proceſſes of my own, and that I was far from believing thoſe, that I had met with in printed books, to be true ones, he would not acquieſce in this anſwer; but declaring, that he reſolved to make attempts to gain ſuch mercuries, and had rather do it by methods of my propoſing, than of his own deviſing, he preſſed me ſo much to let him know, which way I would go to work, in caſe I had the ſame deſign, that he then had, that to be rid of his importunity, I told him what on a ſudden came into my thoughts. And as ſometimes the mind being put to ſuch plunges, happens upon a lucky hit, and ſuch as much premeditation would not have led it to; ſo it happened at that time to me: for when I, becauſe of my diſtemper, had forgot this affair, the chymiſt, who was a plain honeſt man, came to me with great joy to give me thanks for the inſtructions I had given him, bringing along with him ſome mercury of antimony, and a little mercury of lead, that he had already made by the help of thoſe inſtructions; by purſuing which, he expected to obtain much more mercury from the minerals when they ſhould be longer digeſted with the concourſe of the air, in thoſe ſalts, that I had adviſed him to grind with them. This pleaſing ſucceſs of directions, which I had as to divers particulars forgotten, made me deſire them of the chymiſt; who, beginning to be proud of his attainment, when he perceived I remembered not ſo much as he thought I did, ungratefully delayed to bring me the account he promiſed me at firſt, till the plague reaching to the place, where he lived, and diſpatching him, deprived me of the hopes of ſatisfying my curioſity.

Two gentlemen of my acquaintance, but unacquainted with each other, working almoſt at the ſame time upon ſilver, did each of them, to his wonder, find parts of his ſilver turned into running mercury; with which odd accident each of them came to acquaint me, bringing along with them a little portion of the unexpected mercury. One of theſe portions a ſervant of mine loſt by miſtake, before I could try any thing with it; the other I found, by a trial unknown to the maker of it, not to be common, but metalline mercury; of which the chymiſt complained to me, that he had ſometimes had conſiderable quantities to his great loſs, becauſe much of the ſilver he employed in an operation, that he expected would prove lucriferous, being turned into quickſilver, had ſwallowed up all his gain; and this was that, which invited him to apply himſelf to me, hoping to be able to prevent or remedy this inconvenience by my advice; which I willingly gave him, but, becauſe of his departure out of *England*, could not know with what ſucceſs.

A FELLOW-TRAVELLER of mine, having occaſion to employ a ſaline body about lead, after he had finiſhed his operation, left the lead and ſalt together for ſome months, in a veſſel, which he laid by in a garret, where the air had acceſs to it: afterwards wanting ſuch a veſſel, and not being able to ſupply himſelf readily in the country (in which his experiment was made) he remembered this long neglected veſſel, and coming to ſee, whether it was fit for his turn, he found to his wonder, that though he had employed no mercurial body to work upon the lead, yet part of it was already turned into quickſilver, ſeparable by ſtraining, and more ſeemed in a near diſpoſition to admit the like change: whereupon he brought me, as a rarity, a part of the metal, and a little of the mercury, which I found by experience on gold to be of a nobler kind than common mercury. And I the leſs wondered at this mercurification, becauſe examining the gentleman that chanced to make it, I found the main thing he had employed in the operation was common or ſea-ſalt.

AN expert metalliſt of my acquaintance, being deſirous to try, what gold and ſilver he could get out of a fine Engliſh marchaſite I had preſented him at his deſire, he examined it according to his method, without any mercurial preparation, and found to his ſurpriſe, that, it yielded him, beſides other things, ſome running mercury, which he brought and gave me, becauſe it was afforded by the marchaſite I had preſented him.

THE mercury of antimony more than one of my friends have made, by unſuſpected additaments, ſuch as ſalts, that have nothing to do with ſublimate, or other compoſitions, whereof common mercury is an ingredient. One of theſe antimonial mercuries looked ſo oddly, that, though it were made by diſtillation, I had that curioſity to try, whether it would not operate on gold, in a peculiar manner; and having accordingly put a little fine calx of that metal (as about half a drachm or a drachm) into the palm of my hand, I added to it an equal or double weight of the above mentioned mercury; they immediately incorporated with a very manifeſt heat. And this was the quick way I uſed to examine other mercuries of bodies; for though this alone be not a certain ſign of a mercury's being of that ſort, becauſe I can obtain a mercury ſo qualified by another way than any I have hitherto mentioned; yet as their aſſertions and relations gave me ſufficient ground to conclude, that they had obtained thoſe mercuries from the bodies, that they affirm to have yielded them; ſo the readineſs of theſe mercuries to mix with gold, without the help of fire, and even to grow hot with it, which vulgar mercury will not do, confirmed, that they were metalline mercuries, rather than of the ſame kind with common quickſilver. And my way of obtaining incaleſcent mercury is ſo quite differing from any of thoſe, that there was not the leaſt cauſe to ſuſpect, that the mercuries of bodies we have been mentioning were ſo obtained, eſpecially ſince I knew, that my way was unknown to moſt of the perſons I have mentioned,

mentioned, and was practiſed by none of them.

As for the mercury of gold, though I think I have brought a great many parts of crude gold to aſſume a mercurial form, and to come over in that form by diſtillation, (whatever divers learned men think of the inſuperable fixity of gold;) yet I confeſs I have not ſeen any mercury, that I was ſatisfied did deſerve the name of the mercury of that metal. But happening to be once in a place, where a foreigner, that was a ſtranger to me, was ſhowing a friend of his, with whom I had ſome little acquaintance, a metalline experiment, that I confeſs, I could not but admire; (for this foreigner was ſo civil, becauſe I came ſo luckily in, as to let me be preſent at the experiment, though not to diſcover any thing of the drug he employed about it;) I made bold to aſk this civil traveller, who ſeemed a candid man, and I perceived had ſeen uncommon things, whether he had met with any way of making mercury of gold? To which he anſwered, that he knew no ſuch way himſelf, but that he met (ſomewhile before) with a very learned man, in compariſon of whom he confeſſed himſelf but a novice, that put ſome gold into a little phial, full of a certain menſtruum, which my relator owned he knew not how to prepare, and intimated to him, that this menſtruum would have a peculiar operation as well upon gold as ſilver. Afterward this relator having put the phial well ſtopt into his pocket, and carried it about with him, was, when he came home, and took it out to ſet it aſide, much ſurpriſed to find, inſtead of the gold he had ſeen put in, a pretty quantity of running mercury. Which the artiſt, who only lent him the menſtruum, did not ſeem to think ſtrange, when he was made acquainted with it.

If I would relate what I have heard from men, that I judge to be either eaſily deceivable themſelves, or concerned in point of intereſt to deceive others, or at leaſt of a vainglorious bragging humour, I might eaſily ſwell this diſcourſe to a greater bulk; but I have been careful to mention only thoſe relations, to which my ſelf, in ſpite of my long backwardneſs to believe ſuch things, ſaw cauſe to give aſſent. And if it be objected, theſe inſtances were but caſual experiments, notwithſtanding which there may be no ſettled way for the obtaining the mercuries of bodies; I might anſwer, that ſome paſſages of what has been lately delivered make it probable enough, that even ſettled ways of making the mercuries of bodies, or at leaſt of ſome of them, are not unknown to ſome artiſts; though for certain reaſons, and particularly for the ingratitude of many men, they do not think fit to divulge them. But to anſwer more home to the objection; I ſhall need only to ſay, that though moſt of the above recited experiments may be ſaid to have been made by chance, in this reſpect, that thoſe, that made them, did not principally deſign the obtaining of metalline or mineral mercuries; yet the effects produced were as naturally and neceſſarily conſequent to operations ſo managed as they were, as if the artiſt had directly deſigned them, as in ſome of the above mentioned relations they did. And it is not material for us to enquire, whether the quickſilver made by thoſe experiments be to be aſcribed to chance or ſkill; ſince whatever becomes of that queſtion, it is plain, that if metals and minerals could by either way be brought actually to afford running mercury, there needs no more to prove, that ſuch mercuries are really obtainable from them.

Doubts about the pre-exiſtence of running Mercury in metals.

The propoſed queſtion, Whether or no the mercuries of metals and minerals be principles pre-exiſtent in them, and only extracted from them, may to many ſeem, though it do not to you, a ſuperfluous enquiry; ſince the generality of chymiſts, of differing ages and countries, have reſolutely determined it in the affirmative: which is not at all to be wondered at, ſince according to their hypotheſis of the *tria prima*, (or three hypoſtatical principles) whereof they preſume all perfectly mixed bodies to be compoſed, metals, being of this ſort, muſt conſiſt of mercury, as well as of ſalt and ſulphur; and conſequently muſt afford it upon the analyſis of the body into its three primordial ingredients. But notwithſtanding all this, the problem ſeems to me difficult enough to be reſolved, partly becauſe ſuppoſing, that there be true metalline mercuries preparable by chymiſts, they very ſtudiouſly conceal the ways of preparation; and partly, becauſe as it is very difficult to obtain any of the factitious mercuries, wherewith to make ſuch lucriferous trials, as a naturaliſt would deſign; ſo thoſe few authors, that affirm themſelves to have poſſeſſed ſuch mercuries, have given us but an exceeding lame and defective account of them, not mentioning thoſe particulars, which are moſt proper and deſirable, in order to the paſſing a right judgment about them. I pretend not therefore to anſwer your queſtion otherwiſe than conjecturally, till I ſhall be better furniſhed with matters of fact. But in the mean while, that I may comply with your curioſity, as much as I ſafely can, I ſhall confeſs to you, that for the preſent I am, by as much information as yet I have had, inclined to think, that the mercuries obtained from metals do not clearly appear to have been preexiſtent in them, and only ſeparated from them by the artiſt, but that I think, that at leaſt ſome of them may be rather fluid magiſteries of metals, than their extracted principles. One of the moſt obvious things, that ſuggeſted this ſuſpicion to me, was, that whilſt ſome metals, as tin and lead, are in fuſion, they would, to one, that ſhould not know of their being melted, appear to be many parcels of mercury; ſince like it they are fluid and ponderous, and ſtick not to crucibles, or ſtones, bricks, or almoſt any other bodies, except ſome metalline ones, divers of which they will eaſily pierce into, as quickſilver does into ſilver or gold; ſo that if the fluidity of theſe metals were permanent, they might paſs for mercuries. And if in the moon and ſome of the other ſtars, as there are mountains, ſo there are metalline

mines, in caſe the heat of the climate or of the ſoil ſhould keep them conſtantly in ſuch a degree of heat, as we here find ſufficient to melt lead (which we know needs not be very intenſe) theſe metals would there emulate the nature of mercuries, as I have learned from travellers, that in divers parts of the torrid zone, what would here be butter, is fluid as well as unctuous like oil, and is ſold like other liquors, by meaſure, not by weight. And an inquiſitive man, who is a ſcholar as well as a traveller, aſſured me, that whilſt he was in ſome parts of the *Indies*, he furniſhed himſelf with ſome liquid ſubſtances afforded by wounded plants, that as ſoon as he came near *Europe*, and not before, turned into conſiſtent and pulverable bodies; it did not therefore ſeem to me impoſſible, that the piercing ſalts, and other ſubtile bodies, employed by artiſts about the mercurification (as ſome ſtyle it) of metals, may either by the agility of their own nature, or by ſo altering the ſhapes, and looſing the wonted coheſion of the metalline corpuſcles, bring them to have ſuch a texture and ſuch pores, as may enable the ethereal ſubſtance, whereto ſo many other bodies owe their fluidity, to agitate them. Theſe cauſes, I ſay, or ſome other, that may be propoſed, may poſſibly keep the prepared metal fluid; as we ſee, that though camphire be a conſiſtent and tough body, yet ſome nitrous ſpirits of aqua fortis will eaſily penetrate it, and may be brought to ſtay ſo long with it, that I have, for curioſity-ſake, kept the camphire ſeveral years without loſs of its fluidity, which I found that this kind of liquor would retain, though for trial-ſake I expoſed it to intenſe degrees of cold, ſuch as would freeze divers other liquors. Nor did it to me ſeem impoſſible, that a ſmall quantity of appropriated additament might ſuffice to put a metal into a ſtate of fluidity; for ſince we ſee, that the vapour of lead can arreſt quickſilver, and make it a conſiſtent body; and ſince *Helmont* aſſures us *, that the liquor alkaheſt being once abſtracted from running mercury, deprives it, and that almoſt irrecoverably, of its fluidity, ſo as to make it pulverable; it appears not, why nature or art may not be able to ſupply ſome corpuſcles, that may expel or diſable thoſe, that keep a metal in the form of a fluid body; and eſpecially ſince, as I have elſewhere ſhewn, the matter of metals themſelves may (at leaſt ſometimes) have been a liquor, or ſome other fluid body.

ANOTHER reaſon, that induced me to ſuſpect, that the mercuries of metals and minerals are not, as it is preſumed, merely extracted principles or ingredients, was, that I have obſerved a greater diſſimilitude between mercuries all of them quick, and furniſhed with all, that is requiſite to make them paſs for true mercuries, than will comport with the ſuppoſition, that they are ſimple and primordial bodies, barely extricated from the others, with which they were at firſt commixed. But this argument being the ſubject of an entire, though ſhort, diſcourſe, (of the diſſimilitude of running mercury) I need not inlarge on it in this place.

IT did alſo ſtrengthen my ſuſpicion to conſider, that the chymiſts, that talk of the mercuries they have drawn from metals, are not wont to tell us, what other ingredients they obtained by their ſuppoſed analyſes, which left me dubious, whether they obtained any ſalt and ſulphur, or not; and of what nature thoſe ſubſtances were, that they did obtain. For if theſe were not true ſalt and ſulphur, the genuineneſs of the analyſis might be queſtioned; becauſe it may be alledged, that the chymical operation and the additament turning ſome parts of the metal into decompounded bodies, which muſt be acknowledged not to have been (in ſuch) forms pre-exiſtent in them, may alſo have by change of texture turned ſome other parts of the metal into the form of mercury.

To the foregoing conſiderations, afforded me chiefly by the nature of the thing, I ſhall, for the ſake of thoſe, that are moved by the authority of adept philoſophers, as they call them, add that, which among them ought to paſs for a proof from experience. For *Raymund Lully*, whom I take to be one of the greateſt chymical philoſophers, whoſe writings are come to our hands, though in many of his other books he ſpeaks of mercury in a dark and allegorical ſenſe; yet in that excellent little tract, which he calls his *Clavicula*, he delivers a proceſs, (which is not to be wrought with vulgar menſtruums, though they bear the ſame names with thoſe he preſcribes and names) from the cloſe whereof it ſeems manifeſt, that his deſign was not to extract a pre-exiſtent quickſilver out of the metal propoſed, but to turn the metal into quickſilver; ſince he orders and directs us to proſecute the mercurification, till the obtained quickſilver be equal in weight to the ſilver, that was to be tranſmuted. And partly upon this I have ventured to ground the foregoing paradox; that the mercuries of bodies are rather magiſteries than extracts. For in this Lullian proceſs, it appears not, that the mercurial principle was extracted from the ſalt and ſulphur, but rather that the body of the metal (without being analyzed) was turned into mercury. And though magiſtery be a term variouſly enough employed by chymiſts, and particularly uſed by *Paracelſus* to ſignify very different things; yet the beſt notion I know of it, and that, which I find authorized even by *Paracelſus* in ſome paſſages, where he expreſſes himſelf more diſtinctly, is, that it is a preparation, whereby there is not an analyſis made of the body aſſigned, nor an extraction of this or that principle, but the whole, or very near the whole body, by the help of ſome additament greater or leſs, is turned into a body of another kind. As when iron or copper by an acid menſtruum, that corrodes and aſſociates itſelf with it, is turned into vitriol of Mars or of Venus; and quickſilver having a ſufficient quantity of aqua fortis ſtrongly abſtracted from it, is changed into a red precipitate; or by being ſublimed up with common ſulphur, is turned into cinnabar; or, to give yet a more appoſite example, when quickſilver (which

Vide Lullium in Clavicula, cap. 2.

* *Eſt ſcilicet* (Corallatus Paracelſi) *Mercurius, a quo liquor Alkaheſt ſemel diſtillatus eſt, reſidetque in fundo coagulatus & pulverabilis, nequicquam in pondere auctus aut diminutus.* Helmontius in Scripto de Arcanis Paracelſi.

(which is the body we treat of) is by the lasting operation of the fire, without external additaments, at least distinct from the igneous particles, turned into a red powder, that chymists call *Præcipitate per se.*

I HAVE received credible information, and some proof too, that there is a place in *Transylvania*, where portions of running mercury, which, when they fall out of the earth, and lie a while in the air, do of themselves coagulate into permanently hard bodies: so little a distance hath nature her self there put between the mercurial fluidity, and the solid consistence of the same portion of matter. So that if so small a thing (and perhaps unponderable as well as invisible) as the contact of the air can expel, is able by its presence to retain a mineral body in the form of a true running mercury, as well as by its recess to leave a solid body; I see not why it should be impossible for art, to intercluse some very minute and restless particles, which, by their various and incessant motions, may keep a metalline body in the state of fluidity, much after some such way, as I lately noted, that the spirits of nitre did, for whole years together, keep camphire in the form of a liquid oil.

HAVING now proposed some of the considerations, that inclined me to think, that the mercuries obtained from metals and minerals may not have been pre-existent in them; the impartiality, that, I think, becomes a naturalist, obliges me to take notice also of those things, that occurred to me, in favour of the received opinion of the chymists, in behalf of which I objected to my self divers specious arguments.

OF these, the first was the general consent of chymists, who take it for granted, that all metals are composed of mercury as a material principle, and commonly more copious, than any other constituent part of those bodies; but this being an argument drawn only from authority was of small weight with me, in a controversy properly determinable by reason and experience.

2. A SECOND objection was afforded me, by many processes I had met with in chymists books, to extract the mercuries, as well as the sulphurs and salts of metals. But neither did this argument appear to me of any great moment, for most of these processes I looked upon as fictitious things; which, if the authors of them had taken the pains to try themselves, they would have found not to succeed in practice; and scarce any of them was so skilfully framed, as to satisfy a considering naturalist, in case it had succeeded, that the obtained mercury was a pure principle only separated or extracted from the other ingredients of the metals, and not a result of some metalline parts conjoined with some parts of the additament; as it seemed manifest enough to me, that the supposed salts of metals, that are pretended to be made by such preparations, are not the principles of such metals, but new concretions, and indeed not simple, but decompounded bodies; as is evident in the salt or sugar of lead made with the spirit of vinegar, and in the salt of steel made with that, or other acids.

3. A THIRD objection, and of greater weight, seemed derivable from this consideration, that quicksilver easily amalgams with metals, because of its cognation with the mercurial part these bodies abound with.

4. AND this argument appeared capable of being strengthened by a more considerable one; which is, that the gravity of the metals is such, as cannot reasonably be deduced from any other cause, than an abundance of the mercurial principle, there being no other bodies (known to us) besides quicksilver, that are near so ponderous as metals.

THESE two objections I thought fit to couch together, to be able, in fewer words, to answer them both: I considered then, that amalgamation being, in effect, but a kind of dissolution of metals in a menstruum or fluid body; (for such mercury is, in reference to them) there is no necessity, that the solvent should find in the metal a copious ingredient just of its own nature; for dissolution depends not so much upon the pretended cognation between the solvent and the body it is to work on, as upon the congruity, as to size and figure, between the pores of the latter and the corpuscles of the former; as may appear by the solution of ivory and hartshorn (which belong to the animal kingdom) that may be made with aqua fortis; and by that, which I have elsewhere shewn may be made of zink, and even of copper, by the spirit of vinegar, the urinous spirit of sal armoniac, and spirit of vitriol separately imployed; though the first of them be a menstruum drawn from a vegetable, the second from an animal, the third from a mineral substance. And as for amalgamations themselves, I observe, that the facility mercury finds in joining with a metal, does not barely depend upon the plenty of the mercurial ingredient, contained in the metal; at least if the greater ponderosity, or specifick gravity of the metal depend upon the copiousness of the same mercurial principle, or ingredient, as the fourth objection supposeth: for we find by experience, that mercury will far more easily amalgam with tin than with copper, which, yet, is much more heavy than it; nay, than with silver, which is a good deal heavier, (in specie) than copper; and is by chymists presumed to be much nearer of kin to mercury than is tin. To which I shall add, that although Mars be specifically heavier than tin, yet it is far from being more easily amalgamable with mercury; that though tin will readily admit this mineral liquor, without the help of heat, there is no way vulgarly known to chymists to make an immediate amalgam between mercury and Mars. So that one of the two objections, I lately joined together, must be declined; since by the trials I have purposely made, it appears, that either the disposition of metals to amalgamate with mercury does not barely depend upon the supposed plenty of mercury contained in the metal; or else that

the

the greatneſs of the ſpecifick gravity does not depend upon the more plentiful participation of that mercurial ingredient. Although the fourth objection be built upon a ſuppoſition, that the great ponderouſneſs of metals, in compariſon of other bodies, can proceed from no other cauſe than the great quantity of mercury they contain; I conſidered too, that it might be juſtly demanded, whence mercury it ſelf, as well as whence metals, derive their great ponderoſity; and I ſee not, why it may not be ſaid, that both the one and the other own it to the ſolidity, and cloſe order, of the corpuſcles they conſiſt of; to which qualification it is not eſſential, that the portion of matter endued with them be in a ſtate of fluidity, rather than in one of conſiſtence: as on the contrary we ſee, that gold and lead are exceeding ponderous bodies, as well when they are in fuſion, as when they are cold and hard; and ſo in quickſilver, as well in its wonted and liquid form, as when it is coagulated, as chymiſts ſuppoſe, by the vapour of lead.

BUT this will be ſomewhat further cleared in what I ſhall ſay to the fifth and laſt objection, that my thoughts ſuggeſted to me, and which philoſophical candour forbids me to conceal; though I find it eaſier to be propoſed than anſwered. It may be then alledged in the fifth place; that the mercuries of metals muſt needs be but partial principles of them, ſince quickſilver being confeſſedly heavier than either the ſulphureous or ſaline principle, and being ſpecifically heavier, than almoſt any metal it ſelf; the gravity of a metal cannot reaſonably be ſuppoſed to proceed from the whole body of the metal, but only from ſome one ingredient heavier in ſpecie than the reſt, and, than the metal it ſelf. And this ingredient or principle can be no other, than the moſt ponderous body, mercury.

THIS difficulty, I confeſs, does keep me yet in ſome ſuſpence, till I have further opportunity, to make ſuch trials, as I think proper to clear it. Yet in the mean time, I ſhall offer ſome few things, which perhaps may leſſen it, if not quite remove it.

I CONSIDER then, that there is no neceſſity to ſuppoſe, that metals, of what denomination ſoever, as tin, iron, or ſilver, gold, are bodies perfectly homogeneous, though they ſeem ſuch to our eyes. This ſuppoſition I elſewhere purpoſely diſcourſe of, but in this place I need not ſpend time about it; ſince the chymiſts (who are thoſe I now reaſon with) do not only allow, but teach it, ſince they will have metals as well as other mixt bodies to conſiſt of three hypoſtatical principles, whereof mercury is one, although it muſt be much heavier in ſpecie, than either the ſalt or the ſulphur it is blended with; becauſe it is from the participation of that ingredient, that they derive the great ponderouſneſs, which metals have, in compariſon of other bodies.

AND to this granted ſuppoſition, I ſee not why it ſhould be abſurd, to add this other, that the more ſolid and heavy particles or corpuſcles of metal may lie in it, not in the form of fluid or mercurial, but conſiſtent parts, and that theſe may be more diſpoſed than the reſt, to be brought by chymical additaments and the operation of the fire into the form of a running mercury. Nor ought it to be judged incredible, that the fore-mentioned ſolid portion of the metal ſhould be more ponderous than quickſilver, ſince, as I have often tried, gold, though a conſiſtent body, is far heavier than quickſilver, to the bare participation whereof gold cannot owe its ſpecifick gravity.

IF this hypotheſis be admitted, it will be eaſy to give an account, how the mercury of a metal may be heavier in ſpecie (that is, bulk for bulk) than the metal that afforded it; for the difficulty is eaſily reſolved, by ſaying, that the ſolid parts, which by the chymical operation are reduced into the form of quickſilver, were far more ponderous in kind, than the other parts of the metal, which being alſo aſſociated with them, did, by their comparative lightneſs, make the entire metal leſs heavy (if the bulks be equalled) than an aggregate or convention of all the ſolid parts alone would have been. Which may be illuſtrated by what I have heedfully obſerved, of the decrement of ſpecifick gravity, ſuſtained by quickſilver, when it is united by ſublimation either with ſulphur into cinnabar, or with ſalts in corroſive ſublimate.

BUT I muſt not diſſemble, that againſt the foregoing diſcourſe there occurr'd to me a couple of arguments (that I have not met with amongſt chymiſts) whereof the *latter* is very conſiderable. For I foreſaw it might be alledged, firſt, that the mercuries of metals being in a liquid form, could not well be ſuppoſed to be ſo cloſe and ponderous bodies, as our hypotheſis requires: and next, that we our ſelves admit an experiment of *Raymund Lully*, whereby he pretends to reduce the whole body of ſilver into mercury, which is a heavier ſubſtance than ſilver; and in this caſe we cannot have recourſe to this anſwer, that the corpuſcles, which aſſume the form of mercury, were far more ponderous, than the others, that concurred with them to compoſe the metal.

THIS twofold objection I do not pretend to anſwer at once, but may perhaps enervate it by degrees.

AND firſt, though it be very poſſible, that a pretty quantity of additament may be employed about the mercurification (to ſpeak in the chymiſts language) of a metal, yet there ſhall really and finally adhere to the metalline parts, but a very ſmall proportion of additament, that will continue with them, and keep them in a mercurial flux. And it may appear the more credible, that a very ſmall quantity of additional matter may have a very great ſtroke in altering the conſiſtence of that, which is obtained from a metal, as its moſt ponderous portion, if you conſider with me, that the bare acceſſion of igneous particles, is able in time, to turn running mercury into that red powder, which chymiſts call *Præcipitate per ſe*: and I have found by trials purpoſely made, and elſewhere related, that this powder

without any further additament may be reduced into running mercury. Nor muſt I pretermit, on this occaſion, a notable paſſage I remember to have met with in *Helmont*, who relates, that by the abſtraction of the liquor alkaheſt (which is wont to come all over in diſtillation from common quickſilver) he did quite deprive it of its fluidity, and turned it into a conſiſtent body, and even into a fixed one; whereby you may ſee how little a quantity of matter will ſerve to change the conſiſtence of a body of a mercurial nature.

BESIDES that, a fluid form does not always argue the lightneſs of the body, that it is found in, ſince it may conſiſt of particles ſo ſolid and ſo numerous, that, notwithſtanding their inteſtine motion, the body they compoſe may be very ponderous: as may appear by red-hot iron, melted lead, and, which is an inſtance appoſite to our purpoſe, in common quickſilver, which though fluid is heavier than any known body in the world, gold excepted.

BUT I conſider farther, that though the ſolid portion of a metal retain more of the additaments imployed to bring it into the form of mercury, than it can be proved to contain; yet this diſadvantage may be compenſated by the new diſpoſition of parts, that the mercurified portion acquires by the operation, that turns it into a liquor, and may be ſuppoſed to bring the parts to a cloſer, or otherwiſe a more expedient order than they were in before: as ice when thawed takes up leſs room in the form of water, than it did before it became a liquor. I ſee no impoſſibility, that the ſpecifick gravity of metalline bodies may be increaſed or diminiſhed by ſuch ſmall proportions of additaments, as do not at all conſiderably add to their abſolute gravity. This the chymiſts ought not to deny, if they conſider what themſelves grant of the efficacy of what they call the philoſophers ſtone, whereof they tell us, that one grain, if it be of a nobler order or degree, may tranſmute a whole pound of quickſilver into perfect gold; and conſequently the ſpecifick gravity of a metal is notably changed by an additament, which (according to the differing pounds uſed in ſeveral countries) amounts not perhaps to the ſixth or ſeventh thouſandth part of its weight. Beſides, the tranſmuting powder being a compounded body, whereof but part is gold, may probably be ſuppoſed to be more light in ſpecie than the metal, that by addition of it is produced; which being pure gold, is the ponderouſeſt body yet known to us. And to confirm the argument, I ſhall add, that there is a way, though I pretend not to know it, of making a metal far lighter in ſpecie, than it naturally is, by the addition of leſs than a hundredth part of its weight, as experience has convinced me.

WHEREFORE to come now to the grand objection furniſhed by *Lully*'s lately-mentioned experiment, it will not preſently follow, that if the whole body of a metal be brought into a mercurial form, this mercury will ſwallow up and deſtroy our hypotheſis: for though I grant, that, in this caſe, it cannot be ſaid, as in the former caſes (wherein a part only of the metal is mercurified,) it may be, that the obtained quickſilver conſiſts of the more ſolid and ponderous parts of the metal; yet it may be ſtill ſaid, that, for aught we know, the mercury, produced by the reduction of the whole metal into a fluid form, may be ſpecifically lighter than common mercury, and ſo cannot be neceſſarily concluded to be ſpecifically heavier than the metal, that afforded it. I lately imployed the words, *for aught we know*, becauſe we are now upon the caſe, wherein philoſophical candour invited me to acknowledge, that I wanted further trials to give my ſelf full ſatisfaction: for although I have had portions of the mercuries of more than one or two metals, yet it was but in ſmall quantities; ſo that the other trials, I had the curioſity to make with them, kept me from examining their ſpecifick gravity, and from finding by an hydroſtatical way, that I have elſewhere declared, whether they were not lighter in ſpecie than inferiour metals, and conſequently than common mercury. For that quickſilver may be ſpecifically lighter than the metal that affords it, I think the chymiſts cannot reaſonably refuſe to grant; ſince they allow, that running mercury may be obtained from gold, and tell us great matters of it, becauſe of its proceeding from ſo noble a body. Now if this golden mercury be ſaid, becauſe of the ſuppoſed reſemblance of all mercuries, to be of the ſame ſpecifick weight with common quickſilver, then I have a notable inſtance of a mercury, that is conſiderably lighter in ſpecie, than the metal, that afforded it. And therefore, till experience have manifeſted the contrary, it will not be abſurd to preſume, that the mercuries of other metals may likewiſe be lighter in ſpecie, than the reſpective bodies, from which they were obtained: but if it be ſaid, that this golden mercury may perhaps be as ponderous as gold itſelf, or even more, then it is plain, that it is poſſible for a metalline body, notwithſtanding its being reduced into the form of a fluid, to be equiponderant to the metal, that afforded it. And that I may not ſeem to argue altogether from the conceſſions the chymiſts ought to make, I will add, by way of confirmation, a couple of things, that perhaps you will think ſomewhat ſtrange. Whereof the former is, that it is poſſible for a metalline body to reſemble another in all the manifeſt qualities, whereby artiſts are wont to examine them, and yet they differ much from it in ſpecifick gravity: as I had once opportunity to obſerve in a metal, that was not only white (within and without) like ſilver, and very malleable, but did, when I purpoſely examined it, endure cupellation, and paſſed for, and was reputed by a very eminent artiſt, that ſent it me to examine, to be good ſilver in all proofs; and yet this metal I found by hydroſtatical trials to be much lighter in ſpecie, than common ſilver. And if the famous perſon, that ſent it me, was not miſtaken, (for ſo I muſt not think he would knowingly miſinform me,) this odd metal may yield me a notable inſtance to my preſent purpoſe, ſince he affirmed this metal to be made without the addition of any metalline body of quickſilver; which, if this be ſo,

muſt, by a change of texture, have made a conſiderable loſs of its ſpecifick gravity. But to proceed to my ſecond inſtance, which will be yet more oppoſite; I ſhall add, that once I had a mercury, which amongſt other remarkable properties, that belong not to this argument, had a very ſtrange one; namely, that it was conſiderably heavier in ſpecie than common mercury (as I found and ſhewed to a great virtuoſo by hydroſtatical trial,) though it was made of a body no heavier than common mercury, and by the help of additaments, which were much lighter than common mercury. And this was ſo far from being a more groſs and ſluggiſh kind of quickſilver than the ordinary, that it looked very fine, and was very agile, and had, before I examined it, been more than once diſtilled. By this it may appear, that from hence, *that a body is in a mercurial form*, we cannot ſafely determine what degree of ſpecifick gravity it has. For ſince by this laſt example it appears, that a ſort of quickſilver may be far more ponderous than common quickſilver; it ſeems not unreaſonable, that a ſort of quickſilver may be far lighter than common mercury, and ſo perhaps lighter than the metals, that were reduced into that form: it being far leſs likely, that the former ſhould be produced than the latter, in regard there is but one mineral body in the world, that we know of, at all heavier than common quickſilver; whereas there are many of thoſe, that are capable of being aſſociated with it, that are far lighter than it.

BUT, as I intimated above, I am unwilling to ſpeak ſo poſitively about this matter as I might do, if I had opportunity to make the trials I would with the mercuries of bodies: only thus much I ſhall venture to ſay, that, for aught yet appears, the argument, I have been anſwering all this while, is not cogent, ſince it is built upon a ſuppoſition, that the mercuries afforded by metals and minerals muſt be of the ſame weight with common mercury; which is not only a prooſleſs aſſertion, but repugnant to the experiment lately mentioned of the diſtilled mercury, that was heavier than common mercury, and to the preſumption derived thence, that there may be bodies, in a mercurial form, more light in ſpecie than common mercury. And whatever becomes of the opinion I incline to; the argument I have been examining of the chymiſts, may be invalidated by what I have ſaid, where I took notice of the notable exceſs of ponderoſity, that pure gold has in regard of common quickſilver: for by that inſtance it plainly appears, that it is not to the participation of common mercury, that metals muſt neceſſarily owe their great ponderoſity, but that nature (and art too) may contrive the parts of a body into ſo cloſe an order, as to make that body (whether ſolid or fluid) more ponderous, bulk for bulk, than common quickſilver it ſelf.

HAVING now diſpatched what I intended to ſay in the foregoing diſcourſe, it remains, that I perform the promiſe I made, of adding the ways of mercurification (as chymiſts ſpeak) above referred to, as delivered by *Paracelſus*, *Helmont*, and *Lully*: about which I muſt give you this advertiſement, that beſides the obſcurities, and imperfections, that a moderate degree of attention may enable you to diſcover in theſe proceſſes, underſtood in the literal ſenſe, there are, if I much miſtake not, ſome affected equivocations in terms, that ſeem very plain, and free from ſuſpicion of ambiguity. As for inſtance, though the word *ſal armoniacum* ſeem to be of this ſort, yet amongſt Hermetick philoſophers it often ſignifies, not common ſal armoniac, which is far from being able to perform the effects they aſcribe to theirs, but a very differing and much more noble and operative thing; which, becauſe it may be ſublimed like common ſal armoniac, they are pleaſed to call by that name. And though ſometimes they give it the title of *ſal armoniacum philoſophorum*, yet oftentimes they omit the diſcriminating epithet, eſpecially in philoſophical proceſſes, (that is, ſuch as thoſe, wherein they deliver their higher arcana,) of which ſort are many of *Paracelſus*'s proceſſes, and more (not to ſay moſt) of *Lully*'s. What is meant by *ſal armoniacum philoſophorum*, I think it needleſs to tell you here, (but may perchance do it on another occaſion;) ſince that compoſition requires an ingredient, that neither of us is furniſhed with, and that you cannot procure. There may be other ambiguities in the following proceſſes, that will not be eaſily diſcovered, but by ſuch as are verſed in the myſterious language, which ſome would call canting, of the Hermetick philoſophers. But, I think, I have ſaid enough already to ſhew, that the annexed proceſſes are fit to confirm, what is delivered upon the firſt Propoſition of the foregoing diſcourſe; and therefore without offering to explain them, I ſhall ſubjoin them in the proper terms of the reſpective authors.

Ratio extrahendi ex omnibus metallis mercurium Paracelſica.

Hæc extractio (ſcilicet mercurii ex metallis) fit per aquam mercurialem, quæ nec *Joanni de Rupeſciſſa*, nec aliis, quicquid etiam jactitent, cognita fuit. Ideoque diligenter eſt cognoſcenda, & indefeſſo labore tractanda. Hoc ergo pacto paretur dicta aqua mercurialis.

Ponatis de noſtro menſtruali fœtenti, facto de duabus partibus vitrioli rubei, & una ſalis petræ, & prædictum menſtruum prius diſtilletur ſepties, & bene rectificetur, ſeparando fæces terreſtres in tantum, quod prædictum menſtruale ſit totum eſſentiale. Deinde lutetur benè metretum, & ponatur ad ignem cinerum, cum parvo igne carbonum, quouſque videris materiam bullire & diſſolvi. Deinde ſic ſupra cineres diſtilla, donec amiſerit menſtruum, & materia fuerit frigida totaliter: cum frigidum fuerit, vas aperiatur, & materia, quæ frigida eſt, ponatur in alio vaſe bene mundo, cum ſua cappa bene lutata ad furnum ſupra cineres, & luto bene deſiccato, fiat ignis paulatim in principio, quouſque totam recipias aquam ipſius. Poſtea augeatur ignis, quouſque materia bene fuerit deſiccata, & ſpiritus fœtentes ſint ad cappam, & in receptorio jam exaltati. Et dum tale ſignum videbis apparere, dimittatur vas infrigidari, ignem minuendo. Et poſt refrigerationem vaſis, extrahatur materia, & in pulverem ſubtiliſſimum redigatur ſuper porfidum; ita quòd pulvis ſit impalpabilis, qui ponatur in vaſe terreo bene cocto & bene vitreato. Et poſt ponatur ſuper dictum pulverem de aqua communi bulliente, movendo ſemper cum baculo mundo materiam, uſque materia fuerit ſpiſſa ſicut ſinapi. Et move dictam ſalſam cum baculo, quouſque videris apparere grana mercurii è corpore, & quod vobis appareat quantitas magna prædicti mercurii vivi, ſecundum quod poſueris de corpore perfecto, id eſt, de luna, & dum habueris magnam quantitatem, interim projice deſuper aquam bullientem; & tandem movendo, quoad tota materia reſolvatur in materiam ſimilem argento vivo vulgari, tollantur terreſtreitates cum aqua frigida, & deſiccetur per pannum: poſtea tranſeat per corium, & videbis mirabilia.* Lullius in Clavicula, Cap. 2.

Of the diſſimilitude of running mercury.

BEFORE I undertake to give you my opinion about your queſtion, I muſt crave leave to ſtate it ſomewhat more clearly, by propounding it thus: whether all the bodies, that in the ſhops, and among chymiſts, paſs for true running mercuries, are homogeneous; or ſo much of one and the ſame nature, that the ſeveral portions of ſuch mercuries are but numerically different? Now to the queſtion thus ſtated, the fear of ſeeming to maintain a paradox, by diſſenting from the generality of chymiſts, as well as naturaliſts, (who are wont to employ indiſcriminately all running mercuries not manifeſtly adulterated) will not keep me from returning a negative anſwer.

AND though it were not over difficult for me to give you the reaſons of my opinion, drawn up into method, and refer ſeveral inſtances I ſhall produce, ſome to the depuration of quickſilver, ſome to the impregnation of it, ſome to the coction, and others to two, or all theſe ways of altering it; yet I ſhall rather preſent you with them, by way of looſe obſervations, becauſe I preſume that freedom will not be unacceptable to you, as it will allow me, to give you ſome few, but uncommon notices and hints about ſuch noble ſubjects as prepared mercuries.

1. IN the firſt place, then, it may be obſerved, that a running mercury may be brought to differ from common quickſilver by depuration: for there are in moſt mercuries either recrementitious particles, or at leaſt ſome looſe adherencies, that are ſeparable from the reſt of the body; and which being ſeparated, the mercury becomes more homogeneous or clean, than it was before this external depuration, (for ſo I call it, to diſtinguiſh it from another, that is internal) that is uſually made, by grinding and waſhing mercury very well with ſalt and vinegar, (for which purpoſe, I alſo ſometimes uſe ſpirit of wine) which one may not unfrequently ſee ſomewhat fouled, by what it carries off from the mercury, which is alſo ſometimes attempted to be purified by the more laborious way of diſtillation; which, though in ſome caſes inſufficient, (as I ſhall ſhew anon) is in ſome others very convenient; whereto ſome artiſts add other probable means, tending to the ſame purpoſe. So that I do not wonder to find, that divers philoſophical Spagyriſts themſelves, before they proceed to more intimate preparations of mercury, order it to be ſeveral times previouſly incorporated and ſublimed with acid ſalts or ſulphurs, and then revived with alkalies. Since without examining their grounds it may be ſaid, according

to

to mechanical principles, that by diligent commixtures the mercury is divided into exceedingly minute, if not inviſible globules, or ſuch like parts; and by this great comminution, it acquires far more of ſurface than it had before, by which means a great multitude of ſeparable parts come to be touched, almoſt of every ſide, by the ſalts or ſulphurs, to which by this means, when the quickſilver is driven from them in the revivification, it is probable, that very many of them ſtick, that were not ſuperficial, when all theſe globules made up but one mercurial maſs. And it is poſſible too, that the alkalies employed to revive the quickſilver, may help to tear off from it ſome of the feculent particles, which the chymiſts would deſire to have it freed from. And here, let me advertiſe you upon the by, that there is no neceſſity to have recourſe to ſalt of tartar or quicklime, or ſuch like alkalies for the reviving of quickſilver: and therefore when I would, with eaſe, obtain a clean and active mercury for ſome purpoſes, I do not employ acid and then alcalizate ſalts, but mix very well common cinnabar finely powdered with a double weight, or at leaſt, an equal weight of filings of iron, or ſteel. For theſe being diſtilled together in a low retort with a ſmart fire, the ſulphur of the cinnabar will faſten upon the filings, and let the mercury come over fair and vivid, and perhaps ſomewhat impregnated with a martial vertue, upon whoſe ſcore it may be better, than if it had been prepared by mere depuration.

2. AND this leads me to the mention of another way of diverſifying mercury, which is by impregnation, either corporeal, or ſpiritual, (if for diſtinction ſake I may ſo call them.) But the impregnation being a comprehenſive way, divers particular methods may, after a manner, be referred to it: yet becauſe the true grounds of ſuch references are ſometimes hard enough to be aſſigned, at leaſt in few words, I ſhall allow my ſelf, without ſcrupulouſly regarding them, to proceed in my free obſervations.

3. THE next thing then, upon whoſe account a running mercury may come to differ from common quickſilver, is a ſpiritual impregnation. By mercury ſpiritually impregnated I mean that, with which ſome ſubtile parts of another body are ſo intimately aſſociated and united, that not only the additament will paſs with the mercury, when it is ſtrained through leather, (though that be the means, by which artiſts uſually ſeparate gold itſelf from the mercury, wherewith it has been amalgamed) but will alſo continue with it after diſtillation, without hindering the mercury from being vivid enough. I know there are many chymiſts, eſpecially among the more cautious, that look upon quickſilver as ſo heteroclite a mineral, that as no body can faſten enough upon it, to alter it intrinſecally, ſo it will not admit any other body to be aſſociated with it any thing intimately, or permanently. And indeed ſince we find, that when gold itſelf, with which of all bodies whatſoever mercury is believed to have the greateſt ſympathy, may yet be ſeparated from it by ſtraining an amalgam of thoſe two metals through leather, which will tranſmit the quickſilver, and retain the gold; and if ſuch an amalgam be diſtilled with a competent fire, the mercury will aſcend, and leave all the gold behind in the retort; ſince mercury I ſay, is ſo ſeparable from gold itſelf, it may ſeem improbable, that it ſhould be more intimately aſſociated with any other bodies. But theſe arguments, though ſpecious, do not, I confeſs, convince me, who muſt not deny, but that the corpuſcles of ſome mineral bodies may be ſo well commixt with quickſilver, as to paſs with it through the pores of leather, and who have found by trial purpoſely made (and elſewhere related) that quickſilver being in a convenient proportion amalgamed with tin, or with lead, and diſtilled with a competent fire, will manifeſtly bring over with it ſome of the aſſociated metal; inſomuch that not only I have found a notable increaſe in the weight of the diſtilled quickſilver, but it would both leave a tail, as they call it, behind it, when it moved upon a ſloping glaſs, and (which was more) when the ſluggiſh mercury had reſted a while, it would appear covered over with a kind of ſcum, made of the emerging corpuſcles of the tin, or lead, either of which, eſpecially the former, is a metal lighter in ſpecie than quickſilver. Hence it appears, that mercury may be ſo ſtrictly united to a not deſpicable proportion of a groſs and ponderous body, and of an ignobler kind, as to carry it along with itſelf in diſtillation; which by this appears not to be near ſo certain a way, as ſome learned chymiſts think it, to try, whether mercury be pure from all adulterating mixtures, and to free it from them, if it had any before. But the chief uſe I will make of this experiment is this, that ſince we ſee, that ſometimes mercury does not refuſe even corporal impregnations, (as for diſtinction ſake I call thoſe lately recited) it ought not to appear incredible, that it may in ſome caſes admit ſpiritual impregnations, and ſo intimately aſſociate with itſelf ſome of the finer parts of certain metals and minerals, as not to part with them, though they be diſtilled, and afterwards perhaps ſeveral times waſhed. This brings into my mind, that I had once a diſtilled mercury made by an impregnation of common mercury, a drop or globule of which, being evaporated from a thin piece of ſilver, not only ſeemed to have ſomewhat penetrated it, but (as I expected) left upon it a rugged ſubſtance apparently lighter than the ſurface of the piece, and of a colour very near that of gold, from whoſe nature perhaps it was not very remote: but that common mercury may indeed be ſpiritually impregnated, I have been perſuaded by divers effects, that I have tried of ſuch impregnations; and I acknowledge to you, that moſt of the uncommon mercuries, that I am now proceeding to tell you of, have been prepared after ſome ſuch manner.

4. ANOTHER thing, wherein a mercury may differ from common quickſilver, is a facility to amalgam with gold: for it is known to gilders, goldſmiths, and others, that are verſed in ſuch experiments, that to make amalgams with gold and mercury, it is uſual enough

to take ſix parts of the latter to one of the former, and ſome take eight or more. Nor is ſo great a proportion of mercury wont to keep them from thinking it requiſite to make both it and the gold ſeparably, and conſiderably hot to facilitate their commixture, but I have divers times had ſpiritually impregnated mercuries with but two parts, of which I would preſently make an amalgam with one part of the calx, or leaves of gold, and that without any other external heat, than that of the palm of my hand. Nay, ſometimes, for trial ſake, I have employed but one part of quickſilver to make in the palm of my hand a mixture, wherein the gold was ſo far from appearing, that the colour of the quickſilver was not ſenſibly ſo much as impaired.

5. ANOTHER difference between ſome mercuries and thoſe that are vulgar, is, that theſe being put to calx of gold, though one do at length bring them to mix, (for it is not ſo eaſily done, as men are wont to preſume) yet they will not diſcloſe any ſenſible heat, but the mixture, as each of the incorporated ingredients was, will to the touch be cold: but though I know there are many learned chymiſts, that look upon incaleſcent mercuries, that is, ſuch as will grow hot upon their mixing with gold, as chymical *non-entia*, or chimæra's, yet they are not competent judges of the poſſibility of things. For I have more than once, or a few times, both alone, and in the preſence of ſome curious perſons, found and evinced, that a diſtilled mercury may be ſo animated, that a ſingle dram of it, or perhaps a far leſs quantity, being mixed barely with my finger, with as much, or perchance half as much, calx of gold, would preſently conceive, not only a ſenſible, but a very conſiderable heat; inſomuch that ſometimes it would prove offenſive to the palm of my hand, wherein I made the mixture. Divers phænomena of this experiment may be ſeen in the author's little Tract *Of the Incaleſcence of Quickſilver with Gold*, now extant in the *Philoſophical Tranſactions*, *Numb.* 112. And I remember, that once being to convince a very eminent chymiſt, that there were ſuch mercuries, as I have been ſpeaking of, I took a remnant of a certain quickſilver, which I intend never to make again, (and of which, for the ſake of mankind, I reſolve not to teach the preparation) of whoſe diſpoſition to incaleſcence I had ſuch an opinion, that though we had no calx, nor ſo much as filings of gold, but only ſuch pieces, as he could groſsly prepare with a hammer and a pair of ſciſſors, I ventured to put my mercury to them in a glaſs-mortar; and yet notwithſtanding the thickneſs and cloſeneſs of the beaten metal, and the coldneſs of the veſſel, the mercury, to the artiſt's wonder, penetrated the gold, and grew manifeſtly hot with it. And this faculty of our quickſilver was not a tranſient and eaſily vaniſhing one; for I had already kept the mercury by me for ſeveral years. The incaleſcent mercuries hitherto mentioned were animated by tedious and laborious operations; but if I had deſired only to convince gain-ſayers, I could have done it by a very much ſhorter way: for though this ſort of impregnated mercuries be many degrees inferiour to the forementioned animated mercuries, yet as to incaleſcence with gold, I know by experience a way, which is indeed hard to hit, and requires a dexterous artiſt, but which, when it ſucceeds aright, will in an hour, and perhaps a leſs time, qualify mercury to grow preſently hot with gold.

6. WHEN an animated mercury is by due impregnation qualified to amalgam readily and intimately with gold, and penetrated ſo as preſently to grow hot with it, it is not much to be admired, that it ſhould alſo differ from common mercury, in the being able to carry up with it part of the gold, wherewith it was ſo ſtrictly aſſociated. I know, that many learned men, and among them divers chymiſts themſelves, do not think it credible, that at leaſt corporal gold ſhould be volatilized by quickſilver. And indeed that, which is common, may be many times diſtilled from gold, without carrying up any of it; but this ought not to conclude againſt ſuch ſpiritually impregnated mercuries, as I lately mentioned: for with a very ſmall quantity of one of them I have ſometimes elevated ſo much calx of gold, that the inſide and neck of the retort were richly gilt by the adherent particles of that metal, which would ſometimes ſtick ſo cloſe, as not to be without difficulty ſeparated from the glaſs. And I remember too, that having with one of theſe noble mercuries amalgamed about half its weight at moſt (if I miſtake not) of calx of gold, though it did not gild the inſide of the glaſs, yet I found, as I expected, that the diſtilled mercury was manifeſtly encreaſed in weight, as well as ſomewhat changed in colour and conſiſtence: which experiment may be added to thoſe, that I formerly mentioned, to prove, that quickſilver (duly prepared) may be corporally impregnated.

7. IN the amalgams made of one of theſe ſpiritually impregnated mercuries with calx of gold, I have ſometimes obſerved a thing, that argues ſuch mercuries to be differing from common quickſilver; of whoſe amalgams with gold ſuch an effect has never (that I know) been taken notice of. The phænomenon I mean was this; that by diſtilling one of thoſe ſubtile amalgams in a retort, a good part of the bottom of the veſſel, which I have yet by me, was left adorned with a very lovely colour, almoſt like that of turquois ſtone, inclining towards the colour of gold, and ſomewhat changeable; and alſo ſo cloſely faſtened to the glaſs, that it ſeems to have penetrated into it, though this beautiful ſtain were left by but a very ſmall quantity of the amalgam, and though this mixture were diſtilled but in a moderate fire, ſince it was in a ſand-furnace. Nor is this the only experiment of this kind, that I would alledge, ſince I elſewhere mention an amalgam of gold with an animated mercury, which being long decocted, when at length by an exceſſive fire unſkilfully adminiſtred the veſſel was unluckily broken, left the lower part of the glaſs permanently tinged with a pure and tranſparent red, that ſeemed to me to emulate that of a not common ruby.

8. ANOTHER

8. ANOTHER difference I found between ordinary quickſilver and ſpiritually impregnated mercuries, that will perhaps ſomewhat ſurprize you. And it is, that though one would expect, that amalgams made with mercuries ſo penetrant, and ſo diſpoſed to adhere cloſely to gold, ſhould make with it amalgams far more eaſy than thoſe made with ordinary quickſilver to be turned into red precipitate, yet I found the quite contrary upon trial. For whereas chymiſts are wont to mention about ſix weeks as the uſual time, wherein mercury may be precipitated even *per ſe*, that is, without additament, and allow but a ſhorter time to make this precipitation, when it is amalgamed with gold, (whereby ſome of it is detained, and all more expoſed to the action of the fire:) I have had the curioſity to keep an animated mercury amalgamed with about a third part of its weight of fine gold above twice ſix weeks, without having ſo much as a grain or two of precipitate (perhaps not half ſo much) that I could perceive, though the mercury grew hot with the gold at their being mingled, and though the mixture were purpoſely kept in a good heat capable to make quickſilver circulate. Nor did I content my ſelf with one trial, nor with one ſort of animated mercury, but in above five or ſix months I obtained not one grain (that I could diſcern) of precipitate, though the heat was ſo ſtrong, as to carry up many parts of the quickſilver, and of the gold with it, to the top of the glaſſes; nay, in one of them (which was a ſomewhat odd caſe) the fire was ſo violent, that the hermetically ſealed glaſſes beginning to melt, the ſpirituous matter included in it was ſo forcibly expanded, as to ſtretch the weaker ſide of the glaſs, and give it as it were a bunch, yet without breaking it; as I can ſhew you in the glaſs it ſelf, that I have yet entire by me. Nor do ſix months make the longeſt term, that the obſtinacy of my curioſity has made me keep gold in decoction with animated mercuries without obtaining a red powder or precipitate, though in the mean time there were produced very pretty vegetations, and ſometimes, which is far more conſiderable, odd changes of colours, about which it is not here neceſſary to entertain you; the main drift of this obſervation being to give you notice, that as far as I have yet tried, the more ſubtle and richly impregnated mercuries are far leſs apt to afford precipitates with gold, than common quickſilver is. As if that diſpoſition to be calcined, (as the chymiſts are pleaſed to ſpeak) or turned into powder, required the preſence of the recrementitious or more ſeparable part of quickſilver, that a chymiſt would perhaps call it ſulphur, which was a diſcovery I could willingly enough have miſſed. For I confeſs I had ſome hope, as well as intention, to try, whether a precipitate, made with gold and ſome of theſe noble and richly impregnated mercuries, would not prove a nobler medicine than precipitates made with gold, and only common mercury; though even of ſome of theſe, when dexterouſly prepared and kept their due time in decoction, experience invited me to have no ſlight opinion; eſpecially, if they be exhibited in a juſt doſe, and accompanied with a proper additament, by which they may be kept from raiſing any ſalivation, and have their operation either altogether or almoſt totally determined downwards.

9. THE laſt difference I ſhall obſerve between ſome diſtilled mercuries and common quickſilver, ſhall be their inequality in point of ſpecifick gravity. I know you will think this a paradox; but I can tell you, that I had once the opportunity to examine hydroſtatically a noble mercury, for the impregnating whereof neither corporal gold nor ſilver was employed; and yet having carefully weighed this quickſilver in water, according to the method I elſewhere teach, in the preſence of a famous and very heedful virtuoſo, I found it, as I had foretold, not only manifeſtly, but very conſiderably heavier in ſpecie (that is, bulk for bulk) than common quickſilver, though this mercury had been ſeveral times diſtilled, and by other ways depurated; which to me ſeemed to argue, that even ſpiritual or volatile gold (for no viſible gold was employed, and no metal but gold is ſo heavy as quickſilver) is able to increaſe the ſpecifick gravity of mercury it ſelf, which, of all the bodies we know, is exceeded or equalled in that quality but by one alone. And the ponderouſneſs of our lately mentioned mercury ſeems to me the more wonderful, becauſe having by the ſame method hydroſtatically examined a mercury, made after a ſtrange way, (without common mercury) I found it ſcarce at all to differ in gravity from common quickſilver, ſince it did not weigh full fourteeen times as much common water of the ſame bulk.

BUT here I ſhall obſerve to you upon the by, that it is not a certain conſequence, to infer, that the heavier the mercury is, the more fixt it muſt be; for I remember, that having been once ſo unadviſed as to comply with the earneſt ſolicitations of an inquiſitive gentleman, that afterward behaved himſelf very ungratefully and unworthily to me, I gave him inſtructions, how to make an animated mercury, which I looked upon as very much of the like nature to the ponderous one, I have been ſpeaking of, but leſs tedious, and far leſs difficult to be prepared; and while he found he needed my renewed directions, according as new difficulties occurred to him, he gave me from time to time an account of his progreſs; and when he was advanced far in the proceſs, he informed me, amongſt other things, that following my direction in purifying and animating his quickſilver, he found it ſo altered and ſubtilized, that he would diſtil it in leſs than half the time he had formerly employed to drive it over, with the like fire and veſſels.

THIS is what I thought fit to ſay at preſent, about the differences between common quickſilver and prepared (but yet running) mercuries. And yet I am content to add two or three advertiſements, for which, and eſpecially for the firſt of them, you will perhaps thank me, if ever you ſhould vigorouſly proſecute, in a ſpagyrical way, the more noble ſort of mercurial experiments.

In the first place then, I shall observe to you, that whatever some learned chymists, and others, teach to the contrary, it is matter of fact, that mercuries may be animated or spiritually impregnated by more ways than one, (not to say, by more than a few) so as to penetrate gold very powerfully, and grow hot with it; and it seems to me very probable, upon grounds not meerly notional, that the differing ways, that are employed to prepare these animated mercuries, by impregnating them with this, or that mineral, or metal, may much diversify their qualities and operations, according to the respective natures of the bodies they are impregnated with. Nay though there seem so great a distance between quicksilver and vegetable substances, yet I have seen a mercury, that was prepared by the help of vegetables without metals or minerals, which was very different from common quicksilver, by being more noble than it.

The second thing I am to acquaint you with, is, that as divers bodies and methods may be employed in the preparation of noble mercuries, (as I have newly observed,) so it seems very probable, that the common mercuries so prepared may have differing, as well as noble qualities and uses, not only in respect of alchymy, but of medicine; as being fitted to have potent operations, as well upon human bodies, as the more stubborn ones of metals and minerals. I am not indeed at all forward to recommend the needless use of mercurial medicines, of which we may too often see bad effects, if they be not as well prudently and cautiously given, as faithfully and skilfully prepared: but since we see, that, in spight of *Helmont*, very many learned and experienced physicians allow themselves to employ, frequently enough, even the vulgar preparations of common mercury, some of which prove indeed oftentimes in some stubborn diseases far more efficacious than ordinary medicines; I see not, why we may not hope for greater and more innocent effects from a mercury well purified and impregnated with the sulphur and finer parts of such bodies, as volatile gold, or Venus, or Mars, or antimony &c. And though, as I lately told you, I found such animated mercuries far more indispos'd than common quicksilver, to make a precipitate with corporal gold; yet this need not hinder, but that divers other preparations may be made, as well with impregnated, as with vulgar mercury; such as are turbith mineral, the white precipitate, that purges downwards, *mercurius dulcis*, pills of crude mercury made up with fit ingredients, (as in those, that are by some called the blue and the black pill) and especially the cinnabar made by subliming quicksilver and sulphur into a purely red substance, which, though wont to be employed chiefly by painters, ought not perhaps to be neglected by physicians; since even in ordinary cinnabar the vulgar mercury is so bridled by the common sulphur, that unless too frequently given without pauses, or in an indiscreet dose, it has not been usually found to salivate, yet does often lie not idle nor useless in the body: so that it may be well worth trying, whether a noble cinnabar may not be obtained by substituting animated mercury for vulgar, especially if instead of common sulphur one should employ that of antimony, or of antimony and vitriol, which I have elsewhere shewn to make.

The third and last advertisement I will give you, shall be, that you are not hastily to conclude, that a mercury, that has been carefully depurated and impregnated, has not been well prepared, if you find it not readily to elevate corporal gold, as it may seem by the past discourse, that most of the animated mercuries I have mentioned did. For though it be true, that I have had some mercuries fitted to penetrate gold so far, and mix with it so closely, that it would quickly upon distillation visibly carry up some of that ponderous metal with it; yet so much is not to be expected from all mercuries, that may lay claim to the title of animated or noble. For I have found, that some even of these may require a strong decoction to incorporate them intimately with gold; and I remember, that once, for trial-sake, I made mercury, which upon bare distillation would not at all colour the glass: I made, I say, this mercury, by decocting or circulating it with the gold for ten days or a fortnight, unite so closely with the metal, that it would afterwards elevate enough of it to gild the inside of the glass; and by a much longer decoction I have sometimes had the gold lodged copiously in the upper part, and even in the neck of considerably tall glass-eggs, hermetically sealed, one or two of which I can yet shew you.

OF THE

Producibleness of PHLEGM or WATER.

PART V.

Of the several substances, that chymists obtain by the fire from mixt bodies, that, which they call phlegm or water, and would have men look upon as mere water, separated by a preceding analysis, seems to the Helmontians, and divers other modern artists, to bid the fairest for the title of elementary and primordial. Wherefore it will now

now be fit to conſider, whether, about that alſo, we may not juſtly retain ſome doubts, and rationally ſuſpect, that all, that they call the phlegm of bodies, was not in the form of elementary ſimple water, pre-exiſtent in the body, whence it is obtained; but that even ſuch portions of matter, as many of thoſe, that paſs among chymiſts for phlegms, may be produced either by the operation of the fire, or by other ways.

IN order to this inquiry, it will be fit to premiſe ſomething againſt the preſumed ſimplicity and homogeneity of the liquors, whereto the Spagyriſts give, in common, the name of phlegm; that in caſe ſome of the produced liquors we ſpeak of ſhall be denied to be preciſely of an elementary nature, it may appear, that that ought not to hinder us from allowing them the name of phlegm, provided that they be not remoter from ſimplicity, than thoſe, to which chymiſts grant that appellation.

AND firſt, I conſider, that beſides thoſe qualities, that are common with water to divers other liquors confeſſedly not ſimple, as tranſparency, want of colour, aptneſs to be imbibed by moſt ſorts of vegetable and animal ſubſtances; the two qualities, upon whoſe account chymiſts are wont to call a body phlegm or water, are its appearing to them inſipid, and its being of a volatile and fugitive nature.

I FURTHER conſider, that not only divers of thoſe liquors, that paſs for phlegm, will yield a taſte ſenſible enough to him, that will hold them with attention of mind, for a competent time, in his mouth, but that the criterion of liquors by the taſte is nothing near ſo certain as many think. For, not to mention, that it is plain, that ſome kinds of dogs, as ſetters, ſpaniels, and blood-hounds, take notice of many things by their odours, that we men have no perception of by our ſmelling, which may argue, that our ſenſes may not be moved with objects, that would affect them, if they were of a more delicate contexture; not to mention this, I ſay, it is plain, that the ſubtlety of the ſenſe of taſting differs among men themſelves. And thoſe, that drink nothing but water, will often tell us of a great diſparity betwixt common water, wherein other men find not any. And I remember, that when once I did, though but for ſome months, confine my ſelf to drink water, I could diſtinguiſh the limpid waters of differing places, almoſt as manifeſtly as I now diſtinguiſh beers, which, after I fell again to drink wine and other liquors, I ceaſed to be able to do.

THE conſideration of quickſilver may, methinks, let us ſee, that it is poſſible for a groſs and fluid body, that is far from elementary water, to be inſipid. For quickſilver is without queſtion a fluid, and at leaſt in reference to ſome bodies, gold, ſilver, and ſome others, a liquor; ſince it ſoaks into their pores, and ſoftens the bodies. The ſame quickſilver may alſo ſerve to ſhew, by its diſpoſition to fly away in the fire, that volatility, even in conjunction with inſipidneſs, is no certain mark of an elementary or ſimple, nor conſequently of a primordial body. And indeed, ſince volatility depends mainly upon the extraordinary minuteneſs of the particles, whereof a body conſiſts, and on their being incoherent, and of ſhapes fitted for motion; this quality may be acquired by ſo many differing ways, and be found in bodies otherwiſe of ſuch differing natures, that unleſs it be found aſſociated with the other qualities proper to phlegm, it will be but an unſure argument, to prove the body, that it belongs to, to be elementary, and not to have been by compoſition, diviſion, or tranſpoſition produced.

IF it be true, as the Carteſians will have it, that water conſiſts of particles, that, like little eels, are long and extremely ſlender, and conſequently flexible; I ſee not any impoſſibility, that the various action of the fire, upon the minute parts of a body, and that, which it may cauſe the corpuſcles of one body to have upon thoſe of another, may produce water, that did not in the form of water pre-exiſt in the body, that affords it: for it ſeems to me poſſible enough, that the particles, whereof a corporeal maſs is made up, may have ſuch ſhapes, ſizes, and contextures, that by the various agitation, which the pervading corpuſcles of the fire may produce amongſt them, whatever edges and points they had before, may by mutual attrition of the corpuſcles be worn off, and by the ſame means ſo much of the ſubſtance may be worn away, that what remains, cannot but be very flexible, and by all theſe qualifications become fit to make a particle of water. As a bar of iron may, by divers ſtrokes of the wedge and hammer ſkilfully imployed, be divided into long and ſlender parts, whoſe edges and points being blunted, they may be reduced into ſlender, and every way flexible wires. But not to build on ſpeculations, let us proceed to ſome experiments, which afford phænomena, that ſeem favourable to our hypotheſis.

AMONGST the bodies, about which chymiſtry is converſant, thoſe, that ſeem to be the moſt indiſpoſed to be turned into water, are the metalline, and mineral ones: ſo that if it can be made appear, that any of this ſort can be changed into an aqueous liquor, it will make it highly probable, that aqueous liquors may be by chymical operations produced, eſpecially in vegetable and animal bodies; which ſeem far more ſuſceptible of ſuch a change, than the ſtubborn ſubjects of the mineral kingdom. And ſince quickſilver is by many learned men, as well chymiſts as others, looked upon as one of the few moſt indeſtructible bodies in nature, and by its great ponderouſneſs, in which it exceeds all the known bodies of the world ſave one, is ſo much the more remote from ſuch a liquor as water, that has not the ſixteenth part of its ſpecifick weight; if quickſilver itſelf can in great part be turned into an aqueous liquor, it will not a little favour the doctrine propoſed in theſe notes; for which reaſon I ſhall ſubjoin the enſuing ſtory.

RELATING to a very ingenious and ſober phyſician of my acquaintance what had befallen me in diſtilling mercury, from whence I once obtained a water without additament, without being

being able to make the like experiment afterwards ſucceed; he aſſured me, that he had a friend of his, had ſome years paſt provided a very large Dutch retort of good earth, furniſhed with a pipe of about a foot long, to caſt in the mercury at; and that having by little and little conveyed through that pipe a pound of quickſilver into the cadent retort, they obtained four ounces of water, and loſt in ſpite of their care two ounces of matter (whatever it were,) the remaining part of the pound having been elevated in the form of mercury. And when I ſuggeſted, that perhaps the water, that came over, was afforded by the aqueous particles of the earthen retort itſelf, he replied, that, to prevent their being impoſed on, they had been careful not to put on the receiver, till the retort had been made throughly glowing hot: and that this liquor was far from common water, he thought to be paſt doubt by that, which follows. For I having acquainted him with an odd trial or two, I had made with mercurial water, and aſked him, whether he found the like effects from his, he told me, that his friend and he poured both their diſtilled mercury and their water into a kind of China cup, and though it were in *June*, left it open in a garret for two or three days, upon a preſumption his friend had, that this mercurial water thus ordered would turn a good part of the quickſilver into its own nature, and ſo multiply itſelf upon it. But when they came to viſit their cup again, they were much ſurpriſed to find their water all gone, and that the greateſt part thereof was turned again into mercury; which they concluded from this, that they miſſed upon the balance but about half an ounce of the whole matter; which (half ounce) they ſuppoſed to have been loſt by evaporation; the other three ounces and a half being found in the increaſed weight of the mercury.

THE mention I have made of quickſilver, puts me in mind of an argument *ad hominem*, that may deſerve to be conſidered by the chief ſect of modern chymiſts, the Helmontians: for if it be true, which their maſter teaches, that by his liquor alkaheſt, not only quickſilver, but all other tangible bodies, may be reduced into inſipid water, juſt like rain water, I may be allowed to infer, that water may be produced, ſince ſalt and ſulphur themſelves may be turned into water. I know the Helmontians may anſwer, that this is not ſo much a production, as a reduction; ſince all things conſiſting originally of water, the alkaheſt does but deprive it of the diſguiſes, that ſeminal principles put it into, to make it appear, under the form of gold, quickſilver, plants, animals, *&c.* But this anſwer may be elſewhere further examined: for the preſent, it may perhaps be ſufficient to reply, that even by this anſwer it is granted to appear by experiment, that water has been copiouſly produced out of mineral bodies, but it has not yet been made appear, that thoſe bodies were produced out of water.

BUT this is not all, nor perhaps the principal thing I have to ſay in favour of the opinion pleaded for in theſe notes. For ſuppoſing bodies by being reduced, by the alkaheſt and the fire, into an inſipid liquor, were really deduced into water, yet the Helmontians would not fully ſatisfy me. For *Helmont* relates, that by abſtracting his immortal liquor from ſtones, or ſuch kinds of bodies, he turns them into ſalt equiponderant to the concrete; which ſalt by further operations he reduces, as he ſuppoſes, into elementary water. Since then he ſtops not at ſalt, but goes to a further tranſmutation, and concludes, that a ſtone doth not conſiſt of ſalt, becauſe that ſalt may, by further operations, be turned into inſipid water; he muſt give me leave, on the ſame ground, to argue, that inſipid water is not the firſt matter of bodies, ſince by a further operation of the fire, that liquor itſelf may be, at leaſt in great part, turned into earth. For I elſewhere relate ſome experiments of my own and a friend's, in which clear water, divers times very ſlowly diſtilled out of clear glaſs bodies, left every time a terreſtrial powder at the bottom: as if (in caſe water be ſo homogeneous a ſubſtance as is ſuppoſed) the whole body of the water might, by reiterated diſtillations, without violence of the fire, be reduced into earth; whereof I remember, in the laſt trial of mine, I had enough to cover the bottom of a large cucurbit, out of which the diſtillations had been made.

AND on this occaſion, I ſhall add a trial, which ſeems to argue, that without the help of often repeated diſtillations in tall cucurbits, clear water it ſelf may, by the operation of the fire, be changed into another body.

WE took, then, very pure and limpid water, which had, by our pneumatick engine, been carefully freed from the aërial particles, that are wont to be harboured in the pores of that liquor: this in a new bolt-head of ſuch a ſize, that the matter might have room to play and circulate, we ſealed up hermetically; and placing the veſſel in a digeſtive furnace, we left it there above a year, and obſerved, as we expected, that after it had continued for a good while, there began to form themſelves, in the water, little concretions heavier than it, which in proceſs of time increaſed in magnitude, and, as we thought, in number; making a kind of *terra foliata*, that conſiſted of a multitude of little thin films or ſcales, (like thoſe of the ſmaller ſort of fiſhes) which, when the glaſs was ſhaken in an enlightened place, were copiouſly diſperſed through the body of the liquor, and appeared variouſly and vividly coloured, being ſome of them almoſt as big as ſpangles, and more glittering: and when the agitation ceaſed, they preſently fell to the bottom, which they covered in the form of a *terra foliata*; by their ſubſidence manifeſting themſelves to be notably heavier, in ſpecie, than the water they had been formed of. And the longer the glaſs was kept in the digeſtive furnace, the more of this fine terreſtrial ſubſtance was produced: and leſt the effect ſhould be aſcribed to the abſtraction of the air from the water, handled as is before related, I ſhall add, that we produced the like ſubſtance, though, as it ſeemed, not ſo copiouſly, after the like manner, in water, that had not at all been freed from air.

OF

OF THE

PRODUCIBLENESS OF EARTH.

PART VI.

OF all the ſubſtances obtainable from mixt bodies, that which, to perſons not prepoſſeſſed with Helmontian opinions, may ſeem the moſt ſimple, elementary, and unchangeable, is that, which they call earth or *terra damnata*; becauſe there is ſuppoſed to be no doubt, but that the calcining or incinerating violence of the fire muſt not only have driven away the mercurial and other volatile parts, but muſt alſo have quite burnt out the ſulphurs, which oftentimes are more fixt than the reſt; as the water on the other ſide muſt have diſſolved away all the alkali or fixt ſalt.

THIS ratiocination, I confeſs, is very ſpecious and probable, but yet not ſo ſatisfactory, but that a ſceptick may retain not irrational doubts about the cogency of it, upon ſuch conſiderations, as I am now going to propoſe.

AND I will begin with conſidering, that, whereas the things, wherein this ſuppoſed ſimplicity, and unchangeableneſs of the earthy part of mixt bodies, is founded, are theſe three: its not diſſolving in water; its not affecting the taſte; and its not having flown away from the incinerated body, that afforded it; it may with probability be doubted, whether any of theſe, or all of them put together, do neceſſarily evince what chymiſts pretend they do.

AND in the firſt place, according to the different conſtitutions of certain ſorts of bodies, I think it fit to make a diſtinction between the dry and heavy parts, that remain after a body has been expoſed to the violence of the fire, and, if need be, freed from its ſalt, as much as it can be, by the affuſion of water. For it is evident, that in ſome bodies, eſpecially of a metalline nature, the fire, that makes that which they call calcination, does not operate as it does in the burning of vegetables. For, beſides that ſometimes almoſt (and ſometimes more than almoſt) the whole weight of a mineral is to be found in that which they call its calx, and is manifeſt in the calcination of lead and tin *per ſe* (if ſkilfully performed) the calx is in great part reducible ſometimes into a body of the ſame nature with that, which afforded it, and ſometimes into ſome other body, very far from being elementary: as is manifeſt partly in the reduction of minium, (which is calx of lead made *per ſe*) which, as to the greateſt part of it, we have more than once, by the bare way of ordering the fire, reduced in a very ſhort time, and without additaments, into malleable lead; and partly in the calces or (as they alſo ſpeak) aſhes of antimony, which by bare fuſion are eaſily reduced into glaſs, whence we have ſometimes obtained an antimonial regulus. So that it is manifeſt, that there is a great deal of difference, between the aſhes (taking that word in a large ſenſe) of metals, and of ſome minerals, where almoſt the whole body is by the fire converted into a dry and heavy powder, and the aſhes of incinerated vegetables, which uſually leave but a little quantity of earth behind them, in compariſon of the matter, which the violence of the fire hath driven away.

BUT ſetting aſide the above-mentioned metalline calces, which without queſtion remain compounded bodies, if metals themſelves be ſo; and to forbear examining, whether they be not further compounded with corpuſcles of the fire, or fuel, that are embodied with them: I conſider, that the qualities, which make other aſhes paſs for elementary earth, may be produced in portions of matter, that are not ſimple, either by compoſition or change of texture.

I HAVE elſewhere occaſion to take notice of bodies, which, though, when they are ſingle, they will eaſily diſſolve in water, yet the reſult of them will not: and you may find inſtances of this kind, among the magiſteries, as chymiſts call them, made of ſeveral bodies, by precipitating their ſolutions (made in acid liquors) with oil of tartar *per deliquium*.

FROM oil of vitriol and ſpirit of wine, though both moſt readily diſſoluble in water, we have, by bare digeſtion and diſtillation, obtained a pretty quantity of a ſubſtance, that we found not to diſſolve in water, and which ſeemed to be inſipid and fixt enough.

THERE are ſtones, ſome more and ſome leſs precious, which though I could by the help of the fire deprive of their colour, and bring to a white powder; yet it did not appear to me, that they were really calcined, or would in water yield any ſalt: ſo that if theſe ſtones be compounded bodies, as Spagyriſts tell us they are, we ſee, that there may be other corpuſcles beſides metalline ones, which though reduced by the help of the fire to a white powder, inſipid, and not diſſoluble in water, are yet remote enough from an elementary nature.

BUT I need ſeek no further, for inſtances of this kind, ſince Spagyriſts themſelves teach us, that the aſhes of wood may, by the violence of the fire, be turned into glaſs; which being a body compoſed of the earthy and ſaline part of the aſhes, (for they tell us, that earth ſeparated from the ſalt will never be vitrified) muſt be according to their own confeſſion a compounded body: which being at laſt made by the utmoſt violence of the fire, muſt be fixed, indiſſoluble in water, and conſequently inſipid. And without taking this vitrification upon the chymiſts authority, it is manifeſt, that in glaſs made the common way, there is a great deal of borellia, ſal alkali, or other lixiviate ſalt mixt with the ſand: as is evident, not only becauſe artificers find the ſalt needful to diſſolve

the

the ſand, and bring it to fuſion, but becauſe the glaſs uſes to weigh very much more, ſometimes (as an ingenious maſter of a glaſs-houſe anſwered me) thirty, or forty pound in an hundred, than the ſand, that was put in.

I SHALL add, that, ſince chymiſts aſcribe all odours to ſulphur, I may reaſonably conclude againſt them, that in ſpite of all the violent fire, which is required to the making common glaſs, there is ſtore of ſulphur, as well as ſalt in it. For I have often tried, that by barely rubbing two large pieces of glaſs, one againſt another, there would quickly be produced a ſtrong offenſive ſmell. And yet glaſs, which thus appears to be, not only a compounded, but a decompounded body, ſince the ſand or cugali (as the Venetian glaſs-men call their pebbles) or other ſtones being themſelves mixt bodies, are further compounded with the ſalts that diſſolve them: glaſs, I ſay, is a body, that manifeſtly poſſeſſes all theſe three qualities, which chymiſts require in their earth, being taſteleſs, indiſſoluble in the water, and fixed in the fire. And if aſhes alone be (as chymiſts teach us they are) capable of vitrification, (and indeed an inquiſitive owner of a glaſs-houſe anſwered me, that once, if he much miſ-remembered not, made, but not eaſily, glaſs of aſhes alone without ſand;) how are we ſure, but that in common aſhes, freed the common way, from their fixt ſalt, that which is called the ſimple earth, may not be a body compounded of two or more ſubſtances, which by their coalition, and new texture produced by the action of the fire, have been brought to a kind of vitrification, or otherwiſe have acquired the few obvious qualities, that chymiſts are wont to think ſufficient to give a production of the fire, the name of earth?

IT is obvious to obſerve, that divers bodies, when they come to be of ſenſible bulk, will ſink in liquors, in which their corpuſcles would freely ſwim, if ſo many of them did not ſtick together. As of ſalt and ſugar, the lumps, and even the grains, whilſt they remain ſuch, will fall to the bottom of water, in which when they are diſperſed into minute and inviſible corpuſcles, they will eaſily ſwim. And I have obſerved, that in ſtopt glaſſes ſome ſalts, and other bodies, that for many months remained undiſtinguiſhed in the liquors, that harboured them, would in tract of time have conventions made of their particles, that would then ſubſide, and be no more carried up and down by the particles of the liquor. And I ſee no impoſſibility, that ſomewhat of this kind may happen to the particles, whereof water conſiſts: for if ſome of theſe, by frequent occurſions and attritions come to apply themſelves to one another, ſo as to have a fuller, and more immediate contact than formerly, and to be intangled among themſelves, and perhaps alſo to exclude ſome very thin and ſubtile air, that may be ſuſpected to lurk about them, and contribute to their ſuſtentation; if, I ſay, this union, or ſtrict adheſion of aqueous corpuſcles, ſhall happen to be made, the aggregates or cluſters, though as to ſenſe but very ſmall, may be too great and unwieldy to be any longer parts of water, but may ſubſide in that liquor; and if their union or adheſion be ſtrict enough, they will upon the ſame account be unfit to be carried up in the form of vapours, and exhalations by heat, and ſo may be like earth fixed in the fire, as well as not diſſoluble in water.

I HAVE ſometimes alſo had a ſuſpicion, that the production of an earthy ſubſtance in water may be furthered by the particles of fire, that are employed to make it circulate; and that of thoſe igneous particles, which, as I am apt to think, pervade the glaſs, ſome of the groſſer, or rather the leſs ſubtile, may in their paſſage faſten themſelves to ſome aqueous particles, fitted to adhere to them, and may with theſe begin to make ſome inviſible concretions; to which afterwards, other congruous particles may, little by little ſtick, in their paſſage, and ſo at length compoſe ſenſible aggregates of powder: which may be illuſtrated by what happens in the precipitation of quickſilver without addition, where the mercurial particles being aſſociated by, and probably with ſome of thoſe of the fire, begin to form concretions, at firſt very minute, which afterwards increaſe more and more, by the acceſſion of other adhering particles, till all the mercury, or the greateſt part of it be reduced, from a fluid body, to a red powder. And perhaps it may countenance my conjecture, about the production of an earthy ſubſtance, by a briſk concurrence of the particles of fire, if I add, that though I have kept high rectified ſpirit of wine for above a year together hermetically ſealed, and for the moſt part of that time in a digeſtive furnace, without finding any earthy reſidence; yet, when I ordered a bolt-head, that, though it were hermetically ſealed, the alcohol of wine that was put into it might be boiled without breaking the glaſs, I found, that in a ſhort time this liquor would afford a not inconſiderable quantity of ſuch a ſubſiding talcky ſubſtance, as I obtained from the water formerly mentioned. But theſe things I need propoſe, but as illuſtrations, that may ſomewhat help you, to conceive how water may be turned into earth. For, whether it be by theſe, or any other ways, that the thing is performed, yet ſince the experiment formerly recited, that water by frequent cohobations may be more and more turned into earth, argues the matter of fact, our not being able to explicate the manner, does not hinder the thing from being true, nor the argument we build on it from being good: ſince even water, to which, by ſome operations of the fire and the alkaheſt, it is pleaded, that bodies are ultimately reduced, may it ſelf by a further and very ſimple operation of the fire be reduced into earth.

I HAVE ſomewhere mentioned, for I remember not in what paper I have obſerved, ſalt-petre diſtilled with clay, to loſe much more of its weight, than can be ſuppoſed to have aſcended in the form either of ſpirit or phlegm. And now to make this experiment more ſhort and eaſy, I ſhall add, that I lately made it in a crucible, (inſtead of a retort) wherein a double weight of finely powdered tobacco-pipe clay,

very

very well mixt with pulverized cryſtals of nitre, were kept three hours, in a violent fire, and then the mixture being taken out, the remaining fixt ſalt was carefully extracted, but amounted to very little in compariſon of what nitre was wont to yield, when calcined with charcoal. And that this ſcant proportion of fixt ſalt did not proceed chiefly from a very copious avolation of nitrous ſubſtance, appeared probable by this, that the *caput mortuum* was much more ponderous, than was to be expected, upon the ſcore of the tobacco-pipe clay, that was firſt employed, and the alkali, that was extracted; ſo that the new weight acquired by the clay ſeemed manifeſtly to proceed from the acceſſion of a portion of the ſalt-petre, that by this operation was turned into earth. Inſomuch, that of ſix drachms, that four ounces of clay had acquired in weight, after the crucible was taken out, not ſo many grains could even by boiling water be obtained from the whole *caput mortuum*; which, when firſt taken out of the crucible, was almoſt quite inſipid.

THAT earth may be *de novo* produced, may likewiſe be probably argued from the experiment I formerly related about the deſtruction of the ſalt of tartar, by igniting it, and putting it into fair water; for there remained after the numerous filtrations, and, if I miſremember not, after every one of them, a ſubſtance in the filter, which, for aught appears, may be as well called earth, as that, which was ſeparated from the calcined tartar, the firſt time it was put in the water, to divide the ſalt from the earth. For in our experiment, as well as in the common operation I come from mentioning, the way of proceeding is the ſame, and in both there remains in the filter a ſubſtance, which, by its ſtaying there, ſhews it was not diſſoluble in the water, and which before it came thither, ſhewed, by its enduring a violent fire, that it was alſo fixt as earth ought to be. Nor would it much move me, if it ſhould be found, that this factitious earth may have ſome ſuch operation upon ſome particular body, as is not thought to belong to true elementary earth. For ſince it is obtained by a chymical analyſis, if it have thoſe qualities, that in the general eſtimations of naturaliſts make up the notion of what they call earth; I think that ought to ſuffice us, at leaſt till the chymiſts give us ſome accurate notion of genuine earth, and ſhew us ſuch a thing, and teach us a better way of analyſis, to obtain it.

FOR in many bodies, that are, without ſcruple, looked upon as earth, I obſerve qualities, that do belong to the received notion of elementary earth. This I ſay, becauſe I ſee not, why ſuch a texture, as will ſuffice to make a portion of matter indiſſoluble in water, fixt in the fire, and inſipid upon the tongue, may not alſo make it fit to operate actively upon ſome bodies, and modify the operations of ſome others, that act upon it. And if our earth from ſalt of tartar be rejected as ſpurious, they ought to confeſs the inſufficiency of their common way of ſeparating a true earth from the bodies they analyze: for it ſeems calcination, and ſolution in water, and filtration, which make up their uſual method, will not ſuffice to make our earth of tartar paſs for true; though it appear not to be near ſo remote from an elementary nature, as ſome other bodies, that are obtained from earth by the vulgar analyſis. Of which I ſhall at the cloſe of theſe notes give an inſtance, in well-dulcified quick-lime, which, according to the doctrine of the chymiſts, ought to be an elementary earth; and yet ſeems not more ſo, (if it be ſo much,) as our earth from ſalt of tartar. And for the preſent, I ſhall add, that the *caput mortuum* of vitriol remaining after it had long endured a violent fire, though it were diligently freed from ſaltneſs by reiterated ablutions with hot water, was yet far from being an elementary earth; as appeareth not only by its deep purpliſh colour, and its ponderouſneſs, far exceeding that of earth, but by a trial, that I purpoſely made to examine it.

UPON this occaſion I remember, that a learned man of my acquaintance, who viſited the mines of *Hungary* (and dealt much in Hungarian vitriol) affirmed to me, when I told him I conceived the *caput mortuum* of it to retain much of the metalline nature, that he had, upon a certain occaſion, out of the colcothar of a certain ſort of Hungarian vitriol, not only received a pretty deal of good copper, but ſeparated from that copper a pretty portion of ſilver, and ſome grains of true gold.

BEFORE I put a period to theſe notes about earth, though my argument do not need nor require, that I ſhould do it, yet upon this fair occaſion I ſhall here take leave to doubt, whether ſuch an elementary earth, as the ſchools tell us of, do yet appear to be more than a notional thing. For to what I have already ſaid concerning the earths ſuppoſed to be produced by chymical analyſes, I ſhall now add, that I have not yet ſeen it proved, that nature does, any more than art, afford us a true elementary earth; at leaſt I can ſay, that ſome, which ſeem to be of the more ſimple ſort, I found upon examination to have qualities not aſcribed to pure earth. For though tobacco-pipe clay, by reaſon of its fixity, whiteneſs, and inſipidneſs, and its lying oftentimes deep enough beneath the ſurface of the ground, may, as probably as almoſt any other native earth we know, be looked upon as elementary; yet tobacco-pipes well baked may ſometimes be made to ſtrike fire. And I have more than once tried, that by briſkly rubbing two pieces of a new tobacco-pipe, one againſt another, they would in a minute or two of an hour grow warm; and being immediately ſmelt to, manifeſtly afford a rank odour, between ſulphureous and bituminous, almoſt like that, which proceeds from pebbles or flints, when they are likewiſe rubbed hard againſt one another. As if tobacco-pipe clay were not a true earth, but a fine white ſand, conſiſting of grains too ſmall to be diſtinctly taken notice of, like thoſe of other ſand. On which occaſion I ſhall add, that I found, by a hydroſtatical trial, that its ſpecifick gravity was but little differing from that of pebbles, its proportion in weight to water of the ſame bulk being as two and a quarter to one. A tobacco-pipe may alſo be ſome-

what melted by a very vehement fire, (for a leſs will ſcarce ſerve the turn) as may be argued from this, that it may by ſuch a fire be brought to bend.

PORCELLANE, or the matter, whereof China diſhes are made, is not, as ſome travellers and learned men have fondly imagined, a compoſition, that requires to be buried under ground, for I know not how many years, to ripen it into porcellane: but as ſome late authors inform us, and as I have been aſſured by a perſon, that went purpoſely to that place in *China*, that is ſo famous for the making of porcellane veſſels, it is a pure ſort of clay; but yet this I find not to be elementary earth. For beſides that I have obſerved, that a violent fire will make it ſomewhat melt; I find, that with ſteel it will eaſily enough ſtrike fire almoſt like a flint. The like I have obſerved in porcellane very artificially imitated with a ſort of Engliſh clay. And I found too, that the matter even of dark-coloured jugs of the better ſort, and well baked, would with a ſteel afford ſparks of fire. I forgot to tell you, when I was ſpeaking of fine porcellane, that I found its ſpecifick gravity to be very near the ſame with that of flints, and tobacco-pipe clay. But I remember I went once to viſit a grove or pit, where at the depth of divers yards, they were wont to dig up a certain white earth, which diſtilled, by an acquaintance of mine, afforded a liquor, that was put into my hand to try, and which I found to be very rich in a volatile ſalt, that taſted and ſmelt much like ſpirit of urine, or hartſhorn, and had almoſt the ſame effects in changing the colours of ſome bodies, and precipitating of others. I remember too, that I found by the operation of a menſtruum or two upon tripoli, that, as white and pure a virgin earth as it ſeemed, yet it was not elementary: and, on the other ſide, a maſter of ſome Engliſh mines having preſented me, among other minerals, which he knew not what to make of, a very white ſubſtance, whereof he had ſtore, which he thought an earth, and which was judged by an excellent artificer, much converſant with tripoli, to be finer even than that earth, I gueſſed it upon examination to be a kind of talc, whoſe leaves were exceeding fine and minute. The reſult of theſe relations may be, not only, that we may yet retain our doubts, whether the aſſertors of elementary earth can ſhew us any native ſubſtance, that deſerves that name; but alſo, whether thoſe things, that remain after chymical analyſes, though they have all the qualities, that are judged ſufficient to denominate a portion of matter, earth, may not yet either be compounded bodies, or be endowed with qualities, which belong not to ſimple earth. To explain and confirm which, I ſhall give an inſtance in ſome quick-lime, that I purpoſely examined. For though it had been, by frequent ablutions in warm water, carefully dulcified, and ſo was as well inſipid, as fixt, and indiſſoluble in water; yet I found, I could readily diſſolve it in divers menſtruums, and even ſpirit of vinegar: whereas true elementary earth ought to be as well indiſſoluble in ſuch liquors as in water.

IF I had not been to deal with chymiſts, but Ariſtotelians, I might have ſaved my ſelf the labour of ſolicitouſly endeavouring to prove, that earth and water may each of them be produced from bodies of a differing nature from it. For though the Peripateticks will not allow the whole elements to have been produced, becauſe they look upon them as integrant parts of the world, which *Ariſtotle* laborioufly (though not ſolidly) maintains to be eternal; yet the portions of the elements they will have to be interchangeably tranſmutable. So that what was once water may be earth, and earth may, by intermediate alterations, be turned into water.

BUT thoſe I have to do with, being the vulgar chymiſts, who will have the material principles or ſimple ingredients of mixt bodies co-eval with the world, and uncapable of being either deſtroyed or produced; it was not allowable for me to proceed upon the Ariſtotelian hypotheſis, of the tranſmutableneſs of what they call elements; eſpecially becauſe, that though I do admit it, as it is, according to my opinion, a part of a more general truth; yet I do not think, they have well proved it by their arguments: which ſince I my ſelf do not like, I think it were diſ-ingenuous to preſs them upon others. And without having recourſe to their doctrine, there will occur ſome other particulars, that may be added to thoſe already mentioned, to countenance the producibleneſs of the principles of mixt bodies, in ſome other papers, that are to follow theſe notes; though in ſtrictneſs I was not obliged to ſay ſo much, as I have already ſaid, ſince pretending to call in queſtion no more than the three hypoſtatical principles of the chymiſts, I might eaſily have excuſed my ſelf for having let alone the production of water and earth; ſince the generality of chymiſts reckon not thoſe bodies amongſt their hypoſtatical principles, but look upon them, as receptacles, or, as others would have them, recrements of theſe, or, as on ſome other account, related to them. But I was not willing to omit water and earth, becauſe ſome of the more learned of the modern Spagyriſts have adopted them into the number of the principles of mixt bodies; and becauſe I find by experience, that in chymical analyſes they are at leaſt as often to be met with, as ſome of the principles confeſſedly hypoſtatical. But what has been delivered about earth and water having much added to the bulk of theſe notes, it is time I ſhould put a period to this part of them, in reference to which I hope it will be conſidered, that I do not pretend, that every ſingle experiment by me alledged does ſufficiently prove, that the body obtained by it was in the ſtricteſt ſenſe produced. For if the ſeveral experiments, and other proofs, do in conjunction, and, as it were in a body, make up a good argument, that the ingredients they relate to, may be produced; it is as much as will, I hope, be expected from theſe notes, which having been written by way of appendix to the *Sceptical Chymiſt*, may be allowed, as well as that book, to employ ſome proofs, not altogether cogent,

and

and may be judged not improper, though ſome of the arguments propoſed in them, to ſhew, that chymical principles are not all ingenerable and indeſtructible, ſhould be but meerly probable. And yet this I ſhall venture to intimate, that vulgar chymiſts and Ariſtotelians may not, perchance, find it ſo eaſy a thing, as it is like many of them will imagine, to confute divers paſſages of the foregoing tract; ſince probably their objections will ſuppoſe ſomething or other, which, though taken for granted among them, and perhaps by ſeveral other learned men, I do not admit as true, or think demonſtrable, but rather queſtionable, upon very rational grounds. And though perhaps I ſhould not have brought in ſome of the experiments mentioned in the preceding notes, if I had not had a mind to throw together what I thought might contribute to ſo uſeful a thing, as a natural hiſtory of chymical principles, on which others, if not I, may hereafter ground a theory of them; yet this may alſo deſerve to be conſidered, that if any of the foregoing experiments, though never ſo few, do really prove, (as it is like ſome of them will be judged to do) that any one of the chymical principles may be, *de novo*, produced; that alone will ſuffice to deſtroy the univerſality and intireneſs of their hypotheſis; and beſides give cauſe to ſuſpect, that by further induſtry, the producibleneſs of other principles alſo may be diſcovered.

SOME

SOME CONSIDERATIONS

Touching the

Uſefulneſs of Experimental Natural PHILOSOPHY.

Propoſed in a familiar DISCOURSE to a FRIEND, by way of Invitation to the Study of it.

The Publiſher to the Reader.

IT is, courteous reader, part of the ſatire of *Petronius* againſt the vice of his own time; *Priſcis temporibus, cum adhuc nuda Virtus placeret, vigebant artes ingenuæ, ſummumque certamen inter homines erat, ne quid profuturum ſæculis diu lateret. Democritus omnium herbarum ſuccos expreſſit, & ne lapidum virgultorumque vis lateret, ætatem inter experimenta conſumpſit.* Other examples of the like induſtry he brings, and then concludes againſt the lazineſs and luxury of his own age: *At nos*, ſaith he, *ne paratas quidem artes audemus cognoſcere, ſed accuſatores antiquitatis vitia tantùm docemus & diſcimus.* It was for want of a *Democritus* or two, that he caſts this hard cenſure upon his own time. For notwithſtanding all his harangue in commendation of ſome ages, which were antient to his own, it is evident out of hiſtory, that there was never at once any great number, who ſeriouſly and in earneſt for the benefit of mankind applied themſelves to theſe ſevere ſcrutinies of natural bodies. It is true, that now and then, in all centuries from the beginning of the world, there have appeared ſome perſons of a nature more refined, as if indeed (according to that fancy of the old poets) ſome *Prometheus* had made them either of another metal, or of another temper, from the vulgar, utterly above all mixture with, or embaſement by the common faſhions of this world; who did make it the end of their lives, by ſevering and mixing, making and marring, and multiplying variety of experiments on all bodies, to diſcover their hidden virtues, and ſo to enlarge the power and empire of man. But theſe were ever very few and ſingular. Even in that ſo much celebrated time of *Democritus*, theſe ſtudies were ſo rare, that his uſual exerciſe of the anatomy of beaſts was looked upon as that, which made the ſoundneſs of his mind queſtionable, even as a ſpice of madneſs in him: and probably much more might the vulgar of his age have been amuſed, had they ſeen him torturing minerals and metals in the more toilſome anatomy of fire.

NOW if it be a diſhonourable crimination to an age, that it hath brought out no perſons who make it their great endeavour *Ne quid profuturum ſæculis lateat*; and if the diſcovery of one or two perſons of this kind be enough to expiate for, and take off the diſhonour of the proletarian lazineſs and luxury of the reſt; I think I may juſtly eſteem, that the exhibiting to the world the hiſtory of the ſtudies of the honourable author of this piece, may ſerve to be the apology and defence of our age, againſt ſuch cenſures, as that, wherewith the newly cited ſatiriſt ſtained his own time.

AND this was one great reaſon, that hath made me very forward to promote the publication of this, and divers other writings of the ſame noble author. For were there only tokens of endeavour in them, the proof of this endeavour (even without attainment) ought to wipe off all imputations of this nature. But this motive (though I do account, that by exhibiting this expiation I do ſomewhat oblige the age, whoſe honour is thereby defended, yet) was far from being the moſt great and forcible. For the excellence of the works themſelves, even as ſoon as they fell from the pen of the author, did long ſince in all equity ſet an Imprimatur on them:

Nec ſumunt aut ponunt ſecures
Arbitrio popularis auræ.

Epicurus, when he was caſting up the account of his life, upon the very day of his death, mentions a very great pleaſure, that he even then took in two parts of his former ſtudies; and theſe were his *Rationes*, and his *Inventa*; points well argued, and things happily found out. The two very ſame particulars are principally conſpicuous in this enſuing piece. There are good concluſions againſt the enemies of the being and providence of God in the firſt part, and in the ſecond there be notices of divers *Inventa* profitable to the uſe of man. By the one, ſound notions are propoſed to the reader's apprehenſion from the contemplation of God's creation and government of the world, and thereby good matter is ſuggeſted to his affections for the advancement of his devotion: by the other, there are divers things delivered, which may tend to enlarge man's power of doing good: by them, in the whole, both our honour to God, and our charity to our neighbours may be aſſiſted; in which two, the ſubſtantial part of all the moſt noble, not only human, but Chriſtian virtues, both ſpeculative and practical, are certainly contained.

I MUST not omit, that an argument of this nature, at this time, may juſtly be commended for its ſeaſonableneſs, when divers perſons, who know not the way of experimental philoſophy, and are loth now to give themſelves the trouble of learning it, have been making ſome attempts, very unthankfully, to traduce both it and its promoters.

THESE conſiderations paſſed with me for reaſons, and had upon me this force and prevalence, that as ſoon as I had the author's leave, I durſt not forbear the committing of them to the preſs, notwithſtanding his many arguments, which were plauſible enough to the contrary; as, namely, that much of the firſt part was written, when he was of ſo immature years, that ſhould I be particular concerning his age then, to any perſon, who hath read the piece, the paucity of ſuch inſtances might juſtly make me deſpair of begetting credit to my relation. Another objection was, that though his method did of neceſſity lead him to it, yet it might be looked upon as unbecoming for him to meddle with the phyſician's art, of which he never did, (nor could, by reaſon of his native honour) make any profeſſion. But theſe oppoſitions being raiſed upon points of curioſity in ceremony and outward decorum, were of little weight, when the forementioned noble offices of charity and doing good were in the other ſcale.

THE greater queſtion was; Suppoſe them to be publiſhed, but why now? why ſo ſoon? ſhould not rather the edition have been delayed, until it might have come out together with the ſecond ſection of the ſecond part? (which diſcovers the uſe, that may be made of experimental learning, to advance the empire of man over other creatures) or until the common preface, and ſome other little tracts, all written long ſince, and intended to accompany this, might be reviſed by the author; or at leaſt until the author might have had leiſure to have made ſome more new and full animadverſions to the receipts and proceſſes contained in the appendix? The conſideration, which anſwered this objection, was, that this piece, as now printed alone, would make (as you ſee it doth) a very competent book, which would have by itſelf the perfection, if not of the whole, yet of a more principal part; and of that part, which to profeſſors or candidates of learning is moſt deſireable. And then the author's avocations and other ſtudies being ſo many, that we could prefix no certain time for the complement of the mentioned remaining parts, I was loth to hazard the preſervation of theſe, by deferring the impreſſion; ſince I know there is no ſecurity of the continuance of thoſe writings, which are repoſed only in ſingle, or at moſt in few written copies. I remember, the author had once loſt for a good while one of theſe very eſſays, which are now here printed, and put beyond that danger for the future. Beſides other caſual accidents, the very contingency of human life, and the chance of a man's papers after death, (for to them the queſtion of king *Solomon* is moſt proper and pertinent, *Who knows, whether then they may happen to fall into the hands of a wiſe man or a fool?*) were of force enough to perſuade me to ſecure theſe, when it was in my power, unto the common uſe. Would not printing in all probability have preſerved unto us that univerſal hiſtory of vegetables from the cedar of *Lebanus*, unto the moſs, that groweth upon the wall, written by that wiſe and learned king, and the loſs of which we now in vain lament? Would not printing have ſaved that excellent book of *Democritus*, which he inſcribed his XEIPOΓXMHTA, or experiments of his own perſonal trial, ſo utterly loſt, that the name of the piece is not mentioned among the catalogue of his writings in *Laertius?* And may not the printing of this piece be a means of the preſervation (beſides the notional part) of divers very uſeful XEIPOΓKMHTA of the honourable author? who hath been ever unwearied in the trial of all probable experiments, that may increaſe the light, or advance the profit of mankind, and whom I may now name to be that moſt learned and noble perſon Mr. *Boyle:* for the ceaſing of certain conſiderations, that before made him willing to have his name ſuppreſt, and the general very good acceptance of this diſcourſe, have extorted from his honour, that he no longer conceal himſelf to be the author.

BUT before I leave the reader, I muſt give him this ſingle advertiſement, that the paſſages included within the paratheſes or crochets, as the preſs ſtyles them, that is, between any two ſuch marks as theſe [ ] were inſerted long ſince the writing of theſe eſſays, upon the relection of ſome parts of the book before he ſent it to me: which I therefore did ſo diſtinguiſh, and do intimate, that there may appear no inconſiſtency in our author, and the reader may not marvel to find ſome things very recent in a book written ſeveral years ago. Farewell.

RO. SHARROCK.

The Author's Advertiſement about the following Eſſays.

THAT the title of the following treatiſe might not raiſe in the reader an expectation of more than he will find in the book, I think myſelf obliged to inform him, that, though it come not forth before, divers parts were ſent to the preſs in 1660, or 1661, and this preſent year 1663; yet the very laſt eſſay of it was written divers years before: ſince when thoſe papers were left, ſometimes in the hands of friends, and ſometimes in diſtant places, where I could not come at them: which I mention, that the reader may neither wonder

nor blame me, if he now meet with ſome things in them, that have already been publiſhed by others, or are more vulgarly known, than my way of mentioning them implies. For it may, this notwithſtanding, very well be, that when I writ them, no body had yet lighted on ſome of them, and that others of them did then but begin to be taken notice of. And as for the five firſt eſſays, which treat of the uſefulneſs of natural philoſophy to the mind of man, though by my addreſſing them all the way to the gentleman I call *Pyrophilus*, they may ſeem to have been originally written to the ſame perſon, and about the ſame time with the eſſays, that make up the ſecond part; yet indeed a great portion of the firſt part was written, as I remember, 10 or 12 years ago, (when I was ſcarce above 21 or 22 years old) to another friend, to whom the conſiderations, that ſerved to confirm piety, and excite devotion, were far more acceptable than thoſe, that were more purely phyſiological. So that having, whether through lazineſs, or want of leiſure, contented myſelf to ſubſtitute the name of *Pyrophilus* for that of my other friend (who was not unwilling I ſhould do ſo) in a diſcourſe written, when I was ſo young, I would not have the reader think, that I do now ſo approve of all thoſe youthful diſcourſes (which I therefore ſuffer to paſs abroad without a name) as to think all the tenets they propoſed to be irrefragable truths, or all the reaſonings they contain, to be demonſtrative; and that I would at preſent have my judgment eſtimated according to their cogency. But yet I do, without much reluctancy, comply with thoſe friends, who would by no means conſent, that the five firſt eſſays of this treatiſe ſhould not come forth with the reſt; partly becauſe not writing all things for all readers, I hold it not unfit to publiſh ſomething to gratify thoſe, who deſire with me, to be both excited and aſſiſted to admire and praiſe the great and wiſe Author of all things; partly becauſe the treatiſe would ſeem maimed and incompleat, if the latter eſſays ſhould come abroad without the reſt; and partly too, becauſe learned men have been pleaſed to aſſure me, that thoſe eſſays are not deſtitute of notions and ratiocinations, that are not altogether vulgar or contemptible. However thoſe readers, that either cannot reliſh, or at leaſt deſire not any thing, but what is merely phyſiological, may, thus advertiſed, paſs by the former part of this treatiſe, and content themſelves to read over the latter; though they, who ſhall take the pains to read both, will not perhaps think their labour loſt; ſince I have taken care to leave even the former part as little diſfurniſhed with experiments and uſeful notions, as, the argument conſidered, I conveniently could. And ſince alſo, for the paucity of ſuch things in the firſt part, I have endeavoured to make amends in the ſecond, which is almoſt wholly phyſiological; concerning which, nevertheleſs, I ſhall admoniſh the reader: and indeed the whole tenets, that make up the following book, are by no means to be looked upon as publiſhed for an accurate treatiſe of the uſefulneſs of true phyſiology, but as familiar writings, that want only the formality of *ſalve* and *vale* to paſs for phyſiological and medical epiſtles; conſiſting of ſuch looſe obſervations, as I thought might be this way preſerved, and did not ſo properly belong to my other writings, as they ſeemed fitted for the uſe, and whereto I have applied them; namely, that being drawn up together into one treatiſe, their union might enable them to make the greater impreſſion, and might (ſomewhat at leaſt) recommend that ſort of learning to a beginner. And one thing, that muſt be eſpecially comprehended in this admonition, is, that the particulars I have mentioned, to ſhew of what uſe chymical experiments may be to a phyſician, are not, poſſibly, the chiefeſt, that even I could ſet down, if I were not reſtrained by ſome juſtifiable conſiderations; eſpecially till I ſee what entertainment the things I now adventure abroad, will meet with there: ſome of thoſe, I reſerve, appearing ſuch to me, that I confeſs, I do not ſlight them enough to be fond of obtruding them upon the publick, if I thought they would not be welcome to it. And I do ſo little deſire to have, what I have written, looked upon as the moſt that can be ſaid, to ſhew the uſefulneſs of experimental philoſophy, that I ſcruple not to acknowledge, there are things, which incline me to ſuſpect, that ſome in the world, though not particularly known to me, may have arcana, to which moſt of the proceſſes I reſerve, as well as all, that is commonly known in chymiſtry, may prove little more than trifles.

OF THE

USEFULNESS OF NATURAL PHILOSOPHY.

PART I.

Of its Uſefulneſs in reference to the Mind of Man.

ESSAY I.

Of the Uſefulneſs of EXPERIMENTAL PHILOSOPHY, principally as it relates to the Mind of Man.

The reaſon why the author endeavours to poſſeſs Pyrophilus *with the true value of experimental philoſophy.*

THE natural philoſophy, wont to be taught in ſchools, being little other then a ſyſtem of the opinions of *Ariſtotle*, and ſome few other writers, is not, I confeſs, *Pyrophilus*, very difficult to be learned; as being attainable by the peruſal of a few of the more current authors. But, *Pyrophilus*, that experimental philoſophy, which you will find treated of in the following Eſſays, is a ſtudy, if duly proſecuted, ſo difficult, ſo chargeable, and ſo toilſome, that I think it requiſite, before I propoſe any particular ſubjects to your inquiries, to poſſeſs you with a juſt value of true and ſolid phyſiology; and to convince you, that by endeavouring to addict you to it, I invite you not to miſpend your time or trouble on a ſcience unable to merit and requite it. In order, *Pyrophilus*, to the giving you this ſatisfaction, give me leave to mind you, that it was a ſaying of *Pythagoras*, worthy ſo celebrated a philoſopher, that there are two things, which moſt ennoble man, and make him reſemble the gods; *to know the truth*, and *to do good*. For, *Pyrophilus*, that diviner part of man, the ſoul, which alone is capable of wearing the glorious image of its author, being endowed with two chief faculties, the underſtanding and the will; the former is bleſt and perfectionated by knowledge, and the latter's lovelieſt and moſt improving property is goodneſs. A due reflection upon this excellent ſentence of him, to whom philoſophers owe that modeſt name, ſhould, methinks, *Pyrophilus*, very much endear to us the ſtudy of natural philoſophy. For there is no human ſcience, that does more gratify and enrich the underſtanding with variety of choice and acceptable truths; nor ſcarce any, that does more enable a willing mind to exerciſe a goodneſs beneficial to others.

That experimental philoſophy is conducive to the improving of man's underſtanding and to the increaſing man's power.

To manifeſt theſe truths more diſtinctly, *Pyrophilus*, and yet without exceeding that brevity, my avocations and the bounds of an Eſſay exact of me, I ſhall, among the numerous advantages accruing to men from the ſtudy of the book of nature, content my ſelf to inſtance only in a couple, that relate more properly to the *improving of men's underſtandings*, and to mention a few of thoſe many, by which it *encreaſes their power*.

THE two chief advantages, which a real acquaintance with nature brings to our minds, are, firſt, by inſtructing our underſtandings, and gratifying our curioſities; and next, by exciting and cheriſhing our devotion.

Arguments to prove, that man's curioſity for knowledge is much thereby gratified.

AND for the firſt of theſe: Since, as *Ariſtotle* teacheth, and was taught himſelf by common experience, *all men are naturally deſirous to know*; that propenſity cannot but be powerfully engaged to the works of nature, which being inceſſantly preſent to our ſenſes, do continually ſollicit our curioſities: of whoſe potent inclining us to the contemplation of nature's wonders, it is not, perhaps, the inconſiderableſt inſtance, that, though the natural philoſophy hitherto taught in moſt ſchools hath been ſo litigious in its theory, and ſo barren as to its productions; yet it hath found numbers of zealous and learned cultivators, whom ſure nothing but men's in-bred fondneſs for the object it converſes with, and the end it pretends to, could ſo paſſionately devote to it.

AND ſince that (as the ſame *Ariſtotle*, taught by his maſter *Plato*, well obſerves) admiration is the parent of philoſophy, by engaging us to enquire into the cauſes of the things at which we marvel; we cannot but be powerfully invited to the contemplation of nature, by living and converſing among wonders, ſome of which are obvious and conſpicuous enough to amaze even ordinary beholders; and others admirable and abſtruſe enough to aſtoniſh the moſt inquiſitive ſpectators.

THE bare proſpect of this magnificent fabrick of the univerſe, furniſhed and adorned with ſuch ſtrange variety of curious and uſeful creatures,

creatures, would ſuffice to tranſport us both with wonder and joy, if their commonneſs did not hinder their operations. Of which truth Mr. *Stepkins*, the famous oculiſt, did not long ſince ſupply us with a memorable inſtance: For (as both himſelf and an illuſtrious perſon that was preſent at the cure, informed me) a maid of about eighteen years of age, having by a couple of cataracts, that ſhe brought with her into the world, lived abſolutely blind from the moment of her birth; being brought to the free uſe of her eyes, was ſo raviſhed at the ſurprizing ſpectacle of ſo many and various objects, as preſented themſelves to her unacquainted ſight, that almoſt every thing ſhe ſaw, tranſported her with ſuch admiration and delight, that ſhe was in danger to loſe the eyes of her mind by thoſe of her body, and expound that myſtical Arabian proverb, which adviſes, *to ſhut the windows, that the houſe may be light.*

A relation of the tranſport and ſurprizal of a maid born blind, when being about 18 *years old, ſhe obtained the firſt ſight of the various objects of the world inſtantly preſented her with.*

BUT if the bare beholding of this admirable ſtructure, is capable of pleaſing men ſo highly; how much ſatisfaction, *Pyrophilus*, may it be ſuppoſed to afford to an intelligent ſpectator, who is able both to underſtand and to reliſh the admirable architecture and ſkilful contrivance of it: for the book of nature is to an ordinary gazer, and a naturaliſt, like a rare book of hieroglyphicks to a child, and a philoſopher; the one is ſufficiently with the oddneſs and variety of the curious pictures that adorn it; whereas the other, is not only delighted with thoſe outward objects, that gratify his ſenſe, but receives a much higher ſatisfaction, in admiring the knowledge of the author, and in finding out and inriching himſelf with thoſe abſtruſe and veiled truths dexterouſly hinted in them.

That the knowledge of the inward architecture, and contrivances of nature is more delightful than the ſight of the outward ſhapes.

YES, *Pyrophilus*, as the underſtanding is the higheſt faculty in man, ſo its pleaſures are the higheſt he can naturally receive. And therefore I cannot much wonder, that the famous *Archimedes* lighting in a bath upon an expedient to reſolve a perplexing difficulty in natural philoſophy, ſhould leap out of the bath, and run unclothed like a madman, crying nothing but Εὑρηκα, Εὑρηκα, *I have found it, I have found it.* Nor do I ſo much admire, as deplore the fatally venturous curioſity of the elder *Pliny*, who, as the younger relates, could not be deterred by the formidableneſs of deſtructive flames vomited by *Veſuvius*, from endeavouring by their light to read the nature of ſuch Vulcanian hills; but in ſpite of all the diſſuaſions of his friends, and the affrighting eruptions of that hideous place, he reſolved, that flaming wonder ſhould rather kill him, than eſcape him; and thereupon approached ſo near, that he loſt his life to ſatisfy his curioſity, and fell (if I may ſo ſpeak) a martyr to phyſiology. For we daily ſee alchymiſts hazard their lives on mineral experiments in furnaces, where, though the fires are not ſo vaſt and fierce, as thoſe that *Pliny* went to conſider, yet the (dangerous, when not pernicious) fumes, do ſometimes prove as fatal.

Examples and inſtances of the prevalence of the pleaſure, that ariſes from the attainment of knowledge

ONE would think, *Pyrophilus*, that the converſing with dead and ſtinking carcaſſes (that are not only hideous objects in themſelves, but made more ghaſtly by putting us in mind, that our ſelves muſt be ſuch) ſhould be not only a very melancholy, but a very hated employment. And yet, *Pyrophilus*, there are anatomiſts, who dote upon it; and I confeſs its inſtructiveneſs hath not only ſo reconciled me to it, but ſo enamoured me of it, that I have often ſpent hours much leſs delightfully, not only in courts, but even in libraries, than in tracing in thoſe forſaken manſions, the inimitable workmanſhip of the omniſcient Architect.

THE curious works of famous artificers are wont to invite the viſits, and excite the wonder of the generality of inquiſitive perſons. And I remember, that in my travels, I have often taken no ſmall pains to obtain the pleaſure of gazing upon ſome maſter-piece of art: but now, I confeſs, I could with more delight look upon a ſkilful diſſection, than the famous clock at *Straſburgh*. And, methinks, *Ariſtotle* diſcourſes very philoſophically in that place, where paſſing from the conſideration of the ſublimeſt productions of nature, to juſtify his diligence in recording the more homely circumſtances of the hiſtory of animals, he thus diſcourſes: *Reſtat* (ſaith he) *ut de animanti natura diſſeramus, nihil pro viribus omittentes vel vilius vel nobilius. Nam & in iis, quæ hoc in genere minùs grata noſtro occurrunt ſenſui, natura parens & autor omnium miras excitat voluptates hominibus, qui intelligunt cauſas & ingenuè philoſophantur. Abſurdum enim nulla ratione probandum eſt, ſi imagines quidem rerum naturalium non ſine delectatione propterea inſpectamus, quòd ingenium contemplamur, quod illas condiderit, id eſt, artem pingendi aut fingendi; rerum autem ipſarum naturæ ingenio miráque ſolertia conſtitutam contemplationem non magis proſequamur atque exoſculemur, modo cauſas perſpicere valeamus:* 'It remains (ſaith he) that we diſcourſe 'of the natures of animals, being circumſpect 'to omit none either of the nobler or inferiour 'ſort: for even from thoſe creatures, which leſs 'pleaſe our ſenſe, does the univerſal parent, 'nature, afford incredible contentments to ſuch 'perſons, as underſtand their cauſes, and philoſophize ingenuouſly. Since it were abſurd 'and inconſiſtent to reaſon, if we ſhould behold the portraitures of natural things with 'delectation, becauſe we obſerve the accurateneſs, wherewith they are deſigned, namely, the 'ſkill of painture or ſculpture; and not much 'more affect and purſue the contemplation of 'things themſelves, contrived by the exquiſite 'artifice and ſagacity of nature, provided we 'be able to underſtand their cauſes.' And the better to make out to you, *Pyrophilus*, the delightfulneſs of the ſtudy of natural philoſophy, let me obſerve to you, that thoſe pleaſing truths it teacheth us, do highly gratify our intellectual faculties, without diſpleaſing any of them: for they are none of thoſe criminal pleaſures, which injured and incenſed conſcience does very much allay, even in the fruition, and turns into torments after it. Nor are the enquiries I am recommending of that trifling and

That the knowledge of the moſt curious artificial works is not more delightful than the knowledge of natural.

Ariſt. de Part. Anim. lib. 1. c. 5.

That the delight herein is altogether inoffenſive.

and unſerviceable ſort of imployments, which though conſcience condemns not as unlawful for a Chriſtian, reaſon diſapproves as not worthy of a philoſopher; and wherewith to be much delighted, argues a weakneſs; as to be pleaſed with babes and whiſtles ſuppoſes unripe and weak intellectuals: but the contemplation of nature is an imployment, which both the poſſeſſors of the ſublimeſt reaſon, and thoſe of the ſevereſt virtue, have not only allowed, but cultivated. The learned author of the book *De Mundo*, aſcribed to *Ariſtotle*, begins it with this elogium of natural philoſophy: *Mihi quidem ſæpe* (ſays he) *divina quædam res, Alexander, admirationeque digna viſa eſt philoſophia; præcipuè verò in ea parte, in qua ſola ipſa ſublimè ſeſe tollens, ad contemplandas rerum naturas magno illic ſtudio contendit exiſtentem in eis veritatem pernoſcere.* 'Philoſophy (ſays he) 'O *Alexander*, hath oftentimes ſeemed to me 'a divine and admirable thing; but chiefly, 'that part of it, which aſpires to contemplate 'the natures of things, imploying its utmoſt 'power in ſearching out the truth contained 'in them.' The reaſonableneſs of which commendation he handſomely enough proſecutes in the ſubſequent diſcourſe; to which I ſhall refer you, that I may proceed to mind you, that *Pythagoras*, *Democritus*, *Plato*, and divers others of thoſe, whoſe wiſdom made after-ages reverence antiquity, did not only eſteem the truths of nature worth ſtudying for, but thought them too worth travelling for as far as thoſe eaſtern regions, whoſe wiſe-men were then cried up for the beſt expoſitors of the obſcure book of nature. And that ſevere teacher, and perſuaſive recommender of the ſtricteſt virtue, *Seneca*, (whoſe eminent wiſdom made him invited to govern him, that was to govern the world, and who ſo often and ſo excellently preſſes the huſbanding of our time) does not only in ſeveral paſſages of his writings praiſe a contemplation of nature, but writes himſelf ſeven books of natural queſtions, and addreſſes them to that very *Lucilius*, whom in his epiſtle he takes ſuch pains to make compleatly virtuous; and in his preface, after he had ſaid according to his manner, loftily, *Equidem tunc naturæ rerum gratias ago, cum illam non ab hac parte video, quæ publica eſt, ſed cum ſecretiora ejus intravi, cum diſco, quæ univerſi materia ſit, quis author, aut cuſtos, &c.* 'Then do I pay 'my acknowledgments to nature, when I be-'hold her not on the outſide, which is obvi-'ous to publick view, but am entered into her 'more ſecret receſſes; when I underſtand what 'the matter of the univerſe is, who its author, 'and preſerver, &c.' He concludes in the ſame ſtrain, *Niſi ad hæc admitterer, non fuerat operæ pretium naſci:* 'Had I been debarred 'from theſe things, it would not have been 'worth coming into the world.' And to add what he excellently ſays in another treatiſe, *Ad hæc quærenda natus* (ſays he, having ſpoken of enquiries concerning the univerſe) *æſtima quàm non multùm acceperit temporis, etiamſi illud totum ſibi vindicet, cui licet nihil facilitate eripi, nihil negligentia patiatur excidere; licet horas ſuas avariſſimè ſervet, & uſque in ultimæ ætatis humanæ terminos procedat; nec quicquid illi, ex eo quod natura conſtituit, fortuna concutiat; tamen homo ad immortalium cognitionem nimis mortalis eſt. Ergo ſecundum naturam vivo, ſi totum me illi dedi, ſi illius admirator cultorque ſum. Natura autem utrumque facere me voluit & agere, & contemplationi vocare:* 'Being 'born deſignedly for ſearching out theſe things, 'conſider, that the portion of time allotted to 'man is not great, if this ſtudy ſhould in-'groſs it all; ſince though he ſhould preſerve 'his hours with the greateſt frugality all his 'life-time, not ſuffering any to be ſtolen from 'him, or ſlide away negligently, and never be 'diſturbed by accidents of fortune in the im-'ployment nature has appointed him, yet is 'he too moral to attain the knowledge of im-'mortal things. Wherefore, I live agreeable 'to nature, when I give up my ſelf wholly to 'her, and am her admirer and adorer: more-'over, nature hath deſigned me to act, and 'imploy my ſelf in contemplation.' How far religion is from diſ-approving the ſtudy of phyſiology, I ſhall have occaſion to manifeſt ere long, when we ſhall come to ſhew, that it is an act of piety to offer up for the creatures the ſacrifice of praiſe to the creator; for, as anciently among the Jews, by virtue of an Aaronical extraction, men were born with a right to prieſthood; ſo reaſon is a natural dignity, and knowledge a prerogative, that can confer a prieſthood without unction or impoſition of hands. And as for reaſon, that is ſo far from making us judge that imployment unworthy of rational creatures, that thoſe philoſophers (as *Ariſtotle*, *Epicurus*, *Democritus*, *&c.*) that have improved reaſon to the greateſt height, have the moſt ſeriouſly and induſtriouſly imployed it to inveſtigate the truths, and promote the ſtudy of natural philoſophy.

Inſtances of the eſteem divers antient philoſophers had for it.

Seneca in Præf. lib. 1. Nat. Quæſt.

Sen. de Otio Sap. c. 32.

How this ſtudy conſpires with religion.

AND indeed, that noble faculty called reaſon, being conſcious of the great progreſs it may enable us to make in the knowledge of nature's myſteries, if it were induſtriouſly imployed in the ſtudy of them, cannot, but like a great commander, think it ſelf diſobliged by not being conſiderably employed. And certainly we are wanting to our ſelves, and are guilty of little leſs than our own degradation, that being by God's peculiar vouchſafement endowed with thoſe noble faculties of underſtanding, and diſcourſing, and placed amidſt a numberleſs variety of objects, that inceſſantly invite our contemplations, can content our ſelves to behold ſo many inſtructive creatures, which make up this vaſt univerſe, whoſe nobleſt part we are deſigned to be, with no more, or but little more diſcerning eyes than thoſe leſs favoured animals, to whom nature hath denied the prerogative of reaſon, as we deny our ſelves the uſe of it. *Ariſtotle* well obſerves, that among animals, man alone is of an erected ſtature; and adds, That it is becauſe his nature hath ſomething in it of divine: *Officium autem divini* (infers he) *eſt intelligere atque ſapere:* 'The qualifications of a divine being, are under-'ſtanding and wiſdom.' And it cannot but miſbecome the dignity of ſuch a creature to live ignorant or unſtudious of the laws and conſti-

The abſurdity of not imploying humane faculties on the contemplation of thoſe objects, to which they are fitted.

De part. Anim. lib. 4. c. 10.

tutions of that great commonwealth (as divers of the antients have not improperly ſtyled the world) whereof he is the eminenteſt part. And were we not lulled aſleep by cuſtom or ſenſuality, it could not but trouble, as well as it injures a reaſonable ſoul, to ignore the ſtructure and contrivance of that admirably organized body, in which ſhe lives, and to whoſe intervention ſhe owes the knowledge ſhe hath of other creatures.

IT is true indeed, that even the generality of men, without making it their deſign, know ſomewhat more of the works of nature, than creatures deſtitute of reaſon, can, by the advantage of that ſuperiour faculty, which cannot but even unurged, and of its own accord make ſome, though but ſlight, reflections on the information of the ſenſes: but if thoſe impreſſions be only received and not improved, but rather neglected; and if we (contenting our ſelves with the ſuperficial account given us of things by their obvious appearances and qualities) are beholden for that we know, to our nature, not our induſtry, we faultily loſe both one of the nobleſt imployments, and one of the higheſt ſatisfactions of our rational faculty. And he, that is this way wanting to himſelf, ſeems to live in this magnificent ſtructure, called the univerſe, not unlike a ſpider in a palace; who taking notice only of thoſe objects, that obtrude themſelves upon her ſenſes, lives ignorant of all the other rooms in the houſe, ſave that wherein ſhe lurks; and diſcerning nothing either of the architecture of the ſtately building, or of the proportion of the parts of it in relation to each other, and to the entire ſtructure, makes it her whole buſineſs, by intrapping of flies, to continue an uſeleſs life; or exerciſe herſelf to ſpin cobwebs, which, though conſiſting of very ſubtile threads, are unſerviceable for any other than her own trifling uſes. And that the contemplation of the world, eſpecially the higher region of it, was deſigned for man's imployment by nature's ſelf, even the heathen poet (perhaps inſtructed by *Ariſtotle*) could obſerve, who ſings,

Illuſtrated by the ſimilitude of a ſpider in a palace, taking notice of nothing beſide her own cobweb.

Pronaque cum ſpectent animalia cætera terram,
Os homini ſublime dedit, cœlumque tueri
Juſſit, & erectos ad ſidera tollere vultus.

'Wiſe nature, framing brutes with down-
'ward looks,
'Man with a lofty aſpect did endue,
'And bad him heaven with its bright glories
'view.

I might annex, *Pyrophilus*, the ſtory *Joſephus* tells us in the beginning of his *Jewiſh Antiquities*, that it was the holy *Seth* and his poſterity (who are in *Geneſis* ſtyled the ſons of God) that were the inventors of aſtronomy, whoſe more fundamental obſervations (to perpetuate them to mankind, and ſever them from the foretold deſtructions by fire and water) they engraved upon two pillars, the one of brick, the other of ſtone; the latter of which our hiſtorian reports to have been extant in *Syria* in his time. And it is an almoſt uncontrolled tradition, that the patriarch, whom God vouchſafes to ſtyle *his friend*, was the firſt teacher of aſtronomy and philoſophy to the Egyptians, from whom, long afterwards, the Grecians learned them. *Beroſus* himſelf records him to have been ſkilled in the ſcience of the ſtars, as he is cited by *Joſephus*, (*Ant.* lib. 1. c. 8.) who a little after ſpeaking of *Abraham* and the Egyptians, expreſly affirms, that *Numerorum ſcientiam & ſiderum benignè illis communicavit: nam ante Abrahami ad ſe adventum, Ægyptii rudes erant hujuſmodi diſciplinarum; quæ à Chaldæis ad Ægyptios profectæ, hinc ad Græcos tandem pervenerunt.*

The opinion that Ovid, Seth, Abraham, *and* Solomon *had of man's fitneſs for the ſtudy of aſtronomy and other phyſiology.*

Iſaiah xli. 8. James xi. 23.

BUT, *Pyrophilus*, to put it out of queſtion, that the ſublimeſt reaſon needs not make the poſſeſſor of it think the ſtudy of phyſiology an employment below him, that unequalled *Solomon*, who was pronounced the wiſeſt of men by their omniſcient Author, did not only juſtify the ſtudy of natural philoſophy, by addicting himſelf to it, but ennobled it by teaching it, and purpoſely compoſing of it, thoſe matchleſs records of nature, from which I remember ſome Jewiſh authors relate *Ariſtotle* to have borrowed divers; which (if it be true) may well be ſuppoſed to be the choiceſt pieces, that adorned his philoſophy, and which Providence perhaps deprived the world of, upon ſuch a ſcore, as it did the Jews of the body of *Moſes*, leſt men ſhould idolize it, or, as ſome Rabbies are pleaſed to inform us, leſt vicious men ſhould venture upon all kinds of intemperance, out of confidence of finding out by the help of thoſe excellent writings the cure of all the diſtempers their diſſoluteneſs ſhould produce.

Why Providence might deprive us of Solomon's *phyſiology.*

AND, *Pyrophilus*, yet a little further to diſcover to you the delightfulneſs of the contemplations of nature's works, give me leave to mind you of their almoſt unimaginable variety, as of a property, that ſhould, methinks, not faintly recommend natural philoſophy to curious and active intellectuals.

FOR moſt other ſciences, at leaſt as they are wont to be taught, are ſo narrow and circumſcribed, that he, who has read one of the beſt and receneſt ſyſtems of them, ſhall find little in the other books publiſhed on thoſe ſubjects, but diſguiſed repetitions; and a diligent ſcholar may in no long time learn, as much as the profeſſors themſelves can teach him. But the objects of natural philoſophy being as many as the laws and works of nature, are ſo various and ſo numberleſs, that if a man had the age of *Methuſelah* to ſpend, he might ſooner want time than matter, for his contemplations: and ſo pregnant is each of that vaſt multitude of creatures, that make up the naturaliſt's theme, with uſeful matter to employ men's ſtudy, that I dare ſay, that the whole life of a philoſopher ſpent in that alone would be too ſhort to give a full and perfect account of the natural properties and uſes of any one of ſeveral minerals, plants, or animals, that I could name. It is an almoſt incredible variety of vegetables, that the teeming earth, impregnated by God's *producat terra*, does in ſeveral regions produce. Botaniſts have, a pretty while ſince, reckoned

Of the delight, that may ariſe from the variety of objects, which nature produces.

up

That there be above 6000 ſubjects of the vegetable kingdom.

up near 6000 ſubjects of the vegetable kingdom; ſince when, divers other not deſcribed plants have been obſerved by herbariſts, the chief of which will, I hope, be ſhortly communicated to the world, by that curious and diligent botaniſt, my induſtrious acquaintance, Dr. *How*, to whom I not long ſince preſented a peculiar and excellent kind of pepper, whoſe ſhell taſtes not unlike cinnamon, and ſmells ſo like cloves, that with the odour I have deceived many, which he confeſt to be new even to him; it having been lately gathered in *Jamaica* (where it abounds) and preſented me by the inquiſitive commander of the Engliſh forces there. And yet, *Pyrophilus*, this great variety of ſimples could not deter either ancient or modern inquirers from writing entire treatiſes of ſome particular ones. So *Pliny* tells us, [a] that *Themiſon* the phyſician publiſhed a volume (for ſo he called it) of that vulgar and deſpiſed herb called Plantain. So the ſame [b] author tells us, that *Amphilochus* writ a volume *De Medica Herba, & Cytiſa*; and king [c] *Juba* another, of a ſort of *Nymphæa* by him found on mount *Atlas*. And in our times, not to mention thoſe many books, that have been written by phyſicians, of the ſtructure of man's body, and *De Uſu partium*, *Carolus Roſenbergius* writ ſome years ſince an entire book *of Roſes*, which he calls his *Rhodologia*: *Martinus Blochwitius* ſince publiſhed another book *of Elder*, under the title of *Anatomia Sambuci*. Among the chymiſts, *Angelus Sala* publiſhed in diſtinct treatiſes, his *Vitriologia*, *Tartarologia*, *Saccharologia*. *Untzerus* alſo writ peculiar tracts *De Mercurio*, *De Sulphure*, *De Sale*. And *Paracelſus* himſelf vouchſafed diſtinct treatiſes to *Hypericon*, *Perſicaria*, *Helleborus*, and ſome other particular plants. *Baſilius Valentinus* (one of the moſt knowing and candid chymical writers) publiſhed long ſince an excellent treatiſe of *Antimony* inſcribed *Currus triumphalis Antimonii*; but though in his other, he hath alſo taught us divers other things concerning it, yet he left ſo much undiſcovered in antimony, that *Angelus Sala* was thereby emboldened to publiſh his *Anatomia Antimonii*. And *Hamerus Poppius*, (if that be his true name,) *Johannes Tholdius*, and the experienced *Alexander Van Suchten*, thought fit to write entire treatiſes of that ſame mineral, by which if they ſeem to eclipſe the diligence of *Baſilius*, at leaſt they bore witneſs to his judgment: for modeſtly inviting his readers to make further inquiries into the nature and preparations of that abſtruſe mineral, he gives this account of his leaving many things unmentioned, *That the ſhortneſs of life makes it impoſſible for one man throughly to learn antimony, in which every day ſomething of new is diſcovered.* And I remember, that having lately given a chymiſt, upon his requeſt, ſome directions for drawing, not an imaginary mercury of antimony, as thoſe, which are wont to be taught by chymiſts, but a real fluid quickſilver; he ſome days ſince brought me about an ounce of it (which you may command when you pleaſe) as the firſt fruits of directions, differing enough from thoſe, which I have hitherto met with in authors. A peculiar way likewiſe of ſeparating from antimony, not ſuch a ſubſtance as thoſe, which are as improperly as vulgarly called antimonial ſulphurs, but a really combuſtible body, which looks and burns ſo like common brimſtone, that it is not eaſily diſtinguiſhable from it, we ſhall elſewhere, God willing, *Pyrophilus*, teach you. And I remember, that whereas, according to the way mentioned by *Baſilius* in his *Currus triumphalis*, and both generally tranſcribed by authors, and formerly practiſed by our ſelves, the tincture of the glaſs of antimony is very tedious to make, being to be drawn with ſpirit of vinegar, I once made a menſtruum to draw it more expeditiouſly; which having not hitherto met with, in any of the authors I have read, I ſhall not conceal from you. Taking then an arbitrary quantity of the beſt French verdigreaſe, and diſtilling it orderly in a ſtrong naked fire, I found the extorted liquor to extract (even in an ordinary digeſting heat) from powdered antimonial glaſs, a blood-red tincture in three or four hours; and my curioſity leading me to abſtract the menſtruum from the tinging powder, and put it again upon pulverized glaſs, I found it again highly tinged in very few hours. And proſecuting the experiment, I found, that by drawing off the menſtruum, and digeſting ſpirit of wine upon the remaining calx, I could ſoon obtain a red tincture, or ſolution; from which ſome chymiſts, if I ſhould tell them, what I have now told you, would perhaps expect no ordinary medicine. But this, I ſuppoſe, you will think leſs ſtrange, than that with a liquor eaſily ſeparated, by a way which I may elſewhere teach you, from an obvious vegetable, of which you may ſafely eat a whole pound at a time, I have drawn a deep red tincture, even from crude antimony, and that in not many hours, and without heat.

Of an excellent Jamaica pepper newly brought over.

Of divers ſingle ſubjects that require large treatiſes to unfold them.

How many treatiſes are already made of antimony, which yet has not been perfectly diſcovered.

Of a real mercury of antimony.

And a real combuſtible ſulphur of antimony, that burns like ordinary brimſtone.

A new tincture of antimonial glaſs, with the intire proceſs to draw it.

AND to theſe experiments of antimony, I might (partly from the communication of my friends, and partly from ſome trials of my own) add divers other undivulged experiments relating to that mineral, if it were not now more ſeaſonable, reſerving them for other papers, to mind you, that the learned *Kircherus* hath enriched us with a great volume in folio, of light and ſhadows; and another in quarto, of the load-ſtone: and yet none of theſe have ſo exhauſted the ſubjects they have treated of, but that an after enquirer may be able to recruit their obſervations with many new ones, perhaps more numerous or more conſiderable than the former: as after our learned countryman *Gilbertus* had written a volume of the load-ſtone, the Jeſuit *Cabæus* was not by that deterred from writing another of the ſame ſubject: and though ſince *Cabæus* the ingenious *Kircherus* have ſo largely proſecuted it in his voluminous *Ars Magnetica*, yet he has not reaped his field ſo clean, but that a careful gleaner may ſtill find ears enough to make ſome ſheaves. And what I have lately tried or ſeen, makes me think it very poſſible to recruit thoſe many of *Kircherus*, with ſome further magnetical experiments unmentioned in his book. And I have, the very day I writ this, made in that admi-

Of Gilbertus, Cabæus, and Kircher, who ſucceſſively writ the experiments of the load-ſtone.

admirable ſtone a not inconſiderable experiment, not extant (that I remember) there: for taking an oblong load-ſtone, and heating it red-hot, I found the attractive faculty in not many minutes, either altogether aboliſhed, or at leaſt ſo impaired and weakened, that I was ſcarce, if at all able to diſcern it. But this hath been obſerved, though not ſo faithfully related, by more than one; wherefore I ſhall add, that by refrigerating this red-hot load-ſtone either north or ſouth, I found that I could give its extremes a polarity (if I may ſo ſpeak) which they would readily diſplay upon an excited needle freely placed in æquilibrium: and not only ſo, but I could by refrigerating the ſame end ſometime north, and ſometime ſouth, in a very ſhort time change the poles of the load-ſtone at pleaſure, making that which was a quarter of an hour before the north pole, become the ſouth; and on the contrary, the formerly ſouthern pole become the northern. And this change was wrought on the load-ſtone, not only by cooling it directly north and ſouth, but by cooling it perpendicularly; that end of it which was contiguous to the ground growing the northern pole, and ſo (according to the laws magnetical) drawing to it the ſouth end of the needle; and that which was remoteſt from it, the contrary one: as if indeed the terreſtrial globe were, as ſome magnetick philoſophers have ſuppoſed it, but a great *Magnes*, ſince its effluviums are able, in ſome caſes, to impart a magnetick faculty to the loadſtone it ſelf. Some other experiments of this nature, not extant in *Kircherus*, we may have elſewhere fit opportunity to mention. And indeed, that ænigmatical mineral (if I may ſo call it) the load-ſtone, is a ſubject ſo fertile in rarities, that, I hear, he himſelf is reprinting that accurate treatiſe, with new large additions.

Of ſome new experiments hitherto undiſcovered of that ſtone.

NOR are the ſmalleſt and moſt deſpicable productions of nature ſo barren, but that they are capable both to invite our ſpeculations, and to recompenſe them. *Pliny* in the eleventh book of his natural hiſtory, where he treats of inſects, is a little after the entrance tranſported with an unwonted admiration of the workmanſhip of nature in them: *Nuſquam alibi* (ſays he) *ſpectatiore naturæ rerum artificio:* 'In no-'thing elſewhere (ſaith he) is the workman-'ſhip of nature more remarkable than in the 'contexture of theſe little creatures.' And after a wonder, not unworthy a philoſopher, he concludes, *Rerum natura nuſquam magis quam in minimis tota eſt:* 'Nature in her whole pow-'er is never more wholly ſeen than in her 'ſmalleſt works.' To which *epiphonema* he adds this ſober and philoſophical admonition: *Quapropter, quæſo, ne hæc legentes, quoniam ex his ſpernunt multa, etiam relata faſtidio damnent, cum in contemplatione naturæ nihil poſſit videri ſupervacaneum:* 'Wherefore I would requeſt 'the peruſers of theſe diſcourſes, that although 'the ſubjects we treat of are contemptible in 'their eyes, they would not therefore diſdain 'the relations we ſhall make of them; ſince 'nothing ought to ſeem ſuperfluous in the 'contemplation of nature.' I remember, that it is from the conſideration of ſo deſpicable a part as the ſkin of the ſoal of the foot, that *Galen* takes occaſion to magnify the wiſdom of God in thoſe excellent terms, that we ſhall have occaſion to mention hereafter. And, as he ſays rarely well, though ſome creatures ſeem made of much coarſer ſtuff than others, yet even in the vileſt, the Maker's art ſhines through the deſpicableneſs of the matter. For idiots admire in things the beauty of their materials; but artiſts, that of the workmanſhip: to which, after a great deal of philoſophical diſcourſe, he adds, *Neque oculo nec cerebro deterius eſt pes conſtructus, ſi utraque pars ad actiones, cujus gratia fuit facta, ſe habeat optimè; neque cerebrum ſine pede ſe probe haberet, neque pes ſine cerebro: eget enim, opinor, illud vehiculo, hic autem ſenſu:* 'Nor is the 'foot worſe contrived than the brain or eye, 'provided each part be duly diſpoſed for the 'performance of the actions to which it was 'deſigned: ſince the brain could not conve-'niently want the foot, nor the foot the brain. 'For, I conceive, that one ſtands in need of 'a ſupport for local motion; and the other, 'of a ſource, from whence to derive the facul-'ties of feeling.' To which we may annex that judicious reaſoning of *Ariſtotle*, who, deſcending from the contemplation of the ſublimer works of nature, to treat of the parts of animals, thus endeavours to keep his readers from thinking, that the object of it muſt render that enquiry deſpicable: *Reſtat* (ſays he) *ut de animanti natura diſſeramus.* And having ſet down thoſe words, which you have not long ſince read, in connection to theſe, he thus proſecutes his diſcourſe: *Quamobrem, viliorum animalium diſputationem perpenſionemque faſtidio quodam puerili ſpreviſſe, moleſtéque tuliſſe dignum nequaquam eſt: cum nulla res ſit naturæ, in qua non mirandum aliquod habeatur. Et quod Heraclitum ferant dixiſſe ad eos, qui cum alloqui eum vellent, quòd fortè in caſa furnaria quadam caloris gratia ſedentem vidiſſent, accedere temperarunt, ingredi enim eos fidenter juſſit; quoniam, inquit, ne huic quidem loco dii deſunt immortales; hoc idem in indaganda quoque natura animantium faciendum eſt. Aggredi enim quæque ſine ullo pudore debemus; cum in omnibus naturæ numen, & honeſtum pulchrumque inſit ingenium:* 'Wherefore it is altogether 'unſeemly to reject with a kind of childiſh 'nicety, or be offended at the diſcourſe and 'ſpeculation of inferior animals; ſince there 'is nothing in all nature, but contains in it 'ſomewhat worthy of admiration. And as it 'is recorded of *Heraclitus*, that ſeeing ſome 'perſons deſirous to ſpeak with him, refuſed 'to approach towards him, becauſe they be-'held him warming himſelf in a miſerable cot-'tage, he bad them come in without ſcruple, 'ſince here alſo (ſaith he) are the immortal 'gods preſent: ſo in like manner ought we 'to be highly perſuaded of the dignity of ani-'mals, when we make enquiries into their 'natures. Which we ought in no wiſe to be 'aſhamed of; ſince the mighty power and 'laudable wiſdom of nature is conſpicuous in 'all things.' Nay, *Paracelſus* himſelf, as haughty as he was, was philoſopher enough not to diſdain

That admirable ſpeculations may ariſe from the moſt deſpicable productions of nature.

diſdain to write a book *De Myſteriis Vermium*; wherein, though, according to his manner, he hath ſet down many extravagances, he is more candid in the delivery of ſeveral remedies (which experience hath recently taught us to be more effectual than probable) than in moſt other of his writings. And in that treatiſe he juſtly reprehends the lazineſs and pride of thoſe phyſicians, who not only neglect and ſcorn enquiries of nature themſelves, but when the fruits of ſuch enquiries are preſented them by others, inſtead of a grateful acceptance, receive them with contempt and deriſion. To which, a while after, he adds, what is moſt true, 'That 'God hath created nothing ſo vile, deſpicable, 'abject, or filthy in the world, that may not 'make for the health and uſe of man.' And certainly whatever God himſelf has been pleaſed to think worthy his making, its fellow-creature man ſhould not think unworthy of his knowing. Nor is it a diſparagement to a human notion, to repreſent a creature, which has the honour to have been framed according to a divine idea; and therefore the wiſeſt of men, in his natural hiſtory, ſcruples not to write as well of abject reptiles, as of lions, eagles, elephants, and other noble animals; and did not only treat of the tall cedars of *Lebanon*, but that deſpicable plant (whatever it be that is deſigned by the Hebrew *ezob*) which grows out of the wall. For my part, if I durſt think my actions fit to be examples, I ſhould tell you, that I have been ſo far from that effeminate ſqueamiſhneſs, that one of the philoſophical treatiſes, for which I have been gathering experiments, is of the nature and uſe of dungs. And though my condition does (God be praiſed) enable me to make experiments by others hands; yet I have not been ſo nice, as to decline diſſecting dogs, wolves, fiſhes, and even rats and mice, with my own hands. Nor, when I am in my laboratory, do I ſcruple with them naked to handle lute and charcoal.

Whatever God has thought worthy of making, man ſhould think unworthy of knowing.

I SHOULD here, *Pyrophilus*, ceaſe to entertain you with diſcourſes of the pleaſantneſs of natural philoſophy, but that I remember I have not yet told you, that the ſtudy of phyſiology is not only delightful, as it teaches us to know nature, but alſo as it teaches us in many caſes to maſter and command her. For the true naturaliſt (as we ſhall ſee hereafter) does not only know many things, which other men ignore, but can perform many things, which other men cannot do; being enabled by his ſkill not barely to underſtand ſeveral wonders of nature, but alſo partly to imitate, and partly to multiply and improve them. And how naturally we affect the exerciſe of this power over the creatures, may appear in the delight children take to do many things (which we may have occaſion to mention elſewhere) that ſeem to proceed from an innate propenſity to pleaſe themſelves in imitating or changing the productions of nature.

AND ſure it is a great honour, that the indulgent Creator vouchſafes to naturaliſts, that though he gives them not the power to produce one atom of matter, yet he allows them the power to introduce ſo many forms (which philoſophers teach to be nobler than matter) and work ſuch changes among the creatures, that if *Adam* were now alive, and ſhould ſurvey that great variety of man's productions, that is to be found in the ſhops of artificers, the laboratories of chymiſts, and other well furniſhed magazines of art, he would admire to ſee what a new world, as it were, or ſet of things has been added to the primitive creatures by the induſtry of his poſterity.

Of the dominion and power that phyſiology gives the proſperous ſtudiers of it.

AND though it be very true, that man is but the miniſter of nature, and can but duly apply agents to patients, (the reſt of the work being done by the applied bodies themſelves;) yet by his ſkill in making thoſe applications, he is able to perform ſuch things, as do not only give him a power to maſter creatures otherwiſe much ſtronger than himſelf, but may enable one man to do ſuch wonders, as another man ſhall think he cannot ſufficiently admire. As the poor Indians looked upon the Spaniards as more than men, becauſe the knowledge they had of the properties of nitre, ſulphur and charcoal duly mixed, enabled them to thunder and lighten ſo fatally, when they pleaſed. And this empire of man, as a naturaliſt, over the creatures may perchance be to a philoſophical ſoul preſerved by reaſon untainted with vulgar opinions, of a much more ſatisfactory kind of power or ſovereignty than that, for which ambitious mortals are wont ſo bloodily to contend. For oftentimes this latter being commonly but the gift of nature, or preſent of fortune, and but too often the acquiſt of crimes, does no more argue any true worth or noble ſuperiority in the poſſeſſor of it, than it, argues one braſs counter to be of a better metal than its fellows, in that it is choſen out to ſtand in the account for many thouſands pounds more than any of them. Whereas the dominion, that phyſiology gives the proſperous ſtudier of it (beſides that it is wont to be innocently acquired, by being the effect of his knowledge) is a power, that becomes man as man. And to an ingenious ſpirit, the wonders he performs bring perchance a higher ſatisfaction, as they are proofs of his knowledge, than as they are productions of his power, or even bring acceſſions to his ſtore.

ESSAY II. *Of the ſame.*

That the knowledge of nature excites and cheriſhes devotion.

THE next advantage, *Pyrophilus*, that we mentioned the knowledge of nature to bring to minds of men, is, that therein it excites and cheriſhes devotion; which when I ſay, *Pyrophilus*, I forget not, that there are ſeveral divines (and ſome of them eminent ones)

that out of a holy jealousy (as they think) for religion, labour to deter men from addicting themselves to serious and thorough inquiries into nature, as from a study unsafe for a Christian, and likely to end in atheism, by making it possible for men (that I may propose to you their objection as much to its advantage as I can) to give themselves such an account of all the wonders of nature, by the single knowledge of second causes, as may bring them to disbelieve the necessity of a first. And certainly, *Pyrophilus*, if this apprehension were well grounded, I should think the threatened evil so considerable, that instead of inviting you to the study of natural philosophy, I should very earnestly labour to dissuade you from it. For I, that had much rather have men not philosophers than not Christians, should be better content to see you ignore the mysteries of nature than deny the author of it. But though the zeal of their intentions keep me from harbouring any unfavourable opinion of the persons of these men, yet the prejudice that might redound from their doctrine (if generally received) both to the glory of God from the creatures, and to the empire of man over them, forbids me to leave their opinion unanswered; though I am sorry, that the necessity of vindicating the study I recommend to you from so heinous a crime as they have accused it of, will compel me to theologize in a philosophical discourse: which that I may do, with as much brevity as the weight and exigency of my subject will permit, I shall content myself only in the explication of my own thoughts, to hint to you the grounds of answering what is alledged against them.

The end of God's creation: his own glory. Job viii. 9.

AND first, *Pyrophilus*, I must premise, that though it may be a presumption in man, (who to use a Scripture expression, *is but of yesterday, and knows nothing, because his days upon the earth are but as a shadow*) precisely and peremptorily to define all the ends and aims of the omniscient God in his great work of the creation; yet perhaps, it will be no great venture to suppose, that at least in the creating of the sublunary world, and the more conspicuous stars, two of God's principal ends were, the manifestation of his own glory, and the good of men. For the first of these; *The Lord hath made all things for himself*, says the preacher; *for of him, and through him, and to him, are all things*, says the apostle. And, *Thou hast created all things, and for thy pleasure they are and were created*, say the twenty-four prostrate elders (representatives, perhaps, of the whole church of both testaments, propagated by the twelve patriarchs, and the like number of apostles) to their Creator; which truth, were it requisite, might be further confirmed by several other texts, which, to decline needless prolixity, I here forbear to insist on. Consonantly to this, we hear the Psalmist proclaiming that *the heavens declare the glory of God, and the firmament sheweth his handy-works.* To which purpose we may also observe, that though man were not created, till the close of the sixth day (the resident's arrival being obligingly suspended till the palace was made ready to entertain him) yet, that none of God's works might want intelligent spectators and admirers, the angels were created the first day, as divines generally infer from the words of God in *Job*; *Where wast thou, when I laid the foundations of the earth?* and a little after; *when the morning stars sang together, and all the sons of God shouted for joy.* Where, by the *morning stars* and *sons of God*, are supposed to be meant the newly created angels; one of whose earliest exercises was, it seems, to applaud the creation, and take thence occasion to sing hymns to the almighty author of it. I should not, *Pyrophilus*, add any thing further on this subject, but that having since the writing of these thoughts, met with a discourse of *Seneca*'s, very consonant to some of them, I suppose it may tend to your delight as well as to their advantage, if I present you some of the truths you have seen in my coarser language, dress't up in his finer and happier expressions. *Curiosum nobis* (saith he) *natura ingenium dedit, & artis sibi pulchritudinisque conscia spectatores nos tantis rerum spectaculis genuit, perditura fructum sui, si tam magna, tam clara, tam subtiliter ducta, tam nitida, & non uno genere formosa solitudini ostenderet; ut scias illam spectari voluisse, non tantum aspici, vide quem locum nobis dedit; nec erexit tantummodo hominem, sed etiam ad contemplationem factum, ut ab ortu sidera in occasum labentia prosequi posset, & vultum suum circumferre cum toto, sublime illi fecit caput, & collo flexibili imposuit. Deinde sena per diem, sena per noctem signa produxit; nullam non partem sui explicuit, ut per hæc, quæ obtulerat ejus oculis, cupiditatem faceret etiam cæterorum: nec enim omnia nec tanta vidimus quanta sunt, sed acies nostra aperit sibi investigando viam, & fundamenta veri jacit, ut inquisitio transeat ex apertis in obscura, & aliquid ipso mundo inveniat antiquius:* 'Nature, 'conscious to her self of her own beauty and 'artifice, hath given us a curious searching 'wit, and to so excellent and great shews be-'gat us to be spectators; otherwise she would 'have lost the fruit of her self, if to a desart 'and solitude she should have set forth so 'magnificent, so famous, so finely drawn, so 'fair and many ways beautiful pieces. That 'you may know she would not only have 'them seen, but looked upon, take notice of the 'place she hath given us: for she hath not 'only made man of an upright stature, but 'being so made, for better contemplation, that 'he might follow with his eye the course of 'the stars, from the rising to the setting, and 'carry about his looks, together with his 'whole body, she hath both given him a tall 'head, and placed that upon a flexible neck; 'then she shews six constellations by day, and 'six by night. She hath laid open every part 'of her self, that by those things, which she 'hath offered to the eyes of man, she might 'breed a desire of knowing the rest. Yet 'neither do we see all her works, nor those 'that we see, do we see in those proportions 'which they truly have; but our sight, by 'searching, does open a way unto it self, and 'lay the grounds of truth, that so inquiry 'may pass from things that are plain, to things

Job xxxviii. 7.

Sen. de Oti. Sap. 32.

Rom. xi. 36.

Psal xix. 1.

'that are obſcure, and find ſomewhat more 'ancient, even than the world it ſelf.' See *Sen. De Vita Beata*, cap. xxxii. And leſt you might be offended at his mentioning of nature, and ſilence of God, give me leave to inform you, that about the cloſe of the chapter immediately preceding that, whence the paſſage you come from reading is tranſcribed, having ſpoken of the enquiries of philoſophers into the nature of the univerſe, he adds, *Hæc qui contemplatur, quid Deo præſtat? ne tanta ejus opera ſine teſte ſint*; 'What does he, that 'contemplates the nature of the univerſe, of 'honour unto God? this, that his great works 'are not without a witneſs.'

That man's good is a ſecond end, proved by ſcripture.

AND to proceed to that, which we have formerly aſſigned for the ſecond end of the creation; that much of this viſible world was made for the uſe of man, may appear, not only from the time of his creation (already taken notice of) and by the commiſſion given to the firſt progenitors of mankind, to *repleniſh the earth and ſubdue it, and to have dominion over the fiſh of the ſea, and over the fowls of the air, and over all the earth, and over every living thing that creepeth or moveth on the earth:* but alſo by God's making thoſe noble and vaſt luminaries, and other bodies, that adorned the ſky, to give light upon the earth, though inferiour to them in dimenſions, and *to divide between the day and between the night, and to be for ſigns, and for ſeaſons, and for days, and for years.* To this agrees that paſſage in the prophet, *Thus ſaith the Lord that created the heavens, God himſelf that formed the earth, and made it, He hath eſtabliſhed it, He created it not in vain, He formed it to be inhabited, &c.* And the inſpired poet ſpeaks of man's dignity in very comprehenſive terms, *For thou* (ſays he to his Maker) *haſt made him little lower than the angels, and haſt crowned him with glory and honour; Thou madeſt him to have dominion over the works of thy hands, thou haſt put all things under his feet.*

Gen. i. 28, 29.

Iſai. xlv. 18.

Pſal. v. 5, 6.

THE ſame truth may be confirmed by divers other texts, which it might here prove tedious to inſiſt on. And therefore I ſhall rather obſerve, that conſonantly thereunto, God was pleaſed to conſider man, ſo much more than the creatures made for him, that he made the ſun it ſelf at one time to ſtand ſtill, and at another time to go back, and divers times made the parts of the univerſe forget their nature, or act contrary to it; and has (in ſum) vouchſafed to alter by miracles the courſe of nature, for the inſtruction or relief of man (as when the fire ſuſpended its deſtructive operation, whilſt the three reſolute Jews, with their protector, walked unharmed in the midſt of thoſe flames that deſtroyed the kindlers; and as the heavy iron, emerged up to the ſwimming piece of wood, miraculouſly by *Eliſha* made magnetical.) And you may alſo, *Pyrophilus*, take notice, that when *Adam* had tranſgreſſed, immediately the ground was curſed for his ſake. And as it is not unuſual in human juſtice to raze the very houſes of regicides and reſembling traitors; ſo when the provocations of *Sodom* ſwelled high enough to reach heaven, God did not only deſtroy the inhabitants from the face of the earth, but for the inhabitants ſins deſtroyed the very face of the earth. So when in *Noah*'s time, a deluge of impiety called for a deluge of waters, God, looking upon the living creatures, as made for the uſe of man, ſtuck not to deſtroy them with him, and for him; but involved in his ruin all thoſe animals, that were not neceſſary to the perpetuation of the ſpecies, and the ſacrifice due for *Noah*'s preſervation. And ſo, when (in the laſt days) the earth ſhall be repleniſhed with thoſe ſcoffers mentioned by St. *Peter*, *who will walk after their own luſts*, and deride the expectation of God's foretold coming to judge and puniſh the ungodly, their impiety ſhall be as well puniſhed as ſilenced by the unexpected flames (perhaps haſtened by that very impiety) that ſhall either deſtroy or transfigure the world. For as by the law of *Moſes*, the leprous garment, which could not be recovered by being waſhed in water, was to be burned in the fire; ſo the world, which the deluge could not cleanſe, a general conflagration muſt deſtroy.

2 Pet. iii. 3, 5, 6, 7, 8, 10.

Lev. xiii. 54, 55.

The ſame proved by reaſon and authority, xxvi, xxvii, xxvii.

NOR is reaſon it ſelf backward to countenance what we teach. For it is no great preſumption to conceive, that the reſt of the creatures were made for man, ſince he alone of the viſible world is able to enjoy, uſe, and reliſh many of the other creatures, and to diſcern the omniſcience, almightineſs, and goodneſs of their author in them, and return him praiſes for them. It is not for themſelves, that the rubies flame, other jewels ſparkle, the bezoar-ſtone is antidotal; nor is it for their own advantage, that fruitful trees ſpend and exhauſt themſelves in annual profuſions. The light, which he diffuſes through the world, is uſeleſs to the ſun himſelf, whoſe inanimate being makes him incapable of delighting in his own ſplendor, which he receives but to convey it to the earth, and other by him illuminated globes: whence probably the Hebrews called him *Shemeſh*, which grammarians derive from the root *Shemaſh*, ſignifying, in the Chaldean tongue, *to ſerve*, or *miniſter to*; the ſun being the great miniſter of nature, and ſervant general of the univerſe. And as animals alone, among the creatures, ſeem to have a proper ſenſe of, and complacency in, their own being; ſo man alone among animals is endowed with reaſon, at leaſt ſuch a pitch of it, as by which he can diſcern God's creatures to be the gifts of God, and refer them to their Creator's glory. This truth I find not only embraced by Chriſtians, but aſſented to even by Jews and Heathens. Among the Jews, my learned acquaintance, *Manaſſeh Ben Iſrael*, profeſſedly labours to prove it by ſcripture and tradition, (though in ſome of his arguments, he might appear more a philoſopher, if he would have appeared leſs a Rabbi) and among other paſſages I remember he alledges that, wherein the wiſe man ſays (as our tranſlators engliſh it) *that the righteous is an everlaſting foundation*, which he renders, *juſtus eſt columna mundi, the juſt man is the pillar of the world.* And indeed, if the context did not ſomewhat diſfavour the interpretation, the

How the ſun (Sheneſh) *is the great miniſter of the univerſe.*

In Probl. de Creat.

Prov. x. 25. Gen. vi. 9.

Hebrew

Gen. ii. 26, 28, 29. Pſal. viii. 7. Heb. ii. 7. Job v. 3. Ho. ii. 28, 21, 22. Rom. viii. 28. 2 Cor. iii. 22. 2 Tim. iv. 3. 2 King vi. 5, 6.

Hebrew words [*tzadîk yesôd olám*] would well enough bear the ſenſe aſſigned them. Congruouſly whereunto, I remember, that when *Noah* (who is called in ſcripture a righteous
2 Pet. ii. 5. man, and κήρυξ δικαιοσύνης, a *herald*, or *proclaimer of righteouſneſs*) offered up that noble ſacrifice of all the ſorts of clean beaſts and fowls, as a thank-offering for the reprieve of the world, God is ſaid to have *ſmelled a ſavour of reſt*, and to have reſolved in his heart never to curſe the ground for man's ſake, but to
Gen. viii. 21, 22. continue the viciſſitudes of ſummer, and winter, day, and night, *&c.* as long as the earth ſhall remain. And among the philoſophers themſelves, the truth we are now manifeſting, has not been altogether ignored. For though *Seneca* ſomewhere, more wittily than truly,
Secundo *De Ira*, cap. 27. ſays, *Non cauſa mundo ſumus hyemem æſtatemque referendi; ſuas iſta leges habent, quibus divina exercentur. Nimis nos ſuſpicimus, ſi digni nobis videmur, propter quos tanta moveantur:* 'We 'are not the cauſe of the ſeaſons and returns 'of ſummer and winter to the world: theſe 'have their own laws, accommodated to the 'exerciſe of divine beings. We arrogate too 'much honour to our ſelves, if we eſteem our 'ſelves worthy, that ſuch vaſt bodies ſhould 'fulfil ſuch motions for our ſakes.' Yet *Lactantius* (not to mention other authors) tells us, that the *Stoicks generally believed the world to*
De Ira Dei, cap. 13. *have been made for man. Vera eſt* (ſays he) *ſententia Stoicorum, qui aiunt noſtra cauſa mundum fuiſſe conſtructum. Omnia enim, quibus conſtat, quæque generat ex ſe mundus, ad utilitatem hominis accommodata ſunt:* 'True is the opinion 'of the Stoicks, that ſay, how that for our 'ſakes the world was made; for all things, that 'are, and that the world doth by itſelf generate, 'are accommodated to the advantage of man.' And *Seneca* himſelf ſpeaks elſewhere almoſt as if he had read and believed the beginning of
De Benef. cap. 28. *Geneſis: Dii* (ſays he) *non per negligentiam nos genuere, quibus tam multa genuerant: cogitavit enim nos ante natura, quam fecit:* 'The gods 'were not careleſs or unconcerned in the mak-'ing of man, for whom they made ſo many 'other creatures: for nature deſigned us, and 'drew us out in idea, before ſhe made us.'

NOR were the Stoicks the only philoſophers, to whom the contemplation of the univerſe diſcovered this end of it. For to inſtance now in *Cicero* only; *Quorum igitur causâ*
Secundo *De Nat. Deor.* (ſays that great orator) *effectum eſſe mundum? Eorum ſcilicet animantium, quæ ratione utuntur: hi ſunt dii & homines, quibus profecto nihil eſt melius*; 'And for whoſe ſake then, was the 'world made? for thoſe beings, that have 'reaſon and intelligence, *viz.* gods and men, 'than whom, no being is more excellent.'

HAVING thus premiſed, *Pyrophilus*, that two of God's principal aims in the creation were the manifeſtation of his own glorious attributes, and the welfare of his nobleſt viſible creature, man; it will not be perhaps difficult for you to diſcern, that thoſe, who labour to deter men from ſedulous enquiries into nature, do (though, I grant, deſignleſly) take a courſe, which tends to defeat God of both thoſe mentioned ends.

That accommodation and delight, which the creatures might afford man, is much impaired by the want of natural philoſophy.

For to ſpeak, firſt, to the laſt of them, that man's external fruition of the creatures, and the delight and accommodation which they may afford him, muſt be highly prejudiced and impaired by his ignorance of that natural philoſophy, wherein his dominion over the creatures chiefly conſiſts, what we ſhall ſay hereafter concerning the uſefulneſs of the knowledge of nature to human life, will ſufficiently evince. But ſuch an animal fruition (if I may ſo call it) of the works of nature affords not man all the good, that God deſigned him in them. For religion being, not only the great duty of man, but the grand inſtrument of his future happineſs, which conſiſts in an union with, and fruition of God, during that endleſs term, that ſhall ſucceed the expiration of his tranſitory life on earth; whatever increaſes or cheriſhes his religion, deſerves to be looked on as a great contributer to his happineſs. And we may therefore venture to affirm, that the knowledge of the creatures does leſs advantage man, as it ennables him to maſter them, than as it aſſiſts him, by admiring and ſerving him, to become acceptable to their author. And whatever our diſtruſtful adverſaries are pleaſed to ſurmiſe to the contrary, certainly God intended, that his creatures ſhould afford not only neceſſaries and accommodations to our animal part, but inſtructions to our intellectual. The world is wont to be ſtyled not unfitly by divines, the Chriſtian's inn; but perchance it may be altogether as properly called his ſhip: for whereas both appellations ſuppoſe him a traveller, the inn, though it refreſh him in his journey, does not further him in it, but rather retard his progreſs, by detaining him in one place; whereas a ſhip, not only ſerves the paſſenger for an inn when he is weary, but helps to convey him towards his journey's end. And according to this notion, to ſuppoſe, that God hath placed in the world innumerable things to feed man, and delight him, and none to inſtruct him, were a conceit little leſs injurious to God, than it were to a wiſe merchant, that ſends perſons he loves to a far country, to think, that he would furniſh their cabinets with plenty of proviſions, ſoft beds, fine pictures, and all other accommodations for their voyage, but ſend them to ſea diſprovided of ſea-charts, and mariner's compaſſes, and other requiſite helps to ſteer their courſe by to the deſired harbour.

That the inſtructions to our intellectual part are more conſiderable than the accommodations we have from nature to our animal part.

Of the hints of natural philoſophy in the hiſtory of the creation, and other references to it in other places.

AND indeed ſo far is God from being unwilling, that we ſhould pry into his works, that by divers diſpenſations he impoſes on us, little leſs than a neceſſity of ſtudying them. For firſt he begins the book of ſcripture with the deſcription of the book of nature, of which he not only gives us a general account, to inform us, that he made the world (ſince for that end, the very firſt verſe in the bible might have ſufficed) but he vouchſafes us by retail the narrative of each day's proceedings; and in the two firſt chapters of *Geneſis*, is pleaſed to give nobler hints of natural philoſophy than men are yet perhaps aware of. Though, that in moſt other places of the ſcripture, where the works of nature are mentioned but incidently, or in order

ces. 30, 31.

to

to other purpoſes, they are ſpoken of rather in a popular than accurate manner, I dare not peremptorily deny, being unwilling to intereſt the reputation of Holy Writ (deſigned to teach us rather divinity than philoſophy) in the doubtful contentions of naturaliſts, about ſuch matters, as may (though the hiſtory of the creation cannot) be known by the meer light of natural reaſon. We may next obſerve, that God has made ſome knowledge of his created book, both conducive to the belief, and neceſſary to the underſtanding of his written one; our Saviour making it one cauſe of the Sadducees great error about the reſurrection, that they *knew not the power of God.* And the Scripture being ſo full of alluſions to, and compariſons borrowed from the properties of the creatures, that there are many texts not clearly intelligible without ſome knowledge of them; as may appear even by the firſt Goſpel (the promiſe *that the ſeed of the woman ſhould bruiſe the ſerpent's head, and have his heel bruiſed by that ſubtle creature*) preached to fallen man in *Paradiſe*, and by the repreſentation of the world's four great monarchies, and the genius of each of them under the notion of four beaſts, in *Daniel*'s prophetick viſion: and that often repeated precept of our great Maſter to his diſciples is couched in an expreſſion alluding to the properties of animals. For where he commands them to be wiſe as ſerpents, and harmleſs as doves, he does not only recommend to them a ſerpentine warineſs in declining dangers, but ſeems alſo to preſcribe not alone an inoffenſiveneſs towards others(the conſpicuouſneſs of which quality in pigeons hath made them, though erroneouſly, be ſuppoſed to have no gall,) but alſo as harmleſs a way of eſcaping the dangers they are actually ingaged in, as that of doves, who being purſued by birds of prey, endeavour to ſave themſelves not by fight, but only by flight.

AND indeed ſo many of the texts in Scripture are not to be competently illuſtrated, without ſome knowledge of the properties of the creatures related to in them, that I wonder not that *Levinus Lemnius*, *Frantzius*, *Ruæus*, and other learned men have thought it requiſite to publiſh entire treatiſes, ſome of the animals, others of the ſtones, and others of the works of nature mentioned in Scripture. Only I could wiſh, that they had been as wary in their writings as commendable for their intentions, and had not ſometimes admitted doubtful or fabulous accounts into comments upon that book, whoſe prerogative it is to teach nothing but truth.

NOR ought their labours to deter others from cultivating the ſame theme: for as (ſuch is God's condeſcenſion to human weakneſs) moſt of the texts, to whoſe expoſition phyſiology is neceſſary, may be explicated by the knowledge of the external, or at leaſt more eaſily obſerved qualities of the creatures; ſo, that there are divers not to be fully underſtood without the aſſiſtance of more penetrating indagations of the abſtruſities of nature, and the more unobvious properties of things, an intelligent and philoſophical peruſer will readily diſcern.

Now if you ſhould put me upon telling you, *Pyrophilus*, what thoſe attributes of God are, which I ſo often mention to be viſibly diſplayed in the fabrick of the world, I can readily anſwer you, that though many of God's attributes are legible in his creatures, yet thoſe, that are moſt conſpicuous there, are his power, his wiſdom, and his goodneſs, in which the world, as well as the bible, though in a differing, and in ſome points a darker way, is deſigned to inſtruct us; which, that you may not think to be affirmed gratis, we muſt inſiſt a while on each of the three.

How God's power is conſpicuous in the creatures. 32, 33, 34.

AND firſt, how boundleſs a power, or rather what an almightineſs is eminently diſplayed in God's making out of nothing all things, and without materials or inſtruments conſtructing this immenſe fabrick of the world, whoſe vaſtneſs is ſuch, that even what may be proved of it, can ſcarcely be conceived, and after a mathematical demonſtration its greatneſs is diſtruſted! which yet is, I confeſs, a wonder leſs to be admired, than the power expreſſed by God in ſo immenſe a work, which nevertheleſs ſome modern philoſophers (whoſe opinions I find ſome cabaliſts to countenance) ſuppoſe to be not the only production of God's omnipotence. Not to mention elephants, or whales, ſome of which an hyperboliſt would not ſcruple to call moving mountains, and floating iſlands; and to paſs by thoſe ſtupendous hills, and thoſe ſeas, where the light loſes it ſelf, as objects, which their nearneſs only repreſents ſo bulky; let us haſten to conſider, that whereas the terreſtrial globe we men inhabit, contains, beſides all thoſe vaſt kingdoms, the union of ſome of which conſtituted the world's four celebrated monarchies, thoſe ſpacious (ſince detected) American regions, that have been deſervedly ſtyled the new world; and that whereas the common account makes the circuit of this terreſtrial globe to be no leſs than 22600 *Italian* miles, conſiſting each of 1000 geometrical paces, (which number the more recent account of the accurate *Gaſſendus* makes amount to 26255 miles of the ſame meaſure;) whereas, I ſay, this globe of earth and water ſeems to us ſo vaſt, aſtronomers teach us, that it is but a point in compariſon of the immenſity of heaven; which they not irrationally prove by the parallaxis (or circular difference betwixt the place of a ſtar, ſuppoſed to be taken by two obſervations, the one made at the centre, and the other on the ſurface of the earth) which *Gaſſendus* confeſſeth to be undiſcernible in the fixt ſtars; as if the terreſtrial globe were ſo mere a point, that it were not material, whether a fixt ſtar be looked upon from the centre, or from the ſurface of the earth. This may leſſen our wonder at the Ptolemæans making the ſun (which ſeems not half a foot over) to be above a hundred ſixty and ſix times bigger than the earth, and diſtant from it one thouſand one hundred ſixty and five ſemi-diameters of the earth, each of which contains, according to the aforementioned computation of *Gaſſendus*, 4177 miles; and at their ſuppoſing the fixt ſtars (whoſe diſtance the ſame author, as a Ptolemæan, ſupputes to be 19000 ſemi-diame-

Gaſſend. Inſt. Aſtr. l. 2. c. 13

ters of earth) ſo great, that they conclude each of the fixed or ſmalleſt magnitude to be no leſs than 18 times greater than the whole earth, and each ſtar of the firſt or chief magnitude to exceed the terreſtrial globe 108 times. And as for the Copernicans (that growing ſect of aſtronomers) they, as their hypotheſis requires, ſuppoſe the vaſtneſs of the firmament to be exceedingly greater, than the ancients believed it. For *Philippus Lansbergius*, who ventured to aſſign diſtances and dimenſions to the planets and fixed ſtars (which *Copernicus* forbore to do) ſuppoſes as well as his maſter, that the great orb it ſelf (as the Copernicans call that, in which they eſteem the earth to move about the ſun) though its ſemi-diameter be ſuppoſed to be 1500 times as great as that of the earth, is but as a point in compariſon of the firmament or ſphere of the fixed ſtars; which he ſuppoſes to be diſtant from the earth, no leſs than 28,000 ſemi-diameters of the great orb, that is, 42,000,000, of ſemi-diameters of the earth; or, according to the former computation of common miles, 175,434,000,000, which is a diſtance vaſtly exceeding that, which the Ptolemæans ventured to aſſign, and ſuch as even imagination it ſelf can hardly reach to. I confeſs indeed, that I am not ſo well ſatisfied with the exactneſs (nor perhaps with the grounds) of theſe kinds of computations, by reaſon of the difficulty I have met with in making exact celeſtial obſervations with either teleſcopes, or other inſtruments, ſufficiently witneſſed, by the great diſparity remarkable betwixt the computations of the beſt artiſts themſelves. But on the other ſide I am not ſure, but that even the Copernicans aſcribe not too great a diſtance to ſome of the fixed ſtars; ſince (for aught we yet know) thoſe of the ſixth magnitude, and thoſe, which our teleſcopes diſcover (though our bare eyes cannot) are not really leſs than thoſe of the firſt magnitude, but only appear ſo by reaſon of their greater diſtance from our eyes: as ſome fixed ſtars ſeem no bigger than *Venus* and *Mercury*, which are much leſſer than the earth. And therefore upon ſuch conſiderations, and becauſe the modeſteſt computation allows the firmament to be great enough to make the earth but a point in compariſon of it; it will be ſafe enough, as well as juſt, to conclude with the Pſalmiſt, *Great is the Lord, and greatly to be praiſed; and his greatneſs is unſearchable.*

Gaſſend. lib. 3. cap. 11.

How God's wiſdom is conſpicuous in them.

THE next attribute of God, that ſhines forth in his creatures, is his wiſdom; which to an intelligent conſiderer appears very manifeſtly expreſſed in the world, whether you contemplate it as an aggregate or ſyſtem of all natural bodies, or conſider the creatures it is made up of, both in their particular and diſtinct natures, and in relation to each other, and the univerſe, which they conſtitute. In ſome of theſe the wiſdom of God is ſo conſpicuous, and written in ſuch large characters, that it is legible even to a vulgar reader: but in many others the lineaments and traces of it are ſo delicate and ſlender, or ſo wrapt up and covered with corporeity, that it requires an attentive and intelligent peruſer. So numberleſs a multitude, and ſo great a variety of birds, beaſts, fiſhes, reptiles, herbs, ſhrubs, trees, ſtones, metals, minerals, ſtars, *&c.* and every one of them plentifully furniſhed and endowed with all the qualifications requiſite to the attainment of the reſpective ends of its creation, are productions of a wiſdom too limitleſs not to be peculiar to God: to inſiſt on any one of them in particular (beſides that it would too much ſwell this diſcourſe) might appear injurious to the reſt; which do all of them deſerve that extenſive exclamation of the Pſalmiſt, *How manifold are thy works, O Lord; in wiſdom haſt thou made them all.* Pſal. civ. 24. And therefore I ſhall content my ſelf to obſerve in general, that, as highly as ſome naturaliſts are pleaſed to value their own knowledge, it can at beſt attain but to underſtand and applaud, not emulate the productions of God. For as a novice, when the curiouſeſt watch the rareſt artiſt can make, is taken in pieces and ſet before him, may eaſily enough diſcern the workmanſhip and contrivance of it to be excellent; but had he not been ſhewn it, could never have of himſelf deviſed ſo ſkilful and rare a piece of work; ſo, for inſtance, an anatomiſt, though when by many and dextrous diſſections of human bodies, and by the help of mechanical principles and rules (without a competent ſkill wherein, a man can ſcarce be an accompliſhed and philoſophical anatomiſt) he has learned the ſtructure, uſe, and harmony of the parts of the body, he is able to diſcern that matchleſs engine to be admirably contrived, in order to the exerciſe of all the motions and functions, whereto it was deſigned: and yet this artiſt, had he never contemplated a humane body, could never have imagined or deviſed an engine of no greater bulk, any thing near ſo fitted to perform all that variety of actions we daily ſee performed either in or by a human body. Thus the circular motion of the blood, and ſtructure of the valves of the heart and veins (the conſideration whereof, as himſelf told me, firſt hinted the circulation to our famous *Harvey*) though now modern experiments have for the main (the modus ſeeming not yet ſo fully explicated) convinced us of them, we acknowledge them to be very expedient, and can admire God's wiſdom in contriving them: yet thoſe many learned anatomiſts, that have for many ſucceeding ages preceded both Dr. *Harvey* and *Columbus*, *Ceſalpinus*, *Padre Paulo*, and Mr. *Warner* (for each of theſe four laſt are ſuppoſed by ſome to have had ſome notion of the circulation) by all their diligent contemplation of human bodies, never dreamed (for aught appears) of ſo advantageous an uſe of the valves of the heart, nor that nimble circular motion of the blood, of which our modern circulators think they diſcern ſuch excellent uſe, not to ſay, neceſſity.

Particular obſervations of the ſtructure of human bodies.

AND though it be true, that the greater works of God do as well declare his great wiſdom as his power, according to that of the inſpired philoſopher; *The Lord by wiſdom hath founded the earth, by underſtanding hath he eſtabliſhed the heavens. By his knowledge the depths are broken up, and the clouds drop down* Prov. viii. 19, 20.

the

the dew; yet does not his wiſdom appear leſs in leſſer creatures; for there is none of them ſo little, but it would deſerve a great deal of our wonder, did we attentively enough conſider it. And as *Apelles* (in the ſtory) was diſcovered by the ſkilful *Protagoras*, by ſo neat and ſlender a line, that *Protagoras*, by being ſcarce able to diſcern it, diſcerned it to have been drawn by *Apelles:* ſo God, in theſe little creatures, oftentimes draws traces of omniſcience, too delicate to be liable to be aſcribed to any other cauſe. I have ſeen elephants, and admired them leſs than the ſtructure of a diſſected mole, which hath better eyes than thoſe, that will not ſee a deſignation in the dimneſs of its eyes (made only to ſee the light, not other objects by the help of it) and the unwonted poſture of its feet, given it not to run on the ground, but to dig it ſelf a way under ground. And, as deſpicable as their littleneſs makes the vulgar apt to think ſome creatures, I muſt confeſs my wonder dwells not ſo much on nature's clocks (if I may ſo ſpeak) as on her watches, and is more exerciſed in the coyneſs of the ſenſitive plant, and the magnetical properties of a ſmall and abject loadſtone, than the bulk of the talleſt oaks, or thoſe vaſt rocks, made famous by ſhipwrecks. I have paſſed the *Alps*, and have ſeen as much to admire at in an ant-hill; and have ſo much wondered at the induſtry of thoſe little creatures themſelves, that inhabited it, that I have ceaſed to wonder at their having given a theme to *Solomon*'s contemplation. Thoſe vaſt exotick animals, which the multitude flocks to ſee, and which men give money to be allowed to gaze on, have had many of them leſs of my admiration than the little caterpillar, (as learned naturaliſts eſteem it) to which we are beholden for ſilk. For (not to mention all the obſervables crouded by nature in that little worm) I thought it very well deſerved my wonder (when not long ſince I kept ſome of them purpoſely to try experiments) how this curious ſpinſter, after he had buried himſelf alive in the precious tomb he had wrought for himſelf out of his own bowels, did caſt off his former ſkin and legs, and, in ſhew, his former nature, appearing for divers days but an almoſt moveleſs maggot; till at length, diveſting this ſecond tegument alſo (in which neſt, phœnix-like, he had been regenerated out of his own remains) he came forth (if I may ſo ſpeak) out of his attiring room under another form, with wings, eyes, and legs, *&c.* to act a new part upon the ſtage of the world; which having ſpent ſome days, without feeding (that I could obſerve) in providing for the propagation of his ſpecies, he forſakes and dies. And I the rather mention the ſilk-worm, becauſe that there have been of late divers ſubtle ſpeculators, who would fain perſuade us, that animals do nothing out of inſtinct, or, if you pleaſe, innate or ſeminal impreſſions; but ſpin, build neſts, and perform all the other actions, for which they are admired, barely by imitation of what they have ſeen done by others of the ſame kind. But in the ſilk-worm (at leaſt here in *England*) this plauſible opinion will not hold: for the ſilk-worms I kept, were not hatched but in the ſpring, out of eggs laid ſome days in the ſun; and the worms, that laid thoſe eggs, being every one of them dead the winter before, it was impoſſible theſe new ſilk-worms, when they firſt began to ſpin their ſcarce imaginable fine web, and incloſe themſelves in oval balls of a very artificial figure and texture, ſhould have wrought thus by imitation; there not having been for many months before, in the place, where they were hatched (nor perhaps in the whole country) any ſilk-worms alive which they might imitate. But I muſt leave theſe curious ſpinſters to their work, and proceed to tell you, that ſeas and mountains, with the other hyperboles of nature (if I may ſo term them) proclaim indeed God's power, but do not perhaps more manifeſt his wiſdom, than the contrivance of ſome living engines, and (if I may ſo call them) breathing atoms, that are ſo ſmall, that they are almoſt all workmanſhip; ſo that, as before, in the Pſalmiſt's expreſſion we truly ſaid of God's greatneſs, *That it was unſearchable*; we may now as truly ſay of his wiſdom in the prophet's words, and in the ſame text where he repreſents him as the Creator of the ends of the earth, *That there is no ſearching of his underſtanding.* Iſa. xl. 28.

Of the eyes and feet of moles.

Of the ſilk-worm.

That it works by inſtinct, and not by imitation.

AND if I durſt, *Pyrophilus*, make this part of this eſſay of a length too diſproportionate to the reſt, I could eaſily, as well as willingly, repreſent to you divers things, which might ſerve to illuſtrate the πολυποικίλος σοφία τ῀ Θε῀, *manifold wiſdom of God* (as St. *Paul* ſpeaks on another occaſion:) but though I dare not expatiate on this ſubject, yet neither dare I altogether conceal from you, that I have ſometimes admired to ſee, what ſcarce imaginable variety of living engines his plaſtick ſkill (if I may ſo ſpeak) has been able to produce, (eſpecially in the waters) without ſcarce any other reſemblance betwixt them, than that they are each of them excellent in its own kind, and compleatly furniſhed according to the exigency of its nature. And that, which much encreaſes this wonder, is the diſproportion of thoſe living engines, wherein the great [*Yotzêer hakkôl*] *Former of all things* (as the ſcripture juſtly calls God) has been pleaſed to diſplay an almoſt equally ſkilful contrivance. Amongſt terreſtrial animals we have the elephant, of whoſe ſtupendous vaſtneſs ſuch ſtrange things are related, even by eminent writers, that I know not well how either to diſ-believe them, or give credit to them: and therefore we ſhall content our ſelves to mention that, which is left on record by the accurate *Gaſſendus* in the life of *Peireskius*. For this matchleſs gentleman having cauſed an elephant, in the year 1631, to be weighed in a ſcale, purpoſely provided, he was found to weigh, of the Roman pounds (conſiſting of twelve ounces a-piece) very near five thouſand. And yet ſurely that this elephant was very far from being one of the largeſt of that ſort of beaſts, he, that ſhall conſider the bigneſs and length of ſome of their teeth, as they are commonly called, which are to be ſeen at divers places, both in *England* and elſewhere, and is not reſolved not to believe the conſonant relations of Eaſtern travellers (among whom

Jer. x. 16.

Gaſſend. in Vit. Peireſkii, lib. 4. *Of the vaſtneſs of the elephant, and its diſproportion to the ἄνοῤῥοι, and ſuch like mites.*

whom *Linſchoten* tells us, there have been ſome teeth found to weigh two hundred pounds a-piece, each pound conſiſting of twenty-four ounces) may be eaſily perſuaded. On the other ſide, let us reflect upon the ſmallneſs of ſome terreſtrial animals; and not to mention that little white creature bred in wax, which *Ariſtotle* calls Ἄκαρι, and ſpeaks of as ſuppoſed to be the leaſt of all living creatures whatſoever; let us conſider thoſe little mites, that are bred in mouldy cheeſe; for divers of theſe ſcarce amount to the weight of a grain, and every pound containing five thouſand ſeven hundred and ſixty grains; ſuppoſing each mite did weigh a whole grain, yet that formerly mentioned ſmall elephant would exceed him near 28,800,000 times. And yet though a mite ſeem but a moving atom, and, unleſs there be divers together, is not eaſily diſcerned by the unaſſiſted eye; yet in an excellent microſcope, I have, you know, ſeveral times both ſeen and ſhewn to others, even in a gloomy day, and a diſadvantageous place, not only the limbs of this little animal, but the very hair growing upon his legs. Now let us but conſider, how ſtrangely ſkilful and delicate a workmanſhip muſt be employed to contrive into ſo narrow a compaſs the ſeveral parts internal and external, requiſite to make up this little animal; how many muſt go to the texture of the eyes, and other organs of ſenſe; how many to the ſnout (which he has, not unlike a hog) and the ſeveral parts of it; how many to the ſtomach and guts, and the other inward parts addicted to the digeſtion of aliment, and excluſion of excrements; and, to be ſhort, how unimaginably ſubtle muſt be the animal ſpirits running to and fro in nerves ſuitable in ſuch little legs: and if, as we have obſerved them to multiply by eggs, the little creatures be hatched in thoſe little eggs, after the manner of divers other oviparous animals, how much ſmaller than a hatched mite muſt be a mite upon the animation of its delineated parts? ſince in hen's eggs we have ſometimes ſeen the chick manifeſtly alive, and its limbs clearly delineated, whilſt yet it took up ſo ſmall a portion of the egg, that both the white and the yolk (betwixt which it is generated, and not of the chalaza or treadle, as *Aquapendente* and other moderns teach) ſeemed to be ſometimes yet intire, as well as involved in their peculiar membranes. But it is not ſo conſpicuous in gradient animals (if I may ſo ſpeak) as in ſwimming ones; how vaſtly diſproportionate maſſes of matter the wiſe Former of all things can faſhion into living engines. For whales are much more ſtupendous creatures than elephants: And not to mention what *Hartenius (apud Johnſtonum)* tells us of twenty ſorts of whales, whereof the eighteenth ſpecies, which he calls *Nordhwal* is by him related to be ninety ells long; but what ells he means, I know not: nor to mention thoſe leſs incredible accounts, which are given of the vaſtneſs of whales by our Engliſh navigators, who are wont to fiſh for them; I ſhall only ſet down what is related by one of the eminenteſt modern Lyncean philoſophers, becauſe he ſpeaks as an eye-witneſs, when he tells us, that in the year 1624, there was caſt upon a place near *Santa Severa*, about 30 miles from *Rome*, a dead whale of 91 palms in length, and 50 in thickneſs: he adds, that its mouth was 16 palms long, and ten high; in which, being opened and kept gaping, a man on horſe-back might find competent room; this mouth being uſed to harbour a tongue of twenty palms (which may make out fifteen foot) in length. The ſame inquiſitive writer adds, that four years before, near the iſland of *Corſica*, not far from the coaſt of *Italy*, another whale was caſt, one hundred foot long, which being a female, was found to be big with a cub of thirty foot long, 1500 pound weight. But that, which will let you ſee, *Pyrophilus*, the diſproportion betwixt theſe kind of fiſhes and common elephants, is that, which the ſame author adds, *that the lard only, or fat*, (as he ſpeaks, *carnea pinguedo*) *of this corpulent creature, weighed one hundred and thirty-five thouſand pound*; that is, above twenty ſeven times the weight of the whole elephant, which was cauſed to be weighed by *Peireſkius*. And though the omnipotent Creator be able to make ſwimming creatures of ſuch prodigious bigneſs, that the ocean itſelf may ſeem to be but a proportionate pond for ſuch fiſhes; yet is the ſame omniſcient continuer as able to make a ſwimming engine more ſlender than a cheeſe-mite, and ſo little, that the ſmall part of a grain may out-weigh divers of them. For, *Pyrophilus*, I muſt here acquaint you with a ſtrange obſervation, which I have been informed to have been ſome while ſince made in *Italy* by *Panarola* a famous phyſician in *Rome*, who is ſaid, by the help of an excellent microſcope, to have diſcerned in vinegar ſmall living creatures, which he takes to be worms. The mention of ſo unlikely an experiment made me ingage ſome excellent philoſophers and mathematicians to aſſiſt me in examining it: but though our microſcopes exceeded the beſt, that were brought us over from *Rome*, yet all our diligence and attention did but make them conclude, that *Panarola*'s eyes had been deluded. Notwithſtanding which, cauſing a ſomewhat hollow bottom of pure cryſtalline glaſs to be fitted to my microſcope, I proſecuted the enquiry myſelf; and at length was ſo lucky, as not only to diſcover theſe little creatures with a microſcope, but by holding the liquor in a cryſtal phial, almoſt upon the ſtrong flame of a candle, to diſcover multitudes of them with my naked eyes, as weak as they are. But though I have already convinced thoſe, that formerly derided ſuch obſervations, as not to be made with the beſt microſcope, yet the great weakneſs of my ſight has not permitted me to perfect my obſervations concerning theſe creatures. And therefore reſerving the more particular mention of this odd obſervation till another time, I ſhall now only tell you as much as is pertinent to our preſent purpoſe; namely, that having with a certain parcel of ſtrong white-wine vinegar (for it is not in every vinegar, that they are conſtantly to be found) filled up to the top thin phials, with long and ſlender necks; and having likewiſe with the ſame liquor filled other ſmall cryſtalline phials, though ſhort-necked, and held them

Of the vaſtneſs of the whale, and its diſproportion to the ſmall worms or fiſhes lately diſcovered in vinegar.

* Jo. Faber. Lynceus *in his expoſition of ſome paſſages of* p. 568.

them betwixt my eye and the ſun, or a window open towards it, or very near a great candle, I have often in theſe glaſſes, eſpecially in their ſlender necks, after having a while fixed my eye on them, (attention being in this caſe very neceſſary) admiringly obſerved great numbers (and ſometimes as it were ſhoals) of living creatures, which ſeemed to be rather fiſhes than worms; for they ſwim freely up and down the liquor, and often hover about the top of it with a wriggling motion, like that of eels, to which likewiſe their long and ſlender ſhape reſembles them. And though theſe ſwimming creatures be not all exactly of a ſize, yet ſome of them ſeemed ſlenderer than any ſort of living ones, that hath hitherto been taken notice of by the unaſſiſted eye. And I remember, that having looked in a good microſcope upon one of them, and a cheeſe-mite, much about the ſame time, the fiſh appeared ſo ſlender, that we judged it not much thicker than one of the legs of the mite: ſo that conſidering what a vaſt deal of matter the great Creator can manage and faſhion into a whale, and in how little room he can contrive all the parts requiſite to conſtitute a fiſh, we may juſtly ſay to him in the Pſalmiſt's language, *there is none like unto thee (O Lord) neither are there any works like unto thy works.*

Pſalm lxxxvi. 8.

How God's goodneſs is conſpicuous in his creatures by his proviſion of accommodations for them all, but eſpecially for his favourite, man.

THE laſt of the three properties of God, which we mentioned him to have manifeſted in the creation, is his goodneſs; of which all his creatures do in their due meaſure partake, partly by their having a being vouchſafed them, and partly by their being preſerved in it, as long as their ſubordination to higher purpoſes, and to more powerful creatures do permit, by that ſupporting influence of God, which keeps them from relapſing into their firſt nothing; according to that memorable paſſage, where *Nehemiah* having mentioned God as the *Creator of the heavens, the earth, the ſeas, and all the creatures belonging to them*, he calls him the *Preſerver*, or (as the original has it) *the Enlivener of them all.* And as for animals, who are more capable of enjoying, though not moſt of them of diſcerning his bounty, his goodneſs to them is more conſpicuous. For beſides that in ſcripture he is called the *Preſerver both of man and beaſt*, and accordingly is ſaid to *give food even to the young ravens that cry*, and to have, after the *flood*, remembered not only *Noah*, but *every living thing that was with him in the ark*; his goodneſs to them is apparent, by the plentiful and eaſily attainable proviſion he makes according to the exigence of their ſeveral natures, for that innumerable ſwarm of various birds, beaſts, fiſhes, reptiles, and other animals, that people the terreſtrial globe, and the contiguous parts of the world, and by his endowing each of them with all the qualifications requiſite to the perpetuation of their ſpecies, and the preſervation of their lives, as far forth as is conſiſtent with his ends in their creation. But moſt reſplendent does the goodneſs of God appear towards his favourite creature, man, whom having vouchſafed to ennoble with his own image, he makes moſt of the creatures of the world viſible to us, pay homage to him, and in ſome manner or degree do him ſervice; God's liberality at once beſtowing on him all thoſe creatures, by endowing him with a reaſon enabling him to make uſe of them; ſo that even thoſe creatures, which he is not able to ſubdue by power, he is able to make ſerviceable to him by his knowledge: as thoſe vaſt globes of light, which are ſo far above him, that their immenſity and brightneſs can ſcarce render them viſible to him, are by man's mathematicks forced to give him an account of all their motions, and waiting upon his dials keep time for him; and even the defects of ſuch works of nature are by man's ſkill made ſerviceable to him, as the eclipſes of the moon ſerve geographers notably in that difficult and uſeful work of finding longitudes. The ſtars ſerve for candles to give man light, and the celeſtial orbs are his candleſticks. He breathes the air, the fire warms him, and ſerves him not only in his kitchen, but to maſter moſt other bodies in his furnaces. The clouds water his land, the earth ſupports him and his buildings, the ſea and winds convey him and his floating houſes to the remoteſt parts of the world, and enable him to poſſeſs every where almoſt all that nature or art has provided for him any where. The earth produces him an innumerable multitude of beaſts to feed, clothe, and carry him; of flowers and jewels to delight and adorn him; of fruits, to ſuſtain and refreſh him; of ſtones and timber, to lodge him; of ſimples, to cure him; and in ſum, the whole ſublunary world is but his magazine. And it ſeems the grand buſineſs of reſtleſs nature ſo to conſtitute and manage his productions, as to furniſh him with neceſſaries, accommodations, and pleaſures.

Nehem. ix. 6.

Gen. viii. 1.

OF ſuch a number of plants, animals, metals, minerals, *&c.* that people and enrich the terreſtrial globe, perhaps there is not any one, of which man might not make an excellent uſe, had he but an inſight into its nature: nor are the moſt abject and deſpicable therefore the leaſt uſeful. There is not any ſtone, no not the ſparkling diamond it ſelf, to whom man is ſo much beholden, as he is to the dark and unpromiſing load-ſtone; without which the new-world probably had never been detected, and many regions of the old world would have little or no commerce with each other. Nor have the lion, the eagle, and the whale joined all together, (though reputed the chief of birds, beaſts, and fiſhes) been ſo ſerviceable to man, as that deſpicable inſect, the ſilk-worm. And if we impartially conſider the lucriferouſneſs (if I may ſpeak in my Lord of *St. Alban*'s ſtyle) of the properties of things, and their medical virtues, we ſhall find, that we trample upon many things, for which we ſhould have cauſe to kneel, and offer God praiſes, if we knew all their qualities and uſes. But of this ſubject we may elſewhere purpoſely treat.

Of the unknown and new detected properties and virtues of divers concretes.

TO which I muſt only add, *Pyrophilus*, that you will injure nature, if you ſuppoſe, either that all the concretes, endowed with excellent properties, have long ſince been notorious; or that all the medicinal virtues of ſimples, commonly uſed, are already known; or

that all thoſe concretes are deſtitute of conſiderable properties, to whom none have been yet aſcribed by eminent authors. For almoſt every day either diſcloſes new creatures, or makes new diſcoveries of the uſefulneſs of things; almoſt each of which hath yet a kind of *terra incognitâ*, or undetected part in it. How many new concretes, rich in medicinal virtues, does the new world preſent the inquiſitive phyſicians of the old? *Notatu dignum* (ſays the ingenious *Piſo*, in his new publiſhed *Medicina Braſilienſis*, *lib.* 1.) *quod eximiæ tot arbores, frutices, & innumeræ herbæ, figura, foliis, & fructibus à veteris orbis vegetabilibus, paucis exceptis, diſſimillimæ appareant. Inde de avibus, animantibus, & piſcibus deprehenditur, ut & inſectis alatis, atque alis deſtitutis, quæ ineffabili colorum pulchritudine & portentoſa multitudine generantur, partim nota nobis, partim incognita:* 'It is obſervable, that ſo many excellent trees, ſhrubs, and an innumerable company of herbs, ſome few excepted, ſhould all appear ſo unlike the vegetables of the antiently known world, both in figure, leaf, and fruits: and the ſame obſervation is made of birds, beaſts, and fiſhes; and of inſects both flying and creeping, which are monſtrouſly numerous, and of unſpeakable beauty in colour, ſome known to us, and ſome unknown.' And of the known American ſimples, how many latent virtues does experience from time to time diſcover? And (to mention now no others) the febrifugal property of that Peruvian tree, called by the natives *Gannanaperide*, whoſe bark, called commonly *China febris*, has been at *Rome*, and freſhly alſo at *London*, found ſo wonderfully effectual againſt thoſe ſtubborn diſeaſes, quartan agues; and though a learned author endeavours to depreciate it, by alledging, that it is wont rather to ſuſpend the fits, than truly cure the diſeaſe, which after a while will return again; yet, beſides that it may be often very beneficial to a weakened patient to have his fits put off, the phyſician thereby alſo gaining opportunities to imploy ſtrengthening and preventing remedies; beſides this, I ſay, if you will credit that great perſon, Sir *Kenelm Digby*, it is rather the patient's or doctor's fault, than the medicine's, if the diſeaſe return. For having purpoſely conſulted him about this objection againſt the uſe of the *cortex febrifugus*, he ſolemnly aſſured me, that of betwixt twenty and thirty perſons, that he had himſelf cured of quartans by this remedy, not ſo many as two fell into a relapſe.

Of the Peruvian bark, commonly called the Jeſuits powder.

AND now I am upon the more freſhly diſcovered virtues of American drugs, I might acquaint you with the admirable properties, not only in diſeaſes, but even in wounds, of a certain mineral, which (though careful examination of it has not yet taught me, to what ſpecies of ſtones to reduce it) you cannot but have heard mentioned with wonder, under the name of Sir *Walter Raleigh*'s ſtone, which my father, ὁ μαχαίτης, enjoyed, and did ſtrange things with for many years, and by his will bequeathed (as the higheſt legacy he could leave him) to his deareſt friend, the moſt learned and famous Bp. *Uſher*, Primate of *Ireland*. But of this ſtone, the merit of the ſubject makes me reſerve what I have to ſay, to a diſcourſe, wherein I may be allowed to ſay more to it than now I dare: and therefore I ſhall proceed to tell you, that it is not in the ſimples of the new world only, that new medicinal properties may be diſcovered; for even thoſe, which daily obtrude themſelves upon our careleſs eyes, or are trampled under our regardleſs feet, may poſſeſs virtues, to which the major part of botaniſts are mere ſtrangers. To which purpoſe I remember, that I have often gathered a little ſhort-lived and deſpicable plant, (namely *Paronychia folio rutaceo*) with which alone (ſlightly infuſed in beer) I lately knew a young kinſman of Sir *Kenelm Digby*'s, in few days, and without pain, as both himſelf, his mother, and his phyſician aſſured me, cured of that ſtubborn and ſeldom vanquiſhed diſeaſe of the king's evil, againſt which it doth wonders: and yet having conſulted not only ſome of the famouſeſt and recenteſt herbals, both Engliſh and Latin, about this, but alſo enquired of two or three eminent herbariſts, I could find neither any ſuch virtue, nor almoſt any at all, aſcribed by authors to that excellent plant.

Of the uſe of Paronychia fol. rutaceo *in the king's-evil, and of divers other concretes obſervable for their unknown properties.*

AND whereas God's bounty to man in the creatures ſeems a little clouded and ſtreightened by his permitting ſome poiſonous plants and venomous animals to have a being in nature; to that it may be replied, firſt, that many poiſonous bodies contain their own antidotes; inſomuch that the diligent *Piſo*, who hath had great opportunities to examine the effects of both, ventures to ſay, treating of the poiſons and antidotes to be met with in *Braſil*, *Equidem vix dixeris, venena an Alexiteria plura ſint pronata.* And a little lower, *Sic folia, flores, & fructus herbarum Tangaraca & Juquerii, venena Braſiliæ facilè prima, propriam ſuam unaquæque radicem oppoſitum habet antidotum.* And a little after, *Barbari viperarum pinguedinem & capita, tum & integra inſecta, quæ vulnera intulerint, ex arte parata, audaciter & felici cum ſucceſſu venenatis ictibus applicant; adeoque per ipſos effectus comprobare nituntur in omni veneno contineri ſuam antidotum:* 'You can ſcarce determine, whether in theſe countries there are found more poiſons or antidotes: the leaves, flowers, and fruits of the herbs Tangarack and Juquer, the two moſt potent venoms of *Braſil*, each of theſe hath its proper root for an oppoſite antidote. The Barbarians apply the fat and heads of vipers, and the whole bodies of thoſe inſects, prepared according to art, that ſtung or ſtuck any perſon, and that with boldneſs and happy ſucceſs, to the wounds made by them, and ſo by the effects do attempt to prove, that in every venom its own antidote is contained.' And next, that the noxiouſneſs of many (and therefore not improbably of all of them) is not ſo incorrigible, but that by man's art and chymical preparations, they may be made, not only innocent and harmleſs, but uſeful too. This truth, *Pyrophilus*, antimony and quickſilver, and ſome other noxious bodies (which men have learned to make medicinal) have already taught our modern

Of the uſe of divers noxious concretes, and that they contain their own antidotes.

modern phyſicians; who preſcribe, even in their diſpenſatories, divers medicines made out of thoſe churliſh minerals, to which in the enſuing diſcourſes you will find divers others (perhaps not inferiour) added. That opium is reckoned by phyſicians among poiſons, I need not tell you; and yet ſuch powerful remedies may be made with it for many deſperate caſes, eſpecially in hot countries, that the good it may do, ſo much exceeds the harm, that phyſicians would be ſorry there were none of it in the world. The oil of ſcorpions is not only antidotal againſt their ſtings, but is witneſſed by experience, to be very uſeful to bring away the deſcending ſtone of the kidneys, and to remedy divers other miſchiefs, beſides thoſe, that ſcorpions can do. And to theſe I ſhall need but to add one inſtance more, becauſe of the nobleneſs of that ſingle one, and that is the root *Mandihoca*, ſo common all over the *Weſt-Indies*: for nature is ſo far from having been a ſtep-mother to man, in making that plant abound ſo much in thoſe countries, though in its crude ſimplicity (as the Helmontians ſpeak) it be confeſſedly a rank poiſon, that ſhe hath ſcarce in any one plant been ſo bountiful to the Americans. For by a ſlight and eaſy preparation, which we ſhall hereafter mention, it affords many populous nations almoſt all the bread they eat, and ſome of them a good part of their drink; the root freed by a ſtrong preſs from the noxious juice, and dried, affording them that Caſſavy meal, whereof they make their bread; which by the taſte and colour I could not diſcern to be other than good. Nor is this the only uſe this poiſonous plant affords them; for the above-commended *Piſo* gives us this ſhort, but comprehenſive character of it; *Ex Mandihoca radice maximo ſcatente veneno, optimum alimentum non ſolùm, ſed & antidotum concinnatur*, (lib. 3.) 'From the root Mandi-'hoca, that abounds with a very potent poi-'ſon, there is made not only excellent aliment, 'but even antidote too.' But concerning the uſe, that may be made of poiſonous creatures, we elſewhere profeſſedly diſcourſe; and ſhall therefore now proceed to obſerve to you here, that I have not yet mentioned to you the inſtance, which moſt manifeſts the greatneſs of the good, which God intended man in the creatures. For, not content to have provided him all, that was requiſite either to ſupport or accommodate him here, he hath been pleaſed to contrive the world ſo, that (if man be not wanting to himſelf) it may afford him not only neceſſaries and delights, but inſtructions too. For each page in the great volume of nature is full of real hieroglyphicks, where (by an inverted way of expreſſion) things ſtand for words, and their qualities for letters. The Pſalmiſt obſerves, *That the heavens declare the glory of God:* and, indeed, they celebrate his praiſes, though with a ſoundleſs voice, yet with ſo loud a one (and which gives us the moral of *Plato*'s exploded notion of the muſick of the ſpheres) to our intellectual ears, that he ſcruples not to affirm, that *there is no ſpeech nor language, where their voice is not heard*, (or as *Junius* and *Tremellius* render it, without violence to the Hebrew text, *there is no ſpeech nor words, yet without theſe their voice is underſtood) and that their line is gone throughout all the earth:* that is (as the learned *Diodati* expounds it) their writing in groſs and plain draughts, and their words to the end of the world; their language having ſo eſcaped the confuſion of tongues, that theſe natural and immortal preachers give all nations occaſion to ſay of them, as the aſſembly at pentecoſt did of the inſpired Apoſtles, *we do hear them ſpeak in our tongues the wonderful works of God.* Acts ii. 11.

Of that excellent Weſt-Indian root Mandihoca.

How we are by the creatures inſtructed to devotion. Pſal. xix. 1.

NOR can we, without liſtening to theſe ſermons, derive the entire (perhaps not the chiefeſt) benefit deſigned us in the creatures. For ſure that God, who hath compoſed us both of body and ſoul, hath not confined the uſes of ſo many admirable creatures, and ſo much inimitable workmanſhip, to that ignoble part of man, which coupleth him to the beaſts, with the neglect of that diviner portion, which allies him to the angels; vouchſafing to the lord of the creatures, in the fruition of this his palace, no higher prerogative, than he is pleaſed to allow to the brutes, that ſerve but to complete the variety requiſite for its embelliſhment. Of this opinion I lately found that excellent writer, St. *Auſtin*, to have been before me: For, *Non debes uti oculis* (ſays he) *ut pecus, tantum ut videas, quæ addas ventri, non menti: utere, ut homo, intende cœlum, & intende facta, & quære factorem; aſpice quæ vides, & quære quem non vides, crede in eum quem non vides, propter iſta quæ vides. Nolite fieri ſicut equus & mulus, &c.*

'You ought not to uſe your eyes as a brute,
'only to take notice of proviſions for your bel-
'ly, and not for your mind: uſe them as a
'man; pry up into heaven; ſee the things made,
'and enquire the Maker; look upon thoſe
'things you can ſee, and ſeek after him, whom
'you cannot ſee, and believe on him you can-
'not ſee, becauſe of thoſe things you ſee: and
'be not like the horſe and mule, *&c.*'

NOR can the creatures only inform man of God's being and attributes (as we have already ſeen) but alſo inſtruct him in his own duties; for we may ſay of the world, as St. *Auſtin* did of the ſacraments, that it is *verbum viſibile*. And certainly, God hath never ſo confined himſelf to inſtruct men by words or types, as not to reſerve himſelf the liberty of doing it by things: witneſs his appointing the rainbow to preach his goodneſs to all nations, and fortify the faith of mankind againſt the fear of a ſecond deluge. It is ſomething too high a ſaying for an heathen, that of *Plato*, where he teaches, *That the world is God's epiſtle, written to mankind.* For by *Solomon* God ſends the *ſluggard to ſchool to the ant*, to learn a provident induſtry. Chriſt commands his diſciples to *learn of ſerpents and pigeons* prudence and inoffenſiveneſs. The ſame divine teacher enjoins his apoſtles to *conſider the lillies*, or (as ſome would have it) the *tulips of the field*, and to learn thence that difficult virtue of a diſtruſtleſs reliance upon God. And St. *Paul* ſeems almoſt angry with the Corinthians, that their faith, in ſo abſtruſe myſteries as that of the reſurrection, was not informed and ſtrengthened, by conſidering

D. Aug. Hom. 3.

1 Cor. xv. 36, 37.

ſidering the meliorating death of corn committed to the earth. And the royal poet learns humility, by the contemplation of the moſt elevated parts of nature; *When I conſider* (ſays he) *the heavens, the work of thy fingers, the moon and ſtars, which thou haſt ordained, what is man, that thou viſiteſt him?* Thus you may ſee, that God intended the world ſhould ſerve man, not only for a palace to live in, and to gaze on, but for a ſchool of virtue, to which his philanthropy reſerves ſuch ineſtimable rewards, that the creatures can on no account be ſo beneficial to man, as by promoting his piety; by a competent degree of which, God's goodneſs hath made no leſs than eternal felicity attainable.

Pſal. viii. 3, 4

ESSAY III.

Containing a Continuation of the former.

That their opinion, who would deter men from the ſcrutiny of nature, tends to defeat God of much of that glory man ſhould aſcribe unto him.

HAVING thus, *Pyrophilus*, endeavoured to evince, that the opinion, that would deter men from the ſcrutiny of nature, is not a little prejudicial to man's intereſts, and does very much leſſen the advantages he may derive from the creatures, both in relation to his accommodation in this life, and his felicity in the next; let us proceed to conſider, whether the doctrine we oppoſe do not likewiſe tend, in its own nature, (though not in the intentions of its patrons) to defeat God of much of that glory, which man both ought and might aſcribe to him, both for himſelf and the reſt of the creatures. How unlikely it is, that we ſhould be able to offer to God that glory, praiſe, and admiration, he both expects and merits from ſuch a contemplation of the creatures, as, though it be requiſite to the true knowledge of their nature and properties, is yet ſuppoſed either pernicious, or at leaſt dangerous; you, *Pyrophilus*, or any other impartial perſon may eaſily determine.

FOR the works of God are not like the tricks of jugglers, or the pageants, that entertain princes, where concealment is requiſite to wonder; but the knowledge of the works of God proportions our admiration of them, they participating and diſcloſing ſo much of the inexhauſted perfections of their author, that the further we contemplate them, the more foot-ſteps and impreſſions we diſcover of the perfections of their Creator; and our utmoſt ſcience can but give us a juſter veneration of his omniſcience. And as when ſome country fellow looks upon a curious watch, though he may be hugely taken with the rich enamel of the caſe, and perhaps with ſome pretty landſkip that adorns the dial-plate; yet will not his ignorance permit him ſo advantageous a notion of the exquiſite maker's ſkill, as that little engine will form in ſome curious artiſt, who beſides that obvious workmanſhip, that firſt entertains the eye, conſiders the exactneſs, and knows the uſe of every wheel, takes notice of their proportion, contrivance, and adaptation all together, and of the hidden ſprings, that move them all: ſo in the world, though every peruſer may read the exiſtence of a Deity, and be in his degree affected with what he ſees, yet he is utterly unable to deſcry there thoſe ſubtler characters and flouriſhes of omniſcience, which true philoſophers are ſharp-ſighted enough to diſcern. The exiſtence of God is indeed ſo legibly written on the creatures, that (as the Scripture ſpeaks in another ſenſe) *He may run, that reads it*; that is, even a perfunctory beholder, that makes it not his buſineſs, may perceive it: but that this God hath manifeſted in theſe creatures a power, a wiſdom, and a goodneſs worthy of himſelf, needs an attentive and diligent ſurveyor to diſcover. How different notions of God's wiſdom do the eggs of hens produce in the ordinary eaters of them, and in curious naturaliſts, who carefully watch, and diligently obſerve, from time to time, the admirable progreſs of nature in the formation of a chick, from the firſt change appearing in the *cicatricula* (or little whitiſh ſpeck diſcernible in the coat of the egg's yolk) to the breaking of the egg-ſhell by the perfectly hatched bird; and on nature's exquiſite method in the order and faſhioning of the parts, make ſuch philoſophical reflections, as you may meet with (not to mention what *Ariſtotle* and *Fabricius ab Aquapendente* have obſerved on that ſubject) in the ingenious treatiſe of generation, which our accurate and juſtly famous anatomiſt, Dr. *Highmore*, has been pleaſed to dedicate to me; and in the excellent Exercitations *De Ovo* of that great promoter of anatomical knowledge, Dr. *Harvey*. And whereas it may be alledged, that the attributes of God, which are not taught us, but after much ſpeculation of the world, are things, of which no man but an atheiſt doubts; to this it may be replied, that beſides that it ill becomes the ſenſe we ought to have of our weakneſs to deſpiſe any helps vouchſafed us of God to aſſiſt us to know or ſerve him; beſides this, I ſay, God loving, as he deſerves, to be honoured in all our faculties, and conſequently to be glorified and acknowledged by the acts of reaſon, as well as by thoſe of faith, there muſt be ſure found a great diſparity betwixt that general, confuſed, and lazy idea we commonly have of his power and wiſdom, and the diſtinct, rational, and affecting notions of thoſe attributes, which are formed by an attentive inſpection of thoſe creatures, in which they are moſt legible, and which were made chiefly for that very end. The queen of *Sheba* had heard in her own country a very advantageous fame of the wiſdom of *Solomon*; but when the curioſity of a perſonal viſit made her an eye-witneſs of thoſe particular both exquiſite ſtructures,

Hab. ii. 2.

and almoſt divinely prudent conducts and contrivances, wherein that wiſdom did inimitably diſplay it ſelf, ſhe then brake forth into pathetick and venerating exclamations, that acknowledged how much juſter and improved a character (of his wiſdom) her eyes had now given her, than formerly her ears had done.

VERY like a philoſopher, methinks, does the great *Mercurius Triſmegiſtus* (if we grant him to be the author of the books aſcribed to him) ſpeak, when he tells his ſon, 'There 'can be no religion more true or juſt, than to 'know the things that are, and to acknowledge thanks for all things to him, that made 'them; which things I ſhall not ceaſe to do.' He continues 'Be pious and religious, O my 'ſon! for he, that does ſo, is the beſt and 'higheſt philoſopher; and without philoſophy, 'it is impoſſible ever to attain to the height 'and exactneſs of piety and religion.' And it was perhaps, *Pyrophilus*, to engage us to an induſtrious indagation of the creatures, that God made man ſo indigent, and furniſhed him with ſuch a multiplicity of deſires; ſo that whereas other creatures are content with thoſe few obvious and eaſily attainable neceſſaries, that nature has almoſt every where provided for them; in man alone, every ſenſe has ſtore of greedy appetites, for the moſt part of ſuperfluities and dainties, that to relieve his numerous wants, or ſatisfy his more numerous deſires, he might be obliged with an inquiſitive induſtry to range, anatomize, and ranſack nature, and by that concerned ſurvey come to a more exquiſite admiration of the omniſcient Author. To illuſtrate this ſubject yet a little further, *Pyrophilus*, give me leave to obſerve to you, that philoſophers of almoſt all religions have been, by the contemplation of the world, moved to conſider it under the notion of a temple: *Ne adoremus* (ſays *Plutarch*) *elementa, cœlum, ſolem, lunam, &c. ſpecula ſunt hæc, in quibus artem illius ſingularem intueamur, qui mundum condidit, & adornavit; nec eſt alius mundus quàm templum ejus:* 'Let us not venerate the ele-'ments, the heaven, the ſun, the moon, &c. 'theſe are but mirrors, wherein we may be-'hold his excellent art, who framed and adorned the world; nor is the world any thing elſe 'but his temple.' *Homines* (ſays *Cicero*) *tuentur illum globum, quem in templo hoc medium vides, qui terra dicitur:* 'Men abide upon that 'globe, which you ſee in the middle of this 'temple, and is called the earth:' which *Macrobius* handſomely thus expounds; *Quicquid humano aſpectui ſubjicitur, templum ejus vocavit, qui ſola mente concipitur, ut qui hæc veneratur ut templa, cultum tamen maximum debeat Conditori, ſciatque quiſquis in uſum templi hujus inducitur, ritu ſibi vivendum ſacerdotis:* 'All that 'human view reaches, he terms his temple, 'who is apprehended by the mind alone; to 'the end, that whoſo reverences theſe things 'as temples, might render the greateſt wor-'ſhip to the Maker: and every one, that is 'brought to converſe in this temple, might 'know himſelf obliged to live like a prieſt.'

Merc. Triſm. l. 1. Engliſhed by Dr. Everard.

That philoſophers of all religions have conſidered the world under the notion of God's temple.

AND the lofty *Seneca* (to mention now no other Heathens) in divers paſſages of his excellent writings, ſtyles the world a temple; and I remember, in his treatiſe *De Beneficiis*, he avers in terms not unworthy his mind or his ſubject, *Totum mundum deorum eſſe immortalium templum, ſolum quidem amplitudine illorum ac magnificentia dignum:* 'That the whole world is 'the temple of the immortal gods, being 'alone worthy of their grandeur and magni-'ficence.' The aſſent of the Jewiſh philoſophers to this notion you may be pleaſed to receive from their eloquent *Philo*, who not only gives the world the name of temple, but gives us this account of that appellation; *Templum Dei ſupremum & verè tale exiſtimare totum hunc mundum, qui ſacrarium quidem habet, puriſſimam rerum naturæ partem, cœlum; ornamenta, ſtellas; ſacerdotes, adminiſtros potentiæ ejus, angelos, & incorporeas animas:* 'The whole 'world is to be accounted the chiefeſt temple 'of God; the *Sanctum Sanctorum* of it is of the 'pureſt part of the univerſe, heaven; the 'ornaments, the ſtars; the prieſts, the mini-'ſters of his power, angels, and immaterial 'ſouls.' And as for Chriſtian philoſophers, I ſuppoſe it would be needleſs to enumerate the paſſages, wherein they adapt the notion of the world already mentioned; and therefore I ſhall content my ſelf to add, that the ſcripture it ſelf ſeems to authoriſe it by repreſenting to us, in the eighth or ninth chapters of the epiſtle to the Hebrews, the Moſaical tabernacle, as an adumbration of that great temple of the world; and particularly there is a ſignal text in the latter of thoſe chapters, where it is ſaid, that Chriſt is not entered into holy places made with hands [χειροποίητα ἅγια] which are copies of the true, [ἀντίτυπα τῶν ἀληθινῶν] but into heaven it ſelf, now to appear in the preſence of God for us.

Templum Dei ſupremum & verè tale exiſtimare totum hunc mundum, qui ſacrarium quidem habet, puriſſimam rerum naturæ partem, cœlum; ornamenta, ſtellas; ſacerdotes, adminiſtros potentiæ ejus, angelos, & incorporeas animas: Philo Jud. de Monarchia.

Heb. viii. 2, 5.

Heb. ix. 24.

UPON what account, *Pyrophilus*, I eſteem the world a temple, I may elſewhere have occaſion to declare; but this for the preſent: it will not be raſh to infer, that if the world be a temple, man ſure muſt be the prieſt, ordained (by being qualified) to celebrate divine ſervice not only in it, but for it. For as in ſchools, when the prince or ſome munificent benefactor confers ſome large poſſeſſion or rich annuity upon the foundation, though all the boys be concerned in the benefit, yet becauſe moſt of them are too young to be ſenſible of it, or too unlearned to be able to make the retribution of a handſome acknowledgment, either the maſter, or that other perſon of ſociety, who is moſt capable and the beſt ſpokeſman, is by a kind of natural right engaged to the duty of returning praiſe and thanks, not for himſelf alone, but in the name of all the reſt; ſo in the world, where there are ſo many inanimate and irrational creatures, that neither underſtand, how much they owe to their Creator, by owing him even themſelves, nor are born to a condition enabling them to acknowledge it; man, as born the prieſt of nature, and as the moſt obliged and moſt capable member of it, is bound to return thanks and praiſes to his Maker, not only for himſelf, but for the whole creation. In which ſenſe we may reconcile thoſe two current aſſertions, *That God made all things for his own glory,*

That in this temple man muſt be the prieſt.

glory, and that God made all things for man, and man for himſelf. Since whether or no man be a microcoſm or little world in *Paracelſus*'s ſenſe, if not as a reſembler, yet as a repreſenter of the macrocoſm or great world, he preſents with his own adorations the homages of all the creatures to their Creator, though they be ignorant of what is done, as infants under the law were of the ſacrifices offered on their account. And in this relation may the creatures anſwer the ſolemn invitation made them in the whole 148th Pſalm, and numerous other ſcriptures; which they may do (to borrow a barbarous, but ſignificant ſchool-term) objectively, though not formally; I mean, by proving occaſions, though not ſingers, of his praiſes; being ſuch objects, as prompt and invite man to pay God that praiſe upon their ſcore, which they cannot actually pay him themſelves; even God's muteſt works being capable of being ſaid to praiſe him in the ſame ſenſe (though in an incomparably tranſcendenter degree) that *Solomon* ſays of his virtuous woman (in the laſt verſe of the Proverbs) *Let her own works praiſe her in the gates*; that is, give the conſiderers of them occaſion to extol her: and thus by man's referring the knowledge of the creature to the Creator's glory, it becomes in ſome ſenſe, and congruouſly to its own nature, the praiſer of its maker, as may ſeem intimated in this oeconomy of the laſt part of one of the Pſalms, *Bleſs the Lord, all ye his hoſts, the miniſters of his, that do his pleaſure. Bleſs the Lord, all his works, in all places of his dominion: bleſs the Lord, O my ſoul.* Where, by ſhutting up the reſt of God's creatures betwixt angels and man's ſoul, he ſeems to inſinuate, that the irrational creatures bleſs the Lord by the mouth of thoſe, that are intelligent.

Prov. xxxi. 13.

Pſal. ciii.

The contemplation of God's mercy ought not ſo to ingroſs our thoughts, as to make us neglect the glory of his power and wiſdom.

AND truly, *Pyrophilus*, I fear it may reliſh a little of ſelfiſhneſs, to make ſuch a diſparity betwixt perfections, all of them equal, becauſe all of them infinite, as to let God's mercy, becauſe it moſt advantages us, ſo to ingroſs our thoughts and wonder, as to make us neglect the contemplation of thoſe other glorious attributes, his power and his wiſdom, which were thoſe, that exacted both man and angels adoration, before ſin gave occaſion to the exerciſe of the firſt. And I ſhall not ſcruple to confeſs unto you, that I dare not confine the acts of devotion to thoſe, which moſt men ſuppoſe to comprize the whole exerciſe of it: not that I at all undervalue, or would depreciate any, even the meaneſt practices of devotion, which either Scripture, or reaſon conſonant to it, recommends; but that I eſteem, that God may be alſo acceptably (and perhaps more nobly) ſerved and glorified by our entertaining of high, rational, and, as much as our nature is capable of, worthy notions, attended with a profound and proportionable admiration of thoſe divine attributes and prerogatives, for whoſe manifeſting he was pleaſed to conſtruct this vaſt fabrick.

To which purpoſe I conſider, that in the life to come, when we ſhall queſtionleſs glorify God exactlieſt, we ſhall have little either need or uſe of faith, prayer, liberality, patience, and reſembling graces; but our worſhip will chiefly conſiſt in elevated notions, and a proſtrate veneration of God's omnipotence, wiſdom, goodneſs, and other perfections; and ſuch a one as this is repreſented in the *Apocalypſe*, to be the preſent imployment of the bleſſed ſpirits in heaven, where the elders, that aſſiſt about the throne of God, are deſcribed caſting their crowns before it, and ſaying to him, that ſits on it, *Thou art worthy, O Lord, to receive glory, and honour, and power: for thou haſt created all things, and for thy pleaſure they are and were created.* Rev iv. 11.

BY this time, *Pyrophilus*, I hope you begin to think, that the doctrine, that tends to deter men from inquiring into nature, is as well derogatory from God's glory, as prejudicial to man's intereſts. And indeed, I purpoſed to content myſelf with the having diſperſed, throughout the paſt diſcourſe the grounds of anſwering their objection againſt the ſtudy of phyſiology, who pretend it is apt to make men atheiſts: but becauſe I am much concerned to have you ſatisfied of ſo important a truth, as that, which we have hitherto been labouring to evince, I muſt beg your leave, *Pyrophilus*, to add *ex abundanti* (as they ſpeak) to what has been already alledged, ſome things, that may more directly anſwer the objection of our adverſaries, and manifeſt, how little their ſeverity is befriended, either by Scripture, reaſon, or experience.

AND firſt, it ſeems not at all probable, that if the omniſcient Author of nature knew, that the ſtudy of his works did really tend to make men diſbelieve his being or attributes, he would have given men ſo many invitations, and almoſt neceſſities, to ſtudy and contemplate the nature of his creatures. Of theſe invitations divers have been mentioned already, and more might be added to them, if we thought it requiſite. But what has been above alledged, will make us forbear the annexing of any, ſave that of the ancient inſtitution of the ſabbath, which many eminent divines do not groundleſly hold to have been ordained to commemorate the creation, and give men the opportunity every ſeventh day to contemplate God in his works, as he himſelf was pleaſed to reſt on the firſt ſeventh day, and contemplate himſelf in the works of the firſt ſix. And though our weſtern churches, for certain reaſons (not here to be inquired into) have long ſince diſuſed the ſolemnizing of the Saturday, and appointed the Sunday for the celebration of both the works of the redemption, and creation of the world together; yet it is evident enough, that the primitive Chriſtians did for the moſt part keep the Saturday as holy-day, as well as the Sunday: for that ancient book (whoever be reſolved to have written it) which goes under the name of *Clement's Conſtitutions*, affords us, among others, theſe two memorable paſſages to our purpoſe: and firſt, Τὸ Σάββατον μέντοι (ſays he) ἡμῖν τὴν κυριακὴν ἑορτάζετε, ὅτι τὸ μὲν δημιουργίας ἐστὶν ὑπόμνημα, ἥδε ἀναστάσεως. *Keep the ſabbath and the Lord's day as holy days; that being dedicated to the remembrance of the creation, and this to that of the redemption.* To which we ſhall add this ſecond paſſage of the ſame author,

Proved further from the ancient inſtitution of the Sabbath.

Lib. vii. c. 24.

Ἐργα-

Ἐργαζέσθωσαν οἱ ἕξ λοι, &c. *Let ſervants work for five days; but on the ſabbath, and the Lord's day, let them attend in the church the doctrine of godlineſs.* To which purpoſe, I remember the moſt learned *Grotius* obſerves, that the converted emperor *Conſtantine* forbad the compelling Chriſtians to appear before tribunals on either of thoſe days, as being their feſtivals: Nay, and if modern travellers do not miſ-inform me, I find, that divers of the eaſtern churches, particularly the * Abyſſine Chriſtians, to this day, do as well ſanctify the ſabbath-day in commemoration of God's having created the world, as the Lord's-day to commemorate the reſurrection of Chriſt. And as for the Jews ſenſe of the fourth commandment, ſome of the learneſt of their criticks are pleaſed to diſtinguiſh betwixt the words *zachôr* and *ſmôr*, *remember*, and *keep*, imployed in the command of ſolemnizing the ſabbath; for, the remembering of it they hold to be an act of religion, performable by all mankind, that are capable of it, and acquainted with its having been commanded; though the keeping of it holy they ſuppoſe only enjoined to the Iſraelites. On which occaſion I remember I was one ſabbath-day entertained at his own lodgings, by a learned Jew (who taught me the holy language) with meat then newly dreſſed; to remove my wonder at which, he told me, 'That it was dreſſed by 'Chriſtians, who, being Gentiles, were not 'obliged to the ſtrict and legal obſervation 'of the ſabbath.' But whatever be thought of this Jewiſh notion, yet queſtionleſs, if the fourth commandment do not, at leaſt, divers other paſſages of ſcriptures do much diſcountenance their ſeverity, who would fright men from the indagation of nature. And he, that ſhall duly conſider divers texts obvious enough in the book of *Job*, and the *Pſalms* (beſides other parts of the bible) will not readily conclude, that natural philoſophy and divinity are at ſuch variance, as the divines we deal with would perſuade us. St. *Paul* Rom. i. 20. ſeems to inform us, that the inviſible things, of God, from the creation of the world, are clearly ſeen, being underſtood by the things, that are made, even *his eternal power and Godhead:* ſo that they, that were mentioned before, are without excuſe. And though I ignore not, that not only ſeveral of the Socinians following their maſter *Socinus*, but ſome few orthodox writers, are pleaſed to give a very differing interpretation of that text, and make the ἀόρατα ἀυτῦ ἀπο κτίσεως κόσμυ, to ſignify thoſe things of God, that have been inviſible ever ſince the creation of the world, and referring the ποιήματα *to things not made*, as we tranſlate it, *but done* (as the miracles of Chriſt and his Apoſtles) yet I ſee no neceſſity, why the ποιήματα ſhould be taken in a ſenſe excluſive of the creation, and not at leaſt admitted to take in all the ways and methods imployed by God, to manifeſt the *inviſible things* there intimated unto man. And certainly, however St. *Paul* may be ſuppoſed to appear but darkly, yet *Job* was clearly of a differing opinion from theirs, who teach, *That the ſtudy of nature leads to atheiſm:* Job xii. 7, *for aſk now the beaſts* (ſays he) *and they will* 8. 9. *teach thee; and the fowls of the air, and they ſhall tell thee; or ſpeak to the earth, and it ſhall teach thee; and the fiſhes of the ſea ſhall declare unto thee. Who knoweth not in all theſe, that the hand of the Lord hath wrought this?* And conſonantly hereunto (which it were not amiſs for our adverſaries to take notice of) we may obſerve; That almoſt all the writers of natural theology, and the moſt alſo of thoſe, that have laboured to demonſtrate the truth of Chriſtian religion (divers of whom have been as well profound divines, as otherwiſe eminent ſcholars) have undertaken to evince, by the conſideration of the univerſe, both that there is a God, and that he is the author of it. Which I the rather mention, *Pyrophilus*, becauſe I would not be miſtaken, as if I diſputed againſt divines in general, or were guilty of the leaſt irreverence towards a faculty, in whoſe ſtudy I have thought my ſelf obliged, as a Chriſtian, to ſpend much of my time; and eſpecially, I would not appear diſreſpectful to divines in *England*, where they have already been but too much vilified, though queſtionleſs for their ſins againſt God, yet, I fear, not without the ſin of their oppreſſors.

That Phyſiologers cannot explicate by ſecond cauſes all the phænomena of nature, ſo as to exclude the firſt.

In the next place I conſider, that ſince phyſiology is ſaid to tempt to atheiſm, but by enabling men to give an account of the phænomena of nature, by the knowledge of ſecond cauſes, without taking in the firſt, it will not be ſo eaſy a matter, as many preſume, for the contemplation of nature, to turn a conſidering man atheiſt. For we are yet, for aught I can find, far enough from being able to explicate all the phænomena of nature by any principles whatſoever. And even of the atomical philoſophers, whoſe ſect ſeems to have the moſt ingeniouſly attempted it, ſome of the eminenteſt have themſelves freely acknowledged to me, their being unable to do it convincingly to others, or ſo much as ſatisfactorily to themſelves. And indeed, not only the generation of animals is a myſtery, which all, that naturaliſts have ſaid to explain it, have been far enough from depriving of that name; but we ſee, that to explicate all the various phænomena, that belong to that ſingle inanimate, and ſeemingly homogeneous body, mercury, ſo as not to make any hypotheſis aſſumed, to make out one of its properties or effects, incongruous to any other hypotheſis requiſite to the explanation of any of the reſt, hath been hitherto found ſo difficult, that if our poſterity be not much happier unriddlers, than our fore-fathers or we have been, it is like to prove a taſk capable of defeating the induſtry and attempts, I ſay not of more than one philoſopher, but of more than one age; even our chymical tortures hitherto having, from that deluding *Proteus*, forced no confeſſions, that bring us not more wonder than ſatisfaction, and do not beget almoſt as many ſcruples, as they reſolve.

* See of the Abyſſine or Æthiopian Chriſtians, and likewiſe of the Maronites in the Eaſt, in reference to their celebration of the Saturday, *Alex. Roſſe*, in his *View of all Religions*, and the Authors by him cited.

ESSAY

ESSAY IV.

Containing a requiſite Digreſſion concerning thoſe, that would exclude the Deity from intermeddling with Matter.

That ſome of the Peripatetick ſect are guilty of this endeavour.

I IGNORE not, that not only *Leucippus*, *Epicurus*, and other Atomiſts of old, but of late ſome perſons, for the moſt part adorers of *Ariſtotle*'s writings, have pretended to be able to explicate the firſt *beginning of things* and the world's phænomena, without taking in, or acknowledging any divine author of it. And therefore, though we may elſewhere, by the aſſiſtance of that author, have an opportunity to give you an account of our unſatisfiedneſs with the attempts made by ſome bold wits in favour of ſuch pretenſions; yet ſince the main truth we plead for in this diſcourſe, is ſo nearly concerned in what hath been taught by thoſe, that would keep God from being thought to have any ſhare in the production of the univerſe, I can ſcarce forbear (as unwilling as I am to digreſs) to repreſent to you, on the preſent occaſion, a few conſiderations, which may aſſiſt you, if not to leſſen the arrogance of ſuch perſons, at leaſt, to keep your ſelf from thinking their evidence as great, as their confidence is wont to be. Now of the philoſophers we ſpeak of, ſome being Atomiſts, and others not, it will be requiſite to ſay ſomething to each of the two ſorts: and becauſe we not long ſince, in an illuſtrious company, where you, *Pyrophilus*, are not unknown, met with one of them, who avowedly grounded his opinions on the Ariſtotelian or vulgar phyſiology, we ſhall firſt recommend to you two or three conſiderations concerning ſuch arrogant Peripateticks, (for I ſpeak not of that ſect in general, of which I know there are divers excellent men.)

That their hypotheſis is very full of miſtakes.

FIRST then, you will in many paſſages of the following eſſays, find, that divers things, that have been very magiſterially taught, and confidently believed among the followers of *Ariſtotle*, are errors or miſtakes; and that as ſeveral, even of the obvious phænomena of nature, do contradict the common Peripatetick doctrine, ſo divers, at leaſt of thoſe, that are more abſtruſe, are not explicable by it: and as confidently as theſe his followers talk of the expounding the very riddles of nature; yet I remember, that he himſelf ſomewhere (for I cannot call to mind the place) did not ſcruple to confeſs, that *As the eyes of owls are to the ſplendor of the day, ſo are thoſe of our minds even to things obvious and manifeſt.*

That theſe excluders of the Deity make but imperfect explications of the phænomena of nature.

I SHALL next take notice, that philoſophers, who ſcorn to aſcribe any thing to God, do often deceive themſelves, in thinking they have ſufficiently ſatisfied our inquiries, when they have given us the neareſt and moſt immediate cauſes of ſome things; whereas oftentimes the aſſignment of thoſe cauſes is but the manifeſting, that ſuch and ſuch effects may be deduced from the more catholick affections of things, though theſe be not unfrequently as abſtruſe, as the phænomena explicated by them, as having only their effects more obvious, not their nature better underſtood: as when, for inſtance, an account is demanded of that ſtrange ſuppoſed ſympathy betwixt quickſilver and gold; in that we find, that whereas all other bodies ſwim upon quickſilver, it will readily ſwallow up gold, and hide it in its boſom. This pretended ſympathy the naturaliſt may explicate, by ſaying, that gold being the only body heavier than quickſilver of the ſame bulk, the known laws of the Hydroſtaticks make it neceſſary, that gold ſhould ſink in it, and all lighter bodies ſwim on it. But though the cauſe of this effect be thus plauſibly aſſigned, by deducing it from ſo known and obvious an affection of bodies, as gravity, which every man is apt to think he ſufficiently underſtands; yet will not this put a ſatisfactory period to a ſevere inquirer's curioſity, who will, perchance, be apt to alledge, that though the effects of gravity indeed be very obvious, yet the cauſe and nature of it are as obſcure, as thoſe of almoſt any phænomenon it can be brought to explicate. And that therefore he, that deſires no further account, deſiſts too ſoon from his inquiries, and acquieſces long before he comes to his journey's end *. And indeed, the inveſtigation of the true nature and adequate cauſe of gravity, is a taſk of that difficulty, that in ſpite of aught I have hitherto ſeen or read, I muſt yet retain great doubts, whether they have been clearly and ſolidly made out by any man. And ſure, *Pyrophilus*, there are divers effects in nature, of which though the immediate cauſe may be plauſibly aſſigned, yet if we further inquire into the cauſes of thoſe cauſes, and deſiſt not from aſcending in the ſcale of cauſes, till we are arrived at the top of it, we ſhall perhaps find the more catholick and primary cauſes of things to be either certain, primitive, general, and fixt laws of nature (or rules of action and paſſion among the parcels of the univerſal matter,) or elſe the ſhape, ſize, motion, and other primary affections of the ſmalleſt parts of matter, and of their firſt coalitions or cluſters †; eſpecially thoſe endowed with ſeminal faculties or properties, or (to diſpatch) the admirable conſpiring of the ſeveral parts of the univerſe to the production of particular effects; of all which

And do not explain the ſcale of cauſes unto the laſt cauſe.

* Phyſiologo qui veritatem contemplatur ultimarum cauſarum cognitio non finis eſt, ſed initium ad primas ſupremaſque cauſas proficiſcendi. *Plutarch. l.* de primo Frigido.

† Τὸ πρῶτον αἴτιον ἐν τῇ ἐυρήσει ἔχατον. Ariſtot. Ethic. Nicom. Lib. III. cap. 8.

which it will be difficult to give a ſatisfactory account, without acknowledging an intelligent author or diſpoſer of things.

AND the better to clear ſo weighty a truth, let us further conſider on this occaſion, that not only *Ariſtotle*, and thoſe that, miſ-led by his authority, maintain the eternity of the world, but very many other philoſophers and phyſicians, who aſcribe ſo much to nature, that they will not be reduced to acknowledge an author of it, are wont very much to delude both themſelves and others in the account they preſumie to give us, as ſatisfactory, of the cauſes or reaſons of very many effects. I will not inſtance in the magnetick properties of things, nor any of thoſe numerous abſtruſities of nature, which it is well-known that the Ariſtotelians are wont to refer to ſympathy, antipathy, or occult qualities, and ſtrive to put men off with empty names, whereby they do not ſo much leſſen our ignorance, as betray their own.

Inſtances of things, wherein their account is not ſatisfactory; as 1. *In the particulars, the cauſes of which, they aſſign occult qualities.*

BUT I ſhall inſtance in thoſe more obvious phænomena, of which they ſuppoſe they have given us very ſatisfactory accounts. If you aſk one of thoſe I ſpeak of, whence it comes to paſs, that if a man put one end of a long reed into a veſſel full of water, and ſuck at the other end, his mouth will be immediately filled with that liquor; he will readily tell you, that the ſuction drawing the air out of the cavity of the reed, the water muſt neceſſarily ſucceed in the place deſerted by the air, to prevent a vacuity abhorred by nature. If you likewiſe aſk ſuch a man, why too women, about a certain age, their *purgationes menſtruæ* do commonly ſupervene; he will think he has ſufficiently anſwered you, when he has told you, that about that age, beginning to be ripe for procreation, nature has wiſely provided, that their ſuperfluous blood ſhould be ſent to the uterine veſſels, partly to diſburden the maſs of blood of an uſeleſs load, and partly to contribute matter, or at leaſt afford nouriſhment in caſe of conception. But though theſe ſolutions are wont to be acquieſced in by ſuch as thoſe that give them, yet I ſee not how they can ſatisfy a rigid reaſoner. For not now to mention, what may be objected againſt them out of ſome modern mechanical and anatomical obſervations, let us a little conſider, that to ſay, that the aſcent of the water in the firſt problem proceeds from nature's deteſtation of a vacuity, ſuppoſes that there is a kind of *anima mundi*, furniſhed with various paſſions, which watchfully provides for the ſafety of the univerſe; or that a brute and inanimate creature, as water, not only has a power to move its heavy body upwards, contrary (to ſpeak in their language) to the tendency of its particular nature, but knows both that air has been ſucked out of the reed, and that unleſs it ſucceed the attracted air, there will follow a vacuum; and that this water is withall ſo generous, as by aſcending, to act contrary to its particular inclination for the general good of the univerſe, like a noble patriot, that ſacrifices his private intereſts to the publick ones of his country.

2. When they aſſign nature's abhorrency of vacuity to be the cauſe, that water doth aſcend in ſuction.

BUT to ſhew men by an eaſy experiment, how little attraction is performed to avoid a vacuum, I have ſometimes done thus. I have taken a ſlender pipe of glaſs, of about four foot long, and putting one of the open ends of it into a veſſel full of quickſilver, I have ſucked as ſtrongly as I could at the other, and cauſed one to watch the aſcent of the quickſilver, and mark where it was at the higheſt, and I found not, that at one ſuck I could raiſe it up much above a foot; and having cauſed a couple of ſtrong men, one after another, to ſuck at the ſame end of the ſame pipe, I found not, that either of them could draw it up much higher. Nor did it appear, that by repeated ſuctions, though the upper end of the pipe were each time ſtopt, to hinder the relapſe of the quickſilver, it could at all be raiſed above the ſeven and twenty digits, at which it uſed to ſubſiſt in the Torricellian experiment *de vacuo*. Whereas the ſame end of the tube being put into a ſmall veſſel of water, I could at one ſuck make the water ſwiftly aſcend through the perpendicularly held tube into my mouth; which argues, that the aſcenſion of liquors upon ſuction rather depends upon the preſſure of the air (againſt the liquors and the ſucker's cheſt) and their reſpective meaſures of gravity and lightneſs compared to that preſſure, than it proceeds from ſuch an abhorrency of a vacuum as is preſumed.

Whereas the contrary is proved in the ſuction of the quickſilver.

AND ſo likewiſe in the other queſtion propoſed, it is implied, that there is in a female body ſomething, that knows the rule of phyſicians, that of a plethora, the cure is the convenient evacuation of blood; and that this intelligent faculty is wiſe enough alſo to propoſe to it ſelf the double end above mentioned, in this evacuation, and therefore will not provide a quantity blood great enough to require an excretion, nor begin it till the female be come to an age, wherein it is poſſible for both the ends to be obtained: and that alſo this preſiding nature is ſo charitable, as, that mankind might not fail, it will make the female ſubject to ſuch monthly ſuperfluities of blood, from which experience informs us, that a whole ſet of diſeaſes, peculiar to that ſex, does frequently proceed. And in a word, there is a multitude of problems, eſpecially ſuch as belong to the uſe of the parts of human body, and to the cauſes and cures of the diſeaſes incident thereunto, in whoſe explication thoſe, we write of, content themſelves to tell us, that nature does ſuch and ſuch a thing, becauſe it was fit for her ſo to do; but they endeavour not to make intelligible to us what they mean by this nature, and how meer, and conſequently brute, bodies can act according to laws, and for determinate ends, without any knowledge either of the one or of the other. Let them therefore, till they have made out their hypotheſis more intelligibly, either ceaſe to aſcribe to irrational creatures ſuch actions, as in men are apparently the productions of reaſon and choice, and ſometimes even of induſtry and virtue; or elſe let them with us acknowledge, that ſuch actions of creatures in themſelves irrational are performed under the ſuperintendence and guidance

3. When they aſſign the cauſes of the purgationes menſtruæ.

And when in other caſes they aſcribe to irrational creatures ſuch actions, as in men are the productions of reaſon and choice.

of a wise and intelligent author of things. But that you may not mistake me, *Pyrophilus*, it will be requisite for me, to acquaint you, in two or three words, with some of my present thoughts concerning this subject: that there are some actions so peculiar to man, upon the account of his intellect and will, that they cannot be satisfactorily explicated after the manner of the actings of meer corporeal agents, I am very much inclined to believe. And whether or no there may be some actions of some other animals, which cannot well be mechanically explicated, I have not here leisure or opportunity to examine. But for (most of) the other phænomena of nature, methinks we may, without absurdity, conceive, that God, of whom in the scripture it is affirmed, *That all his works are known to him from the beginning*, having resolved, before the creation, to make such a world as this of ours, did divide (at least if he did not create it incoherent) that matter, which he had provided, into an innumerable multitude of very variously figured corpuscles, and both connected those particles into such textures or particular bodies, and placed them in such situations, and put them into such motions, that by the assistance of his ordinary preserving concourse, the phænomena, which he intended should appear in the universe, must as orderly follow, and be exhibited by the bodies necessarily acting according to those impressions or laws, though they understand them not at all, as if each of those creatures had a design of self-preservation, and were furnished with knowledge and industry to prosecute it; and as if there were diffused through the universe an intelligent being, watchful over the publick good of it, and careful to administer all things wisely for the good of the particular parts of it, but so far forth as is consistent with the good of the whole, and the preservation of the primitive and catholick laws established by the supreme cause: as in the formerly mentioned clock of *Strasburg*, the several pieces making up that curious engine are so framed and adapted, and are put into such a motion, that though the numerous wheels, and other parts of it, move several ways, and that without any thing either of knowledge or design; yet each performs its part in order to the various ends, for which it was contrived, as regularly and uniformly, as if it knew and were concerned to do its duty. And the various motions of the wheels and other parts concur to exhibit the phænomena designed by the artificer in the engine, as exactly as if they were animated by a common principle, which makes them knowingly conspire to do so, and might, to a rude Indian, seem to be more intelligent than *Conradus Dasypodius* himself, that published a description of it; wherein he tells the world, that he contrived it, who could not tell the hours, and measure time so accurately as his clock. And according to this notion, if you be pleased to bear it in your memory, *Pyrophilus*, you may easily apprehend in what sense I use many common phrases, which custom hath so authorized, that we can scarce write of physiological subjects, without employing either of them, or frequent and tedious circumlocutions in their stead. Thus when I say, that a stone endeavours to descend towards the center of the earth, or that being put into a vessel of water, it affects the lowest place; I mean, that not such a mathematical point as the center of the earth hath power to attract all heavy bodies, the least of which, it being a point, it cannot harbour; or that a stone does really aim at that unknown and unattainable center: but that, as we say, that a man strives or endeavours to go to any place, at which he would quickly arrive, if he were not forcibly hindered by some body, that holds him fast where he is, and will not let him go; so a stone may be said to strive to descend, when either by the magnetical steams of the earth, or the pressure of some subtile matter incumbent on it, or by what ever else may be the cause of gravity, the stone is so determined to tend downwards, that if all impediments, interposed by the neighbouring bodies, were removed, it would certainly and directly fall to the ground; or being put into a vessel with water, or any other liquor much less heavy than it self (for on quicksilver, which is heavier, stones will swim) the same gravity will make it subside to the bottom of the vessel, and consequently thrust away its bulk of water, which though heavy in it self, yet because it is less ponderous than the stone, seems to be light. And so in our late instance in the clock, if it be said, that the hand, that points at the hours, effects a circular motion, because it constantly moves round the center of the dial-plate, it is evident, that the inanimate piece of metal affects not that motion more than any other, but only, that the impression it receives from the wheels, and the adaptation of the rest of the engine, determine it to move after that manner. And though if a man should with his finger stop that index from proceeding in its course, it may be said, in some sense, that it strives or endeavours to prosecute its former circular motion; yet that will signify no more, than that by virtue of that contrivance of the engine, the index is so impelled, that if the obstacle, put by the finger of him that stops it, were taken away, the index would move onwards, from that part of the circle where it was stopt, towards the mark of the next hour. Nor do I by this, *Pyrophilus*, deny, that it may in a right sense be said, as it is wont to be in the schools, that *Opus naturæ est opus intelligentiæ*: neither do I reject such common expressions as *nature always affects and intends that which is best*, and *nature doth nothing in vain*. For since I must, according to the above mentioned notion, refer many of the actions of irrational creatures to a most wise Disposer of things, it can scarce seem strange to me, that in those particulars, in which the author intended, as it was requisite, that irrational creatures should operate so and so for their own preservation, or the propagation of their species, or the publick good of the universe, their actions being ordered by a reason transcending ours, should not only oftentimes resemble the actings of reason in us, but sometimes even surpass them.

Acts xv. 18.

The author's conceit concerning God's creation of the parts of the world, and so placing them, that they (by the assistance of his ordinary concourse) must needs exhibit these phænomena

Illustrated by the motions of the clock at Strasburg.

How far such borrowed and metaphorical phrases, which custom has authorised, may be used.

Quicksilver being heavier than stones, they swim thereon, yet sink in lighter liquors.

That the instances of the action of divers creatures, resembling reason, commend the wisdom of God

them. As in effect we ſee ſilk-worms and ſpiders can, without being taught, ſpin much more curiouſly their balls and webs, than our beſt ſpinſters could; and that ſeveral birds can build and faſten their neſts more artificially, than many a man, or perhaps any man could frame and faſten ſuch little and elaborate buildings. And the induſtries of foxes, bees, and divers other beaſts, are ſuch, that it is not much to be wondered at, that thoſe creatures ſhould have reaſon aſcribed to them by divers learned men; who yet perhaps would be leſs confident, if they conſidered how much may be ſaid for the immortality of all rational ſouls, and that the ſubtile actings of theſe beaſts are determined to ſome few particulars requiſite for their own preſervation, or that of their ſpecies; whereas, on all other occaſions, they ſeem to betray their want of reaſon, and by their voice and geſtures ſeem to expreſs nothing, but the natural paſſions, and not any rational or logical conceptions. And therefore, as when (to reſume our former compariſon) I ſee in a curious clock, how orderly every wheel and other parts perform its own motions, and with what ſeeming unanimity they conſpire to ſhew the hour, and accompliſh the other deſigns of the artificer; I do not imagine, that any of the wheels, *&c.* or the engine it ſelf is endowed with reaſon, but commend that of the workman, who framed it ſo artificially. So when I contemplate the actions of thoſe ſeveral creatures, that make up the world, I do not conclude the inanimate pieces, at leaſt, that it is made up of, or the vaſt engine it ſelf, to act with reaſon or deſign, but admire and praiſe the moſt wiſe Author, who by his admirable contrivance can ſo regularly produce effects, to which ſo great a number of ſucceſſive and conſpiring cauſes are required.

AND thus much, *Pyrophilus*, having been repreſented concerning thoſe, that rejecting from the production and preſervation of things all but nature, yet embrace the principles of the vulgar philoſophy, you will perhaps think it more than enough; but object, that what is not to be expected from the barren principles of the ſchools, may yet be performed by thoſe atomical ones, which we our ſelves have, within not very many pages, ſeemed to acknowledge ingenious. And I know indeed, that the modern admirers of *Epicurus* confidently enough pretend, that he and his expoſitors have already, without being beholden to a Deity, clearly made out, at leaſt the origin of the world, and of the principal bodies it is made up of. But I confeſs, I am ſo far from being convinced of this, that I have been confirmed rather, than unſettled in my opinion of the difficulty of making out the original of the world, and of the creatures, eſpecially the living ones, that compoſe it, by conſidering the accounts which are given us of the nativity (if I may ſo ſpeak) of the univerſe, and of animals, by thoſe great denyers of creation and providence, *Epicurus*, and his paraphraſt *Lucretius:* whoſe having ſhown themſelves (as I freely confeſs they have) very ſubtile philoſophers in explicating divers myſteries of nature, ought not ſo much to recommend to us their impious errors about the original of things, as to let us ſee the neceſſity of aſcribing it to an intelligent cauſe. This then is the account of this matter, which is given us by *Epicurus* himſelf, in that epiſtle of his to *Herodotus*, which we find in *Diogenes Laertius: Quod ad meteora attinet, exiſtimari non oportet, aut motum, aut converſionem, aut eclipſin, aut ortum occaſumvè, aut alia hujuſcemodi ideo fieri, quod ſit præfectus aliquis, qui ſic diſponat, diſpoſueritvè, ac ſimul beatitudinem immortalitatemque poſſideat:* 'As to the meteors, 'you ought not to believe, that there is either 'motion, or change, or eclipſe, or the riſe or 'ſetting of them, becauſe of any ſuperior pre-'ſident, which doth, or hath ſo diſpoſed of it, 'and himſelf poſſeſſes all the while happineſs 'and immortal life.' And having interpoſed ſome lines, to prove, that the providence of God is not conſiſtent with his felicity, he adds, *Quare opinandum eſt, tum cum mundus procreatus eſt, factos fuiſſe eos circumplexus convolventium ſe atomorum, ut nata fuerit hæc neceſſitas, quâ circuitus tales obierint:* 'Wherefore you 'muſt think, that when the world was made, 'thoſe implications and foldings of atoms hap-'pened, which cauſed this neceſſity, that theſe 'bodies ſhould paſs through theſe motions.' And elſewhere in the ſame epiſtle; *Infiniti* (ſays he) *ſunt mundi, alii ſimiles iſti, alii vero diſſimiles. Quippe atomi cum ſint infinitæ, ut non multo ante demonſtratum eſt per infinitatem ſpatiorum, & alibi aliæ, ac procul ab hoc ad fabrefactionem mundorum infinitorum variè concurrunt.* 'There are infinite worlds, ſome like this, 'ſome unlike it: for ſince atoms are infinite (as 'I newly ſhewed from the infiniteneſs of the 'ſpaces) ſome in one, other in others, diſtant 'parts of theſe ſpaces far from us, variouſly 'concur to the making of infinite worlds.' And leſt this Epicurean explication of the world's original ſhould ſeem to owe all its unſatisfactorineſs to its obſcure brevity, we ſhall not ſcruple to give you that elegant paraphraſe and expoſition of it, which *Lucretius* has delivered in his 5th book, *De Rerum Naturâ:*

Sed quibus ille modis, conjectus materiaï
Fundarit cælum, ac terram pontique profunda
Solis, lunaï curſus ex ordine ponam,
Nam certe neque conſiliis primordia rerum
Ordine ſe quæque atque ſagaci mente locarunt,
Nec quos quæque darent motus pepigere profectò:
Sed quia multa modis multis primordia rerum
Ex infinito jam tempore percita plagis,
Ponderibuſque ſuis, conſuerunt concita ferri,
Omnimodiſque coïre, atque omnia pertentare,
Quæcunque inter ſe poſſent congreſſa creare;
Propterea fit, ut magnum volgata per ævum,
Omnigenos cœtus & motus experiundo,
Tandem conveniant: ea quæ conjuncta repentè
Magnarum rerum fiant exordia ſæpè
Terraï maris, & cœli generiſque animantum.

'But how at firſt, when matter thus was 'whirl'd,
'Heaven, earth, and ſea, the high and 'lower world,

Defects in the explication of nature by the Epicureans, who deny the concurrence of God.

The

'The ſun and moon, and all were made,
'I'll ſhew.
'For ſure the firſt rude atoms never knew
'By ſage intelligence, and counſel grave,
'T' appoint the places, that all beings have:
'Nor will I think, that all the motions here
'Order'd at firſt by fixt agreements were,
'But th' elements, that long had beat about,
'Been buffetted, now in, now carried out:
'Screwed into every hole, and tried to take
'With any thing, in any place to make
'Somewhat at laſt; after much time and coil,
'Motions and meetings, and a world of toil
'Made up this junto. And thus being
'join'd,
'And thus in kind embraces firmly twin'd,
'And link'd together, they alone did frame,
'Heaven, earth, and ſea, and the creatures
'in the ſame.'

THE hypotheſis expreſſed in theſe verſes (which pleaſe our author ſo well, that he has almoſt the ſame lines in ſeveral other places of his poem) he proſecutes and applies to ſome particular parts of the univerſe in the ſame 5th book: but whilſt he thus refuſeth to allow God an intereſt in the world's production, his hypotheſis requires, that we ſhould allow him ſeveral things, which he doth aſſume, not prove: as firſt, that matter is eternal. 2. That from eternity it was actually divided, and that into ſuch inſenſibly ſmall parts, as may deſerve the name of atoms; whereas it may be ſuppoſed, that matter, though eternal, was at firſt one coherent maſs, it belonging to matter to be diviſible, but not ſo of neceſſity, to be actually divided. 3. That the number of theſe atoms is really infinite. 4. That theſe atoms have an *inane infinitum* (as the Epicureans ſpeak) to move in. 5. That theſe atoms are endowed with an almoſt infinite variety of determinate figures, ſome being round, others cubical, others hooked, others conical, *&c*, whereas not to mention beforehand what we may elſewhere object beſides againſt this aſſumption, he ſhews not why, nor how this atom came to be ſpherical rather than conical, and another hooked rather than pyramidal: but theſe aſſumptions I inſiſt not on, becauſe of two others much more conſiderable, which our author is fain to take for granted in his hypotheſis. For 6thly, he ſuppoſes his eternal atoms to have from eternity been their own movers, whereas it is plain, that motion is no way neceſſary to the eſſence of matter, which ſeems to conſiſt principally in extenſion: for matter is no leſs matter when it reſts, than when it is in motion; and we daily ſee many parcels of matter paſs from the ſtate of motion to that of reſt, and from this to that, communicating their motion to matter, that lay ſtill before, and thereby looſing it themſelves. Nor has any man, that I know, ſatisfactorily made out how matter can move itſelf: and indeed, in the bodies, which we here below converſe withal, we ſcarce find, that any thing is moved but by ſomething elſe; and even in theſe motions of animals, that ſeem ſpontaneous, the will or appetite doth not produce the motion of the animal, but guide and determine that of the ſpirits, which by the nerves move the muſcles; and ſo the whole body, as may appear by the wearineſs and unwieldineſs of animals, when by much motion the ſpirits are ſpent. And accordingly I find that *Anaxagoras*, though he believed, as *Ariſtotle* did after him, that matter was eternal, yet he diſcerned, that the notion of matter not neceſſarily including motion, there was a neceſſity of taking in a *mens*, as he ſtyles God, to ſet this ſluggiſh matter a moving. And I remember *Ariſtotle* himſelf, in one place of his Metaphyſicks, diſputing againſt ſome of the ancienter philoſophers, aſks, *Quonamque modo movebuntur, ſi nulla erit actu cauſa? non enim ipſa materia ſeipſam movebit, ἀλλὰ τεκτονικὴ rerum opifex virtus:* 'How ſhall 'things be moved, if there be no actual cauſe? 'For matter cannot move itſelf, but requires 'to be moved by a tectonick thing, creating 'power.' But though elſewhere I have met with paſſages of his near of kin to this, yet he ſeems not to expreſs his opinion uniformly and clearly enough to engage me to define it, or make a weapon of it: and therefore I ſhall rather proceed to take notice, that, according to the Epicurean hypotheſis, not only the motion, but the determination of that motion is ſuppoſed. For *Epicurus* will have his atoms move downwards, and that not in parallel lines, leſt they ſhould never meet to conſtitute the world, but according to lines ſomewhat inclining towards one another; ſo that there muſt be not only motion, but gravity in atoms, before there be any center of gravity for them to move towards; and they muſt move rather downwards than upwards, or ſideways, and in ſuch lines as nothing is produced capable of confining them to. Which are aſſumptions ſo bold and precarious, that I find ſome, even of his admirers, to be aſhamed of them: which will ſave me the labour of arguing againſt them, and allow me to take notice in the ſeventh place, that this Epicurean doctrine ſuppoſes, that a ſufficient number of atoms, and their motion downwards, being granted, there will need nothing but their fortuitous concourſe in their fall, to give a being to all thoſe bodies, that make up the world. Indeed, that the various coalitions of atoms, or at leaſt ſmall particles of matter, might have conſtituted the world, had not been perhaps a very abſurd opinion for a philoſopher, if he had, as reaſon requires, ſuppoſed, that the great maſs of lazy matter was created by God at the beginning, and by him put into a ſwift and various motion, whereby it was actually divided into ſmall parts of ſeveral ſizes and figures, whoſe motion and croſſings of each other were ſo guided by God, as to conſtitute, by their occurſions and coalitions, the great inanimate parts of the univerſe, and the ſeminal principles of animated concretions. And therefore I wonder not much, that the Mileſian *Thales* (the firſt of the Grecian philoſophers, as *Cicero* informs us,) that inquired into theſe matters) ſhould hold that opinion, which *Tully* expreſſes in theſe words: *Aquam dixit eſſe initium rerum, Deum autem eam mentem, quæ ex aqua cuncta finxerat:* 'He 'ſaid,

Ariſtot. Metaphyſ. lib. 12. c. 6.

De Nat. Deorum. lib. 1.

'ſaid, water was the principle of all things, 'but God was that intelligence, that made all 'things out of water:' And that of *Anaxagoras* the ſame author ſhould give us this account; *Idem ibidem.* *Omnium rerum deſcriptionem & modum mentis infinitæ vi ac ratione deſignari & confici voluit:* 'The delineation and manner of all things he 'thought to be deſigned and made by the 'power and reaſon of infinite intelligence.' For though theſe great men exceedingly erred, in thinking it neceſſary, that God ſhould be provided of a pre-exiſtent, and by him not created matter, to make the world of; yet at leaſt they diſcerned and acknowledged the neceſſity of a wiſe and powerful agent, to diſpoſe and faſhion this rude matter, and contrive it into ſo goodly a ſtructure, as we behold, without imagining with *Epicurus*, that chance ſhould turn a chaos into a world. And really it is much more unlikely, that ſo many admirable creatures, that conſtitute this one exquiſite and ſtupendous fabrick of the world, ſhould be made by the caſual confluence of falling atoms, juſtling or knocking one another in the immenſe vacuity, than that in a printer's working-houſe a multitude of ſmall letters, being thrown upon the ground, ſhould fall diſpoſed into ſuch an order, as clearly to exhibit the hiſtory of the creation of the world, deſcribed in the 3 or 4 firſt chapters of *Geneſis*; of which hiſtory, it may be doubted, whether chance may ever be able to diſpoſe the fallen letters into the words of one line. I ignore not, that ſometimes odd figures, and almoſt pictures, may be met with, and may ſeem caſually produced in ſtones, and divers other inanimate bodies; and I am ſo far from denying this, that I may elſewhere have opportunity to ſhew you, that I have been no careleſs obſerver of ſuch varieties.

That the figures in nitre, cryſtal, and divers minerals are produced, not by chance, but by ſomewhat analogous to ſeminal principles.

BUT firſt, even in divers minerals, as we may ſee in nitre, cryſtal, and ſeveral others, the figures, that are admired, are not unqueſtionably produced by chance, but perhaps by ſomething analogous to ſeminal principles, as may appear by their uniform regularity in the ſame ſort of concretion, and by the practice of ſome of the ſkilfulleſt of the ſalt-petre men, who, when they have drawn as much nitre as they can out of the nitrous earth, caſt not the earth away, but preſerve it in heaps for ſix or ſeven years; at the end of which time, they find it impregnated with new ſalt-petre, produced chiefly by the ſeminal principle of nitre implanted in that earth. To prove, that metalline bodies were not all made at the beginning of the world, but have ſome of them a power, though ſlowly, to propagate their nature, when they meet with a diſpoſed matter; you may find many notable teſtimonies and relations in a little book of *Phyſico-chymical Queſtions*, written by *Jo. Conradus Gerhardus*, a German doctor, and moſt of them recited (together with ſome of his own) by the learned *Sennertus*. But leſt you ſhould ſuſpect the narratives of theſe authors, as ſomewhat partial to their fellow-chymiſts opinions, I ſhall here annex that memorable relation, which I find recorded by *Linſchotten*, and *Garcias ab Horto*, a pair of unſuſpected writers in this caſe, concerning diamonds; whereby it may appear, that the ſeminal principles of thoſe precious ſtones, as of plants, are lodged in the bowels of the mine they grow in. *Diamonds* (ſays the firſt, in that chapter of his travels, where he treats of thoſe jewels) *are digged like gold out of mines; where they digged one year the length of a man into the ground, within three or four years after, there are found diamonds again in the ſame place, which grow there; ſometimes they find diamonds of* 400 *or* 800 *grains. Adamantes* (ſays the latter) *qui altiſſimè in terræ viſceribus, multiſque annis perfici debebant in ſummo ferè ſolo generantur, & duorum aut trium annorum ſpatio perficiuntur: nam ſi in ipſa fodina hoc anno ad cubiti altitudinem fodias, adamantes reperies. Poſt biennium rurſus illic excavato ibidem, invenies adamantes.* 'Diamonds, which ought 'to be brought to perfection in the deepeſt 'bowels of the earth, and in a long tract of 'time, are almoſt at the top of the ground, 'and in three or four years ſpace made per-'fect. For if you dig this year but the depth 'of a cubit, you will find diamonds; and af-'ter two years dig there, you will find dia-'monds again.' And next, how inconſiderable, alas! are theſe ſuppoſed productions of chance, in compariſon of the elaborate contrivances of nature in animals? ſince in the body of man, for inſtance, of ſo many hundred parts it is made up of, there is ſcarce any, that can be either left out, or made otherwiſe than as it is, or placed elſewhere than where it is, without an apparent detriment to that curious engine; ſome of whoſe parts, as the eye, and the valves of the veins, would be ſo unfit for any thing elſe, and are ſo fitted for the uſes, that are made of them, that it is ſo far from being likely, that ſuch ſkilful contrivances ſhould be made by any being not intelligent, that they require a more than ordinary intelligence to comprehend how ſkilfully they are made.

Sempl. in India nascenti. lib. 1. cap. 47.

That the generation of animals is much leſs to be accounted the production of chance.

As for the account that *Lucretius*, out of *Epicurus*, gives us of the firſt production of men, in I know not what wombs adhering to the ground, and which much more becomes him as a poet, than as a philoſopher; I ſhall not here waſte time to manifeſt its unlikelineſs, that witty father *Lactantius**, having done already that copiouſly for me. And indeed it ſeems ſo pure a fiction, that, were it not, that the hypotheſis he took upon him to maintain, could ſcarce afford him any leſs extravagant account of the original of animals, the unſuitableneſs of this Romance to thoſe excellent notions, with which he has enriched divers other parts of his works, would make me apt to ſuſpect, that when he writ this part of his poem, he was in one of the fits of that frenzy, which ſome, even of his admirers, ſuppoſe him to have been put into by a philtre, given him by his, either wife or miſtreſs *Lucilia*; in the

* Tanta ergo qui videat, & talia poteſt exiſtimare nullo affecta eſſe conſilio, nulla providentia, nulla ratione divina, ſed ex atomis ſubtilibus exiguis concreta eſſe tanta miracula? Nonne prodigio ſimile eſt, aut natum eſſe hominem, qui hæc diceret, ut Leucippum aut extitiſſe qui crederet, ut Democritum, qui auditor ejus fuit, vel Epicurum in quem vanitas omnis de Leucippi fonte profluxit. Lib. II. cap 11.

intervals of which, they ſay, that he writ his books.

That the hypotheſes of philoſophy only ſhew, that an effect may be produced by ſuch a cauſe, not that it muſt.

AND here let us further conſider, that as confidently as many atomiſts, and other naturaliſts, preſume to know the true and genuine cauſes of the things they attempt to explicate; yet very often the utmoſt they can attain to, in their explications, is, that the explicated phænomena may be produced after ſuch a manner, as they deliver, but not that they really are ſo. For as an artificer can ſet all the wheels of a clock a going, as well with ſprings as with weights; and may with violence diſcharge a bullet out of the barrel of a gun, not only by means of gunpowder, but of compreſſed air, and even of a ſpring: ſo the ſame effects may be produced by divers cauſes different from one another; and it will oftentimes be very difficult, if not impoſſible, for our dim reaſons to diſcern ſurely, which of theſe ſeveral ways, whereby it is poſſible for nature to produce the ſame phænomena, ſhe has really made uſe of to exhibit them. And ſure, he, that in a ſkilful watch-maker's ſhop ſhall obſerve, how many ſeveral ways watches and clocks may be contrived, and yet all of them ſhew the ſame things; and ſhall conſider how apt an ordinary man, that had never ſeen the inſide but of one ſort of watches, would be to think, that all theſe are contrived after the ſame manner, as that, whoſe fabrick he has already taken notice of; ſuch a perſon, I ſay, will ſcarce be backward to think, that ſo admirable an engineer as nature, by many pieces of her workmanſhip, appears to be, can, by very various and differing contrivances, perform the ſame things; and that it is a very eaſy miſtake for men to conclude, that becauſe an effect may be produced by ſuch determinate cauſes, it muſt be ſo, or actually is ſo. And as confident as thoſe we ſpeak of uſe to be, of knowing the true and adequate cauſes of things, yet *Epicurus* himſelf, as appears by ancient teſtimony, and by his own writings, was more modeſt, not only contenting himſelf, on many occaſions, to propoſe ſeveral poſſible ways, whereby a phænomenon may be accounted for, but ſometimes ſeeming to diſlike the ſo pitching upon any one explication, as to exclude and reject all others: and ſome modern philoſophers, that much favour his doctrine, do likewiſe imitate his example, in pretending to aſſign not preciſely the true, but poſſible cauſes of the phænomenon they endeavour to explain.

That to a perfect knowledge there muſt not only appear the poſſible, but the definite and real; not only the general, but the particular cauſes.

And I remember, that *Ariſtotle* himſelf (whatever confidence he ſometimes ſeems to expreſs) does in his firſt book of *Meteors* ingenuouſly confeſs, that concerning many of nature's phænomena, he thinks it ſufficient, that they may be ſo performed as he explicates them. But granting, that we did never ſo certainly know, in the general, that theſe phænomena of nature muſt proceed from the magnitudes, figures, motions, and thence reſulting qualities of atoms, yet we may be very much to ſeek as to the particular cauſes of this or that particular effect or event. For it is one thing to be able to ſhew it poſſible, for ſuch and ſuch effects to proceed from the various magnitudes, ſhapes, motions, and concretions of atoms; and another thing to be able to declare what preciſe, and determinate figures, ſizes, and motions of atoms, will ſuffice to make out the propoſed phænomena, without incongruity to any others to be met with in nature: as it is one thing for a man ignorant of the mechanicks to make it plauſible, that the motions of the famed clock at *Straſburg*, are performed by the means of certain wheels, ſprings, and weights, *&c.* and another to be able to deſcribe diſtinctly the magnitude, figures, proportions, motions, and, in ſhort, the whole contrivance either of that admirable engine, or ſome other capable to perform the ſame things.

NAY, a lover of diſputing would proceed farther, and queſtion that way of reaſoning, which even the eminenteſt atomiſts are wont to imploy to demonſtrate, that they explicate things aright.

Some defects in the ways of reaſoning uſed by the moſt eminent atomiſts.

FOR the grand argument, by which they uſe to confirm the truth of their explications, is, that either the phænomenon muſt be explicated after the manner by them ſpecified, or elſe it cannot at all be explicated intelligibly: in what ſenſe we diſallow not, but rather approve this kind of ratiocination, we may elſewhere tell you. But that, which is in this place more fit to be repreſented, is, that this way of arguing ſeems not in our preſent caſe ſo cogent, as they, that are wont to employ it, think it to be: for beſides, that it is bold to affirm, and hard to prove, that what they cannot yet explicate by their principles, cannot poſſibly be explicated by any other men, or any other philoſophy; beſides this, I ſay, that which, they would reduce their adverſaries to, as an abſurdity, ſeems not to deſerve that name. For ſuppoſing the argument to be concluſive, that either the propoſed explication muſt be allowed, or men can give none at all, that is intelligible; I ſee not what abſurdity it were to admit of the conſequence. For who has demonſtrated to us, that men muſt be able to explicate all nature's phænomena, eſpecially ſince divers of them are ſo abſtruſe, that even the learnedeſt atomiſts ſcruple not to acknowledge their being unable to give an account of them. And how will it be proved, that the omniſcient God, or that admirable contriver, Nature, can exhibit phænomena by no ways, but ſuch as are explicable by the dim reaſon of man? I ſay explicable, rather than intelligible; becauſe there may be things, which though we might underſtand well enough, if God, or ſome more intelligent being than our own, did make it his work to inform us of them, yet we ſhould never of our ſelves find out thoſe truths. As an ordinary watch-maker may be able to underſtand the curiouſeſt contrivance of the ſkilfulleſt artificer, if this man take care to explain his engine to him, but would never have underſtood it, if he had not been taught: whereas to explicate the nature and cauſes of the phænomena we are ſpeaking of, we muſt not only be able to underſtand, but to inveſtigate them.

AND whereas, it is peremptorily inſiſted on by ſome Epicureans, who thereby pretend to demonſtrate the excellency and certainty of their

their explications, that, according to them, nature is declared to produce things, in the way that is moſt facile and agreeable to our reaſon: it may be replied, that what we are to inquire after, is, how things have been, or are really produced; not whether or no the manner of their production be ſuch, as may the moſt eaſily be underſtood by us: for if all things were, as thoſe we reaſon withall maintain, caſually produced, there is no reaſon to imagine, that chance conſidered what manner of their production would be the moſt eaſily intelligible to us. And if God be allowed to be, as indeed he is, the author of the univerſe, how will it appear that he, whoſe knowledge infinitely tranſcends ours, and who may be ſuppoſed to operate according to the dictates of his own immenſe wiſdom, ſhould, in his creating of things, have reſpect to the meaſure and eaſe of human underſtandings; and not rather, if of any, of angelical intellects? So that whether it be to God or to chance, that we aſcribe the production of things, that way may often be fitteſt or likelieſt for nature to work by, which is not eaſieſt for us to underſtand.

AND as for the way of arguing, ſo often imployed (eſpecially againſt the truth we now contend for) and ſo much relied on by many modern philoſophers, namely, that they cannot clearly conceive ſuch or ſuch a thing propoſed, and therefore think it fit to be rejected; I ſhall readily agree with them, in the not being forward to aſſent to any thing, eſpecially in philoſophy, that cannot well be conceived by knowing and conſidering men. But there is ſo much difference among men, as to their faculty of framing diſtinct notions of things, and through men's partiality or lazineſs, many a particular perſon is ſo much more apt, than theſe men ſeem to be aware of, to think, or at leaſt to pretend, that he cannot conceive, what he has no mind to aſſent to, that a man had need be wary, how he rejects opinions, that are impugned only by this way of ratiocination: by which, I hope, it will not be expected, that we ſhould be more prevailed with, than that ſect of philoſophers that imploys it moſt. And among thoſe, that reſolve the phænomena of nature into the mechanical powers of things, or the various figures, ſizes and motions of the parts of matter, I meet with ſome, as the Epicureans, who tell us, they cannot frame a notion of an incorporeal ſubſtance or ſpirit, nor conceive how, if the ſoul were ſuch, it could act upon the body: and yet others, that ſeem no leſs ſpeculative, ſeriouſly and ſolemnly profeſs, that they can conceive a clear and diſtinct notion of a ſpirit, which they believe the human ſoul, that regulates at leaſt, if not produces divers motions of the body, to be; denying on the other ſide, that it can be clearly conceived, either that any thing, that is only material, can think, or that there can poſſibly be any vacuum (that is, place without any body) in the univerſe: both which the Epicureans profeſs themſelves not only to conceive as poſſible, but believe as true.

AND thus much, *Pyrophilus*, it may ſuffice to have ſaid in relation to thoſe, who would reject God from having any thing to do, either in the production or government of the world, upon this ground, that they, if you will believe them, can explicate the original and phænomena of it without him; but it is not all, nor the greateſt part of the favourers of the atomical philoſophy, that preſume ſo much of themſelves, and derogate ſo much from God. To ſay therefore ſomething to the more moderate and judicious of that perſuaſion, we will candidly propoſe on their behalf the moſt plauſible objection we can foreſee, againſt the truth we have been all this while pleading for. They may then thus argue againſt us, that though the atomiſts cannot ſufficiently demonſtrate from what natural cauſes every particular effect proceeds, and ſatisfactorily explicate after what determinate manner each particular phænomenon is produced; yet it may ſuffice to take away the neceſſity of having recourſe to a Deity, that they can make out in general, that all the things, that appear in the world, may, and muſt be performed by meerly corporeal agents; or, if you pleaſe, that all nature's phænomena may be produced by the parcels of the great maſs of univerſal matter, variouſly ſhaped, connected, and moved. As a man, that ſees a ſcrewed gun ſhot off, though he may not be able to deſcribe the number, bigneſs, ſhape, and co-aptation of all the pieces of the lock, ſtock, and barrel, yet he may readily conceive, that the effects of the gun, how wonderful ſoever they may ſeem, may be performed by certain pieces of ſteel, of iron, and ſome parcels of wood, of gunpowder, and of lead, all faſhioned and put together according to the exigency of the engine; and will not doubt, but that they are produced by the power of ſome ſuch mechanical contrivance of things purely corporeal, without the aſſiſtance of ſpiritual or ſupernatural agents.

The moſt plauſible argument of the oppoſers of a Deity conſidered.

IN anſwer to this objection, I muſt firſt profeſs to you, that I make great doubt, whether there be not ſome phænomena in nature, which the atomiſts cannot ſatisfactorily explain by any figuration, motion, or connection of material particles whatſoever: for ſome faculties and operations of the reaſonable ſoul in man are of ſo peculiar and tranſcendent a kind, that as I have not yet found them ſolidly explicated by corporeal principles, ſo I expect not to ſee them in haſte made out by ſuch. And if a ſpiritual ſubſtance be admitted to enter the compoſition of a man, and to act by and upon his body; beſides that one of the chief and fundamental doctrines of the Epicureans (namely, that there is nothing in the univerſe but *corpus* and *inane*) will thereby be ſubverted, it will appear, that an incorporeal and intelligent being may work upon matter, which would argue, at leaſt a poſſibility, that there may be a ſpiritual Deity, and that he may intermeddle with, and have an influence upon the operations of things corporeal. But to inſiſt no longer on this, let us give a further and direct anſwer to the propoſed objection, by repreſenting, that although as things are now eſtabliſhed in the world, an atomiſt were ableto explain the phænomena we meet with,

by ſuppoſing the parts of matter to be of ſuch ſizes, and ſuch ſhapes, and to be moved after ſuch a manner, as is agreeable to the nature of the particular phænomenon to be thereby exhibited; yet it would not thence neceſſarily follow, that, at the firſt production of the world, there was no need of a moſt powerful and intelligent being, to diſpoſe that chaos or confuſed heap of numberleſs atoms into the world, to eſtabliſh the univerſal and conſpiring harmony of things; and eſpecially to connect thoſe atoms into ſuch various ſeminal contextures, upon which moſt of the more abſtruſe operations, and elaborate productions of nature appear to depend. For many things may be performed by matter variouſly figured and moved, which yet would never be performed by it, if it had been ſtill left to it ſelf without being, at firſt at leaſt, faſhioned after ſuch a manner, and put into ſuch a motion by an intelligent agent. As the quill, that a philoſopher writes with, being dipt in ink, and then moved after ſuch and ſuch a manner upon white paper, all which are corporeal things, or their motions, may very well trace an excellent and rational diſcourſe; but the quill would never have been moved after the requiſite manner upon the paper, had not its motion been guided and regulated by the underſtanding of the writer. Or rather, yet once more, to reſume our former example of the *Straſburg*-clock; though a ſkilful artiſt, admitted to examine and conſider it, both without and within, may very well diſcern, that ſuch wheels, ſprings, weights, and other pieces, of which the engine conſiſts, being ſet together in ſuch a coaptation, are ſufficient to produce ſuch and ſuch motions, and ſuch other effects as that clock is celebrated for; yet the more he diſcerns the aptneſs and ſufficiency of the parts to produce the effects emergent from them, the leſs he will be apt to ſuſpect, that ſo curious an engine was produced by any caſual concurrence of the parts it conſiſts of, and not rather by the ſkill of an intelligent and ingenious contriver; or that the wheels, and other parts, were of this or that ſize, or this or that determinate ſhape, for any other reaſon, than becauſe it pleaſed the artificer to make them ſo: though the reaſon, that moved the artificer to employ ſuch figures and quantities ſooner than others, may well be ſuppoſed to have been, that the nature of his deſign made him think it very proper and commodious for its accompliſhment, if not better than any other ſuited to the ſeveral exigencies of it.

If an Epicurean ſhould be told, that a man, after having been for ſome days really dead, became alive again, I think it will not be doubted, but that he would reject ſuch a relation as impoſſible, and therefore too manifeſtly falſe to be believed by any man in his wits: and yet, according to his principles, the man, as well ſoul as body, conſiſted only of divers particles of the univerſal matter, by various motions brought together, and diſpoſed after a certain manner: and conſequently, he muſt ground his perſuaſion, that it is impoſſible to redintegrate the engine once ſpoiled by death, upon this, that as chance cannot with the leaſt probability be preſumed to have produced ſuch a ſtrange effect; ſo, according to him, there can be no cauſe aſſigned, knowing and powerful enough to rally and bring together again the diſbanded and ſcattered parcels of matter (or ſubſtitute other equivalent ones) that, together with the remaining carcaſs, compoſed the dead man, ſo to re-unite them to the reſt; and laſtly, ſo to place and put into motion both the one and the other, as were requiſite to make a living man once more reſult from them. I know, that this example reaches not all the circumſtances of the controverſy we have been debating; but yet, if I miſtake not, it will ſerve the turn, for which I propoſe it. For, not now to inſiſt upon this inference from it, That a conſidering man may confidently reject a thing, that is not abſolutely impoſſible, provided it be highly incredible; not to inſiſt on this, I ſay, the thing I aim at in the mention of it, is only to ſhew, that ſuch things may poſſibly be effected by matter and motion, as no wiſe man will believe to have been produced by a bare agitation of the particles of matter, not guided by the ſuperintendency of a powerful and knowing Director.

Now that the atoms, or particles of matter, of which the world conſiſts, made no agreement with each other to convene and ſettle in the manner requiſite to conſtitute the univerſe, *Lucretius* does not ſo properly confeſs, as affirm, in that fore-cited paſſage, where he judiciouſly tells us, that

> *—Certè neque conſiliis primordia rerum*
> *Ordine ſe quæque, atque ſagaci mente locarunt:*
> *Nec quos quæque darent motus pepigêre profectò.*

And the thing it ſelf is manifeſt enough, from the nature of atoms confeſſedly inanimate and devoid of underſtanding.

So that although we ſhould grant, *Pyrophilus*, the poſſible emergency of the innumerable effects we admire in the world, from the various properties and coalitions of atoms, yet ſtill you ſee the formerly mentioned difficulty (touching the reſulting of all things from matter left to it ſelf) would recur; and it would as well be incredible, that an innumerable multitude of inſenſible particles, as that a leſſer number of bigger parcels of matter, ſhould either conſpire to conſtitute, or fortuitouſly juſtle themſelves into ſo admirable and harmonious a fabrick as the univerſe, or as the body of man; and conſequently it is not credible, that they ſhould conſtitute either, unleſs as their motions were (at leaſt, in order to their ſeminal contextures and primary coalitions) regulated and guided by an intelligent contriver and orderer of things. And I ſhould ſo little think it a diſparagement to have but ſo much ſaid of any hypotheſis of mine, that I ſuppoſe I may affirm it, without offending either the moſt ſober, or the generality of the atomical philoſophers, to whom, and to their doctrine, my writings will manifeſt to be no otherwiſe affected than I ought.

ESSAY V.

Wherein the Diſcourſe, interrupted by the late Digreſſion, is reſumed and concluded.

IT remains now, *Pyrophilus*, that we at length return into the way from whence the foregoing digreſſion has, I fear, too long diverted us; and that to proſecute and finiſh our diſcourſe, we take it up where we left it, and were tempted to digreſs; namely, at the third eſſay; betwixt which, and the beginning of this fifth, all that has been interpoſed may be looked upon but as a long parentheſis.

That there are ſome things in nature, which conduce much to the evincing of a Deity, which are only well known to naturaliſts.

IN the third place then I conſider, that whether or no it be true, which our antagoniſts ſuggeſt, that there are ſome things in nature, which tempt philoſophers more than they do the vulgar, to doubt or deny a God; yet certainly there are divers things in nature, that do much conduce to the evincing of a Deity, which naturaliſts either alone diſcern, or at leaſt diſcern them better than other men. For beſides the abſtruſe properties of particular bodies, not diſcovered by any but thoſe, that make particular inquiries into thoſe bodies, there are many things in nature, which to a ſuperficial obſerver ſeem to have no relation to one another; whereas to a knowing naturaliſt, that is able to diſcern their ſecret correſpondencies and alliances, theſe things, which ſeem to be altogether irrelative each to other, appear ſo proportionate and ſo harmonious both betwixt themſelves, and in reference to the univerſe they are parts of, that they repreſent to him a very differing and incomparably better proſpect than to another man: as he, that looks upon a picture made up of ſcattered and deformed pieces, beholding them united into one face by a cylindrical looking-glaſs aptly placed, diſcerns the ſkill of the artiſt, that drew it, better than he, that looks only on the ſingle parts of that picture, or upon the whole picture, without the uniting cylinder. Which brings into my mind, that whereas in the ſacred ſtory of the creation, when mention is made of God's having conſidered the works of each of the firſt ſix days, at the end of it, it is ſaid of the work of every day, *That God ſaw, that it was good*, (except of the ſecond day, becauſe the ſeparation of the waters was but imperfectly made on that day, and compleated in the next, on which it is therefore twice ſaid, *That God ſaw, that it was good*;) whereas, I ſay, when God looked upon his works in particular, it is only ſaid, *That he ſaw, that they were good:* when he is introduced at the cloſe of the creation, as looking upon, and ſurveying his creatures in their harmony, and entire ſyſtem, it is emphatically ſaid, *That he ſaw every thing, that he had made, and behold it was very good.* And if *Ariſtotle* be indeed the author of the book *De Mundo ad Alexandrum*, which paſſes for his, and is ſaid to have been written by him towards the end of his life, it would not be unworthy our obſervation to take notice, how he, that in his other writings is wont to talk of God's intereſt in the creatures darkly, and heſitantly enough, is wrought upon by the contemplation of the univerſe, as it is an orderly aggregate or ſyſtem of the works of nature, to make expreſſions of the divine architect, which are not unworthy of *Ariſtotle*, though, being meerly human, they cannot be worthy of God. Amongſt many, I ſhall ſingle out ſome; and I hope, *Pyrophilus*, you will excuſe me, if in this eſſay, and ſome of the precedent ones, I do, contrary to my cuſtom, employ pretty ſtore of paſſages taken out of other authors. For firſt, the nature of my deſign makes it requiſite for me to ſhew, what opinion the heathen philoſophers had of the ſtudy of phyſiology, and what power their contemplation of nature had to ingage them to acts of religion. And next, ſince divers of the ſame paſſages, wherein they had ſet down their opinions, contained alſo the grounds and reaſons of them, whereby they have anticipated much of what we ſhould ſay upon the ſame ſubjects; I was unwilling to deprive you of their pertinent ratiocinations, or rob them of the glory of what they had well written. And this neceſſary apology premiſed, let us proceed to conſider his paſſages; and firſt, *Reſtat* (ſays he) *ut ſummatim de cauſa diſſeramus, quæ cunctarum ipſa rerum vim habet tutricem & continentem, quemadmodum cætera perſtrinximus: flagitii enim inſtar eſſet, cum de mundo dicere inſtituerim, tractatu ſi minus exquiſito fortaſſe, at certè qui ſat eſſe poſſit ad formulam doctrinæ craſſiorem, intactam præcipuam mundi partem principemque præterire.* 'It remains, that we 'ſpeak briefly concerning that cauſe, whoſe 'power preſerves and ſupports all things, 'in like manner, as we have compendiouſly 'handled other matters. For it would ſeem 'criminal to paſs over the chief part of the 'world untouched, having deſigned to diſ-'courſe of the univerſe in a treatiſe, which, if 'leſs accurate, yet certainly may be ſufficient 'for a rough platform of doctrine.' And a little after, *Etenim* (ſays he) *cunctarum quæ rerum natura complectitur, cum ſervator eſt Deus, tum vero quæcunque in hoc mundo quoquomodo perficiuntur, eorum omnium idem eſt genitor: non ſic tamen ipſe ut opificis in morem, animaliſque laſſitudinem ſentientis labore affici poſſit, ut qui ea facultate utatur, quæ nulli cedat difficultati, cujus ipſe vi facultatis omnia in poteſtate continet, nec minus etiam quæ longius ab ipſo videntur eſſe ſummota:* 'For God is both the preſerver of 'all things contained in the univerſe, and like-'wiſe the producer of every thing whatſoever, 'which is in any wiſe made in this world: yet 'not ſo as to be ſenſible of labour; after the man-'ner of a workman, or a creature, which is ſub-'ject to wearineſs: for he is endued with a power, 'which is inferiour to no difficulty, and where-'by

Explained by the compariſon of the uniting ſcattered pieces of paint into one face by a cylindrical looking-glaſs.

Ariſt. de Mundo, cap. 6.

Ibidem.

The teſtimony of the author of the book de Mundo, *aſcribed to* Ariſtotle, *introduced.*

'by he contains all things under his authority, 'even such as seem most distant from him.' *Eodem Cap.* To which purpose he elsewhere says, *Augustius decentiusque existimandum est, Deum summo in loco ita esse collocatum; numinis ut tamen ejus vis per universum mundum pertingens, tum solem, lunamque moveat, tum cœlum omne circumagat, simulque causam præbeat eorum, quæ in terra sunt salutis atque incolumitatis:* 'It is more 'magnificent and agreeable to conceive God so 'resident in the highest place, that nevertheless his divine energy being diffused throughout the whole world, moves both the sun 'and moon, turns round the whole globe of 'heaven, and affords the causes of safety and 'preservation of such things as are upon the *Eodem Cap.* 'earth.' And in the same book he adds, *Ut vero summatim loquamur, quod in navi gubernator est, quod in curru agitator, quod in choro præcentor, quod denique lex in civitate, & dux in exercitu, hoc Deus est in mundo. Nisi si hactenus interest quod labor, & motus multiplex illos exercet & curæ angunt variæ, cum huic illaborata succedunt omnia, omnis molestiæ expertia:* 'But to sum up all in brief; what the pilot is in 'a ship, what the driver in a chariot, what 'the chief singer is in a dance; finally, what 'magistracy is in a commonwealth, and the 'general in an army, that is God in the world: 'unless there be this difference, that much 'toil and manifold cares perplex them, but all 'things are performed by God without labour 'or trouble.' And certainly he, that is a stranger to anatomy, shall never be able to discern in the circulation of the blood, the motion of the chyle, and the contrivance of all the parts of a human body, those proofs, as well as effects, of an omniscient Δημιουργος, or artist, which a curious anatomist will discover in that elaborate and matchless engine: as I remember, I had occasion not long since to take notice of in the shape of that strange muscle (the *obturator internus*) which some call from its figure *marsupialis*, serving to the motion of the thigh. For this muscle seems so made, as if nature had designed in it to manifest, that she is skilled in the mechanicks, not only as a mathematician, that understands the powers of distance, weight, proportion, motion and figure; but as an artificer, or handycrafts man, who knows by dextrous contrivances to furnish the more endangered parts of his work, with what is more useful to make it lasting; there being (to omit other observables, belonging to that muscle) a deep notch made in the coxendix, to shorten the way betwixt the two extremities of the muscle, and make it bear upon the bone with a blunter angle. And because the tendon is long, lest, notwithstanding the former provision, it should be apt to fret out upon the edge of the bone, nature has provided for it a musculous piece of flesh, wherein it is as it were sheathed, that so it might not immediately bear, and grate upon the bone; just as our artificers use to sew cases of leather upon those parts of silken strings, which being to grate upon harder bodies, were otherwise endangered to be fretted out by attrition.

Of the admirable contrivance of the make of the musculus marsupialis.

AND a like skilfulness of nature in the mechanical contrivance of the parts, is more obviously discernible in the structure of that admirable engine, by which such variety of other engines are made, the hand: where (not to mention the *ligamentum latum*, or wrist-band, that keeps the tendons, that move under it, from inconveniently starting up upon the contraction of the respective muscles) the wonderful perforations, that are made through the tendons of the *musculi perforati* by those of the *musculi perforantes*, for the more commodious motion of the joints of the fingers, may conspicuously manifest the mechanical dexterity of nature; as it may her husbanding (if I may so speak) of her work, that in a fœtus, whilst it lies in the womb, because the lungs are not to be displayed as afterwards, and so the blood needs not circulate thorough them, from the right ventricle of the heart into the left, for the use of respiration, as it must in grown animals, she contrives a nearer way; and by certain short pipes, peculiar to such young creatures, she more commodiously performs in them the circulation of the blood, proportioned to their present condition; and afterwards, when the animal is brought out of the womb into the open air, and put upon the constant exercise of his lungs, these temporary conduit-pipes, little by little, vanish. So careful is nature not to do things in vain.

And of the parts of the hand.

The contrivance for the circulation of the blood in a fœtus before the use of respiration.

AND therefore I do not much wonder, that *Galen*, though I remember he somewhere (unprovokedly and causelessly enough) derides *Moses*, and seems not over-much inclined to make religious acknowledgements; yet when he comes to consider particularly the exquisite structure of a human body, should break forth into very elevated, and even pathetical celebrations of God, and tell us, that in his books, *De Usu Partium*, he composed hymns to the Creator's praise. And certainly he, that shall see a skilful anatomist dextrously dissect that admirable part of man, the eye, and shall consider the curious contrivance of the several coats, humors, and other parts it consists of, with all their adaptions and uses, would be easily persuaded, that a good anatomist has much stronger invitations to believe, and admire an omniscient Author of nature, than he, that never saw a dissection; especially if he should see how all of these concur to make up one optical instrument, to convey the species of the visible object to the optick nerve, and so to the brain; as I have with pleasure considered it, in the recent eye of a cat (for with keeping it will grow flaccid) cut cleanly off, where the optick nerve enters the sclerotis, and is going to expand itself into the retina; for holding this eye at a convenient distance betwixt yours and a candle, you may see the image of a flame lively expressed upon that part of the back side of the eye, at which the optick nerve enters the above mentioned sclerotis. Something of this kind we have also shown our friends with eyes of dead men, carefully sever'd from their heads; and with the (dexterously taken out) crystalline humour of a human eye, we have often read, as with a lens or magnifying glass. And

Galen's speech, that his books de Usu Partium *were as hymns to the Creator.*

Galenus lib. 3o. De Usu Partium.

The fabrick of the eye considered.

Some experimental observations of the eye, and use of its parts in order to vision.

to

to aſſiſt you in ſo pleaſing a ſpeculation, as that of the eye, we ſhall add, that by reaſon ox eyes are much larger, and more eaſier to be had than human ones, we are wont to make much uſe of them, and to diſcern ſome things better in their coats, we immerſe them for a little while in boiling water; and to be able to conſider the form and bigneſs of the vitreous and cryſtalline humours, better than the fluidity of the one, and the ſoftneſs of the other are wont to allow anatomiſts to do; we have ſometimes, by a way hereafter to be ſet down, ſpeedily frozen eyes, and thereby have turned the vitreous humour into very numerous and diaphanous films (as it were of ice, and the cryſtalline into a firm ſubſtance,) but (which perhaps you will wonder at) not tranſparent. An eye thus frozen may be cut along that, which optical writers call the optical axis, and then it affords an inſtructive proſpect, which we have not been able to obtain any other way. But becauſe, notwithſtanding this expedient in the eyes of men, and the generality of terreſtrial animals, the opacouſneſs of the ſclerotis hinders the pictures, that outward objects (unleſs they be lucid ones) make within the eye to be clearly diſcerned; we think our ſelves obliged to that excellent mathematician of your acquaintance, *Pyrophilus*, who, upon ſome diſcourſe we had with him concerning this ſubject, lately adviſed us to make uſe of the eyes of white rabbits (for if thoſe animals be of another colour, he ſays, their eyes will not prove ſo fit for our purpoſe.) For having held ſome of theſe eyes at a convenient diſtance betwixt my eyes and the window, I found them to be ſo tranſparent, that the rays proceeding from the pains of glaſs, Iron bars, *&c.* of the window, paſſing though the cryſtalline humor and in their paſſage refracted, did, on the retina, exhibit in an inverted poſture, according to the optical laws, the contracted, but lively pictures of thoſe external objects; and thoſe pictures, by reaſon of the tranſparency of the ſclerotis, became viſible through it to my attentive eyes: as in a darkened room the ſhadows of objects without it, projected on a fine ſheet of paper, may, by reaſon of the thinneſs of paper, be ſeen thorough it by thoſe that ſtand behind it. By candle-light we could ſee little in the bottom of theſe eyes but lucid objects, ſuch as the flame of the candle, which appeared tremulous, though inverted; but by day-light we could manifeſtly diſcern in them, both the motions of very neighbouring objects, and the more vivid of their colours.

The way to prepare the eyes of animals for the better making obſervations on them

Some particulars wherein the eyes of white rabbits are better than others for obſervation.

AND really, *Pyrophilus*, it ſeems to me, not only highly diſhonourable for a reaſonable ſoul to live in ſo divinely built a manſion, as the body ſhe reſides in, altogether unacquainted with the exquiſite ſtructure of it; but I am confident, it is a great obſtacle to our rendering God the praiſes due to him, for his having ſo excellently lodged us, that we are ſo ignorant of the curious workmanſhip of the manſions our ſouls live in: for not only the Pſalmiſt, from the conſideration of the divine art diſplayed by God, in the moulding and faſhioning his body in the womb, takes a juſt occaſion to celebrate his Maker, *I will praiſe thee* (ſays he) *becauſe I am fearfully and wonderfully made. Marvellous are thy works, and that my ſoul knoweth right well: my ſubſtance was not hid from thee, when I was made in ſecret, and curiouſly wrought*, (with as much curioſity as tapeſtry or embroidery, as the Hebrew *Rukkamti* ſeems to import.) *In the loweſt parts of the earth thine eyes did ſee my ſubſtance, yet being unperfect; and in thy book all my members were written, which in continuance were faſhioned, when as yet there were none of them.* But even from *Galen* himſelf anatomical reflections have been able to extort expreſſions of devotion: *Cum igitur* (ſays he) *quod in omnibus recte fit, omnes ad artem referunt, quod autem in uno, aut duobus non ad artem, ſed fortunam; merito ex noſtri ſtructura corporis licet admirari ſummam artem, æquitatem & vim naturæ quæ nos conſtruxit. Conſtat ſiquidem corpus noſtrum ex oſſibus pluribus quam ducentis, ad ſingula oſſa vero pervenit nutriens vena; ſicut ad muſculos: cum hâc etiam arteria & nervi; pariaque adamuſſim ſunt, & omnino ſimilia in dextra animantis ſita, iis quæ in altera ſunt; os oſſi, muſculus muſculo, vena venæ, arteria arteriæ, ac nervus nervo; idque exceptis viſceribus, atque nonnullis particulis, quæ habere propriam deſcriptionem videntur. Duplices itaque corporis noſtri partes, omnino inter ſe ſunt ſimiles & magnitudine & conformatione, ſicuti & conſiſtentia quam voco juxta mollitiem, duritiemque differentia. Quemadmodum igitur de humanis effectibus judicium faciamus, ex navi ſumma arte conſtructa cognoſcentes peritiam artificis, ita etiam de Divinis facere convenit, corporiſque noſtri opificem admirari, quicunque tandem is deorum exiſtat, etiamſi eum non videmus:* 'Whereas therefore (ſaith he) all men aſcribe 'that to art, which is made aright in all reſpects, but that, which is only in one or 'two, not to art, but fortune; the ſtructure 'of our body gives us cauſe to admire the excellent art, exactneſs, and power of nature, 'which framed us. For our body conſiſts of 'above two hundred bones; to each of which 'tends a vein for conveying of nouriſhment '(in like manner as to the muſcles) which is 'accompanied with an artery and a nerve; and 'the parts are exactly pairs, and thoſe placed 'in the right ſide of an animal are wholly 'alike to thoſe in the other, bone to bone, 'muſcle to muſcle, vein to vein, artery to artery, and nerve to nerve; excepting only 'the bowels, and ſome other parts, which 'ſeem to have a peculiar conſtruction. So 'that the parts of our body are double, and 'altogether alike among themſelves, both in 'greatneſs and ſhape, as alſo in conſiſtence, 'which I place in the diverſity of ſoftneſs and 'hardneſs. As therefore we uſe to judge of 'things made by men, acknowledging the 'ſkill of a workman, by the building of a 'ſhip with extraordinary art; ſo alſo it behoveth to do in thoſe of God, and to admire the framer of our body, whoſoever of 'the gods he were, although we do not ſee 'him.'

Pſal. cxxxix 14, 15, 16.

Proved out of inſtances in the Pſalmiſt and Galen.

Galen de plac. Hip. & Plat. lib. 7.

That it is diſhonourable for the ſoul to be unacquainted with the exquiſite ſtructure of the body, being its own manſion.

PERHAPS it may be truly ſaid yet further, that

that, although in human bodies, many wonders, as we have lately mentioned, have been diſcovered to us by anatomy, yet anatomy it ſelf has not diſcovered to us all the wonders to be met with in a human body, nor will detect them, till anatomiſts be ſkilled in ſome other things over and above that of dexterouſly diſſecting. For it ſeems very probable, that the excellent contrivance of ſome parts will never be fully apprehended, without a competent knowledge of the nature of thoſe juices, that are to paſs thorough them, and ſome of them receive their beginning, or ſome alteration, in them; and the nature of theſe juices will ſcarce be exactly known, without ſome ſkill in divers parts of phyſiology, and eſpecially in chymiſtry. Beſides, the reaſon of the origination, ſhape, bulk, length, progreſs, and inſertion of each particular muſcle, can hardly be well accounted for without ſome ſkill in the principles of mechanicks, and in the nature and properties of leavers, pulleys, *&c.* Moreover, there is a certain harmonious proportion betwixt the parts of a human body, in reference both to the whole, and to one another, which is not wont to be heeded by anatomiſts, but much taken notice of by ſtatuaries and painters. For they reckon, that when a man's arms are diſplayed, the diſtance betwixt his middle fingers is equal to the height of his body; ſo they reckon ſometimes ſeven, ſometimes eight lengths of the head, to the length of the body; and four times the length of the noſe to that of the head, as three times the ſame length to that of the face. And divers ſuch obſervations we have met with among them, which we ſhall not now inſiſt on, but rather tell you, that without ſome ſkill in opticks, it will be hard for an anatomiſt to ſhew the wiſdom of God in making the cryſtalline humour of the eyes of men only of a ſomewhat convex or lenticular form, rather than as thoſe of fiſhes of an almoſt perfectly ſpherical one, (as to the anterior part, which is obverted to the outward objects.) Nor do I remember, that in anatomy ſchools I have heard any account give of this difference, which yet tends much to manifeſt the wiſdom of the author of nature, who has ſo excellently ſuited the eyes of animals to the ſeveral parts of the univerſe he deſigned them to inhabit. For men, and other terreſtrial animals living in the air, the beams of light, reflected from viſible objects, and falling over the cornea, and the aqueous humour, do neceſſarily ſuffer a refraction there, as coming from the air, which is a thinner medium, into a thicker, and ſo there needs the leſs of farther refraction to be made by the cryſtalline humour, and conſequently its figure needs to be but moderately convex: whereas fiſhes living conſtantly in the water, the medium, through which they ſee things, is almoſt of a like thickneſs with the cornea and aqueous humour; ſo that there being little or no refraction made in their eyes but by the cryſtalline it ſelf, it was neceſſary, that that ſhould be exceedingly convex, that it might make a very great refraction, and thereby unite the beams nearer at hand; which, if the cryſtalline were leſs convex, would tend to a point of concourſe beyond the retina, and conſequently paint on it but a languid and confuſed picture of the object they ſhould repreſent.

Why the anterior part of fiſhes eyes ought to be more ſpherical than thoſe of men.

As for *Paracelſus*, certainly he is injurious to man, if (as ſome eminent chymiſts expound him) he calls man a microcoſm, becauſe his body is really made up of all the ſeveral kinds of creatures the macrocoſm or greater world conſiſts of, and ſo is but a model or epitome of the univerſe: for (to omit, that the ancients, as *Galen* informs us, gave the title of microcoſms to animals in general) it is the glory and prerogative of man, that God was pleaſed to make him, not after the world's image, but his own. On which occaſion give me leave to tell you, that however the conſideration of the dignity conferred on us in the image of God, (in whatever that image be reſolved to conſiſt) ſhould, methinks, be ſome engagement to us to look upon our ſelves as belonging unto God; as our Saviour, from the image of *Cæſar* ſtampt upon a coin, pronounced it fit to render unto *Cæſar* the things of *Cæſar*, and to God thoſe of God.

That God made man not after the world's image, but his own.

Lib. 3. De Uſu Part.

That the image of God on us ſhould engage us to eſteem ourſelves as belonging to God.

In the fourth place, I conſider, that the univerſal experience of all ages manifeſts, that the contemplation of the world has been much more prevalent to make thoſe, that have addicted themſelves to it, believers, than deniers of a Deity. For it is very apparent, that the old philoſophers, for the moſt part, acknowledged a God; and as evident it is, by their want of revelation, by many paſſages in their writings, and by divers other things not now to be inſiſted on, that the conſideration of the works of nature was the chief thing, that induced them to acknowledge a divine author of them. This truth I could eaſily make out, were I at leiſure to tranſcribe teſtimonies, which, becauſe I am not, I ſhall content my ſelf to mention to you one, which may well ſerve for many, it being a confeſſion made by *Ariſtotle*, or whatever other learned philoſopher it was, who writ the book *de Mundo*, that God's being the architect and upholder of the world was the general belief of the ages, that preceded his. *Vetus* (ſays he) *ſermo eſt à majoribus proditus, inter omnes homines, univerſa tum ex Deo tum per Deum conſtituta fuiſſe atque coagmentata, nullamque naturam ſatis inſtructam ad ſalutem eſſe poſſe, quæ citra Dei præſidium, ſuæ ipſa demum tutelæ permiſſa ſit:* 'It is an ancient tradition (ſaith 'he) diffuſed amongſt all mankind from our 'anceſtors, that all things were made and pro-'duced of God, and by God; and that no 'nature can be ſufficiently furniſhed for its own 'ſafety, which is left without the ſupport of 'God, to its own protection.' And as for both the opinion of that eminent author himſelf, and the grounds of it, he ſpeaks of God and the creation almoſt in the terms of St. *Paul: Proinde* (ſays he) *hæc etiam de Deo ſentienda nobis ſunt, illo quidem, ſi vim ſpectes, valentiſſimo; ſi decorem, formoſiſſimo; ſi vitam, immortali; denique, ſi virtutem, præſtantiſſimo. Quapropter cum ſit inconſpicabilis naturæ omni interituræ, ipſis nihilominus ipſe cernitur ab operibus, atque ea quidem quæ aëre quoquo modo affecto,*

Argument from authority, and the experience of all ages, that the contemplation of the world has addicted man to the reverence of God.

Libro De Mundo, cap. 6.

Alibi eodem c.

affecto, quæ in terra, quæ in aqua, ea certè Dei opera eſſe meritò dixerimus: Dei inquam opera, cum imperio ſummo mundum, ac pro poteſtate obtinentis, ex quo Deo, ut inquit Empedocles phyſicus:

Omnia quotquot erunt, quot ſunt præſentia, quotque
Orta fuere antehac ſtirpes, homineſque feræque,
Indè etiam volucres, piſceſque humoris alumni.

'Thus therefore we ought to conceive of 'God: if we conſider his power, he is omni-'potent; if his ſhape, moſt beautiful; if his 'life, immortal; and finally, if his virtue, moſt 'excellent. Wherefore though undiſcernible 'by any corruptible nature, yet he is perceived 'by ſuch in his works; and indeed thoſe things 'which are produced in the air, by any mu-'tation whatſoever, in the earth, or in the 'water, we ought deſervedly to term the 'works of God; which God is the abſolute 'and ſovereign Lord of the world, and out of 'whom (as ſaith *Empedocles* the naturaliſt,)

All things beginning have, which e'er ſhall be,
Are preſent or to come, plants, men, and beaſts,
And fowl, and fiſh the off-ſpring of the ſea.

AND thoſe few philoſophers (if ever there have been any at all) that have been really atheiſts, are no ways conſiderable for their number, in reſpect of thoſe, that have aſſerted a Deity; and their paradoxes have been looked upon as ſo irrational, that, as ſoon as they have been propoſed, they have been diſdainfully rejected and condemned by all the reſt of mankind, who have looked upon the patrons of them as monſters, rather than philoſophers. And if there be, at this day, any nations (as navigators inform us there are in *Braſil*, and ſome other parts of the *Indies*) that worſhip no God, they conſiſt not of naturaliſts, but brute, and irrational barbarians, who may be ſuppoſed rather to ignore the being of God, than deny it; and who, at leaſt, are little leſs ſtrangers to the myſteries of nature, than to the author of it. And if it be a truth, that there are really ſuch atheiſtical people, it may ſerve to recommend to us the ſtudy of phyſiology, by ſhewing us, that without the help of any ſuch innate belief, or perſuaſion of a God, as is ſuppoſed connatural to man, reaſon exerciſed upon the objects the creation preſents us with, is ſufficient to convince philoſophers of a Deity. And indeed ſuch a care has God taken, to make his being conſpicuous in his creatures, that they all ſeem loudly and unanimouſly to ſpeak to their attentive conſiderers, in the Pſalmiſt's language, *Know ye, that the Lord he is God; it is he, that hath made us, and not we our ſelves.* And as it is ſaid, *That the ſtars in their courſes fought againſt Siſera*, ſo it may be truly ſaid, that not only the ſtars, but all the reſt of the creatures do in their courſes fight againſt the atheiſt, by ſupplying an unprejudiced conſiderer of them with weapons fit to overthrow his impious error. To which purpoſe, I remember, *Ariſtotle*, in his book *de Mundo*, makes uſe of a pretty ſimile, to declare the conſpicuouſneſs of the Creator in his creatures: *Fama eſt* (ſays he) *Phidiam illum ſtatuarium, quum Minervam illam* cap. 6. *quæ eſt in arce coagmentaret, in medio ejus ſcuto faciem ſuam expreſſiſſe, oculoſque fallenti artificio ita devinxiſſe ſimulachro, eximere ut indè ipſam ſiquis cuperet, minimè poſſet, aliter quidem certè, quam ut ipſum ſolveret ſimulachrum, opuſque ejuſmodi compactile confunderet? hanc eandem rationem Deus habet in mundo, utpote qui univerſorum coagmentationem cohærentem cohibeat & coarctet, incolumitatemque univerſitatis conſervet; niſi quatenus non medio ille loco in terra ſcilicet, ubi turbida regio eſt, ſed in excelſo ſitus eſt, purus ipſe in puro loco:* 'It is reported, that when 'Phidias, the excellent ſtatuary, made the 'image of *Minerva*, which is in the caſtle at 'Athens, he contrived his own picture in the 'middle of her ſhield, and faſtened the eyes 'of it to the ſtatue by ſo cunning workman-'ſhip, that if any one were minded to take it 'away, he could not do it without break-'ing the ſtatue, and diſordering the con-'nection of the work. After the ſame man-'ner is God in the world, retaining and up-'holding the coherence of all things, and pre-'ſerving the ſafety of the univerſe: only he 'is not in the midſt of it, namely the earth, 'which is a turbulent region; but in the high-'eſt place, which is ſuitable to his purity.'

A compariſon of the image of God in the creature to that of Phidias *on* Minerva's *ſhield.*

BUT to declare, how atheiſts may be reduced either to confeſs a firſt cauſe, or to offer violence to their own faculties, by denying things as certain as thoſe, which it is apparent that (in other caſes) themſelves firmly aſſent to, would require a diſcourſe too large to be proper to be proſecuted here; and therefore if I have not, in another treatiſe, an opportunity of inſiſting on that ſubject, I muſt content my ſelf to refer you, for further ſatisfaction on it, to the writers of natural theology.

NOR does phyſiology barely conduce to make men believe the exiſtence of a Deity, but admire and celebrate the perfections of it: and the nobleſt worſhip from that greater part of the world, to which God did not vouchſafe any explicite and particular revelation of his will, hath been paid him by thoſe, whom the beauty of this goodly temple of the univerſe tranſported with a rational wonder at the wiſdom, power, and goodneſs of the divine architect. And this kind of devotion being commonly proportionate to the diſcoveries of nature, that begot it, it needs not ſeem ſtrange, that divers of the beſt philoſophers amongſt the Heathens ſhould be the greateſt celebrators of God. And it was therefore, perhaps, not without cauſe, that the Indian gymnoſophiſts, the Perſian magi, the Egyptian ſacrificers, and the old Gauls druids, were to their people both philoſophers and prieſts; and that in divers civilized nations, philoſophy and prieſthood were ſo allied, that thoſe whoſe profeſſion ſhould give them moſt intereſt in the definition of man, made a more ſtrict profeſſion of celebrating and praiſing God. I might eaſily, with divers inſtances, manifeſt, how great a veneration the ſtudy of the creatures has given philoſophers, for thoſe attributes of God, that are ſtampt upon them, and conſpicuous in them:

That thoſe people, who worſhip not God, are not naturaliſts, but barbarians; and that their atheiſm doth continue for want of the contemplation of the world.

Pſalm c 3.

Judg. v. 20.

them: but my willingneſs to haſten to the more experimental part of what I have to ſay concerning the uſefulneſs of phyſiology, makes me content my ſelf to preſent you with a couple, or a leaſh of authorities, for proof of what has been alledged: the firſt ſhall be of *Galen*, in his third book *De uſu partium*, where treating of the ſkin, that inveſts the ſoal of the foot, *Cutem ipſam* (ſays he) *non laxam, aut ſubtilem, aut mollem, ſed conſtrictam, & mediocritèr duram, ſenſilemque ut non facilè pateretur, ſubdidit pedi ſapientiſſimus Conditor noſter: cui commentarios hos, ceu hymnos quoſdam compono, & in eo pietatem eſſe exiſtimans, non ſi taurorum ἑκατόμβας ei plurimas quiſpiam ſacrificarit, & caſias aliaque ſexcenta unguenta ſuffumigarit. Sed ſi noverim ipſe primus, deindè expoſuerim aliis, quænam ſit ipſius ſapientia, quæ virtus, quæ providentia, quæ bonitas; ignorantia quorum ſumma impietas eſt, non ſi à ſacrificio abſtineas. Quod enim cultu convenienti exornavit omnia, nulliquè bona inviderit id perfectiſſimæ bonitatis ſpecimen eſſe ſtatuo. Inveniſſe autem quo pacto omnia adornarentur ſummæ ſapientiæ eſt, at effeciſſe omnia quæ voluit virtutis eſt invictæ.* 'Our moſt wiſe 'Creator hath placed under the foot a ſkin, 'not looſe, or thin, or ſoft, but cloſe, and of 'indifferent hardneſs and ſenſe, to the end it 'might not eaſily ſuffer injury. To him I 'compoſe theſe commentaries as certain hymns, 'eſteeming piety not to conſiſt in ſacrificing 'many hecatombs of oxen to him, or burning 'caſſia, and a thouſand other perfumes; but 'in this, firſt to know my ſelf, and then to 'declare to others, what his wiſdom, power, 'providence, and goodneſs is: the ignorance 'of which, not the abſtaining from ſacrifice, 'is the greateſt impiety. For I account it an 'evidence of moſt perfect goodneſs, that he 'hath furniſhed all things with convenient or'nament, and denied his benefits to none. 'Now to have deviſed, how all things might 'be handſomely framed, is the part of higheſt 'wiſdom; but to have made all things, which 'he would, of inſuperable power.' To which illuſtrious paſſage he annexes much more, worthy of *Galen*'s pen, and your peruſal.

The nobleſt worſhip, that has been paid God, from ſuch, who have not had particular revelation of his will, has aroſe from the ſpeculation of God's wiſdom, power, and goodneſs in the fabrick of the creatures.

The teſtimonies of Galen, Hermes, Paracelſus, L. Bacon.

To this let me add, in the ſecond place, that of *Hermes Triſmegiſtus*, almoſt at the very beginning of his firſt book, Engliſhed by Dr. *Everard*: *He that ſhall learn and ſtudy the things that are, and how they are ordered and governed, and by whom, and for what cauſe, or to what end, will acknowledge thanks to the workman, as to a good father, an excellent, nurſe and a faithful ſteward; and he that gives thanks ſhall be pious or religious, and he that is religious ſhall know both where the truth is, and what it is; and learning that, he will be yet more and more religious.* To which I cannot but add, a reſembling paſſage of that great Hermetical philoſopher (as his followers love to call him) *Paracelſus*: *Oppidò* (ſays he) *admirabilis, in ſuis operibus, Deus eſt; à quorum contemplatione nec interdiu, nec noctu deſiſtendum, ſed jugiter illorum indagationi vacandum eſt, hoc enim eſt ambulare in viis Dei:* 'God is very admirable in his works; from 'the contemplation of which we ought not to 'deſiſt night or day, but continually be im'ployed in the inquiſition of them: *for this is 'to walk in the ways of God.*' All which bears witneſs to, and may, in exchange, receive authority from that remarkable paſſage of that great and ſolid philoſopher, Sir *Francis Bacon*, who ſcruples not ſomewhere to affirm, 'That 'a little or ſuperficial taſte of philoſophy, may, 'perchance, incline the mind of a man to athe'iſm; but a full draught thereof brings the 'mind back again to religion. For in the en'trance of philoſophy, when the ſecond cauſes, 'which are next unto the ſenſes, do offer 'themſelves to the mind of man, and the 'mind it ſelf cleaves unto them, and dwells 'there, a forgetfulneſs of the higheſt cauſe 'may creep in: but when a man paſſeth fur'ther, and beholds the dependency, continu'ation, and confederacy of cauſes, and the 'works of providence, then, according to the 'allegory of the poets, he will eaſily believe, 'that the higheſt link of nature's chain muſt 'needs be tied to the foot of *Jupiter*'s chair: or (to ſpeak our chancellor's thoughts more ſcripturally) 'That phyſiology, like *Jacob*'s 'viſion, diſcovers to us a *ladder, whoſe top 'reaches up to the foot-ſtool of the throne of God.*' To which he deſervedly adds; *Let no man, upon a weak conceit of ſobriety, or ill-applied moderation, think or maintain, that a man can ſearch too far, or be too well ſtudied, in the book of God's word, or in the book of God's works, divinity, or philoſophy. But rather let men awake themſelves, and cheerfully endeavour and purſue an endleſs progreſs or proficiency in both; only let them beware leſt they apply knowledge to ſwelling, not to charity, to oſtentation, not to uſe: And again, that they do not unwiſely mingle and confound theſe diſtinct learnings of theology and philoſophy, and their ſeveral waters together.*

Sir Francis Bacon *Advan. of Learning*, lib. I.

Gen. xxviii.

Paracel. *de Mineral. Tract.* I.

In the fifth place, *Pyrophilus*, I conſider, that when the divines we are anſwering, ſuppoſe phyſiology likely to render a man an atheiſt, they do it (as hath above been noted already) upon this ground, that natural philoſophy may enable him to explicate both the regular phænomena, and the aberrations of nature, without having recourſe to a firſt cauſe or God. But though this ſuppoſal were as great a truth, as we have endeavoured to make it a miſtake, yet I ſee not, why a ſtudier of phyſiology, though ever ſo great a proficient in it, may rationally be an utter enemy to atheiſm. For the contemplation of the creatures is but one of the ways of coming to be convinced, that there is a God; and therefore, though religion were unable to make uſe of the argument drawn from the works of nature, to prove the exiſtence of a Deity, yet has ſhe other arguments enough beſides, to keep any conſiderate and impartial man from growing an atheiſt. And here give me leave, for the ſake of theſe divines, to obſerve, that though the devils be ſpirits, not only extremely knowing in the properties of things, (by their hidden ſkill in phyſiology, by which they teach magicians, and their other clients, to do divers of the ſtrange things for which they are admired) but alſo unmeaſurably proud, and willing to pervert their

That religion has other arguments beſides thoſe drawn from the works of nature, enough to keep any conſidering man from atheiſm.

their knowledge to the cheriſhing of atheiſm, yet St. *James* informs us, *that they themſelves believe there is a God, and tremble at him:* which argues, either, that ſkill in natural philoſophy does not neceſſarily lead to atheiſm, or that there are other arguments, beſides thoſe drawn from ſcience, ſufficient to convince the moſt refractory of the exiſtence of a Deity.

Jam. ii. 19.

BUT not to inſiſt on any thing of this nature, nor ſo much as to mention, what proofs the conſideration of our own minds, and their in-bred notions may afford us of a Deity, I ſhall content my ſelf to mind you, that the ſeveral patefactions, which God has been pleaſed to make of himſelf, to man eſpecially, thoſe made by ſeaſonably accompliſhed prophecies, and by miracles, do not only demonſtrate the being, but the providence, and divers of the attributes of God. And indeed, methinks, the divines we reaſon with, may well allow theſe patefactions to be capable of evincing the exiſtence of a God, ſince they are ſufficient, and, for aught I know, the beſt arguments we have to convince a rational man of the truth of the Chriſtian religion. For the miracles of Chriſt (eſpecially his reſurrection) and thoſe of his diſciples, by being works altogether ſupernatural, overthrow atheiſm; and being owned to be done in God's name, and to authorize a doctrine aſcribed to his inſpiration, his goodneſs and his wiſdom, permit us not to believe, that he would ſuffer ſuch numerous, great, and uncontrolled miracles, to be ſet as his ſeals to a lye, and delude men little leſs than inevitably into the belief of a doctrine not true. And as for the miracles themſelves (eſpecially that of Chriſt's reſurrection, ſo much, and ſo deſervedly inſiſted on by *Peter* to the Jews, and *Paul* to the Gentiles) the truth of them is ſo aſcertained to us by many of the ſolemneſt, and moſt authentick ways of atteſtation, whereby the certainty of matters of fact is capable of being ſatisfactorily made out, that it is hard to ſhew how theſe teſtimonies can be denied, without denying ſome acknowledged principle of reaſon, or ſome other received notion, which theſe contradictors opinions or practice manifeſt them to look upon as a truth. And upon this account, ſo much might be ſaid to evince the reaſonableneſs of aſſenting to the Chriſtian religion, and to ſhew, that as much may be ſaid for it, as need be ſaid for any religion, and much more, than can be ſaid for any other; that it need be no wonder, that, as learned men as ever the world admired, have not only been many of them embracers, but ſome of them champions of it. But having more fully, in another treatiſe, diſcourſed of this ſubject, I ſhall content my ſelf to make this inference from what has been alledged, that ſince the moſt judicious propugners of Chriſtianity have held and found, that, upon the ſcore of God's miraculous revelations of himſelf, rational men might be brought to believe the abſtruſer articles of the Chriſtian religion, thoſe revelations cannot but be ſufficient to convince them of ſo fundamental and refulgent a truth (which all the others ſuppoſe) as that of the exiſtence of God.

IN the ſixth and laſt place, I will here add (on this occaſion) that an inſight into phyſiological principles may very much aſſiſt a man to anſwer the objections of atheiſts againſt the being of a Deity, and the exceptions they make to the arguments brought to prove, that there is one. For though it has long been the cuſtom of ſuch men, to talk, as if themſelves, and thoſe of their mind, were not alone the beſt, but almoſt the only naturaliſts; and to perplex others with pretending, that, whereas it is not conceiveable, how there can be a God; all things are by the principles of the atomical philoſophy, made clear and facil: Though this, I ſay, have long been uſed among the oppoſers of a Deity, yet he, that, not regarding their confidence, ſhall attentively conſider the very firſt principles of things, may plainly enough diſcern, that of the arguments, wherewith natural philoſophy has furniſhed a heiſts, thoſe, that are indeed conſiderable, are far fewer than one would readily think; and that the difficulty of conceiving the eternity, ſelf-exiſtence, and ſome other attributes of God (though that afford them their grand objection) proceeds not ſo much from any abſurdity belonging to the notion of a Deity, as ſuch; as from the difficulty, which our dim human intellects find to concieve the nature of thoſe firſt things (whatever we ſuppoſe them) which, to be the cauſes of all others, muſt be themſelves without cauſe: for he, that ſhall attentively conſider, what the atomiſts themſelves may be compelled to allow, concerning the eternity of matter, the origin of local motion (which plainly belongs not to the nature of body) the infinity or boundleſſneſs of ſpace, the diviſibleneſs or non-diviſibility of each corporeal ſubſtance into infinite material parts, may clearly perceive, that the atomiſt, by denying, that there is a God, cannot free his underſtanding from ſuch puzzling difficulties, as he pretends to be the reaſons of his denial: for inſtead of one God, he muſt confeſs an infinite number of atoms to be eternal, ſelf-exiſtent, immortal, ſelf-moving, and muſt make ſuppoſitions, incumbred with difficulties enough to him, that has competently accuſtomed his thoughts to leave ſecond cauſes, beneath them, and contemplate thoſe cauſes, that have none. But I am unwilling to ſwell this eſſay, by inſiſting on ſuch conſiderations as theſe, eſpecially ſince you may find them more aptly deduced in other papers, ſome of which treat of the truth of Chriſtian religion, and others are deſigned for the illuſtration of ſome things in this and the foregoing eſſays. For I muſt confeſs to you, *Pyrophilus*, that by reaſon of ſundry avocations, I have been ſo diverted from propoſing ſome of the reaſons I have employed to their beſt advantage, that I my ſelf, at another time, could have both mentioned them with leſſer diſadvantage, and have added divers others: and therefore, I have not only had thoughts of enlarging upon ſome paſſages of our paſt diſcourſe, but I long ſince made a collection (though it be not now in my power) of obſervations, and experiments to elucidate a point in one of thoſe diſcourſes, whereby may be enervated one of the three chief

That the difficulty of conceiving the eternity, ſelf-exiſtence, and other attributes of one God, is leſs, than to conceive infinite eternal ſelf-exiſtent and ſelf-moving atoms.

chief phyſiological reaſonings, that I have met with, among the atheiſts.

UPON conſideration of all the premiſes, I confeſs, *Pyrophilus*, that I am inclined to think there may, perhaps, be more cauſe to apprehend, that the delightfulneſs of the ſtudy of phyſiology ſhould too much confine your thoughts and joys to the creatures, than that your proficiency in it ſhould bring you to diſbelieve the Creator. For I have obſerved it to be a fault, incident enough to ingenious perſons, to let their minds be ſo taken up, and, as it were, charmed with that almoſt infinite variety of pleaſing objects, which nature preſents to their contemplation, that they too much diſ-reliſh other pleaſures and employments, and are too apt to undervalue even thoſe, wherewith the improved opportunities of ſerving God, or holding communion with him, are capable of bleſſing the pious ſoul.

BUT, *Pyrophilus*, though comparatively to fame, and miſtreſſes, and bags, and bottles, and thoſe other tranſient, unſatisfactory, (in a word) deluding objects, on which the greateſt part of miſtaken mortals ſo fondly doat, the entertaining of our nobleſt faculties with objects ſuited to them, and proper both to gratify our curioſity, and to enrich our underſtandings, with variety of acceptable and uſeful notions, affords a ſatisfaction, that very well deſerves the choice and preference of a rational creature; yet certainly, *Pyrophilus*, as God is infinitely better than all the things, that he has made, ſo the knowledge of him is much better than the knowledge of them: and he, that has placed ſo much delightfulneſs in a knowledge, wherein he allows his very enemies to become very great proficients, has ſure reſerved much higher, and more contenting pleaſures to ſweeten and endear thoſe diſcloſures of himſelf, which he vouchſafes to none but thoſe that love him, and are loved by him.

As God is infinitely better than all his creatures, ſo the knowledge of him is better than the knowledge of his creatures.

AND therefore, *Pyrophilus*, though I will allow you to expect from the contemplation of nature a greater ſatisfaction, than from any thing you need decline for it, yet I would not have you expect from it any ſuch ſatisfaction as you may entirely acquieſce in; for nothing but the enjoyment of him, that made the ſoul for himſelf, can ſatisfy it, the creatures being as well uncapable to afford us a complete felicity by our intellectual ſpeculations of them, as by our ſenſual fruitions of them. For though the knowledge of nature be preferable by odds to thoſe other idols, which we have mentioned, as inferiour to it, yet we here attain that knowledge but very imperfectly, and our acquiſitions of it coſt us ſo dear, and the pleaſure of them is ſo allayed with the diſquieting curioſity they are wont to excite, that the wiſeſt of men, and greateſt of philoſophers among the ancients, ſcruples not, upon his own experience, to call the addicting of *one's heart to ſeek and ſearch out by wiſdom, concerning all things that are done under the heaven, a ſore travel given by God to the ſons of men; to be exerciſed* (or, as the original hath it, *to afflict themſelves*) *therewith*. And the ſame experienced writer elſewhere tells us, *That he that increaſes knowledge, increaſes ſorrow*. And it was perhaps for this reaſon, that *Adam* was formed out of paradiſe, and afterwards by God brought into it, to intimate, that felicity is not a thing, that man can acquire for himſelf, but muſt receive as a free gift from the liberal hand of God. And as the children of the prophets ſought tranſlated *Elias* with very great diligence, but with no ſucceſs, ſo do we, as fruitleſly as induſtriouſly, ſeek after perfect happineſs here, both they and we miſſing of what we ſeek, for the ſame reaſon; becauſe we ſeek for that on earth, which is not to be found but in heaven. And this I forewarn you of, *Pyrophilus*, not at all to diſcourage you from the ſtudy of phyſiology, but to keep you from meeting with that great diſcouragement of finding in it much leſs of ſatisfaction than you expected; an over-great expectation from it being one of the diſadvantagiouſeſt circumſtances with which it is poſſible for any thing to be enjoyed.

The imperfection and diſquiet, that there is in human ſcience.

Eccleſ. i. 13.

Eccleſ. i. 18.

2 King. cap. ii.

BUT at length, *Pyrophilus*, though late, I begin to diſcern, into how tedious a digreſſion my zeal for natural philoſophy, and for you, has miſ-led me, and how it has drawn from my pen ſome paſſages, which may ſeem to reliſh more of the preacher, than the naturaliſt; yet I might alledge divers things to juſtify, or, at leaſt, extenuate what I have done: as firſt, that if in making this excurſion I have erred, I have not done ſo without the authority of great examples. For not only *Seneca* doth frequently both ſeaſon his natural ſpeculations with moral documents and reflexions, and owns, that he purpoſely does ſo, where he ſays, *Omnibus rebus, omnibuſque ſermonibus aliquid ſalutare miſcendum eſt, cum imus per occulta naturæ, &c.* But even *Pliny* (as far as he was from being guilty of over-much devotion) does, from divers paſſages in his Natural Hiſtory, allow himſelf to take occaſion to inveigh againſt the luxury, exceſſes, and other epidemical vices of his time. And I might next repreſent, that perhaps the endeavouring to manifeſt, that the knowledge of the creatures ſhould, and how it may be referred to the Creator's glory, is not altogether impertinent to the deſign I have of promoting phyſiology; for it ſeems conſonant both to God's goodneſs, and that repeated axiom in the goſpel, which tells us, *that he, that improves his talents to good uſes, ſhall be intruſted with more*; that the imploying the little knowledge I have in the ſervice of him I owe it to, may invite him to increaſe that little, and make it leſs deſpicable. And perhaps it is not the leaſt cauſe of our ignorance, in natural philoſophy itſelf, that when we ſtudy the great book of nature, called the Univerſe, we conſult, peradventure, almoſt all other expoſitors to underſtand its myſteries, without making any addreſs for inſtruction to the author, who yet is juſtly ſtyled in the ſcripture, *that Father of lights* (in the plural number) *from whom deſcends every good and every perfect gift*; not only thoſe ſupernatural graces, that relate to another world, but thoſe intellectual endowments, that qualify men for the proſperous contemplation of this: and therefore in the evangelical prophet, he is ſaid, to inſtruct Iſa xxviii. even 25, 26.

Seneca *nat. quæſt.* lib. 2. cap. 59.

How the favour of God contributes to promote men's proficiency in the ſtudy of nature.

Jam i. 17.

even the plough-man, and teach him the ſkill and underſtanding he diſplays in his own profeſſion. And though I dare not affirm, with ſome of the Helmontians and Paracelſians, that God diſcloſes to men the great myſtery of chymiſtry by good angels, or by nocturnal viſions, as he once taught *Jacob*, to make
Gen. xxxi. lambs and kids come into the world ſpeckled, and ring-ſtreaked; yet perſuaded I am, that the favour of God does (much more than moſt men are aware of) vouchſafe to promote ſome men's proficiency in the ſtudy of nature, partly by protecting their attempts from thoſe unlucky accidents, which often make ingenuous and induſtrious endeavours miſcarry; and partly by making them dear and acceptable to the poſſeſſors of ſecrets, by whoſe friendly communication they may often learn that in a few moments, which coſt the imparters many a year's toil and ſtudy; and partly too, or rather principally, by directing them to thoſe happy and pregnant hints, which an ordinary ſkill and induſtry may ſo improve, as to do ſuch things, and make ſuch diſcoveries by virtue of them, as both others, and the perſon himſelf, whoſe knowledge is thus increaſed, would ſcarce have imagined to be poſſible: and in effect, the chiefeſt of the ſecrets, that have been communicated to me, the owners have acknowledged to me to have been attained, rather, as they were pleaſed to ſpeak, by accidental hints, than accurate inquiries: conceſſions of this nature I have divers times met with in the writings of the more ingenious of the chymiſts, and of other naturaliſts, and by one of theſe accidental hints, of late, the acute and lucky *Pecquet* was directed to find the newly diſcovered *lactea thoracica*, as before him *Aſellius* found without ſeeking, as himſelf confeſſeth, the *lactea meſenterica*; and by an accident too (as himſelf hath told me) did our induſtrious anatomiſt, Dr. *Jolive*, firſt light upon thoſe yet more freſhly detected veſſels, which afterwards the ingenious *Bartholinus*, without being informed of them, or ſeeking for them, hath met with, and acquainted the world with, under the name of *vaſa lymphatica*; and the two great inventions of the latter ages, gunpowder, and the loadſtone's reſpect unto the poles, are ſuppoſed to be due rather to chance, than any extraordinary ſkill in philoſophical principles (which indeed would ſcarce have made any man dream of ſuch extravagant properties, as thoſe of magnetick bodies) as if God deſigned to keep philoſophers humble, and (though he allow regular induſtry, ſufficient encouragment, yet) to remain himſelf diſpenſer of the chief myſteries of nature.

To what hath been repreſented, *Pyrophilus*, I might add much more to excuſe my excurſions, if I were not content to be beholden to you for a pardon; and to invite you to grant it me, I ſhall promiſe you to be very careful not to repeat the like offence. And whereas moſt chymical writers take occaſion, from almoſt every diſcovery or proceſs they acquaint us with, to digreſs and wander into tedious, and too often dull and impertinent theological reflections or ſermons; I have troubled you with almoſt all that I have to ſay (to you) of theological at once, and I have endeavoured to ſprinkle it, as far the ſubject would allow me, with ſome paſſages experimental. And indeed I ſhould not at all have engaged my ſelf into ſo long a diſcourſe of the not only innocency, but uſefulneſſes of the knowledge of nature, in reference to religion, but that I could not acquieſce in what I had met with on that ſubject in any of the writers I have peruſed, divines being commonly too unacquainted with nature, to be able to manage it phyſiologically enough, and naturaliſts commonly eſteeming it no part of their work to treat of it at all. And therefore I ſcruple not to confeſs freely to you, *Pyrophilus*, that, as I ſhall think my ſelf richly rewarded for all the enſuing eſſays, if the paſt diſcourſe but prove ſo happy as to bring you to value, and to make the religious uſe of the creatures recommended to you in it; ſo I had rather any of my papers ſhould be paſſed by unperuſed, than thoſe parts of theſe eſſays, that treat of that uſe. And indeed it is none of the leaſt of ſatisfactions I hope to derive from my phyſical compoſures, that by premiſing before them the now almoſt finiſhed diſcourſe, I have done my hearty endeavour to manifeſt and recommend the true uſe of all the diſcoveries of nature, which either my inquiries, or your own, may afford you. And indeed for my part, *Pyrophilus*, I eſteem the doctrine I have been pleading for of that importance, that I am perſuaded, that he, that could bring philoſophical devotion into the requeſt it merits, would contribute as much to the ſolemnizing of God's praiſes, as the benefactors of choriſters and founders of chauntries, and not much leſs than *David*'s ſo celebrated deſignation and ſettlement of that religious Levitical muſick, inſtituted for the ſolemn celebration of God.

The reaſon of the author's ſo long diſcourſe on this ſubject.

FOR the ſenſible repreſentations of God's attributes to be met with in the creatures, occurring almoſt every where to our obſervation, would very aſſiduouſly ſollicit us to admire him, did we but aright diſcern him in them; and the impreſſions made on the mind by theſe repreſentations, proceeding not from a bare (and perhaps languid) whether belief or notion of the perfections expreſſed in them, but from an actual and operative intuition of them, would excite an admiration (with the devotion ſpringing thence) by ſo much the more intenſe, by how much (it would be) more rational. And ſure, *Pyrophilus*, ſo much admirable workmanſhip, as God hath diſplayed in the univerſe, was never meant for eyes that wilfully cloſe themſelves, and affront it with the not judging it worthy the ſpeculating. Beaſts inhabit and enjoy the world; man, if he will do more, muſt ſtudy, and (if I may ſo ſpeak) ſpiritualize it. It is the firſt act of religion, and equally obliging in all religions: it is the duty of man, as man; and the homage we pay for the privi-
ledge of reaſon; which was given us, not only to refer our ſelves, but the other creatures, that want it, to the Creator's glory. Which makes me ſometimes angry with them, who ſo buſy themſelves in the duties and imployments

Beaſts inhabit and enjoy the world, it is man's duty to ſpiritualize it.

That it being the prime duty of man to give God the honour of his creatures, it is to be preferred before ſecondary duties.

of their ſecond and ſuperinduced relations, that they will never find the leiſure to diſcharge that primitive and natural obligation, who are more concerned as citizens of any place, than of the world; and both worſhip God ſo barely as Catholick or Proteſtants, Anabaptiſts or Socinians, and live ſo wholly as lords or councellors, Londoners or Pariſians, that they will never find the leiſure, or conſider not, that it concerns them to worſhip and live as men. And the neglect of this philoſophical worſhip of God, for which we are pleading, ſeems to be culpable in men proportionably to their being qualified, and comply with that invitation of the Pſalmiſt, *to ſing praiſes to God with underſtanding*, or (the expeſſion in the original being ſomewhat ambiguous) *to ſing to him a learned canticle*, as he elſewhere ſpeaks, *to praiſe him according to his excellent greatneſs*. For knowledge being a gift of God, intruſted to us to glorify the giver with it, the greatneſs of it muſt aggravate the neglect of imploying it gratefully; and the ſublimeſt knowledge here attainable will not deſtroy, but only heighten and enoble our admiration, and will prove the incenſe or more ſpiritual and acceptable part of that ſacrifice of praiſe, (for thoſe reflections, which their nature makes only acts of reaſon, their end may make acts of piety) wherein the intelligent admirer offers the whole world in eucharists to its Maker. For admiration (I do not ſay aſtoniſhment or ſurprize) being an acknowledgment of the objects tranſcending our knowledge, the learneder the tranſcendent faculty is, the greater is the admired object's tranſcendency acknowledged. And certainly, God's wiſdom is much leſs glorified by the vulgar aſtoniſhment of an unlettered ſtarer, (whoſe ignorance may be as well ſuſpected for his wonder, as the excellency of object) than from their learned hymns, whoſe induſtrious curioſity hath brought their underſtandings to a proſtrate veneration of what their reaſon, not ignorance, hath taught them not to be perfectly comprehenſible by them.

Pſal. xlvii. 7.

Pſal. cl. 2.

And as ſuch perſons have ſuch piercing eyes, that where a tranſient or unlearned glance ſcarce obſerves any thing, they can diſcern an adorable wiſdom, being able (as I may ſo ſpeak) to read the ſtenography of God's omniſcient hand; ſo their ſkilful fingers know how to chuſe and how to touch thoſe ſtrings, that may ſound ſweeteſt to the praiſe of their Maker. And on the opened body of the ſame animal, a ſkilful anatomiſt will make reflections, as much more to the honour of its Creator, than an ordinary butcher can; as the muſick made on a lute, by a rare lutaniſt, will be preferable to the noiſe made on the ſame inſtrument by a ſtranger unto melody. And give me leave to tell you, *Pyrophilus*, that ſuch a reaſonable worſhip (λογικὴ λατρεία) of God (to uſe St. *Paul*'s expreſſion, though in another ſenſe) is perhaps a much nobler way of adoring him, than thoſe, that are not qualified to practiſe it, are aware of, and is not improper even for Chriſtians to exerciſe. For, *Pyrophilus*, it would be conſidered, that as God hath not, by becoming (as the Scripture more than once ſtyles him) our Saviour, laid by his firſt relation to us as our Creator (whence St. *Peter* exhorts, even the ſuffering Chriſtians of his time, to commit their ſouls to God under the notion of a faithful Creator) ſo neither hath he given up his right to thoſe intelligent adorations from us, which become us upon the account of being his rational creatures: neither are ſuch performances made leſs acceptable to him by the filial relation, into which Chriſt hath brought us to him; that glorious relation as well endearing to him our ſervices, as our perſons.

That the different greatneſs in the knowledge makes a like difference in the honour given to the Creator.

Rom. xii. 1.

1 Tim. i. 1. Tit. ii. 10.

1 Pet. iv. 19.

God, by becoming our Saviour, has not laid aſide the relation of a Creator.

And let me add, *Pyrophilus*, that not only *Galen* (as we have ſeen already) tells us, that the diſcerning one's ſelf, and diſcovering to others the perfections of God diſplayed in the creatures, is a more acceptable act of religion, than the burning of ſacrifices or perfumes upon his altars: and not only *Triſmegiſtus*, forbidding *Aſclepius* to burn incenſe, tells him, 'That the thanks and praiſes of men, are the 'nobleſt incenſe that can be offered up to God:' But God himſelf (in his written word) is pleaſed to ſay, *That he, that ſacrificeth praiſe* (for ſo it is in the original) *honoureth him*. And the Scripture conſonantly mentions as a very acceptable part of religious worſhip, the *ſacrifice of praiſe, and the calves of our lips:* by offering up of which, we make that true uſe of the creatures, of ſo referring them to their Creator's glory, that (to conclude this diſcourſe by crowning it, as it were, with that excellent circle mentioned by the Apoſtle) as *all things are of him, and through him*, ſo they may be *to him; to whom be glory for ever*, Amen.

That he, who ſacrificeth praiſe, honoureth God.

Hermet Triſm. in Aſclep. c. 15.

The concluſion.

Heb. xiii. 15.

Rom. xi. 36.

OF

OF THE USEFULNESS OF NATURAL PHILOSOPHY.

PART II.

SECT. I.
Of its Uſefulneſs to PHYSICK.

ESSAY I.
Containing ſome particulars tending to ſhew the Uſefulneſs of Natural Philoſophy to the Phyſiological Part of Phyſick.

AFTER having, in the former part of this treatiſe, *Pyrophilus*, thus largely endeavoured to manifeſt to you the advantageouſneſs of natural philoſophy to the mind of man, we ſhall now proceed to ſpeak of its uſefulneſs both to his body and fortune.

The advantage of the knowledge of nature towards the increaſing the power of man; and its uſe as to health of the body and goods of fortune.

For I muſt ingeniouſly confeſs to you, *Pyrophilus*, that I ſhould not have near ſo high a value as I now cheriſh for phyſiology, if I thought it could only teach a man to diſcourſe of nature, but not at all to maſter her; and ſerved only, with pleaſing ſpeculations to entertain his underſtanding, without at all increaſing his power. And though I preſume not to judge of other men's knowledge; yet, for my own particular, I ſhall not dare to think my ſelf a true naturaliſt, till my ſkill can make my garden yield better herbs and flowers, or my orchard better fruit, or my field better corn, or my dairy better cheeſe, than theirs that are ſtrangers to phyſiology. And certainly, *Pyrophilus*, if we ſeriouſly intend to convince the diſtruſtful world of the real uſefulneſs of natural philoſophy, we muſt take ſome ſuch courſe, as that Mileſian *Thales* did, who was by the antients reckoned among the very firſt of their naturaliſts, and their ſeven celebrated wiſe men. Of this *Thales* it is reported, that being upbraidingly demanded, what advantage the profeſſors of aſtrology could derive from the knowledge of it; he aſtrologically foreſeeing what a year it would prove for olives, before any wonted ſigns of it did appear to huſbandmen, ingroſſed, by giving earneſt, the greater part of the olives, which the next ſeaſon ſhould afford to *Chios* and *Miletus*; and being thereby enabled, when moſt men wanted oil, to ſell his at his own rates, he made advantage enough of his ſkill, to let his friends ſee, that philoſophers may have the acquiſition of wealth more in their power than in their aim.

That in man's knowledge of the nature of creatures, conſiſts his empire over them.

METHINKS, it ſhould be a diſparagement to a philoſopher, when he deſcends to conſider huſbandry, not to be able, with all his ſcience, to improve the precepts of an art, reſulting from the lame and unlearned obſervations and practice of ſuch illiterate perſons as gardeners, plowmen, and milkmaids. And indeed, *Pyrophilus*, though it be but too evident, that the barren philoſophy, wont to be taught in the ſchools, hath hitherto been found of very little uſe in human life; yet if the true principles of that fertile ſcience were thoroughly known, conſidered, and applied, it is ſcarce imaginable, how univerſal and advantageous a change they would make in the world. For in man's knowledge of the nature of the creatures, doth principally conſiſt his empire over them, (his knowledge and his power having generally the ſame limits.) And as the nerves, that move the whole body, and by it, that great variety of engines imployed by man on his manifold occaſions, proceed from the brain; ſo all the operations, by which we alter nature, and produce ſuch changes in the creatures, flow from our knowledge of them. Theological inquiries excepted, there is no imployment, wherein mankind is ſo much and ſo generally concerned, as it is the ſtudy of natural philoſophy. And thoſe great tranſactions, which make ſuch a noiſe in the world, and eſtabliſh monarchies or ruin empires, reach not ſo many perſons with their influence, as do the theories of phyſiology.

That the diſcovery of America is owed to the knowledge of the loadſtone's polarity.

That the martial affairs all over the world were altered by the knowledge of the nature of brimſtone and ſaltpetre.

To manifeſt this truth, we need but conſider, what changes in the face of things have been made by two diſcoveries, trivial enough; the one being but of the inclination of the needle, touched by the loadſtone, to point toward the pole; the other being but a caſual diſcovery of the ſuppoſed antipathy between ſalt-petre, and brimſtone: for without the knowledge of the former, thoſe vaſt regions of *America*, and all the treaſures of gold, ſilver, and precious ſtones, and much more precious ſimples they ſend us, would have probably continued undetected; and the latter giving an occaſional riſe to the invention of gunpowder, hath quite altered the condition of martial affairs over the world, both by ſea and land. And certainly, true natural

natural philoſophy is ſo far from being a barren ſpeculative knowledge, that phyſick, huſbandry, and very many trades (as thoſe of tanners, dyers, brewers, founders, *&c.*) are but corollaries or applications of ſome few theorems of it.

How prejudicial the miſtake of that aphoriſm (that if teeming women be let blood, they will miſcarry) *hath been to female patients.*

IF I had not a great reſpect for the great *Hippocrates*, I ſhould venture to ſay, that ſome of thoſe rigid laws of *Draco* (whoſe ſeverity made men ſay, that they were written in blood) have, perhaps, coſt fewer perſons their lives, than that one aphoriſm of *Hippocrates*, which teaching, 'That if a teeming 'woman be let blood, ſhe will miſcarry,' has for divers ages prevailed with great numbers of phyſicians, to ſuffer multitudes of their female patients to die under their hands, who might probably have been reſcued by a diſcreet phlebotomy, which experience hath aſſured us (whatever the cloſe of the aphoriſm ſays to the contrary) to have been ſometimes not only ſafely, but uſefully employed, even when the infant is grown pretty big. But my reſpect for ſo great a perſon as *Hippocrates* makes me content it ſhould be thought, that, till of late, phyſicians have for the moſt part miſtaken their dictator's meaning in this aphoriſm, provided it be granted me, that through this miſtake numbers of teeming women have been ſuffered to periſh, who might probably, by the ſeaſonable loſs of ſome of their blood, have prevented that of their lives.

AND if an error, which occaſioned only a fault of omiſſion, hath been ſo prejudicial to mankind, I ſuppoſe you will readily grant, that thoſe errors of phyſicians, that are apt to produce faults of commiſſion, and raſh attempts, may prove much more hurtful. And ſo much I find to be acknowledged by *Galen*, in that honeſt and excellent paſſage of his, in his *Comment upon the Aphoriſms*, where having mentioned the danger of trying concluſions upon men, by reaſon of the nobleneſs of the ſubject; and having added, that the phyſician's art is not like that of a potter, a carpenter, or the like, where a man may freely try what he pleaſes to gratify his curioſity, or ſatisfy himſelf about his notions, becauſe, that if he ſpoils (for inſtance) the wood he works on, no body is indangered by his miſcarriage; he thus concludes, *In corpore autem humano ea tentare, quæ non ſunt experientium comprobata periculo, non vacat; cùm temerariæ experientiæ finis ſit totius animantis internecio*; 'But I dare not try 'thoſe things upon human body, which have 'not been before tried upon former experi-'ences; for the end of ſuch raſh experiments 'may be the ruin of all lives.'

Comment. in Aph. I. Lib. I.

The intereſt of this knowledge to the happineſs and life of man.

AND indeed, ſince the phyſician borrows his principles of the naturaliſt, I cannot but ſomewhat admire to ſee divers perſons, who are by themſelves and others thought ſuch wiſe men, think the ſtudy of natural philoſophy of ſmall concernment: for when by their policy or good fortune, they have acquired never ſo much wealth or power, and all other tranſitory goods, and are bleſt with children to inherit them, if the principles of natural philoſophy be miſlaid, we oftentimes ſee the ignorance or the miſtake of a doctor, deprive them of all at once, and ſhew how dangerous it is to be ſollicitous of the means of attaining the accommodations of life, with the contempt of that knowledge, which in very many caſes is humanly neceſſary to the preſervation of life it ſelf.

BUT, *Pyrophilus*, though our unintended prolixity in the former part of our diſcourſe, concerning the uſefulneſs of phyſiology, oblige us to the greater brevity in this latter part of it; yet, to ſhew you, that of the two things, which you may remember we told you, *Pythagoras* pronounced moſt god-like in man, *(The knowledge of truth, and the doing of good,)* phyſiology as well qualifies us for the latter, as it inriches us with the former. It will not be amiſs a little more particularly (though as ſuccinctly as ſo copious a ſubject will permit) to conſider the probability there is, that no ſmall improvement may be made by men's proficiency in experimental knowledge of thoſe arts, which are the chiefeſt inſtruments of man's dominion over the creatures. Theſe arts (to divide them not accurately, but popularly) do ſerve either to relieve man's neceſſities, as phyſick and huſbandry; or for his accommodation, as the trades of ſhoe-makers, dyers, tanners, *&c.* or for his delight, as the trades of painters, confectioners, perfumers, *&c.* to all which arts, and many others allied to them, philoſophical experiments and obſervations may, by a knowing naturaliſt, be made to extend a meliorating influence.

The enumeration of thoſe arts, to which this knowledge is profitable

IF I ſhould, *Pyrophilus*, ſay this, without offering any thing at all by way of proof, that I ſay it not inconſiderately, you would, I fear, believe, that I deliver it too ſlightly for a matter of that moment: and if, on the other ſide, I ſhould in this diſcourſe, preſent to you all the particulars, that I think I could without impertinency employ, to countenance what I have ſaid, it would ſwell this treatiſe to a volume, and defraud divers of my other eſſays. And therefore I hold it not unfit to chuſe a middle way, and ſet down, on this occaſion, either only, or chiefly thoſe things, which do the moſt readily occur to me, and do not ſo properly belong to the reſt of my phyſiological papers. And to avoid confuſion, I ſhall, according to the diviſion newly propoſed, employ one ſection of this ſecond part of the preſent treatiſe, in ſetting down ſuch things, as relate to the improvement of phyſick. And in the other ſection, deliver ſuch particulars, as concern thoſe other uſeful arts, that depend upon natural philoſophy. But in regard that (as I have already intimated) the following diſcourſe is to conſiſt chiefly of thoſe things, that belong not to any of my other eſſays, you will not, I preſume, expect that I ſhould handle any ſubject fully or methodically on this occaſion: which warning I eſpecially intend for that part of the enſuing diſcourſe, that relates to phyſick. For you will eaſily believe, that I am far from pretending to be a doctor in that faculty: and accordingly, in this and the four following eſſays, I ſhall only throw together divers ſuch particulars, as, not belonging

The method or way intended for the enſuing diſcourſe

to

* *Hipp. Aph.* Lib. V. Γυνὴ ἐν γαστρὶ ἔχουσα, φλεβοτομωθεῖσα ἐκτιτρώσκει· ϗ μᾶλλον εἰ μείζου εἴη τὸ ἔμβρυον.

to my writing, would perhaps be loſt, if I did not lay hold on this opportunity for their preſervation; of which they are not altogether judged unworthy by ſome knowing men, whoſe encouragements, to mention them to you, have diſſuaded me from wholly paſſing by, in this diſcourſe, matters properly medical, what ſcruples ſoever I had to venture at ſpeaking of them: eſpecially ſince I have not now the conveniency to furniſh theſe eſſays with divers particulars (by ſome, thought not inconſiderable,) which I may, perhaps, be invited to add to them hereafter, if I find by your reception of theſe, that the others are like to be welcome.

The diviſion of phyſick in five parts.

To ſay ſomething then of phyſick, and to ſuppoſe the fitneſs of the now received diviſion of it into five parts; the phyſiological, (the phyſician taking that in a ſtricter ſenſe than philoſophers, and than we do every where, ſave in this eſſay) pathological, ſemeiotical, hygieinal, and therapeutical; let us briefly take notice, how each of theſe is indebted to, or capable of being improved by experienced naturaliſts. And indeed, ſuch is the affinity between natural philoſophy and phyſick, or the dependance of this on that, that we need not wonder at the judicious obſervation of *Ariſtotle*, where he thus writes, *Naturalium ferè plurimis & medicorum, qui magis philoſophicè artem proſequuntur, illi quidem finiunt ad ea, quæ de medicina; hi vero ex iis quæ de natura, incipiunt quæ de medicina:* 'This is the 'courſe of naturaliſts and phyſicians, who pro-'ſecute their art philoſophically: the naturaliſt 'ends where medicine begins, and medicine 'begins where the naturaliſt endeth.' But we muſt inſtance theſe things more particularly: and firſt for phyſiology, it is apparent, that the phyſician takes much of his doctrine in that part of his art from the naturaliſt: and to mention now no other parts of phyſiology, in its ſtricter acception, the experience of our own age may ſuffice to manifeſt, what light the anatomical doctrine of man's body may receive from experiments made on other ſubjects. For ſince it were too barbarous, and too great a violation of the laws, not only of divinity but humanity, to diſſect human bodies alive, as did *Herophilus* and *Eraſiſtratus*, who (as I find in ſome of the ancients) obtained of kings the bodies of malefactors for that purpoſe, and ſcrupled not to deſtroy man to know him; and ſince, nevertheleſs, divers things in anatomy, as particularly the motion of the blood and chyle cannot be diſcovered in a dead diſſected body (where the cold hath ſhut up and obliterated many paſſages) that may be ſeen in one opened alive; it muſt be very advantageous to a phyſician's anatomical knowledge, to ſee the diſſections of dogs, ſwine, and other live creatures, made by an inquiſitive naturaliſt: conſonantly whereunto we may remember, that the diſcoveries of the milky veſſels in the meſentery by *Aſellius*, of thoſe in the thorax by *Pecquet*, and of the *vaſa lymphatica* by *Bartholinus*, were firſt made in brute bodies, though afterwards found to hold in human ones. Nor is it a ſmall convenience to the anatomiſt, that he may in the bodies of brutes make divers inſtructive experiments, that he dares not venture on in thoſe of men; as for inſtance, that late noble, and by many not yet credited experiment, of taking out the ſpleen of a dog without killing him: for that this experiment may be very uſeful, we may elſewhere have occaſion to ſhew. And that it is poſſible to be ſafely made (though many, I confeſs, have but unproſperouſly attempted it, and it hath been lately pronounced impoſſible in print) ourſelves can witneſs. And becauſe I have not yet met with any author, that profeſſes himſelf not to relate this experiment (of the exemption of a dog's ſpleen) upon the credit of others, but as an eye-witneſs; I am content to aſſure you, that that dextrous diſſector, Dr. *Jolive* (of whom we formerly made mention) did the laſt year, at my requeſt, take out the ſpleen of a young ſetting-dog I brought him: and that it might not be pretended, the experiment was unfaithfully or favourably made, I did part of it myſelf, and held the ſpleen (which was the largeſt in proportion to his body, that ever I ſaw) in my hand, whilſt he cut aſunder the veſſels reaching to it, that I might be ſure there was not the leaſt part of the ſpleen left unextirpated: and yet this puppy, in leſs than a fortnight, grew not only well, but as ſportive and as wanton as before; which I need not take pains to make you believe, ſince you often ſaw him at your mother's houſe, whence at length he was ſtolen. And though I remember the famous empirick *Fioravanti*, in one of his Italian books, mentions his having been prevailed with by the importunity of a lady (whom he calls *Marulla Græca*) much afflicted with ſplenetick diſtempers, to rid her of her ſpleen; and adds, that ſhe out-lived the loſs of it divers years: yet he, that conſiders the ſituation of that part, and the conſiderableneſs of veſſels belonging to it in human bodies, will probably be apt to think, that though his relation may be credited, his venturouſneſs ought not to be imitated. The experiment alſo of detaining frogs under water for very many hours (ſometimes amounting to ſome days) without ſuffocation, may, to him, that knows that frogs have lungs and breathe as well as other terreſtrial animals, appear a conſiderable diſcovery, in order to the determining the nature of reſpiration. Beſides, the ſcrupulouſneſs of the parents or friends of the deceaſed perſons deprives us oftentimes of the opportunities of anatomizing the bodies of men, and much more thoſe of women; whereas thoſe of beaſts are always and every where to be met with. And it was perhaps, upon ſome ſuch account, that *Ariſtotle* ſaid, that the external parts of the body were beſt known in men, the internal in beaſts; *Sunt enim* (ſays he, ſpeaking of the inward parts) *hominum imprimis incertæ atque incognitæ; quamobrem ad cæterorum animalium partes, quarum ſimiles ſunt humanæ, referentes eas contemplari debemus.* 'The parts of hu-'man body are unknown, and therefore we 'ought to conſider them by the parts of other 'animals, to which they are like.' And queſtionleſs in many of them, the frame of

Ariſt. lib. de ſenſu & ſenſili, cap. 1.

How the phyſiological part of phyſick is advantaged by the knowledge of natural philoſophy.

That the anatomical doctrine of man's body receives light from experiments made on other creatures.

Proved by divers inſtances: as of the finding the lacteals and lymphæ-ducts in brute bodies firſt.

The experiment of taking out the ſpleen in dogs.

The ſame thing done by Fioravanti in a woman.

The reſpiration of frogs divers hours, ſometimes days, under water, without ſuffocation.

Ariſt. *Hiſt.* lib. 1. cap. 16.

the parts is ſo like that of thoſe anſwerable in men, that he that is but moderately ſkilled in androtomy (as ſome of the moderns call the diſſection of man's body, to diſtinguiſh it from zootomy, as they name the diſſections of the bodies of other animals) may, with due diligence and induſtry, not deſpicably improve his anatomical knowledge. In confirmation of which truth, give me leave to obſerve to you, that though *Galen* hath left to us ſo many, and by phyſicians ſo much magnified anatomical treatiſes; yet not only divers of thoſe modern phyſicians, that would eclipſe his glory, deny him to have learned the ſkill he pretends to, out of the inſpection of the diſſected bodies of men or women, or ſo much as to ever have ſeen a human anatomy. But I find, even among his admirers, phyſicians, that acknowledge, that his knives were much more converſant with the bodies of apes, and other brutes, than with thoſe of men, which in his time, thoſe authors ſay, it was thought little leſs than irreligious, if not barbarous, to mangle; which is the leſs to be wondered at, becauſe even in this our age, that great people of the Muſcovites, though a Chriſtian and European nation, hath denied phyſicians the uſe of anatomy and ſkeletons; the former, as an inhuman thing; the latter, as fit for little but witchcraft, as we are informed by the applauded writer *Olearius*, ſecretary to the embaſſy lately ſent by that learned prince, the preſent duke of *Holſtein*, into *Muſcovia* and *Perſia*. And of this, the ſame author gives us the inſtance of one *Quirin*, an excellent German chirurgeon, who, for having been found with a ſkeleton, had much ado to eſcape with his life, and was commanded to go out of the kingdom, leaving behind him his ſkeleton, which was alſo dragged about, and afterwards burnt.

What uſe Ariſtotle and Galen made of the diſſections of brutes.

Anatomy of man counted now in Muſcovy for inhuman; and the uſe of skeletons for witchcraft.

Voyage de Muſcovie & de Perſe, p. 128.

To theſe things we may add, *Pyrophilus*, that the diligence of zootomiſts may much contribute to illuſtrate the doctrine of androtomy, and both inform phyſicians of the true uſe of the parts of an human body, and help to decide divers anatomical controverſies. For as in general it is ſcarce poſſible to learn the true nature of any creature, from the conſideration of the ſingle creature it ſelf; ſo particularly of divers parts of an human body it is very difficult to learn the true uſe, without conſulting the bodies of other animals, wherein the parts inquired after is by nature either wholly left out as needleſs, or wherein its differing bigneſs, or ſituation, or figure, or connection with, and relation to other parts, may render its uſe more conſpicuous, or at leaſt, more diſcernible.

The uſe of the compariſon of the parts of human body, with thoſe of beaſts.

Illuſtrated by divers particular obſervations.

THIS truth may be ſomewhat illuſtrated by the following obſervations, which at preſent offer themſelves to my thoughts upon this occaſion.

THE lungs of vipers, and other creatures (whoſe hearts and whoſe blood, even whilſt it circulates, we have always found, as to ſenſe, actually cold) may give us juſt occaſion to inquire a little more warily, whether the great uſe of reſpiration be to cool the heart.

THE ſudden falling and continuing together, which we may obſerve in that part at leaſt of a dog's lungs, that lie on the ſame ſide with the wound, upon making a large wound in his cheſt, though the lungs remain untouched, is a conſiderable experiment, in order to the diſcovery of the principal organ of reſpiration.

IF you dexterouſly take out the hearts of vipers, and of ſome ſmaller fiſhes, whoſe coldneſs makes them beat much more unfrequently and leiſurely, than thoſe of warm animals, the contraction and relaxation of the fibres of the heart may be diſtinctly obſerved, in order to the deciding or reconciling the controverſy about the cauſe and manner of the heart's motion, betwixt thoſe learned modern anatomiſts, that contend, ſome of them, for Dr. *Harvey*'s opinion; and others, for that of the Carteſians.

TOWARDS ſatisfying my ſelf in which difficulty, I remember, I have ſometimes taken the heart of a flounder, and having cut it tranſverſly into two parts, and preſſed out, and with a linnen cloth wiped off, the blood contained in each of them, I obſerved, that for a conſiderable ſpace of time, the ſever'd and bloodleſs parts held on their former contraction and relaxation. And once, I remember, that I obſerved, not without wonder, that the ſever'd portions of a flounder's heart did, not only after the blood was drained, move as before, but the whole heart obſerved for a pretty while ſuch a ſucceſſion of motion in its divided and exſanguious pieces, as I had taken notice of in them, whilſt they were coherent, and as you may with pleaſure both ſee and feel in the intire heart of the ſame fiſh.

SOME of the other controverſies agitated among anatomiſts and philoſophers, concerning the uſe of the heart, and concerning the principal ſeat of life and ſenſe, may alſo receive light from ſuch experiments, that we made in the bodies of brutes, as we could not of men.

AND the firſt of theſe, that we ſhall mention, ſhall be an experiment, that we remember our ſelves formerly to have made upon frogs. For having opened one of them alive, and carefully cut out his heart, without cloſing up the orifice of the wound (which we had made wider than was neceſſary) the frog notwithſtanding leaped up and down the room as before, dragging his entrails (that hung out) after him; and, when he reſted, would upon a puncture leap again, and being put into the water, would ſwim, whilſt I felt his heart beating betwixt my fingers. The hearts of others of them were taken out at an inciſion, no greater than was requiſite for that purpoſe: when we had ſtitched or pinned up the wound, we obſerved them to leap more frequently and vigorouſly than the former: they would, as before they were hurt, cloſe and open their eye-lids upon occaſion. Being put into a veſſel not full of water, they would as orderly diſplay their fore and hinder legs in the manner requiſite to ſwimming, as if they wanted none of their parts, eſpecially not their hearts; they would reſt themſelves, ſometimes upon the ſurface of the

Divers motions and actions of frogs after their hearts were cut out.

the water, ſometimes at the bottom of it; and ſometimes alſo they would nimbly leap, firſt out of the veſſel, and then about the room, ſurviving the exſection of their hearts, ſome about an hour, and ſome longer. And that, which was further remarkable in this experiment, was, that we could, by gently preſſing their breaſt and belly with our fingers, make them, almoſt at pleaſure, make ſuch a noiſe, as to the by-ſtanders made them ſeem to croak. But how this experiment will be reconciled to the doctrine aſcribed to Mr. *Hobbes*, or to that of the Ariſtotelians, who tell us, that their maſter taught the heart to be the ſeat of ſenſe (whence alſo, though erroneouſly, he made it the original of the nerves) let thoſe, that are pleaſed to concern themſelves to maintain all his opinions, conſider.

Obſervations of the motion of a chicken's heart, after the head and other parts were cut off.

AND whereas frogs, though they can move thus long without the heart, yet they cannot at all bear the exemption or ſpoiling of the brain; we will add what we have obſerved, even in hot animals, whoſe life is conceived to be much more ſuddenly diſſipable, and the motion of each part much more dependent upon the influence of the brain: we opened then an egg, wherein the chick was not only perfectly formed, but well furniſhed with feathers; and having taken him out of the membrane, that involved him, and the liquors he ſwam in, and laid him on his back on a flat piece of glaſs, we clipped away, with a pair of ſciſſors, the head and the breaſt-bone; whereby the heart became expoſed to view, but remained faſtened to the headleſs trunk: and the chick lying in this poſture, the heart continued to beat above a full hour, and the ears ſeemed to retain their motion a pretty while after the heart it ſelf had loſt his; the motion of none of the other parts appearing many moments to ſurvive the loſs of the head: and, which is moſt conſiderable, the ſeemingly dead heart was divers times excited to new, though quickly ceaſing motion, upon the puncture of a pin, or the point of a pen-knife. And to evince, that this was no caſual thing, the next day we dealt with the chick of another egg, taken from the ſame hen, after the above-recited manner; and when the motion of the heart and ears began to ceaſe, we excited it again, by placing the glaſs over the warm ſteam of a veſſel full of hot water, bringing ſtill new water from off the fire to continue the heat, when we perceived the former water to begin to cool, and by this means we kept the heart beating for an hour and an half by meaſure. And at another time for further ſatisfaction, we did, by theſe and ſome other little induſtries, keep the heart of a ſomewhat elder chick, though expoſed to the open air, in motion, after we had carefully clipped off the head and neck, for the ſpace of (if our memory do not much miſ-inform us) two hours and an half by meaſure. Upon what conjectures we expected ſo laſting a motion in the heart of a chick, after it had loſt the head, and conſequently the brain, would be more tedious and leſs fit to be mentioned in this place, than the ſtrange vivacity we have ſometimes, not without wonder, obſerved in vipers: ſince not only their hearts clearly ſever'd from their bodies may be obſerved to beat for ſome hours (for that is common with them to divers other cold animals) but the body it ſelf may be, ſometimes, two or three days after the ſkin, heart, head, and all the entrails are ſeparated from it, ſeen to move in a twining or wriggling manner: nay (what is much more) may appear to be manifeſtly ſenſible of punctures, being put into a freſh and vivid motion, when it lay ſtill before, upon the being pricked, eſpecially on the ſpine or marrow, with a pin or needle.

Of the vivacity of diſſected vipers.

AND though tortoiſes be in the *Indies* many of them very large animals, yet that great traveller *Vincent le Blanc*, in his *French Voyages*, giving a very particular account of thoſe tortoiſes, which the Eaſt-Indian king of *Pegu*, (who was much delighted with them) did, with great curioſity, cheriſh in his ponds, adds this memorable paſſage as an eye-witneſs of what he relates: *When the king hath a mind to eat of them, they cut off their heads, and five days after they are prepared; and yet after thoſe five days they are alive, as we have often experienced.* Now although I will not ſay, that theſe experiments prove, that either it is in the membrane, that ſenſation reſides (though I have ſometimes doubted, whether the nerves themſelves be not ſo ſenſible, chiefly as they are inveſted with membranes) or that the brain may not be confined to the head, but may reach into the reſt of the body, after another manner than is wont to be taught; yet it may be ſafely affirmed, that ſuch experiments as theſe may be of great concernment in reference to the common doctrine of the neceſſity of unceaſing influence from the brain, being ſo requiſite to ſenſe and motion; eſpecially if to the lately mentioned particulars we add, on this occaſion, what we have obſerved of the butterflies, into which ſilk-worms have been metamorphoſed; namely, that they may, not only, like common flies, and divers other winged inſects, ſurvive a pretty while the loſs of their heads, but may ſometimes be capable of procreation after having loſt them: as I not long ſince tried (though not, perhaps, without ſuch a reluctancy as *Ariſtotle* would have blamed in a naturaliſt) by cutting off the heads of ſuch butterflies of either ſex. *Quamvis enim mas, cui prius amputatum eſt caput, nequaquam adduci poſſet (quæcunque inſecti illius eſt ſalacitas) ut fœminam comprimeret, decollata tamen fœmina marem alacriter admiſit. Et licèt poſt horas aliquot cœitu inſumptas ita requierit immota, ut mortuam per multas horas cogitarem, non ſolùm quia omnem penitus motum perdiderat, & in thorace ſatis magnum apparebat foramen, quod à parte aliqua corporis ſimul cum capite à trunco diſruptâ factum videbatur; verum etiam quoniam eodem permanſit ſtatu, idque per plures horas, ultra tempus, quo poſt coitionem cum mare hujus generis animalcula ſolent ordiri prolificationem. Tandem verò poſtquam jam diu de vita ejus deſperatum eſſet, ova fœtare tam confertim cœpit, ut vel exiguo temporis intervallo eorum plura in manu mea deponeret. An verò prolifica ſint futura, nondum comperi.*

And tortoiſes.

Whether there be a neceſſity of the unceaſing influence of the brain to ſenſe and motion.

That the ſilk-worm butterfly is capable of procreation after the loſs of its head.

THEIR opinion, that aſcribe the redneſs of the blood to the colour of the liver, through which it paſſes, is not diſcountenanced by the livers of men: but in hen-eggs, about the third or fourth day after incubation (for we have found the circumſtances of time much to vary) you may obſerve the *punctum ſaliens*, or heart, to be ever and anon full of conſpicuouſly red blood, before the naked eyes can ſo much as diſcern a liver, at leaſt before they can diſcover in it any redneſs; a yellowneſs being all I could obſerve in the parenchyma of the livers of divers chickens perfectly formed, and furniſhed with feathers, though not great enough to make their way out of the ſhell. And in divers great fiſhes I have found the veſſels of the liver full of very red blood, though the parenchyma or ſubſtance of it were white, or at leaſt did not at all participate, much leſs impart a ſanguine colour.

That the redneſs of the blood is not to be aſcribed to the liver, proved by the inſpection of the liver of chickens unhatched.

THE doctrine ſo unanimouſly delivered by phyſicians and chirurgeons, concerning the irreparable loſs of the limb of an animal, once violently ſever'd from the body, will appear unfit to be admitted, whithout ſome reſtriction, by what may be experienced in lizards, in lobſters, and craw-fiſhes, and perhaps in ſome other living creatures. For of lizards it hath been often obſerved in hot countries, and even in *France*, that their tails being ſtruck off will grow again. And the like hath been of old obſerved by *Pliny*; and the experienced *Bontius* delivers it upon his own knowledge in theſe words: *Hoc in domeſticis meis non ſemel animadverti, dum filioli mei luſitabundi bacillo caudas iis decutiebant, quas tamen poſt diem unum aut alterum ad ſolitum pabulum revertentes vidi, caudaſque iis paulatim reaccreſcere:* 'This I 'have more than once obſerved in lizards, 'which I kept in my own houſe. For my 'children being at play, when with a rod 'they had ſtruck off the lizards tails, I ſaw 'them within a day or two come out to feed, 'and their tails then by little and little ſtill in-'creaſing and growing bigger.'

That the loſs of a limb in all animals is not irreparable.

THAT the claws likewiſe of lobſters being torn off, another will ſometimes grow in the room of it, is not only ſaid by fiſhermen, but hath been affirmed to me by very credible perſons, one of which aſſured me, that he himſelf had obſerved it very often. And I am the more apt to believe it, becauſe the like is to be met with among craw-fiſhes, which are ſo like lobſters, that by many they are taken (though not conſiderately enough) to be but a ſmaller kind of them. For I remember, that going to look upon a repoſitory, where a multitude of them was kept, and cauſing divers of the faireſt to be thrown up, that I might take the ſtony concretions, commonly called *oculi cancrorum*, out of their heads, I obſerved one large fiſh, that had one of his claws proportionable to the bulk of his body, but the other ſo ſhort and little, that the greater ſeemed to be four or five times as big as it; whereupon its good ſhape and freſh colour ſeeming to argue it to be but young and growing, invited me to aſk one of them, that had the overſight of the fiſh, whether he had formerly ſeen any claws torn off grow again, he affirmed to me, that in that ſort of fiſh it was very uſual.

I COULD alſo tell you, how fruitleſly I have endeavoured to diſcover that ſtomachical acidity, to which many of our modern phyſicians are pleaſed to aſcribe the firſt digeſtion of the nutriment of animals, in the purpoſely diſſected ſtomachs of ravenous ſea-fiſhes; in whoſe ſtomachs, though our taſte could not perceive any ſenſible acidity, yet we found in one of them a couple of fiſhes, each of them about a foot long: whereof the one, which ſeemed to have been but newly devoured, had ſuffered little or no alteration in the great fiſh's ſtomach; but the other had all its outſide, ſave the head, uniformly waſted to a pretty depth, beneath the former ſurface of the body, and looked as if it had been not boiled, or wrought upon by any conſiderable heat, but uniformly corroded, like a piece of ſilver coin kept a while in aqua fortis, according to the criminal tricks of adulterators of money.

That notwithſtanding the great ſolution and digeſtion of meat in the ſtomachs of fiſhes, no ſenſible acidity is found there.

YET I am loth, till I have perfected what I deſign in order to that inquiry, either to embrace or reject the opinion I find ſo general among the moderns, concerning the ſolution of meat in the ſtomach by ſomething of acid. And I remember, that when I was conſidering what might be alledged for, as well as againſt that opinion, I deviſed this experiment, among others, in favour of it. I provided a liquor, with which I drenched a piece of a wing of a pullet, having firſt well cruſhed it between my fingers, to make ſome amends for the omiſſion of chewing it; and having a little incorporated the liquor and the muſculous fleſh, they immediately changed colour, and in about an hour grew to be a kind of gelly, in colour and conſiſtence not unlike quince marmalade. This mixture, by the next morning, did, as I expected, turn to a deep blood-red, or ſometimes rather a lovely purple liquor, though all this while there had been no external heat imployed to promote the action of the menſtruum. And the like experiment I tryed alſo with a piece of mutton, with bread, and a piece of veal, and other edible things, which at that time occurred to me; and found the operation of the liquor almoſt uniform, though it ſeemed to act moſt effectually upon fleſh. And to gratify in ſome meaſure your curioſity, *Pyrophilus*, I am content to tell you, that the menſtruum was drawn from vitriol, and that with the bare oil of it I have (though I could not with aqua fortis) performed no leſs than what I have yet mentioned: but leſt this ſhould be thought a digreſſion, let it ſuffice to have, on this occaſion, mentioned thus much upon the by.

Experiments concerning the ſolution of meats, and their change of colours by acid menſtruums.

To what we lately took notice of concerning the heart may be added, that on the ſea-coaſt *Ireland*, I obſerved a ſort of fiſhes about the bigneſs of mackrels, whoſe hearts were of an inverted figure, compared to thoſe of other animals; the baſis or broad end of the heart being neareſt the tail, and the acuminated part or apex being coherent to the great artery, and reſpecting the head.

To

To all theſe triſling obſervations divers more conſiderable ones might be added, but they may be more ſeaſonably inſiſted on elſewhere; and thoſe already mentioned may ſuffice to let you ſee, that the naturaliſt his zootomy may be very ſerviceable to the phyſician in his anatomical inquiries.

NOR is it only by the diſſection of various animals, that the naturaliſt may promote the anatomiſt's knowledge, but perhaps alſo he may do it by deviſing ways to make the dead bodies of men, and other animals, keep longer than naturally they would do. For ſince experience teaches us, that men find it very eaſy to forget the originations, windings, branchings, inſertions, and other circumſtances of particular veſſels, and other parts of the body, as well as thoſe, that ſtudy botanicks, are wont to complain of their eaſy forgetting the ſhapes, differences, and alterations of ſmaller plants; it cannot but be a great help to the ſtudent of anatomy to be able to preſerve the parts of human bodies, and thoſe of other animals, eſpecially ſuch monſters, as are of a very ſingular or inſtructive fabrick, ſo long, that he may have recourſe to them at pleaſure, and contemplate each of them ſo often and ſo conſiderately, till he have taken ſufficient notice of the ſhape, ſituation, connection, *&c.* of the veſſel, bone, or other part, and firmly impreſſed an idea of it upon his memory. We find our ſelves much helped to retain in our memory the figures and differences of vegetables, by thoſe books, which ſome curious botaniſts make, wherein the plants themſelves, artificially dried, are diſplayed upon, and faſtened to leaves of white paper. If it were not for one of thoſe books, wherein I have in one vaſt volume almoſt all the plants of one of the chief phyſick-gardens in *Europe*, I ſhould every year forget, by the end of winter, to know again moſt of the ſmaller plants I had learned to take notice of in the ſpring. And by the way it is obſervable, how long plants, by being carefully indeed, but barely dried in the ſhade betwixt ſheets of paper, which help to ſoak up the ſuperfluous moiſture, may be preſerved. For I have divers years had an herbal, wherein ſeveral of the flowers, and other plants, retain their native yellow and blue, *&c.* (but ſomewhat faint) though by the date it appeared to be 22 or 23 years old. And I am apt to think, that it would be very poſſible for anatomiſts alſo to preſerve the bodies they contemplate for a conſiderable time: for experience hath informed us in good number of ſuch animals, that butterflies, and divers other flying inſects, may have their ſhape and colours preſerved, I know not how long, by running them through in ſome convenient part with pins, and therewith ſticking them to the inſide of large boxes. And on this occaſion, I remember, that having ſometimes reflected upon the laſting of ſpiders, flies, and other ſmall living creatures, that having been caſually encloſed in amber whilſt it was ſoft, are ever preſerved entire and uncorrupted, I thought it not amiſs to try, whether ſome ſubſtance, like amber (at leaſt as to the newly mentioned uſe of it) might not eaſily be prepared by art. And hereupon I quickly found, that by taking good clear *Venice* turpentine, and gently evaporating away about a third part of it, (ſometimes more, ſometimes leſs, according to the exigency of my particular purpoſe;) I could make a reddiſh gum, diaphanous and without bubbles, which would melt with a very gentle heat, and eaſily (being ſuffered to cool) become again ſo hard as to be brittle. This reſinous ſubſtance ſhould be melted with as little heat as is poſſible, (and therefore ſhould be firſt powdered) that the texture of the vegetable or animal bodies to be caſed over with it, might receive the leſs alteration: and when it is brought to the requiſite degree of fluidity, then the body to be preſerved (being, if that be needful, ſtruck through with a pin) muſt be gently plunged into it, and preſently taken out and ſuffered leiſurely to cool, being turned from time to time this way or that way, if there be occaſion, that the inveſting matter may be every where of an equal thickneſs upon it. And if at the firſt time the caſe be not thick enough, it may again, when it is cold, be immerſed into the liquid matter, (as chandlers are wont to thicken their candles, by dipping them frequently into melted tallow) of which ſome will every way adhere to it. And though theſe caſes be inferiour to amber, in regard of their being more apt to be ſullied by duſt, or otherwiſe; yet that inconvenience may be eaſily remedied, by keeping them ſhut up in glaſſes or boxes, at thoſe times, when one hath not occaſion to conſider them. And their clearneſs (eſpecially if they be thin) and their ſmooth ſurfaces, together with their exactly keeping out the air from the body they encloſe, may, perhaps, make ſo cheap and ſo eaſy an experiment a not unwelcome trifle, eſpecially conſidering, how eaſily it is capable of improvement.

Ways of artificial drying and preſervation of plants.

And inſects.

BUT to return to the preſervation of more bulky bodies, it is a known thing to the collectors of rarities, that the external idea of fiſhes, crocodiles, birds, and even horſes, may be preſerved for many years, by taking out the more corruptible parts, and ſtuffing their prepared ſkins with any convenient matter. And that the internal membranous parts of bodies may be long and eaſily kept from putrefaction, is not unknown to many anatomiſts. And not to mention what we have tried of this ſort, we have ſeen the veins, arteries, and nerves of a human body, laid out in their natural ſituation upon three boards, by the pains and ſkill of an accurate anatomiſt of *Padua*. And elſewhere, *Uterum vidimus atque omnia mulieris genitalia*, together with the bladder, all diſplayed upon a board, preſerved for many years ſo entire, and in a ſituation ſo near the natural, that this ſcheme was far more inſtructive, than the moſt accurate printed one could poſſibly be. We have likewiſe known the fleſh of vipers, kept not only ſweet but efficacious, for divers years, by the ſmoke of a peculiar powder, chiefly conſiſting of aromatick ingredients, and of which you, *Pyrophilus*, may command the compoſition.

And more bulky bodies.

Particularly the ſchemes of divers parts of human body.

We have also seen the skeleton of a monkey, made by an excellent French chirurgeon of our acquaintance, whereon the tendons and fibres of the muscles were so preserved, that it was looked upon as a rarity, very useful to shew their originations and insertions, and to explain the motions of the limbs: and perhaps there may be some way to keep the arteries and the veins too, when they are emptied of blood, plump, and unapt to shrink overmuch, by filling them betimes with some such substance, as, though fluid enough when it is injected to run into the branches of the vessels, will afterwards quickly grow hard. Such may be the liquid plaister of burnt alabaster, formerly mentioned, or ising-glass steeped two days in water, and then boiled up, till a drop of it in the cold will readily turn into a still gelly. Or else *saccharum Saturni*, which, if it be dissolved often enough in spirit of vinegar, and the liquor be each time drawn off again, we have observed to be apt to melt with the least heat, and afterwards to grow quickly into a somewhat brittle consistence again. But I must not insist on these fancies, but rather add, that I have known an embryo, wherein the parts have been very perfectly delineated and distinguishable, preserved unputrified for several years; and I think it still continues so, by being seasonably and artificially embalmed with oil (if I much misremember not) of spike. And I have elsewhere seen a large embryo, which after having been preserved many years, by means of another liquor (whose composition I do as yet but guess at) did, when I saw it, appear with such an admirable entireness, plumpness, and freshness, as if it were but newly dead: and that which concurs to make me hope, that some nobler way may be yet found out, for the preservation of dead bodies, is, that I am not convinced, that nothing can powerfully resist putrefaction in such bodies, but things, that are either saline and corrosive, or else hot; nor that the embalming substances cannot be effectually applied, without ripping open the body to be preserved by them. For *Josephus Acosta*, a sober writer, relates, that in certain American mountains, men, and the beasts they ride on, sometimes are killed with the winds, which yet preserve them from putrefaction, without any other help. So insensible a quantity of matter, such as it may be, may, without incision made into the body, both pervade it, and as it were embalm it. I know also a very experienced and sober gentleman, who is much talked of, for curing of cancers in womens breasts, by the outward application of an indolent powder, some of which he also gave me, but I have not yet had the opportunity to make trial of it. And I shall anon tell you, that I have seen a liquor, which, without being at all either acid or caustick, is in some bodies far more effectual against putrefaction, than any of the corrosive spirits of nitre, vitriol, salt, &c. and than any of the other saline liquors, that are yet in use. We have also tried a way of preserving flesh with musk, whose effects seemed not despicable to us, but must not here be insisted on.

Of the preservation of an embryo divers years, by embalming it with oil of spike.

Instances of men in the American mountains killed, and afterwards preserved from putrefaction, only by the wind.

Nor were it amiss, that diligent trial were made, what use might be made of spirit of wine, for the preservation of a human body. For this liquor being very limpid, and not greasy, leaves a clear prospect of the bodies immersed in it; and though it do not fret them, as brine, and other sharp things, commonly imployed to preserve flesh, are wont to do; yet it hath a notable balsamick faculty, and powerfully resists putrefaction, not only in living bodies (in which, though but outwardly applied, it hath been found of late one of the potentest remedies against gangrenes) but also in dead ones. And I remember, that I have sometimes preserved in it some very soft parts of a body for many months (and perhaps I might had done it for divers years, had I had opportunity) without finding, that the consistence or shape was lost, much less, that they were either putrified or dried up: we have also, by mixing with it spirit of wine, very long preserved a good quantity of blood, so sweet and fluid, that it was wondered at by those, that saw the experiment. Nay, we have for curiosity sake, with this spirit, preserved from further stinking a portion of fish, so stale, that it shined very vividly in the dark; in which experiment, we also aimed at discovering, whether this resplendent quality of the decaying fish would be either cherished or impaired by the spirit of wine, (whose operations in this trial, we elsewhere inform you of) and it would be no very difficult matter for us to improve, by some easy way, this balsamical virtue of spirit of wine, in case you shall think it worth while. But not to anticipate what I may more properly mention to you elsewhere, I shall at present say no more touching the conservation of bodies, since probably by all these, and some other particulars, we may be induced to hope so well of human industry, as not to despair, that in time some such way of preserving the bodies of men, and other animals, will be found out, as may very much facilitate and advance too, anatomical knowledge. Neither is it only by advancing this, that the naturalist may promote the physiological part of physick: for since the body consists not only of firm and constant parts, as the bones, muscles, heart, liver, &c. but of fluid ones, as the blood, serum, gall, and other juices; and since consequently to the complete knowledge of the use of all the parts, we should investigate not only the structure of the solid ones, but the nature of the fluid ones; the naturalist may do much more than hath yet been done, towards the perfecting of this knowledge, not only by better explicating what it is in general, makes bodies either consistent or fluid, but by examining particularly, and especially in a pyrotechnical way, the nature of the several juices of the body, and by illustrating the alterations, that those juices, and the aliments they are made of, receive in the stomach, heart, liver, kidneys, and other viscera. For although a human body, being the most admirable corporeal piece of workmanship of the omniscient Architect, it is scarce to be hoped, but that even among the things, that happen ordinarily and regularly in it, there will be

Of the use of spirit of wine, for the preservation of bodies from putrefaction.

That the examination of the juices of human body, by the art of chirurgery, may illustrate their use and nature.

be many, which we ſhall ſcarce be able to reach with our underſtanding, much leſs to imitate with our hands: yet peradventure, if chymical experiments, and mechanical contrivances, were induſtriouſly and judiciouſly aſſociated by a naturaliſt profoundly ſkilled in both, and would make it his buſineſs to explain the phænomena of a human body, not only many more of them, than at firſt one would think, might be made more intelligible than as yet they have been; but divers of them (eſpecially thoſe relating to the motions of the limbs and blood) might be by artificial engines (conſiſting as the pattern not only of ſolid, but liquid and ſpirituous parts) not ill repreſented to our very ſenſes: ſince a human body it ſelf ſeems to be but an engine, wherein almoſt, if not more than almoſt, all the actions common to men with other animals are performed mechanically. But of the difference of theſe living engines from others, I may elſewhere have a fitter opportunity to diſcourſe to you. For at preſent, *Pyrophilus*, I have employed ſo much of the little time my occaſions will allow me to ſpend upon the treatiſe I am now writing, in making out to you the uſefulneſs of natural philoſophy to the phyſiological part of phyſick, that I muſt not only not proſecute this ſubject, but muſt both haſten to mention, and to mention the more curſorily its ſerviceableneſs to the four remaining parts of the phyſician's art.

That the actions, which are common to men, with other animals, being performed mechanically, the skill of mechanicks muſt be of uſe to phyſiology.

ESSAY II.

Offering ſome Particulars relating to the Pathological part of Phyſick.

That the naturaliſts knowledge may aſſiſt the phyſician to diſcover the nature and cauſes of diſeaſes.

AND to ſay ſomething in the next place of pathology, that the naturaliſt's knowledge may aſſiſt the phyſician to diſcover the nature and cauſes of ſeveral diſeaſes, may appear by the light of this conſideration, that though divers Paracelſians (taught, as they tell us, by their maſter) do but erroneouſly ſuppoſe, that man is ſo properly a microcoſm, that of all the ſorts of creatures, whereof the macrocoſm or univerſe is made up, he really conſiſts; yet certain is it, that there are many productions, operations, and changes of things, which being as well to be met with in the great, as in the little world, and divers of them diſcloſing their natures more diſcernibly in the former, than in the latter; the knowledge of the nature of thoſe things, as they are diſcoverable out of man's body, may well be ſuppoſed capable of illuſtrating many things in man's body, which receiving ſome modifications there from the nature of the ſubject they belong to, paſs under the notion of the cauſes or the ſymptoms of diſeaſes. If I were now, *Pyrophilus*, to diſcourſe to you at large of this ſubject, I think I could convince you of the truth of what I have propoſed. And certainly, unleſs a phyſician be (which yet I fear every one is not) ſo much a naturaliſt, as to know, how heat and cold, and fluidity, and compactneſs, and fermentation, and putrefaction, and viſcoſity, and coagulation, and diſſolution, and ſuch like qualities, are generated and deſtroyed in the generality of bodies, he will be often very much to ſeek, when he is to inveſtigate the cauſes of preternatural accidents in men's bodies; whereof a great many depend upon the preſence, or change, or vaniſhing of ſome or other of the enumerated qualities, in ſome of the fluid or ſolid ſubſtances that conſtitute the body. And that the explications of a ſkilful naturaliſt may add much to what has hitherto commonly been taught concerning the nature and origin of thoſe qualities in phyſicians ſchools, a little comparing of the vulgar doctrine with thoſe various phænomena, to be met with among natural things, that ought to be, and yet ſeem not to be, explicable by it, will eaſily manifeſt to you. And queſtionleſs it is a great advantage to have been taught, by variety of experiments in other bodies, the differing ways, whereby nature ſometimes produces the ſame effects. For ſince we know very little *à priori*, the obſervation of many ſuch effects, manifeſting, that nature doth actually produce them ſo and ſo, ſuggeſts to us ſeveral ways of explicating the ſame phænomenon, ſome of which we ſhould perhaps never elſe have dreamed of. Which ought to be eſteemed no ſmall advantage to the phyſician; ſince he, that knows but one or few of nature's ways of working, and conſequently is likely to ignore divers of thoſe, whereby the propos'd diſeaſe (or ſymptom of it) may be produc'd, muſt ſometimes conclude, that preciſely ſuch or ſuch a thing is the determinate cauſe of it, and apply his method of relieving his patient accordingly; which often proves very prejudicial to the poor patient, who dearly pays for his phyſician's not knowing, that the quality, that occaſions the diſtemper, may be as probably, if not more rationally, deduced from another origin, than from that, which is preſumed. This will ſcarce be doubted by him, that knows how much more likely explications than thoſe applauded ſome ages ſince, of divers things, that happen as well within as without the body, have been given by later naturaliſts, both philoſophers and phyſicians: and how much the theory of the ſtone, and many other diſeaſes, that has been given us by thoſe many phyſicians, that would needs deduce all the phænomena of diſeaſes from

Proved by general reaſon.

from heat, cold, and other elementary qualities, is inferiour to the account given us of them by thoſe ingenious moderns, that have applied to the advancement of pathology, the circulation of the blood, the motion of the chyle by the milky veſſels to the heart, the conſideration of the effects deducible from the pores of greater bodies, and the motion and figuration of the minute parts, together with ſome of the more known chymical experiments: though both of thoſe, and of the other helps mentioned juſt before them, I fear men have hitherto been far enough from making the beſt uſe, which I hope it will daily more and more appear they are capable of being put to. He that has not had the curioſity to inquire out, and conſider the ways, whereby ſtones may be generated out of the body, not only muſt be unable ſatisfactorily to explicate how they come to be produced in the kidneys and in the bladder, but will, perhaps, ſcarce keep himſelf from embracing ſuch errors, becauſe authorized by the ſuffrage of eminent phyſicians, as the knowledge I am reccommending would eaſily protect them from. For we find divers famous, and, otherwiſe, learned doctors, who (probably becauſe they had not taken notice of any other way of hardening a matter, once ſoft, into a ſtone-like conſiſtence) have believed and taught that the ſtone of the kidneys is produced there by ſlime baked by the heat and dryneſs of the part; as a portion of ſoft clay may, by external heat, be turned into a brick or tile. And accordingly they have, for cure, thought it ſufficient to make uſe of ſtore of remedies to moiſten and cool the kidneys; which, though in ſome bodies this be very convenient, are yet far inferiour in efficacy to thoſe nobler medicines, that by ſpecifick qualities and properties are averſe to ſuch coagulations as produce the ſtone. But (not to mention what a phyſician ſkilled in anatomy would object againſt this theory from the nature of the part affected) it is not unlike, the embracers of this hypotheſis would not have acquieſced in it, if they had ſeen thoſe putrefactions out of the bodies of men, which we elſewhere mentioned. For thoſe would have informed them, that a liquor abounding with petreſcent parts may not only turn wood (as I have obſerved in a petrifying ſpring) into a kind of ſtone, and may give to cheeſe and moſs, without ſpoiling their priſtine appearance, a ſtrong hardneſs and weight; but may alſo produce large and finely ſhaped cryſtalline bodies (though thoſe I tried were much leſs hard than cryſtal) in the boſom of the cold water. Which brings into my mind, that I have divers times produced a body of an almoſt ſtony hardneſs in leſs than half an hour, even in the midſt of the water, by tying up in a rag, about the quantity of a nutmeg of well and recently calcined alabaſter, which being thus tied up and thrown into the bottom of a baſon full of water, did there ſpeedily harden into lapideous concretion. And that even in the bodies of animals themſelves, ſuch concretions may be generated much otherwiſe, than the hypotheſis we have been ſpeaking of ſuppoſes, may appear by what happens to craw-fiſhes, which though cold animals, and living in the waters, have generated at certain ſeaſons in their heads, concretions, which for their hard and pulverizable conſiſtence, divers authors called *lapides cancrorum*, though in the ſhops they are often, but abuſively ſtyled *oculi cancrorum*. And ſuch ſtrong concretions are affirmed to be generated in theſe fiſhes every year, which I the leſs ſcrupled at, becauſe I have not found them at all times in the head of the fiſh. And beſides theſe and many more concretions, that had they been obſerved by the phyſicians we have been ſpeaking of, might eaſily have kept them from acquieſcing in, and maintaining their improbable explication of the manner of the ſtone's nativity; there is yet another kind of coagulation, which may both be added to the former, and perhaps alſo may ſerve to recommend the uſe of chymical experiments, inveſtigating the cauſes of diſeaſes. This is made by the mixture of exquiſitely dephlegmed ſpirit of fermented human urine, with as exactly rectified ſpirit of wine: for upon the confuſion of thoſe two volatile liquors in a juſt proportion, they will both of them, as after *Lullius*, experience hath informed us, ſuddenly coagulate into a white maſs, which *Helmont* calls *Offa Alba*, and by which he endeavours to declare the procreation of the *Duelech*. For ſuppoſing himſelf to have found in human urine a potential *aqua vitæ*, or vinous ſpirit, capable of being excited by a putrid ferment, and coagulable by the volatile ſalt of the ſame urine, if there were any volatile earth lurking in the liquors; that being apprehended by the uniting ſpirits, and coagulated with them both, he ſuppoſeth there may emerge from the union of thoſe three bodies, ſuch an anomalous concretion, as he, after *Paracelſus*, calls *Duelech*.

By particular inſtances of the cauſe of the ſtone in the kidneys.

The cauſe of that diſeaſe illuſtrated by the putrefaction of wood, cheeſe, moſs, water, &c.

The origin of Helmont's Alba Offa, *and* Paracelſus's Duelech, *by the mixture of ſpirit of wine and ſpirit of urine, an example of the generation of the ſtone.* Helmont. *de Lith.* cap. 3 & 4.

AND that a ſubtile terreſtrious ſubſtance may lurk undiſcerned, even in limpid liquors, may appear not only in wine, which rejects and faſtens to the ſides of the containing veſſel, a tartar, abounding in terreſtrious feculency; and in common urine of healthy men, which, though clear, at its firſt emiſſion into the urinal, does, after a little reſt there, let fall an hypoſtaſis, or ſediment, which, if diſtilled before fermentation, leaves in the bottom of the cucurbit an earthy ſubſtance, and commonly ſome gravel: but even in rectified ſpirit of urine it ſelf I have had opportunity to obſerve, that after very long keeping, there hath ſpontaneouſly precipitated a feculency, copious enough in proportion to the liquor, that afforded it. Nay, in another parcel of ſpirit of urine, that hath been kept much longer than that already mentioned, we obſerved the other day, that not only there was a terreſtrial reſidence fallen to the bottom of the glaſs; but to the ſides of it, as far as the liquor reached, there adhered a great multitude of ſmall concretions; which, as far as appeared by looking on them through the cryſtal phial, to whoſe inſides they are faſtened, were no other than little grians of gravel, ſuch as are often found ſticking to the inſides of urinals, employed by calculous perſons.

That a terreſtrious ſubſtance may lurk undiſcerned in limpid liquors.

To which we might add an experiment of ours, whereby we are wont almoſt in a moment, by barely mixing together a couple of liquors, both of them diſtilled and tranſparent, and yet not both of them ſaline, to thick them very notably and permanently, inſomuch that they ſeem not to precipitate each other; yet having once, for curioſity-ſake, diſtilled them with a pretty ſtrong fire, I obtained a great quantity (as I remember, a fourth of the whole mixture) of a blackiſh maſs, that was not only coagulated and dry, but even brittle. But of the coagulation of diſtilled liquors, ſuch as even chymiſts themſelves are not wont to look upon as at all diſpoſed to coagulation, I may elſewhere have a better opportunity to entertain you, and therefore I ſhall forbear to do it now.

AND by this way, *Pyrophilus*, doth *Helmont*, if I underſtand him aright, attempt to make out the generation of the ſtone in human bodies: in which theory though ſome difficulties do yet keep me from acquieſcing, yet beſides that, perhaps what you will meet with by and by (about the diſtillation of the *Duelech*) may make you the leſs wonder at this explication; beſides this, I ſay, granting that none of the enumerated ways of petreſcency (if I may ſo ſpeak) deſerve to be looked upon as ſatisfactory; yet to give ſo much as an account not very abſurd, of a diſeaſe ſo anomalous and abſtruſe, and hitherto ſo unluckily explicated by phyſicians, is perhaps more difficult, than it were to give (at leaſt) a plauſible account of divers other diſtempers.

The uſe of chymiſtry in explaining the nature of, and aberrations in our digeſtions.

AND poſſibly it may be ſafely enough affirmed, that not only phyſiology, in its full extent, but that handmaid to it, which is called chymiſtry, may not a little contribute to clear up the nature of both of the digeſtions, and of thoſe deficiencies or aberrations in them, which produce a great part of diſeaſes; eſpecially if we allow what, as well phyſicians, as Spagyriſts agree in, (whether warily enough or not, I ſhall not now diſpute) *viz.* that whatever is ſeparable from bodies by the fire, was, as a conſtituent element (or principle,) preexiſtent in them.

PERHAPS I need not mind you, *Pyrophilus*, that it is uſual with the meerly Galenical doctors themſelves to explicate the nature of catarrhs, by comparing the ſtomach to a ſeething-pot, and the head to an alembick, where the aſcending vapours, being, by the coldneſs of the brain, condenſed into a liquor, ſometimes diſtil upon the lungs, and ſometimes fall upon other weakened parts: in which explication though for divers reaſons I cannot acquieſce, yet it may ſuffice to ſhew you, how little ſcruple many learned men, not like to be partial in the caſe, would make of employing chymical operations to illuſtrate the doctrine of diſeaſes. And indeed, ſince the liquors contained in the body abound, divers of them, with ſaline or ſulphureous parts, he, that hath been by chymiſtry taught the nature of the ſeveral ſorts of ſalts and ſulphurs, and both beheld and conſidered their various actions upon one another, and upon other bodies, ſeems to have a conſiderable help to diſcourſe groundedly of the changes and operations of the humours, and other juices contained in the body, which he hath not, that hath never had *Vulcan* for his inſtructor. He that finds, that there may be acid juices in the ſtomach, and elſewhere, (as is frequently evident in the ſharp liquors, which many ſtomachs caſt up) and that there are alſo ſulphureous ſalts in the body (as is apparent in blood and urine, which abounds with ſuch:) He that knows that the ſerum, that ſwims upon the blood out of the body, is by a gentle heat immediately coagulable into a thick whitiſh ſubſtance, not unlike a cuſtard; and that chymically analyzed blood yields ſtore of volatile ſulphureous, but (as far as our trials have hitherto informed us) no acid, ſaltneſs:

Proved by a catalogue of conſiderable obſervations.

HE that knows, that theſe animal ſalts and ſpirits may be ſo powerful, that we have been able with ſpirit of urine, or of hartſhorn, to make a red ſolution of flowers of ſulphur, and that with ſpirit of urine (though drawn without violence of fire) we have (as we elſewhere more particularly declare) diſſolved both in a very gentle heat, and in a very ſhort time, the unopened body of crude copper, ſo as to make thereof a ſolution of a rich, deep, and even opacous blue; and that we have done almoſt the like with unrectified ſpirit of man's blood:

HE that hath, as we have done, examined by fire (eſpecially produced by the help of a burning-glaſs) that limpid liquor, that is to be found in the limphatick veſſels, and hath taken notice of that odd conſiſtence, ſmell, crackling, and other qualities diſcernible in it by heat:

HE that obſerves, how acid liquors loſe their acidity, by working upon ſome bodies; as when ſpirit of vinegar grows almoſt inſipid upon the coral it hath corroded; and how thoſe ſaline liquors, by working upon certain bodies, degenerate into ſalts of another nature, as we have ſometimes obſerved in oil of vitriol, working upon the fourth part of its weight of quickſilver, and how the contrariety of acid and ſulphureous ſalts makes them ſometimes diſarm, ſometimes, after ſome ebullition, precipitate each other; and ſometimes unite into a third ſubſtance, of a differing nature from either of thoſe, from whoſe coalition it reſults, as we ſee in *tartarum vitriolatum*; and, as I have obſerved, in a ſalt, I ſometimes make to emerge from a due proportion of oil of vitriol and ſpirit of urine, freed, after conjunction, from their aqueous moiſture: And he, in a word, that hath carefully analyzed and made trials on many parts, both of the macrocoſm and microcoſm, and heedfully applied his experiments made on the former to the illuſtration of the changes obſervable in the latter, ſhall be likely to explicate divers particulars in pathology more intelligibly, than he that is a ſtranger to chymiſtry.

That ſalt and ſulphur have more influence in the cauſation of diſeaſes, than the firſt qualities are, heat, cold, &c.

AND though I am very unwilling to meddle with medical controverſies, and am apt to think, that chymiſts are wont to ſpeak ſomewhat too ſlightingly of the humours of the human body, and allow them too little a ſhare in the production of diſeaſes; yet (to ſkip other reaſons) the ſtrange ſtories related by

by *Skenkius*, and other eminent phyſicians, of the corroſiveneſs of ſome juices, which, rejected by urine or vomits, have been able to boil on braſs, fret linen, and ſtain ſilver; together with ſome odd obſervations of this nature our ſelves have had opportunity to make, do very much incline us to believe, that the generality of former phyſicians have aſcribed too much to the humours, under the notion of their being hot and dry, cold and moiſt, or endowed with ſuch other elementary qualities, and have taken a great deal too little notice of the ſaline (if I may ſo ſpeak) and ſulphureous properties of things. And in this opinion I am not a little confirmed by the authority of *Hippocrates* himſelf, both in other paſſages, and eſpecially where he ſays, *Non calidum, frigidum, humidum, aut ſiccum eſſe, quod magnam agendi vim habet, verum amarum & ſalſum, & dulce & acidum, & inſipidum & acerbum, &c.* are the things, which, though inoffenſive to the body, whilſt they duely allay each other, prove hurtful to it, and diſtemper it, when any of them comes to ſerve it ſelf from the reſt, and grow predominant. And indeed, if the juices of the body were more chymically examined, eſpecially by a naturaliſt, that knows the ways of making fixed bodies volatile, and volatile fixed, and knows the power of the open air in promoting the former of thoſe operations; it is not improbable, that both many things relating to the nature of the humours, and to the ways of ſweetening, acuating, and otherwiſe altering them, may be detected, and the importance of ſuch diſcoveries may be diſcern'd.

Obſervations made upon the liquor, that diſtends the abdomen in the dropſy.

AND perhaps it would add to the uſefulneſs of ſuch an examination, if it were extended to the noxious juices in diſtempered bodies: ſuch as the rotten phlegm ſpit up by thoſe whoſe lungs are diſaffected; the ſlimy excretions voided in the lientery, and the liquor, that diſtends the *abdomen* in the dropſy and *aſcites*: concerning which (to tell you that upon the by) I found, that it was of a differing nature from either water or urine. For a *Paracenteſis* being made in the *abdomen* of one dangerouſly ſick of this ſort of dropſy, I found, that the liquor would keep a pretty while without putrefaction, (nor did the patient's body, when I afterwards ſaw it opened, ſmell almoſt at all, though the inſide of the *abdomen* look'd well as near as black, as if it had been ſphacelated:) and having ſteamed away ſome of it, whilſt it was pretty freſh, over a ſomewhat ſlow fire, it firſt coagulated into a ſubſtance like whites of eggs, and, by a little farther evaporation, turned to ſuch a glutinous ſubſtance, as tradeſmen are wont to call ſize; and being kept longer on the fire grew to be hard like fiſh-glew, but more brittle, and tranſparent enough, but with a little tincture of a greeniſh yellow; and ſome of the foremention'd liquor being diſtilled in a retort, did towards the end of the operation ſo darken the veſſel with a thick blackiſh oil, as hindered me from diſcerning what elſe perhaps I might have ſeen. And I ſuppoſe it may prove a uſeful inſtance to the former purpoſe, if I ſomewhat circumſtantially annex here what occurred to me, when I was accidentally conſidering of the *calculus humanus*.

Paracenteſis.

Obſervations on the calculus humanus.

HAVING therefore obtained of a ſkilful lithotomiſt of my acquaintance divers ſtones, which he had cut out of men's bladders, I choſe a couple of them (which were whitiſh almoſt, of equal bigneſs, and figure, which was near oval, and which together weighed about two ounces and an half:) theſe with the help of a ſtrong knife I carefully opened, to find whether or no either of them conſiſted of an intire and uniform matter, (as moſt other ſtones; and even ſome *calculi humani* do;) and I found, that each of them was made up of ſeveral ſhells, as it were ſucceſſively involving one another, like the rinds of an onion. And ſuch ſhells, but more ſoft, and more of a colour, we likewiſe obſerved in a great ſtone taken a while ſince out of an ox's gall, and ſent us for a preſent: and though all of theſe were of an almoſt ſtony hardneſs, yet that hardneſs was not equal in them all; and in one of the ſtones we obſerved one of the rinds (to make uſe of that expreſſion) to be of a differing colour both from that which immediately embraced it, and from that which it immediately embraced: ſome of theſe rinds equalled in thickneſs the length of a barley-corn, and others were ſomewhat thinner. Though they did cloſely embrace one another, yet they were actually ſeparable, as well as viſibly diſtinguiſhable. And proceeding very warily in the breaking one of theſe ſtones, we found, that in the center of it there lay a ſmall and ſoft oval ſtone, as it were the kernel of thoſe conglomerated ſhells; and this kernel lay ſo looſe, that with a little induſtry and patience we picked it out of the ſhell, and kept it by us as a rarity. This done, being deſirous to know, whether chymical tortures would force theſe concretes to a farther confeſſion of their nature, we cauſed them to be finely powdered, and put into a ſmall but ſtrongly coated glaſs-retort, whereunto luting a much larger retort for a receiver, we found, that theſe two ounces and half of powder, being diſtilled for ſome hours in a naked fire, afforded us great ſtore of volatile ſalt (partly grey and partly white) which almoſt covered the inſide of the receiver, and a pretty quantity of reddiſh ſpirit, which in the receiver itſelf ſoon coagulated into ſalt: and having ſever'd our veſſels, we found in the neck of the receiver a very little darkiſh oil, but in the neck of the retort a greater quantity of the ſame aduſt oil, incorporated with a pretty quantity of volatile ſalt, whoſe ſmell did really recall to my mind that peculiar kind of ſtink, which I had ſometimes taken notice of in the volatile ſalt of unfermented urine; nor were the taſtes of theſe two ſalts unlike. The *caput mortuum* conſiſted of a fine, light, coal-black powder, not unlike the fineſt ſort of ſoot; and by weighing but of ſix drachms, informed us, that above two thirds of the diſtilled *calculi humani* had been, as being volatile, forced from the terreſtrial parts, even in a cloſe veſſel, wherein the *caput mortuum*, though it were left inſipid enough, yet retained ſtink enough to make us think it ſtill contained

pretty

pretty ſtore of heavy oil: as indeed, having put it into a crucible, and kept it a competent while in a ſtronger fire, we found it reduced to about two drachms of a brittle maſs of inſipid white calx, which did not ſlack, or fall aſunder like lime, when it is caſt into the water.

Of the changes, that may reaſonably be thought to happen to our aliments within the body.

To this example of the uſefulneſs of chymiſtry, to diſcover the unobſerved, and otherwiſe ſcarce diſcoverable difference of the *calculus humanus* from other ſtones, we may venture to add, that though ſome Paracelſians do take too much liberty, when they crudely tell us, that there are arſenical, vitriolate, aluminous, and other mineral ſubſtances, generated in human bodies; yet if they had more warily propoſed their doctrine, it would not perhaps appear ſo abſurd, as they are wont to think it, who conſidering only the nature of the aliments men uſually feed upon, cannot conceive, that ſuch being but either animals or vegetables, can by ſo gentle a heat as that of man's body, (by which they ſuppoſe all the changes of the aliments muſt be effected,) be exalted to an energy like that of ſuch bodies, as are compoſed of active mineral ſubſtances, and have ſome of them perchance acquired a violence of operation from the fire. But we ſee, that concretions, ſo like ſtones, (which belong to the mineral kingdom) as to paſs generally for ſuch, may be produced in the bodies not only of men but of ſucking children, whoſe aliment is fluid milk: and it ſeems a miſtake to imagine (how many ſoever do ſo) that heat muſt needs be efficient of all the changes the matter of our aliments may happen to undergo in a human body; where there are ſtrainers, and ſolvents, and new mixtions, and perhaps ferments, and divers other powerful agents, which by ſucceſſively working upon the aſſumed matter, may ſo faſhion and qualify it, as, in ſome caſes, to bring the more diſpoſed part of it to be not unlike even foſſile ſalts, or other mineral ſubſtances. A very eminent perſon was lately complaining to me, that in the fits of a diſtemper, which almoſt as much puzzles her phyſicians as herſelf, ſhe ſometimes vomits up ſomething ſo ſharp and fretting, that, after it hath burnt her throat in its paſſage, almoſt like ſcalding water, it doth not only ſtain the ſilver veſſels, that received it, but alſo work upon them as if it were a corroſive menſtruum. And there died a while ſince a very intelligent perſon, much imployed in publick affairs, who complained to me, that in the fits of the ſtrange diſtemper he laboured under, he divers times obſerved, that that part of his pillow, which his breath paſſed along, would by the ſtrange fuliginous ſteams, which that carried off with it, be blacked over, as if it had been held in ſome ſooty ſmoke or other.

Illuſtrated by the example of juices out of the body.

We may alſo conſider, that the rain-water, which in its paſſage through a vine, or an apricock-tree, or the like plants is turned into a ſweet fruit in its paſſage through thoſe plants, that bear lemons and barberries, is tranſmuted into a liquor ſharp enough to corrode; not only pearls but coral, *lapides cancrorum*, and other hard concretes, as ſpirit of vitriol would do. And writers of unſuſpected credit affirm, that an Indian fruit, (whoſe name I cannot readily call to mind) will ſpeedily corrode and waſte the very ſteel knives it is cut with, if its juice be left long upon them: and we ſee, that ſome ſorts even of our apples and pears will quickly black the blades of knives on which the juice is ſuffered to continue. And leſt what I freſhly mentioned about lemon-trees, ſhould be queſtioned, I will here add, that I remember alſo, that I have made not only ſome other hot and ſtrongly taſted herbs, but even a ranunculus it ſelf, to grow and increaſe notably in weight as well as bulk, though I fed it but with fair water; and allowed it nothing elſe to ſhoot its root into. Wherefore ſince this plant is reckoned amongſt thoſe, that either are poiſonous, or want but little of being ſo; and ſince its operation is ſo violent, that this ſort of vegetables is taken notice of from the experience of country people, to be able by outward application to draw bliſters, and ſince nevertheleſs that, which this plant, without any heat diſcernible by the touch, tranſmutes into ſo virulent a ſubſtance, is but ſo unactive a body as water; why may not ſuch aliments, as may have in them divers parts of a far more operative nature, be in a human body, by an unuſual concourſe of cauſes and circumſtances, ſo altered and exalted, as to approach in operations (eſpecially upon the more tender parts) to thoſe of foſſile ſalts or other minerals? So that a chymiſt might upon ſuch an account, without any great abſurdity, teach ſome parcels of morbifick matter to be of an arſenical, or vitriolate, or an antimonial nature, eſpecially ſince we ſee, that ſometimes cancers, ulcers, and ſharp juices generated in the body, do by their vitiating and waſting the invaded parts, but too much emulate the pernicious operations of arſenick, and of fretting ſalts: and the infuſion of antimony doth ſcarce more ſtimulate nature to disburthen her ſelf both upwards and downwards, than doth ſometimes an humour, ſuch as that, which cauſes the *cholera morbus*, and perhaps more violent diſeaſes.

And that ſuch degeneration of innocent aliments ſhould ſometimes happen in diſcompoſed bodies, you will perhaps think the leſs ſtrange, if you duly perpend what I lately mentioned of the tranſmutation of water into hot and veſicatory ſubſtances; and if thereto I annex, that from a ſingle pound of ſo common and temperate an aliment as bread, I can by an eaſy way, (and that without addition) obtain many ounces of a menſtruum, which (as trial has informed) will work more powerfully upon bodies more compact than ſome hard minerals, or perhaps glaſs it ſelf, than a wary chymiſt would expect to ſee aqua fortis do. Theſe things I have mentioned, *Pyrophilus*, to intimate ſome of the reaſons, why I think chymical experiments may be uſefully applied, to illuſtrate ſome things in pathology, either by imitating out of the body the productions of ſome ſorts of morbifick matter, or by ſuch reſolutions as that, which is generated in the body, as may conduce to the diſcovery

of its nature. And not that I think, as Spagyriſts do, the experiments or notions of vulgar chymiſts ſufficient to explicate the whole doctrine either of digeſtion or diſeaſes: for it would be very difficult for them to make out the manner of nutrition, or ſo much as how they, that feed only on vegetables, ſhould (to propoſe the difficulty in their own terms) have their blood and urine copiouſly enriched with a volatile ſulphureous ſalt, of which ſort plants are not wont to yield any in diſtillation. And much more difficult would it be for them, by principles peculiar to chymiſts, to make out the propagation of hereditary diſeaſes: or how madneſs, and ſome other diſtempers, that do not viſibly vitiate the organs of thoſe functions that they pervert, ſhould not only prove hereditary, but lurk very many years in the inheriting perſon's body, before they begin to diſcloſe themſelves; and ſometimes too, be tranſmitted from the grandfather to the grandchild, and ſkip immediately the intervening ſon. And therefore I ſay again, that I pretend not, that vulgar chymiſtry will enable a phyſician to explicate all or moſt of the pathological phænomena; but that true chymiſtry may aſſiſt him to explicate divers of them, which can ſcarce be ſolidly explicated without it. And let me add, that he, that thoroughly underſtands the nature of ferments and fermentations, ſhall probably be much better able than he, that ignores them, to give a fair account of divers phænomena of ſeveral diſeaſes (as well fevers as others) which will perhaps be never thoroughly underſtood, without an inſight into the doctrine of fermentation; in order to which, for that and other reaſons, I deſigned my hiſtorical notes touching that ſubject.

Difference between vulgar and true chymiſtry.

The uſe of the knowledge of fermentation.

YET I am not ſure, but there may be effervescences, (and perhaps periodical ones) in the blood and other juices of the body without fermentation properly ſo called. For there may be divers other ways of begetting a preternatural heat in the blood. We often ſee, that in coughs, when the phlegm is rotten (as they ſpeak) that is, when its former viſcous texture is altered, it does no longer ſtick faſt to the veſſels of the lungs, to which it obſtinately adhered before. And ſo at certain times other humours in the body, either by growing more fluid themſelves, or by ſome change in the blood, whereby it becomes fitter to diſſolve ſuch humours, may ſwim in, and be circulated with the maſs of blood, and thereby occaſion preternatural heats; either by their indiſpoſition to be well incorporated therewith; or by altering its texture; or diſturbing the wonted motion of its minute parts; or by oppoſing its due rarefaction, as it paſſeth through the heat; or by obſtructing the more ſlender veſſels, and ſo hindering the free circulation of the blood through them; perhaps alſo cauſing ſome extravaſation, as we ſee, that wounds and bruiſes are attended with ſome inflammation, more or leſs, of the part affected; or by ſome other of the ways not now to be declared. And trial hath taught me, that there are liquors, in which the bare admixture of milk, oil, or other liquors, nay or of cold water, will preſently occaſion a notable heat: and I ſometimes employ a menſtruum, in which nothing but a little fleſh being put, though no viſible ebullition enſue, there will in a few minutes be excited a heat intenſe enough to be troubleſome to him, that holds the glaſs. And yet it ſeems not neceſſary, that this ſhould be aſcribed to a true fermentation, which may rather proceed from the perturbed motion of the corpuſcles of the menſtruum, which being by the adventitious liquor or other body put out of their wonted motion, and into an inordinate one, there is produced in the menſtruum a briſk confuſed agitation of the ſmall parts, that compoſe it; and in ſuch an agitation (from what cauſe ſoever it proceeds) the nature of heat ſeems mainly to conſiſt. But to diſpatch, I ſcarce doubt, but that if in the hiſtory of diſeaſes, there were better notice taken of thoſe phænomena, that agree not with the opinions already in requeſt, as well as of thoſe, that are thought conſonant to them; and if alſo chymical trials were ſkilfully varied, and judiciouſly applied to this illuſtrating of pathological phænomena, the former might be made conducing to the better explication of the latter: eſpecially if the buſineſs were managed by a naturaliſt well verſed both in chymical experiments, and in anatomy, and the hiſtory of diſeaſes, without being too much addicted either to the chymiſt's notions, or the received opinions of phyſicians.

Of periodical effervescences in the blood without fermentation.

AND as the naturaliſt may thus illuſtrate pathology as a chymiſt, ſo may he do the like as a zoologer; for either the true knowledge of anatomy muſt be much leſs uſeful to phyſicians than they have hitherto believed, or elſe the diſcoveries made by recent anatomiſts of the Aſellian, Pecquetian, and Bartholinian veſſels, by either overthrowing the received doctrine of digeſtions, (from whoſe aberrations many diſeaſes ſpring) or at leaſt by making divers diſcoveries in relation to the oeconomy of digeſtions unknown to the ancients, muſt probably contribute much to the clearing up of divers pathological difficulties in the explication of ſome diſeaſes; beſides that the very liberty of making thoſe experiments in live beaſts, which are not to be made but in living creatures, nor are allowable to be made in living men, may enable a zoologiſt, by giving us a clearer account of divers parts of the body, to determine divers pathological difficulties ſpringing from either our ignorance or miſtakes of the uſe of thoſe parts, as by the formerly mentioned experiment of the exſection of a live dog's ſpleen, and a watchful obſervation of all the diſeaſes upon that account, befalling him and other dogs ſo ſerved; much light perhaps may be given to the doctrine of the uſe of the ſpleen, together with the diſeaſes ſuppoſed to depend upon that part, which I fear is hitherto (to the no ſmall prejudice of the ſick) by few phyſicians throughly underſtood, and by many unhappily enough miſtaken.

Of the uſe of zoology to the knowledge of diſeaſes.

AND here we may repreſent unto you, *Pyrophilus*, that not only the diſſections of found beaſts may aſſiſt the phyſician to diſcover

cover the like parts of a human body, but the diſſections of morbid beaſts may ſometimes illuſtrate the doctrine of the cauſes and ſeats of diſeaſes. For that this part of pathology has been very much improved by the diligence of modern phyſicians, by diſſecting the bodies of men killed by diſeaſes, we might be juſtly accuſed of want of curioſity, or gratitude, if we did not thankfully acknowledge; for indeed much of that improvement of phyſick, (for which the antients, were they now alive, might envy our new phyſicians) may, in my poor opinion, be aſcribed to their induſtrious ſcrutiny of the ſeat and effects of the peccant matter of diſeaſes in the bodies of thoſe that have been deſtroyed by them.

AND that the inſtructions deducible from ſuch obſervations may be either increaſed or illuſtrated by the like obſervations made in the bodies of beaſts, we have been inclined to think, partly by the having chymically analyzed (as they phraſe it) the blood of divers brutes, as ſheep, deer, *&c.* and found its phlegm, ſpirit, ſalt, and oil, very like that of human blood; and partly, by our having obſerved in the bodies of ſeveral brutes, (not excepting fiſhes) worms, impoſthumes, and the like, ſome of which ſeemed manifeſtly to ſpring from ſuch cauſes, as are wont to produce reſembling diſtempers in men. And if the acute *Helmont* had been a more diligent diſſector of beaſts, he would perchance have eſcaped the error he after others run into (and into which his authority hath tempted others to run) when he affirmed, that the ſtone was a diſeaſe peculiar to men; for that in the bodies of beaſts, eſpecially very old ones, ſtones are ſometimes to be found, not only ſeveral butchers have aſſured me, but you may gather partly from that taken out of an ox's gall, which I have formerly mentioned, which was about the bigneſs of a walnut, but principally from what I elſewhere delivered on purpoſe to diſprove that fond aſſertion. And greater leiſure may, upon another occaſion, invite us to mention ſome pathological obſervations made in diſeaſed beaſts, by which (were we not willing to haſten) we might now perhaps much confirm what we have propoſed touching the poſſibility of illuſtrating, by ſuch obſervations, the nature of ſome of the diſeaſes incident to human bodies.

Helmont's error refuted, that the ſtone is a diſeaſe peculiar to man.

AND here we may alſo conſider, that there are divers explications of particular diſeaſes, or troubleſome accidents propoſed by phyſicians, eſpecially ſince the diſcovery of the blood's circulation, wherein the compreſſion, obſtruction, or irritation of ſome nerve, or the diſtenſion of ſome vein by too much blood, or ſome hindrance of the free paſſage of the blood through this or that particular veſſel, is aſſigned for the cauſe of this or that diſeaſe or ſymptom. Now in divers of theſe caſes the liberty lately mentioned, that a ſkilful diſſector may take in beaſts, to open the body or limbs, to make ligatures ſtrong or weak on the veſſels, or other inward parts, as occaſion ſhall require, to leave them there as long as he pleaſeth, to prick, or apply ſharp liquors to any nervous or membranous part, and whenever he thinks convenient, to diſſect the animal again, to obſerve what change his experiment hath produced there: ſuch a liberty, I ſay, which is not to be taken in human bodies, may in ſome caſe either confirm or confute the theories propoſed, and ſo put an end to divers pathological controverſies, and perhaps too occaſion the diſcovery of the true genuine cauſes of the phænomena diſputed of, or of others really as abſtruſe.

To this let me add, that there is a whole claſſis of diſeaſes to be met with in phyſicians books, which proceed not originally from any internal diſtemper of the patient, but are produced by ſome exteriour poiſon, and are therefore wont to be called by doctors, *morbi à veneno orti*, to the more accurate knowledge of divers of which diſeaſes experiments made on brutes may not a little conduce. For though I deny not, that ſome things may be poiſonous to man, that are not ſo to ſome beaſts; and on the contrary (as we have more than once given to a dog, without much harming him, ſuch a quantity of opium, as would probably have ſufficed to have killed ſeveral men) yet the greater number of poiſons being ſuch both to man and brutes, the liberty of exhibiting them, when, and in what manner we pleaſe, to theſe (which we dare not do to him) allows us great opportunities of obſerving their manner of operation and inveſtigating their nature, as ourſelves have tried, and that ſometimes with unexpected events (as when lately a cat ran mad, ſo that her keeper was fain to kill her) upon a large doſe of opium which we cauſed to be given her.

AND on this occaſion I ſhall not ſcruple to tranſcribe one obſervation out of a diſcourſe, I ſome years ſince writ to a friend, about the turning poiſons into medicines, becauſe that treatiſe I am like, for certain reaſons, to ſuppreſs: the words, as I there find them, are theſe.

'BEFORE I take leave of vipers (or adders, as ſome will have thoſe, that here in *England* commonly paſs for vipers) it will not be impertinent to tell you, that it may be juſtly doubted; whether they be to be reckoned amongſt poiſonous creatures, in ſuch a ſenſe as thoſe other venomous creatures, who have in them a conſtant, and, if I may ſo ſpeak, groſs and tangible poiſon; for it may be ſuppoſed, that the venom of vipers conſiſts chiefly in the rage and fury, wherewith they bite, and not in any part of the body, which hath at all times a mortal property: thus the madneſs of a dog makes his teeth poiſonous, which before were not ſo. And authors of good repute ſupply us with inſtances of hurts, in themſelves free from danger, that have been made fatal by a venom created by the fierceneſs of the enraged (though not otherwiſe poiſonous) creatures that inflicted them. And *Baccius*, if I miſtake not, in his treatiſe *de venenis*, tells us a memorable ſtory (whereof he affirms himſelf to have been an eye-witneſs) of a man, who was killed within three days, by a ſlight hurt received in his left hand, from an enraged dunghill-

That the venom of vipers or adders conſiſts chiefly in the rage and fury, wherewith they bite, and not in any part of the body that hath at all times a mortal property.

'dunghill-cock; and that no parts of the viper 'have any conſtant inherent poiſon in them, 'I have been induced to ſuſpect upon this ex- 'periment, that diſſecting ſome live vipers, 'there came in accidentally a ſtrange dog, to 'whom I gave the head, tail, and gall, (which 'are the parts ſuppoſed to contain the poiſon) 'of one of them; and the head and gall of ano- 'ther, wrapt up in meat; after which I locked 'the little dog up in my own chamber, and 'watched him; but found not, that he was 'ſick, or offered to vomit at all, but only lap- 'ped up greedily ſome drink, which he eſpied 'in the room: nor was he alone very jocund, 'for divers hours that I kept him in, but 'liked his entertainment ſo well, that he would 'afterwards, when he met me in the ſtreet, 'leave thoſe, that kept him, to fawn on and 'follow me. And having ſince related this 'experiment to an inquiſitive friend of mine, 'he aſſured me, that to ſatisfy himſelf further 'in this particular, he gave to a dog a dozen 'heads and galls of vipers, without finding 'them to produce in him any miſchievous 'ſymptom. To which I ſhall add, that the 'old man you know, that makes viper-wine, 'does it (as himſelf tells me) by leaving the 'whole vipers, if they be not very great, per- 'haps for ſome months, without taking out 'the galls, or ſeparating any other part from 'them in the wine, till it hath diſſolved as 'much of it as it can.

'AND though it may ſeem ſomewhat im- 'proper, whilſt we are diſcourſing of poiſons, 'to inſiſt on a remedy againſt them; yet the 'mention of vipers recalling into my mind a 'memorable experiment, which I tried againſt 'the biting of vipers, I ſhall chuſe rather to 'decline the dictates of method, than thoſe 'of charity, which forbids me to ſuppreſs a 'remedy, that may poſſibly reſcue from ſudden 'death a perſon or other fit to live, or un- 'prepared to die; becauſe it does not ſtrictly 'belong to the theme, whereto it is referred.

A certain cure for the biting of vipers.

'The remedy then is this, that as ſoon as ever 'a man is bitten, (for if the poiſon have had 'time enough to diffuſe it ſelf, and gain the 'maſs of blood, I doubt the experiment will 'ſcarce ſucceed) a hot iron be held as near 'the place, as the patient can poſſibly endure, 'till it have, as they ſpeak, drawn out all the 'venom: which eye-witneſſes aſſure me (for 'I have not yet ſeen that my ſelf) will ſome- 'times adhere like a yellowiſh ſpot to the ſur- 'face of the iron. But being upon competent 'grounds ſatisfied of the experiment, to con- 'vince a phyſician, that miſtruſted it; I laſt 'ſummer hired a man (who doubted it as little 'as I) to ſuffer himſelf to be bitten by a viper; 'and having in the phyſician's houſe and 'preſence picked out of a good number of 'them, one of the blackeſt I could find (thoſe 'of that colour being ſuppoſed the moſt miſ- 'chievous) and commanded the fellow to pro- 'voke and anger it, (which to my wonder he 'did, a pretty while before the beaſt would 'faſten on him;) at length being by his very 'rude handling thoroughly exaſperated, it 'bit him with great fury, as it ſeemed: for 'immediately his hand began to ſwell, and 'the injured part was grown tumid, before we 'could take from the fire, which was hard by, 'a knife, that lay heating there; and having 'applied it as near as he could ſuffer it, for 'about ten or twelve minutes, we found, that 'the ſwelling, though it decreaſed not, did not 'ſpread, and the man glad of his money, with- 'out farther ceremony, went about his affairs, 'and told me ſince, that though the tumour 'continued a while, he had no other incon- 'venience attending it, and hath divers times 'got money by repeating the experiment; 'though otherwiſe, by the caſual bitings of 'vipers, he hath been much diſtreſt, and his 'wife almoſt killed.'

BUT, *Pyrophilus*, to return to the experiments of poiſons made on beaſts, we could wiſh phyſicians were more diligent to make trials of them, not only by giving beaſts poiſons at the mouth, but alſo by making external applications of them, eſpecially in thoſe parts, where the veſſels, that convey blood, more approach the ſurface of the body, and alſo by dexterouſly wounding determinate veins with inſtruments dipt in poiſons (eſpecially moiſt or liquid ones) that being carried by the circulated blood to the heart and heat, it may be found, whether their ſtrength be that way more uninfringed, and their operation more ſpeedy (or otherwiſe differing) than if they were taken in at the mouth. For I remember ſober travellers have ſhewed me ſome Indian poiſons, whoſe noxious efficacy they affirmed to be, by great intervals of time, differingly mortal, according as the ſlight hurt made by the points of arrows, infected with them, did open a capillary or larger vein, and were inflicted on a part more or leſs diſtant from the heart; but having not yet made any trial of this my ſelf, I dare not build upon it. Yet I find, that the formerly commended *Olearius*, in his travels into *Muſcovy* and *Perſia*, takes notice of a venomous inſect in *Perſia*, which the natives call *Encureck*, and which he (how juſtly I know not) makes to be a kind of *Tarantula*, becauſe it is, as that creature, in ſhape almoſt like a ſpider, and ſpeckled, though of twice the bigneſs of a thumb: this inſect (ſays he) inſtead of ſtinging or biting, lets his venom fall in form of a drop of water, which immediately produces inſufferable pains in the part to which it faſtens; and ſuddenly penetrating as far as to the ſtomach, ſends up vapours to the head, which ſends again (to uſe his expreſſion) ſo profound a ſleep to all the patient's limbs, that it is impoſſible to awaken him, but by one only remedy, which is to cruſh one of theſe creatures upon the hurt, whence he abſtracts all the poiſon. Some horrid and unuſual ſymptoms of this venom, which yet agree not ſo well with thoſe, that are wont to be produced in perſons bitten by *Tarantula's*, our author proceeds to mention; and furniſhes us with a proof of what we were lately ſaying, when we told you, that ſome things were poiſonous to men, which were not to ſome beaſts; by adding, as an admirable ſingularity, that the ſheep of thoſe parts do not only eat theſe

Of external application of poiſons, and letting them into the veins of beaſts.

Voyage de Moſcovie & de Perſe, pag. 334.

fatal

fatal inſects, but ſeek for them. I know alſo, by ſad experience in my ſelf, what an outward application even of cantharides can do; for having occaſion to have a large bliſter drawn on my neck, the chirurgeon I employed, unknown to me, made uſe of cantharides, among other ingredients of his veſicating plaiſter, which, a few hours after I had taken it, wakened me with exceſſive torment, to which it put me about the neck of my bladder, ſo that I apprehended it might proceed from ſome ſtone unable to get out; of which ſudden and ſenſible pain, after I had a while in vain conjectured, what might be the cauſe, I at length ſuſpected that, which was indeed the true one; and having ſent for the chirurgeon, he confeſſed to me, upon my demand, that he had put ſome cantharides in his plaiſter, not thinking it would have had ſuch an operation: whereupon I ſoon relieved my ſelf, by drinking new milk very well ſweetened with ſugar-candy.

POSTSCRIPT.

TO enable you, *Pyrophilus*, to gratify thoſe inquiſitive perſons, that have heard ſome, and yet but an imperfect report, of a much noiſed experiment, that was ſome years ago deviſed at *Oxford*, and ſince tried in other places before very illuſtrious ſpectators; I am content to take the occaſion afforded me, by what was in the foregoing eſſay lately mentioned concerning the application of poiſons, to inform you, that a pretty while after the writing of that eſſay, I happened to have ſome diſcourſe about matters of the like nature, with thoſe excellent mathematicians, Dr. *J. Wilkins*, and Mr. *Chriſtopher Wren*; at which the latter of thoſe virtuoſi told us, that he thought he could eaſily contrive a way to convey any liquid poiſon immediately into the maſs of blood. Whereupon our knowledge of his extraordinary ſagacity making us very deſirous to try what he propoſed, I provided a large dog, on which he made his experiment in the preſence, and with the aſſiſtance of ſome eminent phyſicians, and other learned men. His way (which is much better learned by ſight than relation) was briefly this: firſt, to make a ſmall and opportune inciſion over that part of the hind-leg, where the larger veſſels, that carry the blood, are moſt eaſy to be taken hold of: then to make a ligature upon thoſe veſſels, and to apply a certain ſmall plate of braſs (of above half an inch long, and about a quarter of an inch broad, whoſe ſides were bending inwards) almoſt of the ſhape and bigneſs of the nail of a man's thumb, but ſomewhat longer. This plate had four little holes in the ſides, near the corners, that, by threads paſſed through them, it might be well faſtened to the veſſel. And in the ſame little plate there was alſo left an aperture, or ſomewhat large ſlit, parallel to the ſides of it, and almoſt as long as the plate, that the vein might be there expoſed to the lancet, and kept from ſtarting aſide. This plate being well faſtened on, he made a ſlit along the vein, from the ligature towards the heart, great enough to put in at it the ſlender pipe of a ſyringe, by which I had propoſed to have injected a warm ſolution of opium in ſack, that the effect of our experiment might be the more quick and manifeſt. And accordingly our dextrous experimenter having ſurmounted the difficulties, which the tortured dog's violent ſtrugglings interpoſed, conveyed a ſmall doſe of the ſolution or tincture into the opened veſſel, whereby, getting into the maſs of blood (ſome quantity of which, it is hard to avoid ſhedding in the operation) it was quickly, by the circular motion of that, carried to the brain, and other parts of the body. So that we had ſcarce untied the dog (whoſe four feet it had been requiſite to faſten very ſtrongly to the four corners of the table) before the opium began to diſcloſe its narcotick quality; and almoſt as ſoon as he was upon his feet, he began to nod with his head, and faulter and reel in his pace, and preſently after appeared ſo ſtupified, that there were wagers offered his life could not be ſaved. But I, that was willing to reſerve him for further obſervation, cauſed him to be whipped up and down a neighbouring garden, whereby being kept awake and in motion, after ſome time he began to come to himſelf again, and being led home, and carefully tended, he not only recovered, but began to grow fat ſo manifeſtly, that it was admired: but I could not long obſerve, how it fared with him; for this experiment, and ſome other trials I made upon him, having made him famous, he was ſoon after ſtolen away from me. Succeeding attempts informed us, that the plate was not neceſſary, if the finger were ſkilfully employed to ſupport the veſſel to be opened; and that a ſlender quill, faſtened to a bladder, containing the matter to be injected, was ſomewhat more convenient than a ſyringe; as alſo, that this notwithſtanding, unleſs the dog were pretty big, and lean, that the veſſels might be large enough and eaſily acceſſible, the experiment would not eaſily ſucceed. The inventor of it afterwards practiſed it in the preſence of that moſt learned noble man, the Marquis of *Dorcheſter*, and found, that a moderate doſe of the infuſion of *crocus metallorum* did not much move the dog, to whom it was given: but once that he injected a large doſe (about two ounces or more) it wrought ſo ſoon, and ſo violently upon a freſh one, that within a few hours after, he vomited up life and all, upon the ſtraw, whereon they had laid him. I afterwards wiſhed, that not only ſome vehemently working drugs, but their appropriated antidotes, (or elſe powerful liquid cordials) and alſo ſome altering medicines, might be in a plentiful doſe injected. And in diureticks a very ingenious anatomiſt and phyſician told me, he tried it with very good ſucceſs. I likewiſe propoſed, that if it could be done, without either too much danger or cruelty, trial might be made upon ſome human bodies, eſpecially thoſe of malefactors. And ſome months after, a foreign ambaſſador, a curious perſon, at that time reſiding in *London*, did me the honour to viſit me, and informed me, that he had cauſed trial to be made with infuſion of *crocus metallorum*, upon an inferiour domeſtick of his, that deſerved to have been

Experiments of conveying liquid poiſons immediately into the maſs of blood.

been hanged; but that the fellow, as ſoon as ever the injection began to be made, did (either really or craftily) fall into a ſwoon, whereby being unwilling to proſecute ſo hazardous an experiment, they deſiſted; without ſeeing any other effect of it, ſave, that it was told the ambaſſador, that it wrought once downward with him, which yet might, perhaps, be occaſioned for fear or anguiſh. But the trials of a very dextrous phyſician of my acquaintance, in human bodies, will perhaps, when I ſhall have received a more circumſtantial account of them, be not unwelcome to you. And in dogs, you may poſſibly, from our own obſervations, receive a further account of an experiment; of which, I now chiefly deſigned but to relate to you the riſe and firſt attempts.

ESSAY III.

Containing ſome particulars relating to the Semeiotical part of Phyſick.

THE ſemeiotical part of the phyſician's art ſeems capable of the leaſt improvement by natural philoſophy. In which yet, firſt the naturaliſt may, by illuſtrating the anatomical and pathological parts, aſſiſt the phyſician to make more certain conjectures from the ſigns he diſcovers of the conſtitution and diſtempers of his patient. For you will eaſily believe, that, *cæteris paribus*, he, that better knows the nature of the parts and juices of the body, will be better able to conjecture at the events of diſeaſes, than he that is leſs ſkilled in them. And ſecondly, the naturaliſt by improving the therapeutical, may at leaſt much change and alter the prognoſticks of the duration, ferocity, and event of diſeaſes. For, *Pyrophilus*, it would be conſidered, that the predictions hitherto current in authors, and commonly made by phyſicians, ſuppoſe the uſe of the received remedies, and the dogmatical method of phyſick; but if there were diſcovered ſuch generous and commanding medicines, as, by powerfully aſſiſting nature, or nimbly proſcribing the morbifick matter, that doth either produce, or (though produced by them) cheriſh ſickneſſes, might enable nature to hinder the diſeaſe from continuing its courſe, and acting almoſt all the ſcenes of its tragedy in the body; phyſicians need not, in acute diſeaſes, wait ſo often for a criſis to inſtruct their prognoſticks; and the threatening ſymptoms of chronical diſtempers would often prove falſe prophets.

That the improvement of the therapeutical would alter the prognoſticks in the ſemeiotical part of phyſick.

To illuſtrate this but with a not ignoble inſtance, give me leave to tell you, that when that Peruvian bark, that now begins to be ſomewhat taken notice of, under the name of the Jeſuits powder, had ſcarce been ſo much as heard of in this part of *Europe*, I went to viſit a virtuoſo, who had been for ſome months afflicted with a quartan ague, ſo violent and ſtubborn, that it had fruſtrated the ſkill, and almoſt tired the endeavours of the moſt eminent doctors of this nation; of one of which, who was then accidentally with his learned patient, I inquired how my friend did, and was anſwered, that he hoped he would recover, when the ſeaſon would give him leave; but in the winter he knew no quartans cured. Yet the gentleman acquainting me with his having procured ſome of the American bark againſt agues, which we mentioned in a former eſſay, and I (after having taſted and conſidered it) having encouraged him, as I have others, to make trial of it, as the ſtrange effects I have obſerved of it have divers times invited me to do; the candid and learned doctor not only oppoſed not my perſuaſions, but added his own to them. And my friend taking two doſes of this powdered bark, though it were at the unhopeful ſeaſon of the year (the winter ſolſtice) and though he ſcarce found any ſenſible operation (unleſs a little by ſweat) of the Peruvian medicine, had by the firſt doſe his fit very much leſſened, and by the ſecond quite removed. And though through ſome irregularities of diet (to which that keen appetite, like that of recovering perſons, which I have obſerved this powder to be wont to produce, tempted him) he did, as I then foretold him he would, after miſſing eight or ten fits, relapſe; yet by the repeated uſe of the ſame remedy, he again recovered, and hath continued ſo ever ſince. Having alſo lately perſuaded the uſe of the ſame medicine, in the ſame diſeaſe, to one of the greateſt ladies in this nation, ſhe told me the other day, that it immediately, and in unlikely weather, freed her from thoſe fits, from whence ſhe deſpaired to be delivered till the ſpring. Having likewiſe ſent ſome of it to a couple of gentlemen, ſick of the like malady, I had word brought me, that one had miſſed his fits for a month, though in the midſt of winter; and the other was by the firſt doſe cured, and continues ſo. And divers eminent phyſicians, to whom I have commended the ſpecifick, have uſed it with ſuch ſucceſs, that one of the ſevereſt of them, though he had formerly deſpiſed it, confeſſed to me, that in a ſhort time he tried it upon eight or nine ſeveral perſons, without finding it to fail in any, though one of them eſpecially were, before he was called, judged irrecoverable; the obſtinate quartan being complicated with other almoſt as dangerous diſtempers. And I confeſs I ſomewhat wonder, that men have not the curioſity to try the efficacy of this powerful bark

An inſtance to that purpoſe in the Peruvian bark.

in other diſeaſes than agues; it being highly probable, that a medicine, capable to prevail ſo ſtrongly againſt ſo obſtinate a diſeaſe as a quartan, (wherein moſt commonly divers of the conſiderable parts of the body are much affected) cannot be uſeleſs to ſeveral other diſtempers. I deny not, that thoſe, that have taken this powder, have divers of them, after having miſſed ſix or ſeven fits, relapſed into them, (as it likewiſe happened to one of the gentlemen I ſent it to) yet (as I have elſewhere told you) it is much, and more than any common remedy does, to ſtop the fit ſo long. Nor is it a ſmall matter to be able to give the patient ſo much breathing time, and allow the phyſician the opportunity of imploying other remedies. And the relapſes we ſpeak of, are commonly cured by the ſame powder; and we have known them prevented, when the medicine hath been adminiſtred, not by unſkilful perſons, but by a prudent phyſician, who knows how to aſſiſt it, by opening and gently purging phyſick. Wherefore that, which I ſhould be moſt gladly ſatisfied of about this remedy, is, whether or no it do indeed, either proſcribe the morbifick matter, or ſo alter its texture as to make it harmleſs; or elſe, whether it doth ſecretly leave ſuch noxious impreſſions upon the ſpleen, guts, or ſome other important part, as may ſhorten life, by producing in proceſs of time, either the ſcurvy, or the dropſy, or ſome other formidable diſeaſe. But becauſe the reſolution of this doubt muſt be a work of time, we muſt at preſent refer it to future obſervation: and therefore ſhall now ſubjoin, that if the famous *Riverius* have not, in his learned obſervations, flattered his own *febrifugum*, whatever he reſolved touching this Indian bark, there will not want a ſafe remedy, which may allow phyſicians to make more chearful predictions about the laſtingneſs and event of quartans, than have hitherto been uſual.

And in Riverius's Febrifugum, *and a new cure of the King's-evil.*

Riverius *in obſervat.*

How painful and ſtubborn a diſeaſe the King's-evil is wont to prove, is ſcarce more known, than that it is ſeldom cured without a tedious courſe of phyſick: and yet by the herb mentioned in one of the former eſſays, the young gentleman there ſpoken of was cured in a ſhort time, and with little or no pain or trouble. And that theſe are not the only diſeaſes, in which obſervations, tending to our preſent purpoſe, may be made, the following part of this treatiſe will afford you opportunity to obſerve.

Vide infra, c. 9.

I MIGHT add, *Pyrophilus*, that I was lately viſited by an ancient chymiſt, enobled by divers eminent cures, who promiſeth to me an experiment of making very unuſual, and yet rational predictions in ſome abſtruſe diſeaſes, by a peculiar way of examining the patient's urine. But becauſe ſome chymiſts have written extravagantly enough upon a like ſubject, and becauſe I have not yet made or ſeen the experiment of it my ſelf, I dare not yet give this new method of foretelling, for an inſtance of the uſefulneſs of natural philoſophy to the ſomeiotical part of phyſick. Though I dare not deny but by precipitations, and ſome other ways, not yet vulgarly practiſed, of examining the urine, made by the ſame patient at ſeveral times, before, in, and after ſome notable alteration in his body, divers things (eſpecially in fevers, and other acute diſeaſes) relating to the ſtate of it, may be diſcovered, eſpecially if thereto be added a ſkilful and ſeaſonable chymical examen of the other excrements, and vitiated ſubſtances of the patient's body.

YOU will perchance expect, *Pyrophilus*, that on this occaſion I ſhould handle that controverſy, which is ſo hotly agitated betwixt the Paracelſians and their adverſaries, concerning the curableneſs of all diſeaſes: but, for aught I can perceive, the difference betwixt the more ſober men of both parties is more about words than things, and might be reduced to a much leſs diſtance, if men could but calmly conſider, that it is one thing to diſpute, whether all diſeaſes be curable, and another, whether all perſons be recoverable? For a diſeaſe may be called incurable, either in its own nature, or by accident; that is, either becauſe ſuch a diſeaſe is not to be cured in any patient, or that it is ſo circumſtantiated in this or that patient, as not to be naturally curable in him. Now this diſtinctly and duly conſidered may conduce much to reconcile the two opinions, if not the parties that maintain them; for neither would a ſober Paracelſian affirm, (though *Paracelſus* himſelf doth ſomewhere ſeem to do ſo,) that every diſeaſe is curable in every patient, there being ſome palſies, gouts, or blindneſſes, or the like, ſo obſtinate, that (eſpecially if they are born with a man, or inherited from his parents) the tone of ſome neceſſary or conſiderable part of the body being thereby rather aboliſhed, than barely vitiated, it were a folly to promiſe recovery to ſuch a patient. And on the other ſide, a moderate Galeniſt, that is not unacquainted with the diſcoveries, which theſe latter ages have made of the power of nature and art, will not be forward to pronounce (as others do, and as the Paracelſians tax the Galeniſts too indiſcriminately for doing,) that the gout, (for inſtance) the dropſy, the dead palſy, and the ſtone, are diſeaſes univerſally incurable; ſince in the writings of *Eraſtus*, and in the obſervations of *Schenckius*, and others, there are inſtances recorded of ſome cures performed of the dropſy, and one or two more of thoſe ſtubborn diſeaſes, even by Galenical remedies.

That though no diſeaſe ſhould be incurable, yet every diſeaſe is not curable in every patient.

BUT, *Pyrophilus*, though we cannot but diſapprove the vain-glorious boaſts of *Paracelſus* himſelf, and ſome of his followers, who, for all that, lived no longer than other men; yet I think mankind owes ſomething to the chymiſts, for having put ſome men in hope of doing greater cures than have been formerly aſpired to, or even thought poſſible, and thereby engage them to make trials and attempts in order thereunto. For not only before men were awakened and excited by the many promiſes and ſome great cures of *Arnoldus de Villanova*, *Paracelſus*, *Rulandus*, *Severinus*, and *Helmont*, many phyſicians were wont to be too forward to pronounce men, troubled with ſuch and ſuch diſeaſes, incurable, and rather detract from nature and art, than con-

That the hope of doing greater cures than ordinary hath engaged artiſts to make profitable trials.

feſs, that thoſe two could do what ordinary phyſick could not; but even now, I fear, there are but too many, who, though they will not openly affirm, that ſuch and ſuch diſeaſes are abſolutely incurable, yet if a particular patient, troubled with any of them, be preſented, they will be very apt to undervalue (at leaſt) if not deride thoſe, that ſhall attempt and hope to cure him.

AND I am apt to think, that many a patient hath been ſuffered to die, whoſe life might have been ſaved, if phyſicians would have but thought it poſſible to ſave it. And therefore I think it were no ill piece of ſervice to mankind, if a ſevere collection were made of the cures of ſuch perſons, as have recovered of having been judged irrecoverable by the doctors; that men might no longer excuſe their own ignorance by the impotency of nature, and bear the world in hand, as if the art of phyſick, and their ſkill, were of the ſame extent. And the cures, that ſeem performed by nature her ſelf, need not be left out of ſuch a collection: for ſtill they ſhew what is poſſible to be done by natural means, to evacuate the morbifick matter, or alter its nature (how dangerous ſoever it is grown,) or how far the tone of a part, or ſtrength of the body may be vitiated or impaired, and yet be capable of ſome reſtitution. And ſuch an obſervation I received from our moſt experienced *Harvey*, when, having conſulted him about my weak eyes, he told me, among other things (as a very remarkable one) that he had once a patient (whoſe name and profeſſion he told me, but I remember not) that had a confirmed cataract in his eye; and yet upon the uſe of phyſick, to which he could not aſcribe ſo wonderful an effect, that cataract was perfectly diſſipated, and the eye reſtored to its wonted function. Which brings into my mind another obſervation, imparted to me a while ſince by that excellent and experienced lithotomiſt, Mr. *Hollyer*, who told me, that among the many patients ſent to be cured in a great hoſpital (of which he is one of the chirurgeons) there was a maid of about 18 years of age, who, without the loſs of motion, had ſo loſt the ſenſe of feeling in the external parts of her body, that when he had, for trial ſake, pinned her handkerchief to her bare neck, ſhe went up and down with it ſo pinned, without having any ſenſe of what he had done to her. He added, that this maid having remained a great while in the hoſpital without being cured, Dr. *Harvey*, out of curioſity, viſited her ſometimes, and ſuſpecting her ſtrange diſtemper to be chiefly uterine, and curable only by hymeneal excerciſes, he adviſed her parents (who ſent her not thither out of poverty) to take her home, and provide her a huſband, by whom, in effect, ſhe was, according to his prognoſtick, and to many men's wonder, cured of that ſtrange diſeaſe. That in acute ſickneſſes perſons given over by the phyſicians may recover, the more judicious, even of thoſe Galeniſts, that are of a deſpondent temper, will not deny. For not only *Celſus* gives us this ſober admonition, *Neque ignorare oportet in acutis morbis fallaces magis notas eſſe & ſalutis & mortis:* 'Nor may we be ignorant, that in 'acute diſeaſes, the notes of life or death are 'more fallacious:' But even *Hippocrates* himſelf, who was ſo ſkilful in prognoſticks, confeſſes, that *Morborum acutorum non in totum certæ ſunt prænunciationes neque ſalutis neque mortis:* whence the French have a proverbial ſaying, that *Il vaut mieux eſtre condamné par les medicins, que par le prevoſt des mareſchaux*; as if in Engliſh we ſhould ſay, "it is better to "be condemned to die by the doctor, than by "the judge." And even in chronical diſeaſes, where events are wont much better to anſwer phyſicians predictions, there are ſometimes ſuch cures performed, as may encourage human induſtry, and keep a ſick man's friends from forſaking the cure of him, till life it ſelf hath unqueſtionably forſaken him. For not only it hath been not unfrequently ſeen, that divers perſons, who have been given over by ſome phyſicians, have been cured by others, perchance rather more lucky than more ſkilful; but thoſe, that have been given over, and that too (ſometimes rather upon the believed incurableneſs of the diſeaſe, than the perſonal condition of the patient) even by judicious and experienced phyſicians, if ſuch as are acquainted but with the ordinary remedies, have been recovered by the uſe of extraordinarily powerful, and eſpecially, chymical phyſick. Of ſuch cures I have ſometimes met with a few, which, becauſe I may elſewhere relate, I ſhall now only mention, on this occaſion, what I have heard concerning the cures of cancers, performed by Dr. *Harberfeld*, one of the principal phyſicians of *Bohemia*. And among other relations of this kind, made me by credible perſons, I cannot omit one, that was of a certain Engliſh woman, of ſixty and odd years of age, who had long lain in an hoſpital in *Zeeland*, ſick of a cancer in the breaſt, and by this doctor was, with one ſingle inward remedy, perfectly cured in the ſpace of three weeks. For this relation was made me by perſons of very ſtrict veracity, the one a doctor of phyſick, who was an eye-witneſs of the cure; the other a child of *Cornelius Drebell*'s, who not only ſaw the cure, but knew the woman before, and out of charity brought her to him, that healed her. The ſame perſons likewiſe informed me, that the chymical liquor the doctor conſtantly made uſe of, does, in the doſe of about a ſpoonful or two, work ſuddenly and nimbly enough by vomit, but hath very quickly ended its operation; ſo that within an hour or leſs, after the patient hath taken it, he is commonly well again, and very hungry. And they having preſented me ſome ſpoonfuls of this liquor, I find the taſte to be offenſive enough, and not unlike that of vitriol, which, by the taſte and emetick operation, I gueſs to be, at leaſt, its principal ingredient, however it be prepared. The ſame perſons aſſured me, that having obtained of Dr. *Harberfeld* a good quantity of his ſpecifick, they had been (in *England*, as well as elſewhere) partly eye-witneſſes, and partly performers of wonderful cures by the help of it alone under God, in the king's-evil.

Examples of ſome unexpected and ſtrange cures.

Examples of cures of cancers.

evil. Inſomuch that an eminent gentleman of this nation, now alive and healthy, hath been cured by it, when the king's-evil had brought his arm to that paſs, that the chirurgeon had appointed a time to cut it off. And with the ſame liquor, only taken inwardly, they profeſs themſelves to have ſeen and done divers cures of inveterate external ulcers, whoſe proud fleſh, upon the taking of it is wont to fall off, and then the ulcer begins to heal at the bottom; but of the recent effects of this liquor, we may elſewhere, perhaps, further entertain you.

An example of the cure of one, that was born with a cataract in the eye.

That ſuffuſions or cataracts may, by a mutual operation be cured even in a patient, that was born with them, I formerly told you, when I related the cure done by my ingenious acquaintance, Mr. *Stepkins*, on a gentlewoman of about eighteen years of age, that brought a couple of cataracts with her into the world.

And other examples of cataracts ſtrangely cured.

And I remember, I was ſome while ſince in the company of another woman, who told me, that ſhe was brought to bed of five children (if I much miſtake not the number) ſucceſſively; of which ſhe ſaw not any in a long while after, by reaſon of a couple of ſuffuſions, that had many years blinded her; and yet now, by the help of a Dutch oculiſt of my acquaintance, ſhe ſees, and reads well, and hath freely enjoyed the reſtored uſe of her eyes for ſome years already.

BUT theſe are rather chirurgical, than medicinal cures; and therefore we ſhall ſubjoin the mention of a very memorable obſervation of the learned *Petronius*, which being collated with that a little above recited from Dr. *Harvey*, they may ſerve to keep each other from paſſing for incredible: *Quidam* (ſays our author) *qui antequam morbo Gallico afficeretur, altero oculo cæcus erat, ſuffuſione denſiſſima (vulgus cataractam vocat) oculum occupante, hydrargyri inunctione à morbo Gallico, et à ſuffuſione, quod maximè mirum eſt, evaſit. Neque à ratione alienum eſt inunctione illa cataractas poſſe diſſolvi, cum frequens experientia doceat præduros tumores ex pituita craſſa & concreta genitos, illitu hydrargyri potenter diſſolvi.* 'One, who before 'he fell into the French pox was blind of a ca'taract in one of his eyes by being anointed 'with quick-ſilver, was recovered, not only 'from the chief diſeaſe, but (which was moſt 'ſtrange) from his cataract. Nor is it irra'tional, that cataracts ſhould be diſſolved by 'ſuch anointing; when experience teacheth, 'that hard tumours clogged together of pitu'itous matter are powerfully diſſolved by 'mercurial inunctions.'

Alexand. Trajan. Petronius lib. 5. De morb. Gallico, c. 1. apud Scheuchium in obſerv. l. 1.

I NEED not tell you what ſad prognoſticks phyſicians are wont to make of dropſies, eſpecially of that ſort, which they call *Aſcites*. And indeed the event does but too frequently juſtify their predictions, when none but ordinary remedies are imployed. But I remember, that being acquainted with an ingenious perſon, that was very happily cured of a dropſy, and inquiring who it was, that had performed the cure; I was informed, that that, and a multitude of the like, had been wrought by a German phyſician, of whom, and of his remedy, I had heard much commendation in *Holland*, where he lived. And though on divers occaſions I found him a modeſt man, and accordingly, when I aſked him concerning his cures of the dropſy, he anſwered me, that he neither did, nor would undertake to cure ſo formidable a diſeaſe; yet he ſcrupled not to tell me, that as far as he had hitherto tried, he had one remedy, which had not failed him, though he had tried it upon perſons of differing ages, ſexes, and complexions. But of this ſpecifick more hereafter. For, at preſent; I muſt proceed to take notice, that as incurable a diſeaſe, as the radicated gout is thought to be, (eſpecially in patients not very temperate;) and as tedious a courſe of phyſick, as one would expect to be requiſite to the cure of it, in caſe it can be cured; yet I have been ſeveral times viſited by an honeſt merchant of *Amſterdam*, who was there noted for his wealth, and his ſkill *in arte tinctoria*. This man, ten or twelve years ago, had been for a long time ſo tormented with the gout, both in hands and feet, that his fits would ſometimes vex and confine him for a great part of the year, and not leave him without hard knots, as unwelcome pledges of their return: but once, that he was tortured to a degree, that made him much pitied, one came and informed him of an empirick, who had received from a great chymiſt, who had lodged in his houſe, a ſecret, with which he had already throughly cured many in a ſhort time: whereupon ſending for this perſon, and offering him any thing for ſome relief, the other refuſed to take above ten crowns, which, as it ſeems, was the uſual rate for the cure, and would not receive that neither, until the reality of it had been evinced by the patient's continuing about ſix months well. And accordingly, with a very few doſes of a certain powder and tincture, the merchant was quickly freed, not only from his pains, but from his gouty tophy. And though he indulged himſelf the drinking of Rheniſh wine very freely, yet he never had a fit ſince, as himſelf aſſured me one morning, wherein, for exerciſe ſake, he walked five or ſix miles to give me a viſit; adding, that the man that cured him, dying ſuddenly, never could diſcover what the ſecret was, wherewith ſo many had been freed from a diſeaſe, that does ſo often mock the ſkill of the greateſt doctors.

Examples of the cure of the dropſy and gout.

I MIGHT, perhaps, if I had leiſure, relate to you ſome other ſtrange ſtories, which may invite you to think, that as the naturaliſt's ſkill in chymiſtry, and other arts retaining to phyſiology, may much aſſiſt him to diſcover more generous remedies, than are yet uſual; ſo the knowledge of ſuch remedies may, in divers caſes, make a happy change in the rules of prognoſticating, what will prove the courſe and event of a ſickneſs. But I ſhall not, at preſent, particularly conſider any more than one diſeaſe, namely, the ſtone in the bladder. For whereas it is by moſt, even of the judicious phyſicians, unanimouſly pronounced incurable by phyſick in what perſon ſoever, if it deſerve the name of a ſtone, and be too big to be voided whole, the remedileſſneſs of this diſeaſe may be juſtly queſtioned. I remember the famous

famous *Monardes*, treating of the ſeed of a Peruvian plant, which they call *Chalchoos*, tells us, that it is highly eſteemed by the inhabitants of the country it grows in, and affirmed not only to be diuretick, and to bring away gravel, but to break the ſtone in the bladder itſelf, if it be not too much hardened: *Ejuſque rei* (adds he) *tam multa proferunt exempla, ut admirationem mihi pariat:* 'And they urge 'many inſtances of it even to my admiration.' He tells us indeed, that he is of opinion, that nothing but ſection can cure the ſtone of the bladder: *Aiunt tamen*, ſaith he, *illius ſemen* (of the *Chalchoos*) *tritum, ex aqua aliqua ad eam rem idoneâ ſumptum, calculum in lutum diſſolvere, quod excretum denuo concreſcit, & in lapideam duritiem convertitur. Adoleſcentem vidi, cui hoc obtigiſſe ſcio; is cum veſicæ calculo torqueretur, idque à lithotomis, qui calculum deprehenderant, intellexiſſem, & ex ſymptomatis quæ patiebatur agnoſcerem; hominem, veris initio, ad fontem, qui à Petro nomen habet, ablegavi, ubi cum duos menſes hæſiſſet, à calculo liberatus redit, & lutum omne, quod paulatim ejecerat, denuo in lapidum fragmenta concretum in charta ſecum retulit.* 'Yet they ſay, that the ſeed of 'the *Chalchoos*, ground and taken in any pro-'per water, doth diſſolve the ſtone into a very 'dirt, which being voided, doth harden a-'gain into a ſtony ſubſtance. I ſaw a young 'man, to whom (upon my knowledge) this 'accident befel. When he was tormented 'with the ſtone in the bladder, which I under-'ſtood both by the lithotomiſt who felt it, and 'by the ſymptoms which he ſuffered; I ſent 'him to a fountain, which takes its name from 'St. *Peter:* when he had ſtaid there two 'months, he returned free from the ſtone, and 'brought home with him all the dirt, which 'he had voided by degrees, in a paper, coagu-'lated as it were into fragments of ſtone.' Which paſſage, I wonder ſuch a writer ſhould immediately annex to the declaration of an opinion, that muſt appear confuted by it, to a reader, that conſiders not ſo much what is thought, as what is proved.

Examples of the cure of the ſtone.

THE very learned and experienced Dr. *Gerard Boot*, of whoſe ſkill you, *Pyrophilus*, have found very good effect in your ſelf, and who was one of the two profeſſors, that writ the *Philoſophia naturalis reformata*, had a very famous remedy (which now he is dead, I intend, God willing, to communicate) againſt the ſtone; and with it he told me, that he had very often cured that diſeaſe in the kidneys: but for the ſtone in the bladder, he thought it impoſſible to be diſſolved; which circumſtances I recite, that you may the more readily believe what he told me a little before his death; namely, that he had cured lately one Mr. *Moulin* of a real ſtone in the bladder; adding, that he could not brag of being the inventor of that remedy he had employed, having but lately learned it of a country gentleman, whom going to viſit laſt ſummer, he ſaw a load of *Perſicaria*, or arſmart, brought to him by ſome of the country people; and deſiring to know what he intended to do with ſo vaſt a quantity of it, the gentleman replied, that he yearly uſed as much, having by the water of it, made by bare diſtillation in a common roſe-water ſtill, cured ſo many of the ſtone, even in the bladder, that he was uſually ſollicited by patients, numerous enough, to exhauſt all the liquor which he yearly prepared.

The uſe of Perſicaria for that cure.

WHAT we, *Pyrophilus*, have obſerved concerning this excellent liquor, of which we uſe to preſcribe a draught every morning for ſome months together, we may elſewhere have occaſion to relate. But now we ſhall go on to tell you, that being ſome years ſince in *Ireland*, I met with an ancient empirick, who was very famous in thoſe parts for cutting of the ſtone of the bladder, and for curing ſore eyes. This man having given (in the parts where I then was, and whilſt I was there) ſome good proof of his ſkill, I ſent for him to me, upon the account of a ſuſpicion I long had of the ſtone in the bladder; which, upon ſearch, he aſſured me I was free from, and ſo (God be praiſed) I have afterwards found it. He was more a traveller than a ſcholar, and yet finding him, to my wonder, very modeſt and ſober, I inquired of him, whether he had never any where met with a remedy, that could diſſolve the ſtone in the bladder, offering him much more for a cure of that kind, than he would require as a lithotomiſt. He anſwered me, that he could cure no man of a confirmed ſtone, but by the help of his knife; but if the ſtone conſiſted of a lump of gravel not very firmly cemented together, he had, by a certain inward remedy he uſed, and a dexterous way of cruſhing the ſtone from without with his fingers, ſo broken the ſtone, partly by crumbling it, and partly by diſſolving the cement, as to make it avoidable by urine. And he added, that he had formerly cured a citizen of *Cork*, of a good large ſtone of the bladder, (for where I then was, he gave a proof of his ſkill, in telling before-hand thoſe he was to cut, the bigneſs and ſhape of the ſtones, that troubled them.)

Inſtances in other happy medicines for the ſame diſeaſe.

PASSING afterwards by *Cork*, I ſent an intelligent ſervant to inquire after this citizen; but, he being caſually abſent, his wife ſent me, by my man, a relation very agreable to that, which he had made me. The receipt I purchaſed of him, and though it ſeem not very artificial, yet I ſuppoſe you will not quarrel with me, for annexing ſo experienced a one, to the end of this eſſay. But becauſe this remedy needed the aſſiſtance of a manual operation, we ſhall further proceed to tell you, that *Cardan*, as he is quoted by *Helmont* (for I have not now his works by me) relates, that in his time there rambled a man over *Lombardy*, who did commonly, and in a few days, by a certain liquor which he adminiſtred to his patients, ſafely, ſpeedily, and certainly, cure thoſe, that were troubled with the ſtone in the bladder: adding (ſaith *Helmont*) his judgment, that he doubted not of this man's being in hell, for having, when he died, envied mortals ſo excellent an art.

De lith. c. 7. num. 14.

I INSIST not on the teſtimony, that the ſame *Helmont* gives to *Paracelſus* of his curing the ſtone, though he often handle him very ſevere-

ly in other places of his writings, becauſe that the epitaph of *Paracelſus* (out of which he labours to prove his having cured the ſtone) makes no expreſs mention of it. Nor ſhall I enumerate thoſe paſſages, from whence the ſame *Helmont*'s followers collect, that he himſelf was able to cure that diſeaſe, by the reſolution of *Paracelſus* his *Ludus*; but this experience hath evinced to me, that a much ſlighter preparation of that ſtone, than was mentioned by *Paracelſus* and *Helmont*, hath been able to do more in that diſeaſe, than a wary man would readily believe. But to detain you no longer on this ſubject, I ſhall only add, that *Wilhelmus Laurembergius*, a learned phyſician, and profeſſor at *Roſtoch*, hath told the world, how he cured himſelf of a confirmed ſtone of the bladder, by the uſe of prepared millepedes (by ſome in *England* called wood-lice) and other remedies, which he hath particularly recorded in the hiſtory, which he hath publiſhed, and I have ſeen of this admirable cure; which having been epitomized by *Sennertus*, and other eminent phyſicians, I ſhall not need to inſiſt on it. And the arguments alledged (even by the moſt judicious) againſt the cureableneſs of the ſtone, though very plauſible, ſeem not to me unanſwerable; for whereas firſt they appeal to the innumerable fruitleſs attempts, that have been made to cure great princes, and rich men, without cutting, that argument drawn from experience may, by the former experiments, be anſwered, eſpecially ſince *Horatius Augenius* (upon whoſe account *Laurembergius* tried millepedes) tells us, not only that he cured a young man at *Rome*, that was going to be cut of the ſtone, but that the Jeſuit, that chanced to confeſs this youth, and perſuaded him to the uſe of millepedes, had experimented their efficacy both upon himſelf and others. And indeed we our ſelves have found them to be highly diuretick and aperitive.

The uſe and ſucceſs of millepedes.

AND whereas it is next objected, that medicines muſt neceſſarily loſe their efficacy before they can reach the bladder, I confeſs, that for the moſt part, it is very true; but yet that it is poſſible for ſome medicines to retain their nature, after many alterations and digeſtions, we have elſewhere declared. And in our preſent caſe, we not only find, that turpentine and aſparagus do manifeſtly affect the urine (as I have often obſerved in my own, and almoſt any man may obſerve it in his;) but that which is moſt to our purpoſe, rhubarb tinges the urine of thoſe, that have taken any quantity of it. And laſtly, whereas it may be yet further alledged, that not only there hath not been yet a liquor found capable of diſſolving ſo ſolid a body as a ſtone; but, if there were, it muſt neceſſarily be ſo corroſive as to deſtroy the patient, by fretting his ſtomach, or guts, or bladder, which are parts ſo much more tender: to the firſt part of this plauſible objection it may be replied, that even good vinegar will diſſolve not only thoſe ſtony concretions, called *lapides cancrorum*, which, like the *calculi* we treat of, are formed in the bodies of animals, but even the more hard and ſolid body of coral, which will loſe but little of its weight, in a fire, that would waſte a great part of the *Duelech:* and that the bare juices of vegetables (ſuch as lemmons and barberries) will readily diſſolve both pearl and coral, is known even to the apothecaries boys. Indeed, what *Paracelſus* and *Helmont* relate of their alkaheſt, with which they prepare their ſpecifick againſt the ſtone, and with which the latter of them, if not both, pretend to be able to reduce, not only the ſtone they call *ludus*, but all other ſtones, vegetables, minerals, animals, *&c.* into inſipid water, is ſo ſtrange (not to ſay incredible) that their followers muſt pardon me, if I be not forward to believe ſuch unlikely things, till ſufficient experience hath convinced me of their truth.

The argument, concerning the incureableneſs of the ſtone, anſwered.

BUT yet I muſt not conceal from you, that a chymiſt, whom you have often ſeen, adviſed with me ſeveral times about the way of preparing this immortal liquor (as *Helmont* calls it) and that, when we had agreed, that ſuch a way was the moſt promiſing, he proſecuted it ſo long, and ſo induſtriouſly, that at length he obtained, and ſhewed me a liquor, which (though it ſeemed to me far ſhort of the alkaheſt) I confeſs I admired; and not I alone; but our ingenious friend Dr. *C.* (who had been imployed into ſeveral parts of *Europe*, by a rich and curious princeſs, to purchaſe rarities) agreed with this chymiſt, to give two hundred crowns for a pint of this menſtruum; and confeſſed to me withall, that he ſaw him, with this liquor, not only diſſolve common ſulphur, and bring it over the helm, but reduce antimony into ſweet cryſtals: with a few of which it was, that he (I mean Dr. *C.*) to the wonder of many, did, without purge or vomit, cure our good friend Sir *C. C.* of a very radicated and deſperate diſeaſe, as the reſtored patient ſoon after told me. And to the ſecond part of this objection it may be anſwered, that if we knew and conſidered well, how many of the operations of natural bodies depend upon the ſuitableneſs and difference of the figures of their parts, and the pores intercepted between them, the number of impoſſibilities would not, perhaps, be thought ſo great, as by many learned men it is.

That there may be a liquor able to diſſolve the ſtone, that may not be corroſive to any other part.

THAT it is very poſſible for a body to have an effect upon another determinate body, without being able to operate in like manner upon a multitude of other bodies, which may ſeem more eaſy to be wrought on by it; may appear by the loadſtone, which will draw and work only upon iron, and (which is but refined iron) ſteel, but not upon wood, or ſtraws, or any of thoſe innumerable concretes, that are lighter, and of a more open texture, than the heavy and ſolid body, which it attracts. And to give you an inſtance, that comes nearer to our caſe, quickſilver, that will not corrode our ſkin, nor ſo much as taſte ſharp upon our tongue, will yet readily diſſolve that moſt compact body of gold, which even aqua fortis, that can inſinuate it ſelf into all other metals, and corrode them, will not meddle with; though the ſame quickſilver will not diſſolve iron, which yet aqua fortis will very nimbly fret aſunder. So that, although I dare not confidently believe all,

all, that I have found averred, even by eminent and learned chymiſts, of their having made or ſeen liquors, which, without appearing any way ſharp to the tongue, would diſſolve gold and ſilver, and other hard compact bodies; becauſe I have not yet my ſelf ſeen any ſevere and ſatisfactory trial made to evince the efficacy of inſipid diſſolvents: yet, by reaſon of divers things I have read and heard, and of ſome things too I have ſeen, I dare not peremptorily deny the poſſibility of ſuch menſtruums. And who knows, but that in nature there may be found, or by art there may be prepared, ſome liquor, whoſe parts may have ſuch a ſuitableneſs to the pores of a human *calculus*, as thoſe of quickſilver have to the pores of gold; and yet may as little work upon the reſt of the body, as we have obſerved the ſame quickſilver to do upon iron, (which yet is a much more porous and open metal) even when it hath been diſtilled in iron veſſels? And as to that part of the objection, wherein the ſtrength of it chiefly lies, let me tell you, *Pyrophilus*, that I have ſometimes, for curioſity's ſake, taken an egg, and ſteeped it in ſtrong vinegar for ſome days, and by taking it out, and ſhewing, that the ſhell was ſo eaten away, that the egg could be ſqueezed into unuſual forms, but the thin ſkin, that involves the white, continued altogether unfretted, I convinced an ingenious man, that the operation of diſſolvents are ſo determined by the various textures of bodies, on which they are employed, that a liquor, which is capable to corrode a more hard and ſolid body, may be unable to fret in the leaſt another more ſoft and thin, if of a texture indiſpoſed to admit the ſmall parts of the menſtruum. And I muſt confeſs to you, *Pyrophilus*, that one thing, among others, which hath made me backward to affirm with many learned men, that there can be no potent diſſolvent, that is not corroſive enough to fret in pieces the parts of a human body, hath been a ſtory, which I divers years ſince, chanced to meet with in the learned *Sennertus*'s *Paralipomena*, where, though he relates it to another purpoſe, yet it is ſo pertinent to our preſent deſign, and in it ſelf ſo ſingular, not to ſay matchleſs, that I cannot forbear to mention it here on this occaſion. He tells us then, that in the end of the year 1632, *Johannes Neſterus*, an eminent phyſician, and his great friend, informed him, that there lived at that time in the neighbourhood, and belonging to a nobleman of thoſe parts, a certain Lorrainer, whom he alſo called *Claudius*, ſomewhat low and ſlender, and about 58 years of age: *Hic* (ſaith he) *nihil foetidum, nihil injucundum abhorret; vitra, lapides, ligna, carbones, oſſa, leporinos & aliorum animalium pedes cum pilis, lineos, laneoſque pannos, viva animalia, & piſces adhuc ſalientes, imò etiam metalla, patinas & orbes ſtanneos dentibus confringere & vorare ſæpiſſimè viſus eſt. Vorat præterea lutum, ſevum & candelas ſebaceas, integras teſtes cochlearum, animalium ſtercora, cum primis bubulum calidum adhuc, prout è matre venit: potat aliorum urinas cum vino & cereviſia mixtas. Vorat fœnum, ſtramen, ſtipulas, & nuper duos mures viventes adhuc deglutivit, qui ipſius ventriculum ad ſemihoram uſque creberrimis morſibus lancinarunt; &, ut brevibus complectar, quicquid illi à nobilibus devorandum offertur, viliſſimâ mercede propoſitâ, dictum ac factum, ingurgitat, ita ut intra paucos dies integrum vitulum crudum & incoctum cum corio, & pilis ſe eſtaturum promiſerit. Teſtes inter alios quamplurimos ipſe ego ſum, quippe qui, &c.* 'He loaths nothing 'that ſtinks, or is otherwiſe unpleaſant. He 'hath been often ſeen to chew and ſwallow 'glaſs, ſtones, wood, bones, the feet of hares, 'and other animals, together with the hair; 'linnen, and woollen cloth; fiſhes, and other 'animals alive; nay, even metals, and diſhes, 'and globes of tin: beſides which, he devours 'ſewet, and tallow-candles, the ſhells of 'cockles, and the dungs of animals, eſpecially 'of oxen, even hot, as ſoon as it is voided. 'He drinks the urine of others mixt with 'wine or beer; he eats hay, ſtraw, ſtubble, 'and lately he ſwallowed down two living mice, 'which for half an hour continued biting at 'the bottom of his ſtomach; and, to be ſhort, 'whatſoever is offered him by any noble perſons, it goes down with him without more 'ado upon the ſmalleſt reward, inſomuch that 'within a few days he hath promiſed to eat 'a whole calf raw, together with the ſkin 'and hair. Among divers others, I my ſelf am 'a witneſs of the truth of theſe, &c.' To this and the following part of the letter, *Sennertus* adds, that not having, during ſome years, heard any thing concerning this *Claudius*, he ſent about four years after to the ſame phyſician, Dr. *Neſterus*, to enquire what was become of him; and that the doctor ſent him back a letter of the miniſter of the church of that place, by way of confirmation of all the formerly mentioned particulars, and anſwered himſelf, that the Lorrainer, whom he had long hoped to diſſect, was yet alive, and did yet devour all the things mentioned in his former letter, but not ſo frequently as before; his teeth being grown ſomewhat blunter by age, that he was no longer able to break bones and metals. Some other examples of this nature, though none ſo ſtrange, we have alſo met with in writers of good credit, and eſpecially that of the glaſs-eater, recorded by *Columbus* in his excellent anatomical obſervations; of which alſo *Sennertus* makes mention, as we ſhall ſee by and by, and with which we may elſewhere entertain you to another purpoſe. And not long ago there was here in *England* a private ſoldier (who, for aught I know, is yet alive) very famous for digeſting of ſtones. And a very inquiſitive man, that gave me the accurateſt account I have met with concerning him, aſſures me, that he knew him familiarly, and had the curioſity to keep in his company for twenty-four hours together to watch him, and not only obſerved, that he eat nothing in that time, ſave ſtones (or fragments of them) of a pretty bigneſs, but that his groſs excrement conſiſted chiefly of a ſandy ſubſtance, as if the devoured ſtones had been in his body diſſolved and crumbled into ſand. But let us not omit, that to the ſecond epiſtle above mentioned *Sennertus* adds this reflection, not impertinent

Examples of thoſe, who could digeſt metals and glaſs.

Medicus Rochlizenſis.

to

to our purpoſe: *Cauſam* (ſays he) *hujus voracitatis, etiam in cadavere, invenire proculdubio erit difficillimum. Poſſet quidem ad illud, quod in cadavere Lazari vitrivoracis obſervavit Columbus, quidam confugere; & ſtatuere quartam illam nervorum conjugationem, quæ guſtus gratia in hominibus à natura producta eſt; neque ad palatum, neque ad linguam pertendere. Verum hoc modo ſaltem guſtus aboliti cauſa redderetur, nondum verò cauſa daretur, cur res tam miras aſſumere ſine ventriculi læſione, imò concoquere potuerit. Quæ proculdubio in ἰδιοσυγκρασίᾳ & peculiari conſtitutione ventriculi & inteſtinorum quærenda eſſet; quæ tamen oculis inveſtigari non poteſt, ſed ſaltem ex effectu patet:* 'To find in the 'carcaſs the cauſe of this voracity, will be, 'queſtionleſs, very difficult. Some one per-'chance would refer it to that, which *Columbus* 'obſerved in the carcaſs of *Lazarus* the glaſs-'eater, and reſolve, that the fourth conjugation 'of nerves, which nature ordained for taſting, 'comes neither to the palate, nor the tongue: 'but ſo there would only be rendered the cauſe 'of this want of taſte, and not why he ſhould 'be able to take ſuch uncouth things, without 'offence to his ſtomach, and digeſt them, which 'without doubt ought to be the particular and 'ſingular conſtitution of his ſtomach and guts, 'which yet may not appear to the eye by the 'effects.' And indeed this memorable ſtory ſeems to argue, not only what we have already alledged it to prove, but alſo that a menſtruum not ſo corroſive as to fret the body, may diſſolve ſtones, metals, and other compact ſubſtances. And ſince one liquor, prepared by nature only, could in this man's ſtomach diſſolve that great variety of bodies above enumerated, why ſhould it be thought, that the alkaheſt, or ſome other menſtruum, wherein nature is ſkilfully aſſiſted, and to the utmoſt heightened by art, ſhould not be able to diſſolve concretes of very differing textures? For though chymiſts muſt acknowledge, that ſuch common menſtruums, as will diſſolve one body, will not oftentimes meddle with another; as aqua fortis will diſſolve ſilver, and not gold; and if by ſal armoniac you turn it into aqua regis, it will indeed diſſolve gold, but then it will not ſilver: yet ſince that may be ſuppoſed to proceed rather from our want of ſkill to prepare the moſt potent menſtruum, than from the impoſſibility of one menſtruum's diſſolving great variety of bodies; why may not nature and art afford a menſtruum, whoſe variety of parts and figures, and, perhaps alſo, motion, may give it ingreſs into bodies of very differing textures? as in our former inſtance, though aqua regalis will diſſolve gold, not ſilver, and aqua fortis ſilver, but not gold, yet quickſilver will diſſolve both, and copper, tin, and lead to boot.

IF I were not at preſent under ſome reſtraint, I might tell you ſome things, that you would, perhaps, think no weak confirmations of the paſt diſcourſe. And however, ſince I have obſerved it to be the main thing, that keeps judicious men from ſeeking, or ſo much as hoping for nobler diſſolvents, that they are ſcarce to be perſuaded there can be conſiderably piercing menſtruums, that are not ſo proportionably corroſive; I will here acquaint you with a liquor, that may, I preſume, aſſiſt you to undeceive ſome of them. We take then ordinary houſhold brown bread (I like that of rye, but I have divers times uſed that of wheat) and when it is cut into ſlices, and ſomewhat dried, we almoſt fill a glaſs retort with it, and placing that in a ſand-furnace, by degrees of fire we draw off what will be made to come over, without much difficulty. The oil, as uſeleſs to our purpoſe, being by a tunnel, or a filter, ſever'd from the reſt of the liquor, we alſo, by a gentle heat, free the ſpirit from ſome of its phlegm, which yet ſometimes we find no great neceſſity to do. And yet this ſpirit, which you will eaſily believe is no ſuch corroſive as aqua fortis, or other diſtilled liquors of mineral ſalts, will work upon the hardeſt ſorts of bodies, and perform things that chymiſts, counted of the judiciouſeſt, would not have us expect from the moſt ſharp and corroſive menſtruums now in uſe. For with this we have, in a ſhort time, and that in the cold, drawn tinctures (which is done by the ſolution of the finer parts of the concrete) not only from crude corals, and ſome of the more open minerals, but likewiſe from very hard ſtones, ſuch as blood-ſtone, and granates, (even unpowdered.) Nay, and though rubies ſeem to be the hardeſt bodies yet known, ſave diamonds, (for I have learned from thoſe, that cut precious ſtones, that they can grind other gems with the powder of rubies, but not theſe with any powder, ſave their own, and that of diamonds;) yet have even theſe afforded me, in the cold, a not ignoble tincture. And not to anticipate what I may elſewhere have occaſion to tell you concerning the efficacy of this menſtruum, which is the ſame, that I have intimated, without naming it, in the laſt and another of the former eſſays; I ſhall now only add, that an expert chymiſt aſſures me he hath, but tells me not how, done greater matters with it, or the like; and that to ſatiſfy my ſelf, that theſe high tinctures proceeded not from the ſtanding or digeſtion of the menſtruum (as we elſewhere obſerve concerning ſome other liquors) I not only tried, that from ſome minerals it will draw a much higher tincture than from others, and from ſome ſcarce any at all; but that it would, if kept by it ſelf, for many months continue clear and limpid. What further uſe I have made, or think others may make of this odd menſtruum, I muſt not, as I ſaid, at preſent expreſs; but returning to what I was diſcourſing concerning the cure of the ſtone, annex, that beſides what hath been objected againſt the poſſibility of making a liquor, which, without being highly corroſive, can be able to work upon ſtone; it may indeed be alſo alledged againſt the hopes we ſeem to countenance, that what hath cured the ſtone in one man's bladder, may be unable to do the like in another's. But firſt, the truth of that hath not been proved; and next, we highly value thoſe ſpecificks, that can remove agues, fluxes, and the like diſeaſes; though ſcarce any of them

The deſcription of a menſtruum, prepared from a common bread, able to draw tinctures from precious ſtones, minerals, &c.

them do alike ſucceed in all patients, eſpecially ſo as to ſecure them during their whole lives, from ever relapſing into the like diſeaſe; and beſides all this, it will be no ſmall matter to find, that the diſeaſe, in its own nature, is not incurable; and it would recompenſe men's induſtry to be able to free, even a few patients, from to painful and ſtubborn a diſeaſe. Which I have rather than any other, choſen to inſiſt upon, becauſe it is ſo generally believed not to be curable by inward remedies in any perſon whatever.

Helmont's argument from the providence of God cenſured.

BUT I have entertained you ſo long on this ſubject, that I muſt reſerve, for ſome other opportunity, what I have to ſay to you concerning the dropſy, and ſome other diſeaſes, commonly put into the catalogue of the incurable ones; and therefore ſhall now only tell you in general, that as on the one ſide I think the arguments, which *Helmont* and others draw from the providence of God, for the curableneſs of all diſeaſes, are not very cogent, and ſomewhat irreverent, (for God being not obliged any more to continue life or health to ſinful man, than to beaſts, that never offended him, we ought humbly to thank him, if he hath, among his creatures, diſperſed remedies for every diſeaſe, but have no right to accuſe him if he have not;) ſo on the other ſide, I am not much convinced by the grand argument alledged againſt *Paracelſus*, and the chymiſts, that hold all diſeaſes to be in their own nature curable, namely, that they themſelves many of them, (no nor even their very maſter) lived not to the age attained by many ſtrangers to chymiſtry.

The argument, that Paracelſus *outlived not the 47th year of his age, anſwered.*

FOR this, that many of them (not deſtroyed by war, or outward accidents) died young enough, and conſequently by ſickneſs, and that *Paracelſus* himſelf out-lived not the 47th year of his age, is a much ſtronger objection againſt the men, than againſt their opinion; for it infers indeed plauſibly, that they had not ſuch remedies as they boaſted of, (ſince probably, had they had any ſuch, they would have cured themſelves with them;) but concludes not, that no ſuch remedies can be prepared by any other. And this you will be the leſs apt to think irrational, if you conſider, how much more learned, ſober, and experienced it is poſſible for many a man to be, than *Paracelſus* appears to have been. For he ſeems not, by his writings, to have been any great logician or reaſoner; he manifeſtly deſpiſed many parts of learning uſeful to a phyſician; he lived not many years, and ſpent divers of thoſe few, which he lived, in an unſettled and diſadvantageous courſe of life; and yet this *Paracelſus* attained to ſome ſuch remedies, as both in his own and after-times have made him a very conſiderable perſon, in ſpight of all his indiſcretions and deficiencies. And among his other remedies, his famous *laudanum* did ſuch wonders, that *Oporinus* himſelf, in that ſhort account, which ſeems to be rather a ſatyr than a narrative of his life, hath this paſſage of it:

The efficacy of Paracelſus's laudanum

De laudano (ſaith he) *ſuo (ita vocabat pilulas inſtar murium ſtercoris, quas impari ſemper numero, in extrema tantùm morborum difficultate tanquam ſacram medicinam exhibebat) ita gloriebatur, ut non dubitarit affirmare ejus ſolius uſu ſe è mortuis vivos reddere poſſe; idque aliquoties, dum apud ipſum fui, re ipſa declaravit:* 'Of his *laudanum* (that name he gave 'to little pills, which in the extremity of diſ-'eaſes he adminiſtered as a moſt divine medi-'cine, always giving them in an odd number) 'he ſcrupled not to affirm, that by that medi-'cine he could put life into thoſe, who were 'as good as dead; and that while I was with 'him, he made good in ſome experiments. So ſignal a teſtimony coming from one, whom the Paracelſians call his fugitive ſervant, hired by his enemies to ſlander him under pretence of writing his life, deſerves not to be ſlighted: and though it manifeſtly contains an hyperbole, yet I do the leſs wonder at the hyperbole, by reaſon of thoſe ſtrange things, which your mother, and divers other of your friends, can tell you, they have ſeen performed in *England* by *Helmont*'s *laudanum opiatum*, (though much inferior to that of *Paracelſus*.) And I remember, that a friend of yours and mine, that is a great enemy to all kinds of chymical remedies, and was before alſo to chymiſtry, having begged of me a little bottle of it, which I had obtained from a friend of the younger *Helmont*'s, to whom he communicated the preparation, gave me a while after an account of ſuch cures, that had been performed, with that ſmall quantity, upon almoſt dying perſons, as I think it not diſcreet for me, that was not an eye-witneſs of them, to relate. And I remember too, that the ſame friend of young *Helmont*'s, being, at the perſuaſion of one woman, whom he had cured of a dangerous conſumption, called to another, that was thought to be dying of an aſthma, came to adviſe with me, whether he ſhould meddle with ſo deſperate a patient; telling me, that ſhe had been many years ſick of that ſtubborn diſeaſe, which, in proceſs of time, paſſing into an orthopnea, had at laſt put her, by want of ſleep (from which the violence of her ſickneſs had very long kept her) into a fever, and ſo deſperate a condition, that it was ſcarce expected ſhe ſhould live till the next morning. But I repreſenting to him, that her condition being avowedly deſperate, he might exerciſe his charity without danger to his reputation; and perſuading him to try *Helmont*'s *laudanum*, together with the ſpirit of man's blood (which we elſewhere teach you to prepare) he gave her that night a doſe of thoſe remedies, which made her both ſleep and breathe pretty freely; and a week after, he coming to viſit me, told me, he had caſually met his patient well and abroad in the ſtreets. But theſe are trifles to the cures, which *Helmont* relates to have been performed by our Iriſh *Butler:* for he tells us, that this man, by ſlightly plunging a little ſtone, he had, into almond-milk or oil, imbued thoſe liquors with ſuch a ſanative efficacy, that a ſpoonful of the former cured (and that without acquainting him with what was given him) a Franciſcan frier (a very famous preacher) of a very dangerous eryſipelas in the arm, in one hour; and one drop of the latter being

Butler's great remedies.

Helmont *in the treatiſe, which he entitles* Butler.

applied

applied in his preſence, to the head of an old laundreſs, that had been ſixteen years troubled with an intolerable hemicrania, the woman was preſently cured, and remained ſo to his knowledge for divers years. He adds almoſt as ſtrange a cure done in one night, upon a maid of his wife's, by anointing the part affected with four drops of that oil. He farther tells us, that the maſter of the glaſs-houſe at *Antwerp*, being troubled and made unwieldy with too much fat, begged ſome relief of *Butler*; who, having given him a little fragment of his little ſtone, with order to lick it nimbly with the tip of his tongue once every morning, I ſaw, ſaith *Helmont*, within three weeks, the compaſs of his waiſt leſſened by a ſpan, without any prejudice to his health. And to theſe, *Pyrophilus*, he adds ſome other narratives, which, though I confeſs I know not well how to believe, yet there are circumſtances, which keep me from daring to reject them. For firſt, as he well obſerves, that, which was moſt ſtupendous in this remedy, was but the ſmallneſs of the quantity. Next, a gentleman in *France* being not long ſince reported to have a fragment of this ſtone, and to have cured ſeveral perſons (and eſpecially one very dignified) of inveterate diſeaſes, by letting them lick it; my noble friend Sir *Kenelm Digby*, then in *France*, was ſolemnly requeſted from hence to inquire into the truth of that report, and anſwered, that he could not, upon examination, find it other than true. Beſides, *Helmont* not only relates theſe cures as an eye-witneſs of them, but tells us, how upon an occaſion, that he mentions, he once ſuſpected the efficacy of the oil; and that, without expecting, that it ſhould do any thing, he anointed it on the right arm and the ancles of his own wife, who had for ſome months been tormented with great pains in the former, and very great tumours in the latter of thoſe parts; and that, almoſt in a trice, motion was reſtored to her arm, and all the *œdema* of her legs and feet vaniſhed; adding, that at the time of his writing ſhe lived healthfully, and had done ſo ſince that recovery, during nineteen years. And this ſtory ſhe, long after her huſband's death, confirmed to our ingenious friend Dr. *C.* who is acquainted with her, and much extols her. Theſe circumſtances may be aſſiſted by two more very conſiderable ones; the one is, that *Helmont* is the more to be credited in theſe relations, becauſe mentioning cures not performed by himſelf, but by others, and that by remedies unknown to him, he ſeems by theſe narrations, out of loyalty to truth, to eclipſe his own reputation: and the other is, that in a memorable ſtory, which we may elſewhere relate to you (being not here proper to inſert ſo long a one) you'll find an eminent and ſtrange teſtimony given to *Butler*'s ſecrets, by our famous countryman Dr. *Higgins*, whoſe confeſſion you will not doubt, if you conſider how rare a phyſician and chymiſt he was, how familiarly he lived in the ſame houſe with *Butler*, and how ſtudiouſly at laſt they endeavoured to take away each other's life.

BUT whatever be to be thought, *Pyrophilus*, of *Helmont's* relation, we may well enough make this reflection on the other things, that have been delivered concerning formidable diſeaſes, that ſince the power of nature and ſkill may reach much farther than many diſtruſtful (not to ſay lazy) men have imagined, it will not be charitable to rely too much upon the prognoſticks, even of famous writers, when they tell us, that ſuch and ſuch diſeaſes, or patients in ſuch and ſuch conditions cannot poſſibly be cured: but rather to follow the ſober counſel of *Celſus*, *Oportet* (ſaith he) *ubi aliquid non reſpondet, non tanti putare authorem quanti agrum, & experiri aliud atque aliud.* 'Where a medicine anſwers not, we ought not ſo much to eſteem the author as the patient, and to try ſomewhat farther and farther.' And this great phyſician's authority I therefore make the moſt uſe of in the enſuing eſſays, becauſe he is accounted very judicious by the Lord *Verulam*, and other writers, that are unqueſtionably ſo themſelves. *De medicina*, lib. 3. cap. 10.

ESSAY IV.

Preſenting ſome things relating to the Hygieinal part of Phyſick.

THAT the dietetical part of phyſick, *Pyrophilus*, may as well as the others, be improved by natural philoſophy, were not uneaſy to manifeſt, if my haſte would permit it: for it is known, that drinks make a very conſiderable part (ſometimes, perchance, amounting almoſt to the one half) of our aliments; and moſt drinks, as wine, beer, ale, mead, *&c.* conſiſt of fermented liquors. Now as on the one ſide the ignorance of the doctrine of fermentation, and of the wholeſome way of both preſerving liquors and making them pleaſant, doth queſtionleſs occaſion more than a few diſeaſes, which in divers places may be obſerved evidently to proceed from the unwholeſome quality of either ill-made or ſophiſticated drinks; ſo, on the other ſide, the diſtinct knowledge of the true nature and particular phænomena of fermentation would enable men to prepare a great variety of drinks, not only as harmleſs, but as beneficial as pleaſant. *That the knowledge of fermentation is uſeful to make our drinks wholeſome for aliment.*

How much preparation may do to correct and meliorate both hard and liquid aliments,

is notably inſtanced by the account, that we receive from both the French and Engliſh that inhabit the *Barbados*, *St. Chriſtophers*, and other *Caribbee* iſlands, who ſolemny inform us (what is atteſted alſo by *Piſo*, and other learned travellers, that write of it) that the plant mandioca (whoſe prepared root makes caſſavy, and which we have alſo ſeen flouriſhing here in *Europe*) to which the Indians are ſo much beholden, is a rank poiſon. And though I ſhall tell you, that having purpoſely inquired of a very intelligent gentleman, who commanded an army of Europeans in *America*, what experience he had ſeen of the qualities of this plant, he told me, that between thirty and forty of his ſoldiers, having on a time (whilſt they were unacquainted with the country) either through ignorance or curioſity, eaten of it unprepared, it coſt moſt of them their lives. And yet this pernicious root, which ſome herbariſts call *yucca*, by the rude Indians ordering, comes to afford them both almoſt all their bread, and no ſmall part of their drink. For this root being grated, and carefully freed from its moiſture, by being included in bags, and very ſtrongly preſſed, till all the juice be ſqueezed out, it is afterwards dried in the ſun, and ſo made into meal, of which they make their bread. And this very root, though (as we ſaid) it be poiſonous, they cauſe their old and almoſt toothleſs women, for the better breaking and macerating it, to chew and ſpit out into water. This juice will, in a few hours, work and purge itſelf of the poiſonous quality, affording them a drink which they eſteem very wholeſome, and at the *Barbados* call *perino*, and account it to be the likeſt in taſte to our Engliſh beer, of any of thoſe many drinks, that are uſed in that iſland.

How much ſimples may be altered by preparation, exemplified by the Indians making Caſſavi *out of the poiſonous plant* Mandioca

Odd unhandſome ways of their making drink from the ſame root.

Hiſtory of the Barbados, pag. 29, 30, 31, 32.

THIS naſty way of preparing drink, *Pyrophilus*, may ſeem ſtrange to you, as it did to me, when I firſt heard of it; but beſides the conſenting relations both of French and Engliſh concerning it, it may be confirmed by the ſtrange aſſertion of *Gulielmus Piſo*, in his new and curious *Medicina Braſilienſis*, where, having ſpoken of ſeveral of the Braſilian wines, he tells us, that they make liquors of ſeveral plants beſides the root of mandioca, after the ſame naſty manner. *Idem fit* (ſaith he) *ex mandioca, patata, milio Turcico, oryza, & aliis, quæ à vetulis maſticantur, maſticataque multa cùm ſaliva exſpuuntur; hic liquor mox vaſis reconditur, donec ferveat, fæceſque ejiciat.* 'The ſame is made of mandioca, potatoe's, 'Turkiſh millet, rice, and other things, which 'being chewed by old women, and ſpit together 'with much ſpittle, this liquor is ſtrait put 'up into veſſels, and there kept, until it fer'ments and caſts down a ſediment.'

Voyage de Muſcovie & de Perſe, p. m. 23.

IN *Muſcovia* itſelf, notwithſtanding the unſkilfulneſs of that rude people, *Olearius* informs us, that the embaſſadors, to whom he was ſecretary, were preſented at one time with two and twenty ſeveral ſorts of drink. And at a country-houſe here in *England* (where I was, by a very ingenious gentleman, that is maſter of it, preſented with divers rare drinks of his own making) I was aſſured, that he had lately, at one time in his houſe, at leaſt the former mentioned number of various drinks, and might eaſily have had a greater, if he had pleaſed.

Of making drink from ſorts of coarſe bread.

AND on this occaſion, I am not willing to pretermit what is practiſed in ſome of our American plantations, as I am informed by the practiſers themſelves; where, finding it very difficult to make good malt of maiz, or Indian corn, (by reaſon of hindrances not to be diſcourſed of in few words) they brew very good drink of it, by firſt bringing the grain to bread; in which operation, the grain being both reduced into ſmall parts, and already ſomewhat fermented, is diſpoſed to communicate eaſily its diſſoluble and ſpirituous parts to the water it is boiled in. To which I ſhall add, that I have reaſon to think, that the art of malting may be much improved by new and ſkilfully contrived furnaces, and a rational management of the grain.

NOR are we alone defective in the knowledge of fermenting drinks, but even in that of the materials, of which drinks may be prepared.

The drinks in uſe in China.

IN that vaſt region of *China*, which is enriched with ſo fertile a ſoil, and comprizeth ſuch variety of geographical parallels, they make not (as *Semedo* informs us) their wine of grapes, but of barley; and, in the northern parts, of rice, where they make it alſo of apples: but in the ſouthern parts, of rice only; yet not of ordinary rice, but of a certain kind peculiar to them, which ſerves only to make this liquor, being uſed in divers manners. And of the wine there drank, even by the vulgar, our author gives us this character: The wine uſed by the common people, although it will make them drunk, is not very ſtrong or laſting; it is made at all times of the year, but the beſt only in the winter: it hath a colour very pleaſing to the ſight, nor is the ſmell leſs pleaſing to the ſcent, or the ſavour thereof to the taſte; take all together, it is a vehement occaſion, that there never wants drunkards, *&c.* And of the inhabitants of the kingdom of *Japan*, I remember alſo, *Pyrophilus*, that *Linſchoten*, in his deſcription of thoſe iſlands, tells us, that they drink wine of rice, wherewith they drink themſelves drunk.

Hiſtory of China, part. 1. c. 1.

Linſchoten's *voyages*, book 1. c. 26.

Of cherry wine.

WE have here in *England*, at the houſe of our experienced mint-maſter, Dr. *Gordon*, taſted a wine, which he made of that ſort of cherries which are commonly called morello, that was, when we drank of it, about a year and a half old, but it was ſomewhat ſour, and needed ſugar. And therefore I ſhall rather take notice to you of my having ſince drank wine made of the juice of good, but not of extraordinary Kentiſh cherries, which, with the help of a *tantillum* of ſugar added in the fermentation, kept ſo well, that though it were above a year old when I taſted it, I found it a ſtrong and pleaſant wine, not inferiour to many wines, that are brought us from foreign parts. But this is nothing to what is averred upon his own experience, by a learned divine (to whom you, *Pyrophilus*, and I, am related) who affirms himſelf to have made out of ſome

Of excellent cyders. ſort of wild apples and pears, by bare fermentation, ſuch liquors, as though at firſt ſomewhat harſh, will not only keep divers years, but, at the end of two or three, attain ſuch ſtrength, and ſo pleaſingly pungent a taſte, that they may compare even with choice outlandiſh wines, and excel thoſe, that are not of the very beſt ſorts of them.

BUT till we have in another eſſay an opportunity of preſenting you ſomething out of the obſervations of *Olearius*, the newly mentioned divine, and our own, concerning fermented liquors, we ſhall content our ſelves to manifeſt our want of curioſity about the materials, of which drinks may be prepared, by this, that the drinks of one whole country are oftentimes unknown to the inhabitants of another. That the wine made of rice, which we lately mentioned to be of frequent uſe in the kingdoms of *China* and *Japan*, is of little or none in *Europe*, I need not prove to you. I have been in divers places, where beer and ale, which are here the common drinks, are greater rarities than the medicated liquors ſold only in apothecaries ſhops. In divers parts of *Muſcovy*, and ſome other northern regions, the common drink is *Of hydromel.* *hydromel*, made of water fermented with honey; and indeed, if a due proportion betwixt thoſe two be obſerved, and the fermentation be ſkilfully ordered, there may be that way, as experience hath aſſured us, prepared ſuch a liquor, both for clearneſs, ſtrength, and wholeſomeneſs, as few, that have not taſted ſuch a one, would readily believe.

Of ſugar wines. THE French and Engliſh inhabitants of the *Caribbee* Iſlands, make, by fermentation, a wine of the dregs collected in the boiling of ſugar. A like to which *Piſo* tells us, that they make Lib. 4. c. 1. in *Braſil*, and commonly call *garapa*, which, though made by the mixture of water, the inhabitants are very greedy of; and when it is old, find it ſtrong enough to make them drunk. And how alſo in theſe colder countries a good wine may be made of only ſugar and water, we may elſewhere have occaſion to teach you.

Lib. 4. c. 6. AND in *Braſil* they likewiſe, as the ſame author informs us, make a wine (unknown to moſt other regions of the world) of the fruit of *acaju*, which yet, upon his experience, he much commends; telling us, that it is ſtrong enough to inebriate, and may, he doubts not, *Of other Braſilian and Barbados wines.* be kept good many years; and that though it be aſtringent, yet both in himſelf and others he found it diuretical.

IN the *Barbados* they have many drinks unknown to us; ſuch as are *perino*, the plantane drink, *grippo*, punch, and the rare wine of pines, by ſome commended more than the poets do their nectar; ſome of which we therefore make not, becauſe the vegetables, whereof they are produced, grow not in theſe colder climates: but others alſo they have, which we have not, though they are made of plants to be met with in our ſoil; as for inſtance, the drink they call *mobby*, made of potatoes fermented with water, which, being fit to drink in a very few days, and eaſy to make as ſtrong almoſt as the maker pleaſeth, would be of excellent uſe, if it were but as wholeſome as it is accounted pleaſant.

IN the Turkiſh dominions, where wine, properly ſo called, is forbidden by *Mahomet*'s law, the Jews and Chriſtians keep in their taverns a vinous liquor made of fermented raiſins, after a manner, which (when we ſhall elſewhere acquaint you with it) you will eaſily diſcern to be capable of much improvement from the knowledge of fermentation. And in- *The way to make wine of raiſins.* deed by the bare fermenting of raiſins and water, in a due proportion, without the help of barm, leaven, tartar, or other additament to ſet them a working, we have divers times, in a few days, prepared a good vinous liquor, which having for trial's ſake diſtilled, it afforded us greater ſtore than we expected, of inflammable ſpirit, like that of other wine.

BUT I have ſometimes wondered, that men had no more curioſity to try what drinks may be made of the juices obtainable by wounding or cutting off the parts of ſeveral trees, and ſome other vegetables: for that in the *Eaſt-* *Of wines from the dropping or weeping of wounded vegetables.* *Indies* their *ſura* is made of the liquor dropping from their wounded coco-trees, we have not long ſince out of *Linſchoten* informed you. And ſober eye-witneſſes have aſſured us, that in thoſe countries they have but too often ſeen the ſea-men drunk, by the uſe of liquors weeping out of the inciſions of wounded vegetables, and afterwards fermented.

AND that even in *Europe*, the alimental liquor, drawn by trees from the earth, may receive great alterations from them, before it be quite aſſimilated by them, may be gathered from the practice of the Calabrians and Apulians; who, betwixt *March* and *November*, do by inciſions obtain from the common aſh-tree, and the *ornus* (which many botaniſts would have to be but a wild aſh) a ſweet juice, ſo like to the manna, adhering in that ſeaſon to the leaves of thoſe kind of trees, that the natives call it in their language, *manna del corpo*, or trunk manna. And leſt we ſhould think they draw all this ſweetneſs from the ſoil of that particular part of *Italy*, where they grow, you may be ſatisfied by the learned *Chryſoſtomus Magnenus*, in his treatiſe *de Manna*, that it is to be met with in ſeveral other places. And he adds, that in the dukedom of *Milan*, where he profeſſeth phyſick, there is no other manna uſed, than that, which is (as he ſpeaks) *vel è trunco expreſſum* (which he ſomewhere calls *manna truncinum*) *aut in ramis ſtriatim concre-* *De Manna, cap. 18.* *tum*; and that yet it is ſafely and proſperouſly uſed.

I HAD communicated to me, as a rarity, *Of the tears of the walnut-trees.* a ſecret of the king of *Poland*'s, which is ſaid to do wonders in many diſeaſes, and conſiſts only in the uſe of the liquor, which drops about the beginning of the ſpring from the bared and wounded roots of the walnut-tree: but becauſe I have not yet made trial of it my ſelf, I ſhall paſs on to obſerve to you, that in ſome northern countries, and even in ſome parts of *England* bordering upon *Scotland*, the almoſt inſipid liquor, that weeps in *March*, or the beginning of *April*, out of the tranſverſly wounded branches (not trunks) of the birch-

tree,

tree, is wont to be uſed by perſons of quality as a preſervative from the ſtone; againſt which cruel diſeaſe, *Helmont* highly extols a drink made of this liquor and *ſemen dauci* and *beccabunga*, and I think not without cauſe. For not to mention all the commendations, that have been given me of it by ſome that uſe it, I have ſeen ſuch ſtrange relief frequently given, among others, to a kinſman of mine, to whom hardly any other remedy (though he tried a ſcarce imaginable variety) was able to give eaſe, (and in whoſe diſſected bladder, after another diſeaſe had killed him, a ſtone of many ounces was found) that I uſually every ſpring take care to provide a quantity of this water, with which alone, without the other ingredients mentioned by *Helmont*, my kinſman uſed to be relieved as long as he could keep it; which you may do the longer, by pouring upon the top of it a quantity of ſallad-oil, to defend it from the air; and perhaps alſo by diſtillation: by which (laſt named) way, I know an ingenious man, that is wont to preſerve it for his own uſe, and ſays, he finds it not thereby impaired in virtue. But the moſt effectual way, that ever I yet practiſed, *Pyrophilus*, to preſerve both this and other liquors and juices, is dextrouſly and ſufficiently to impregnate them with fume of ſulphur, which muſt be at divers and often times as it were, incorporated with the liquor by the due agitation; the manual operation belonging to this experiment, I may hereafter have occaſion to deſcribe more fully, together with the particular effects of it in ſeveral bodies. And therefore it may here ſuffice to tell you, that if you practiſe it carefully, you will, perhaps, think your ſelf obliged to thank me for the diſcovery of it, though a heedful reader may find it, not obſcurely, hinted in *Helmont*'s writings.

The uſe of the tears of birch, with ſome other ingredients, for the ſtone.

The ways to preſerve theſe liquors.

I MIGHT here annex the great commendation, which I have found given to this birch-water, by eminent writers, againſt the hot diſtempers of the liver, and divers other affections; and eſpecially how *Freitagius* commends it very much to dilute wine with: and adds, *Hæc eſt dulcacida & grati ſaporis, ſitim ſedat, viſcerum & ſanguinis fervorem temperat, obſtructiones reſerat, calculum pellit:* 'This birch-water hath a ſweet ſharpneſs, and very pleaſant taſte; it allays thirſt, and the dryneſs of the entrails; it tempers the heat of the blood; it opens obſtructions, and drives out the ſtone.'

The uſe of theſe tears of birch in hot diſtempers of the liver and hot catarrhs.

In conſilio medicinali in catarrho calido pro principe quodam.

BUT I ſuppoſe you will think it high time for me to proceed to another ſubject; and indeed I ſhould not have ſpent ſo much time in diſcourſing of drinks, but that I am apt to think, that if there were greater variety of them made, and if they were more ſkilfully ordered, they might, by refreſhing the ſpirits, and inſenſibly altering the maſs of blood, prevent and cure (without weakening or much troubling the patient) almoſt as many diſeaſes, as the uſe of our common, unwholeſome and ſophiſticated wines is wont to produce.

FOR in fermentation, the ſulphureous (as chymiſts call them) the active, and the ſpirituous parts of the vegetables, are much better looſened, and more intirely ſeparated from the groſſer and clogging parts, in moſt mixts, than they are by the vulgar ways of diſtillation, wherein the concrete is not opened by previous fermentation. And theſe nobler parts being incorporated with our aliments, are with them received freely, and without reſiſtance carried into the maſs of the blood, and therewith, by circulation, conveyed to the whole body, where their operation is requiſite. And I remember, that diſcourſing one day with an eminently learned and experienced phyſician, of the antinephritical virtue of our common wild carrot-ſeed, fermented in ſmall ale; he ſmilingly told me, that he found its efficacy but too great; for having preſcribed it to ſome of his rich patients, who were wont frequently to have recourſe to him in their nephritical diſtempers, after the uſe of this drink for a pretty while, he ſeldom heard of them any more. And for your encouragement, *Pyrophilus*, to make trials of this nature, we will add, that though the ſeed it ſelf be not over-well taſted, yet being fermented in a due proportion with the liquor (we uſed an ounce and half of the ſeed, to a gallon of the ale) the drink compoſed of both taſted pleaſantly, almoſt like lemmon-beer.

The uſe of daucus ale, and proportion of the ſeed to the liquor.

AND that you may the leſs wonder at the efficacy of fermented liquors, it is worth conſidering, what virtue is aſcribed to the bare decoction of that herb, which the French and we call *Thé*, or *Té*, which is much magnified here; and as far as my little experience in my ſelf, and others (of which more hereafter) reaches, not altogether without cauſe: but among the Chineſe and the Japonians, it is the common drink of perſons of quality, by whom it is ſo highly praiſed, that the experienced *Tulpius*, in the new edition of his *Obſervations*, tells us, that one pound of the Japonical *T'chia* (as the natives call it) is not unfrequently ſold for one hundred pounds of ſilver; which is not to be wondered at, if they juſtly aſcribe to it, that in thoſe countries men are not ſubject to the ſtone, or the gout, and if but one half of the virtues he there attributes to it, be for the moſt part to be found in it.

Of Thé or Té.

Obſ. lib. 4. cap. ult.

I MIGHT, when I told you of the variety of materials not uſed among us, have added one ſtrange drink, which a chirurgeon, that a while ſince lived at in the *Eaſt-Indies*, told me, he ſaw much uſed thereabouts: they make it of the raw fleſh of goats, capons, and the like, which together with rice and moloſſes (or black coarſe ſugar) they put into a quantity of water, and diſtil it in an alembick till the liquor be ſtronger than brandy, (as they call common weak ſpirit of wine, or of lees of vinous liquors,) and this *rack* (as the extravagant liquor is called) is often drank in hot weather, and found very comfortable: thoſe, that uſe it, prizing it much, as ſuppoſing it draws a nutritive and cheriſhing virtue from the fleſh, as indeed, if any quantity of the nobler parts of that, do concur to the conſtituting of the liquor, it may probably be, at leaſt to divers bodies, very wholeſome in that country, where they find ſtrong drinks neceſſary to recruit their ſpirits, exhauſted by the exceſſive

Of animal drinks.

ceſſive heat of the climate. As I remember, the experienced *Bontius*, in his *Medicina Indorum*, tells us, that the merchants travelling through the ſcorching deſarts of *Arabia*, *Perſia*, or *Turkey*, find it beſt to quench their thirſt by a draught of the ſpirit of wine, or elſe of the ſtrongeſt Perſian or Spaniſh wine.

Dialog. 3.

The uſe of brandy wine in hot climates.

AND of the great uſe, if not neceſſity, of either brandy, or ſuch other ſtrong and ſpirituous drinks in the hot climates of the *Indies*, divers intelligent perſons of our own country have, upon their own experience, ſufficiently ſatisfied us.

NOR, *Pyrophilus*, is natural philoſophy able only to improve our drinks, but the reſt of our aliments alſo: for not to mention, that experience hath aſſured us, that by ſkilfully contrived ovens (wherein the heat plays every way about the bread, without yet ſuffering any of the ſmoke or ſteams of the fire to come at it, and wherein what degree of heat you pleaſe may be continued from firſt to laſt) better bread may be baked, than in our common ovens, where the bread reſts upon the hearth, and the heat is continually decaying. Not to mention this, I ſay, phyſiology can enable us to confer a very grateful taſte on very many of the things we eat, barely by a ſkilful and moderate untying and exciting the formerly clogged ſpirits, and other ſapid parts contained in them. It can teach us to make better bread than is commonly eaten. And by diſcovering to us a better art of cookery, than *Apicius* and his ſucceſſors have left us, and by ſubſtituting innocently ſapid things, inſtead of thoſe unwholeſome ones, their deliciouſneſs endears to men; it can teach us to gratify men's palates, without offending their healths: and in preſerving of freſh meats, fruits, *&c.* beyond their wonted ſeaſons of duration, the naturaliſt's ſkill may perform much more than you will readily believe.

The uſe of natural philoſophy to meliorate meats.

AND yet to incline you not to be too diffident in this particular, let me inform you, that much hath been already performed, as to the preſervation of aliments, even by thoſe, that have not troubled themſelves to make philoſophical inquiries after the cauſes and remedies of putrefaction in bodies, but only have been taught by obvious and daily obſervations, that the air doth much contribute to the corruption of ſome bodies, and the excluſion of the air to the hindering it. I remember, the inquiſitive and learned Mr. *Boreel* aſſured me ſome while ſince, that he had in his country, *Holland*, eaten biſket, that was yet good, after it had been carried from *Amſterdam* to the *Eaſt-Indies*, and brought back thence again, (in which voyage, between two and three years are wont to be ſpent.) And to confirm my conjecture of the way of preſerving this bread ſo long, he told me, that the curious merchant, whoſe it was, uſed no other art, than the ſtowing his biſket, well baked, in caſks exactly calked; and beſides carefully lined with tin, for the more perfect excluſion of the air: adding, that to the ſame end the biſkets were ſo placed, as to leave as little room as poſſibly might be in the caſk; which alſo was not opened, but in caſe of abſolute neceſſity, and then preſently and carefully cloſed again.

Of preſerving biſket from putrefaction

I MAY elſewhere tell you of an eminent naturaliſt, a friend of yours and mine, that hath a ſtrange way of preſerving fruits, whereby even gooſberries have been kept for many months, without the addition of ſugar, ſalt, or other tangible bodies: but all that I dare tell you, is, that he aſſures me, his ſecret conſiſts in a new and artificial way of keeping them from the air.

Of preſerving fruits.

BUT it ſeems more difficult, as well as more uſeful, to be able to preſerve meat long without ſalt; for it is ſufficiently known to navigators, how frequently, in long voyages, the ſcurvy, and other diſeaſes, are contracted by the want of freſh meat, and the neceſſity of feeding conſtantly upon none but ſtrongly powdered fleſh, or ſalted fiſh: and therefore, he is much to be commended, that hath firſt deviſed the way to keep fleſh ſweet, without the help of thoſe fretting ſalts men are wont to uſe to make it keep. This way is not unknown to ſome ingenious perſons in *London*. One of the moſt noted of whom, upon my conjecturing, how it may be performed, confeſſed to me, that I had hit upon the way in general. But the moſt ſatisfactory account I could get of it was from an Engliſhman, that lately practiſed phyſick in the *Eaſt-Indies*, who, finding I was no ſtranger to what I aſked him about, told me freely, that he had ſeen both goat's-fleſh, and hen's, ſo well preſerved by this way, that though it were put up in the *Eaſt-Indies* a while before he came thence, yet he eat of it, and found it good and wholeſome between the Iſlands of *Cape Verd*, (as the ſeamen call them) and *England*; ſo that this meat continued ſweet above ſix months, notwithſtanding the heat and cloſeneſs of the ſhip, the exceſſive heat they met with, in their paſſage under the line, and conſequently through the torrid zone; and that the way was only this, that the meat being well roaſted, and cut in pieces, was carefully and conveniently ranged in a very cloſe caſk, into which, afterwards, there was poured as much butter melted, ſkimmed, and decanted from the groſſer and ranker parts, as would fill up all the intervals left between the ſeveral pieces of fleſh, and ſwim about them all, and thereby keep out the air from approaching them; and then the caſk being exactly cloſed, was ſtowed up in a convenient place in the ſhip, and kept unopened till the meat was to be eaten. And it muſt not be omitted, that the relator, and others, that had the care of making proviſion for the voyage, were fain, inſtead of butter made of cow's-milk (which could not be had, where they took in their lading) to make uſe of that made of goat's, or ewe's-milk, which is not (as the Indians make it) ſo good, and to whoſe rankneſs he aſcribed that, which he had obſerved in ſome of the meat buried in it, which he thought might have been preſerved *longer* and *better taſted* (for *wholeſome* and *incorrupt* he ſaid it was) in our European butter; whoſe power to preſerve meat buried in it, after due coction, hath been confirmed to me upon

Of preſerving meats waſted, for long voyages.

their own obſervation, by an experienced officer of the Engliſh fleet, that had the overſight of the proviſions, and by others, that had opportunity to obſerve it.

Of preſerving raw meats.

BUT how much the naturaliſts ſkill may advance the dietetical part of phyſick, by enabling men to make aliments much laſtinger than naturally they are, I muſt not here labour to convince you by other inſtances, that I may not anticipate what we have elſewhere to acquaint you with, from other men's experiments, and our own, about the conſervation of bodies. Only I ſhall at preſent tell you in general, that I hope there will be ways found out to preſerve even raw fleſh it ſelf (for of the keeping of roaſted, we have juſt now given you an inſtance) with things, that do not ſo much fret it, nor give it ſo corroſive a quality, when eaten, as our common ſalt doth. For not to mention what ſeveral curious perſons have practiſed, of ſalting neats-tongues with ſalt-petre, which, though done only to make them look red, ſhews, that a body, not corroſive like common ſalt, may preſerve fleſh; I have, for trial ſake, kept an entire puppy of a pretty bigneſs, untainted for many weeks, (and that in the midſt of ſummer) and that without flaying, drying (by fire, or otherwiſe) or ſo much as exenterating him, or cleanſing him, or doing any thing towards the preſerving of him, ſave the keeping him immerſed in a well-ſtopt veſſel, under ſpirit of wine, (from whoſe taſte, I preſume, meat may be eaſily freed by water;) and there ſeemed ſmall cauſe to doubt, that the only thing, that hindred me from keeping him much longer, was the want of time to purſue the experiment, and take notice of its ſucceſs. For I remember, I have the ſame way kept a ſoft ſubſtance, taken raw from an ox or cow, for many months (if I miſtake not, eighteen or twenty) and found no putrefaction or ill ſcent in the immerſed ſubſtance; which, for aught I know, might have been preſerved divers years together the ſame way, or at leaſt, by an eaſy improvement of this method, of which, I lately intimated, I intend you hereafter an account.

Salting neats-tongues with ſalt-petre.

Of preſerving fleſh in ſpirit of wine.

AND I ſhall further add on this occaſion, that if we reflect upon ſugar, which is (at leaſt in theſe weſtern regions) but an almoſt recent diſcovery, and conſider how many bodies are with it, by confectioners and others, not only preſerved, but rendred exceeding grateful to the taſte; that ſingle inſtance may ſuffice to make us think it probable, that expedients yet unthought of may, by an inſight into nature, be found out, for the preſervation of bodies: eſpecially, if our ingenious friend Mr. *W.* would ſhew us, how out of divers other concretes, beſides the ſugar-cane, a ſubſtance not unlike ſugar (though of different taſte, according to the nature of the vegetable, that affords it) may, by a peculiar induſtry, be prepared. Which, that you may not think unfeazable, let me mention to you (for perhaps he hath not yet taken notice of it) what even Indians have done of this nature. And firſt, let me inform you of what we are told by *Linſchoten* * concerning that drink, which in the *Eaſt-Indies* they call *ſura*, and made of the liquor dropping from the bloſſoms, that they cut away from the Indian palm-tree, which bears the cocoa-nut. For this *ſura*, he tells us, that amongſt other things, they make ſugar (which is called *jagra*) which is made by boiling that liquor, and ſetting it in the ſun, where it congeals to ſugar.

Of conſerving by ſugar, and making ſugar of other concretes beſides the cane.

AND though I muſt not conceal from you, that our author adds, that it is not much eſteemed by reaſon of its brown colour, and for that (to uſe his words) they have ſo great quantity and abundance of white ſugar throughout all *India*; yet the latter reaſon, of the cheapneſs of *jagra*, ſeems to be the principal. For probably, if other ſugars were ſcarce, the melioration of this would be attempted; and it is very likely, that if a ſkilful naturaliſt had the ordering of that ſweet juice, of which the Indians make their *jagra*, he might very well make of it a ſugar of no ſmall uſe; and ſuch a ſugar would be very convenient in many caſes, and to many perſons, for its being different from the common ſugar, though it ſhould not be better. *Garcilaſſus* alſo (a much applauded writer concerning the *Weſt-Indies*) treating of the fruits of a Peruvian tree, called by ſome *Molle*, and by others Mulli, *Conficiunt* (ſaith he) *ex eo potum confricando blandè inter manus in aqua calida, donec dulcor omnis defricetur. Percolant hanc aquam, ſervanique dies tres quatuorve, donec ſubſideat; potus eſt limpidiſſimus, &c. Aqua eadem cocta convertitur in optimum mel.* 'They 'make drink of that *Mulli*, rubbing it gently 'in their hands in hot water, until they have 'rubbed out all the ſweetneſs; they ſtrain 'that water, and keep it three or four days, 'until it ſettle, and then it becomes a very 'clear drink: the ſame water boiled turns into 'good honey—Of this fruit boiled with water 'according to different manners is made wine, 'or good drink, or vinegar, or honey.' And of the ſame plant *Petrus de Cieca* hath this confirming paſſage: *Ex hujus fructu cum aqua decocto, pro coctura modo fit aut vinum ſive potio admodum bona, aut acetum, aut mel.* And that there is a great affinity betwixt ſuch vegetable honeys and ſugar, eſpecially if the juices be ordered with a deſign of turning them rather into ſugar than honey, you may eaſily gather from the next and more memorable inſtance, which we are to mention, and which is afforded us by the diligent deſcriber of the Braſilian plants, who treating of the *Caraguata*, or *Erva Baboſa* (or, as ſome would have it, *Herba innominata caule portulacæ*) hath theſe words to our preſent purpoſe: *Porro* (ſaith he) *radendo novacula petroſa ſtolones, emanat ex concavitate liquor quidam tantâ copiâ, ut ex una ſolummodo planta (mirabile dictu) interdum 50 aut plures arobæ effluant, è quo liquore fit vinum, acetum, mel, & ſaccharum: liquor quippe perdulcis*

Apud Joh. de Laet. deſcr. Indiæ, l. 10. c. 3.

Apud eundem eodem loco.

* *Linſchoten's Voyage*, chap. 56.——When they deſire to have no cocus, or fruit thereof, (namely, of the palm-trees,) they cut the bloſſoms of the cocus away, and bind a round pot, with a narrow mouth (by them called *calao*) faſt to the tree, and then ſtop the ſame cloſe round about with pot-earth, ſo that neither wind nor air can enter in, or come forth; and in that ſort, the pot, in ſhort ſpace, is full of water, which they call *ſura*, and is very pleaſant drink, like ſweet whey, and ſomewhat better.

dulcis coquendo redditur multo ſuavior & ſpiſſior, ita ut tandem in ſaccharum congeleſcat: 'Then 'by cutting the ſhoot with a razor-blade made 'of a flint, there runs out of the cut a certain 'liquor in ſuch a quantity, that (which is 'wonderful) out of one ſingle plant, ſome-'times fifty or more *arobæ* run out: from 'which liquor there is made wine, vinegar, 'honey, and ſugar. For the liquor, ſweet of it 'ſelf, is by being boiled made much ſweeter 'and thicker, ſo that it at length kerns into 'honey.'

SINCE the writing of theſe laſt lines, being viſited by an ancient virtuoſo, governour to a conſiderable colony in the northern *America*, and inquiring of him, among other particularities touching his country, ſomething in relation to the thoughts I had about the making of ſeveral kinds of ſugar; he aſſured me, upon his own experience, that there is in ſome parts of *New England* a kind of tree, ſo like our walnut-trees, that it is there ſo called; whoſe juice, that weeps out of its inciſion, *&c.* if it be permitted ſlowly to exhale away the ſuperfluous moiſture, doth congeal into a ſweet and ſaccharine ſubſtance: and the like was confirmed to me, upon his own knowledge, by the agent of the great and populous colony of the *Maſſachuſets*. And very lately demanding of a very eminent and ſkillful planter, why, living in a part of *America*, too cold to bear ſugar-canes, he did not try to make ſugar of that very ſweet liquor, which the ſtalks of maiz, by many called Indian-wheat, afford, when their juice is expreſſed, he promiſed me he would make trial of it; adding, that he ſhould do it very hopefully, becauſe that though he had never been ſolicitous to bring this juice into a ſaccharine form, yet having ſeveral times, for trial ſake, boiled it up to a ſyrup, and employed it to ſweeten tarts, and other things, the gueſts could not perceive, that they were otherwiſe ſweetned than with ſugar. And he further added, that both he and others had, in *New-England*, made ſuch a ſyrup with the juice of water-melons.

That the naturaliſt may find out new ways to inveſtigate the wholeſomeneſs or inſalubrity of aliments, proved by inſtances out of Sanctorius's Medicina Statica.

NOR, *Pyrophilus*, is it only by teaching men to improve the wholeſomeneſs and taſtes of the aliments, or to keep them long uncorrupted, that the naturaliſt may contribute to the preſervation of man's health; for from the ingenious attempts of *Sanctorius*, in his *Medicina Statica*, we may be invited to hope, that there may be ways, as yet unthought of, to inveſtigate the wholeſomeneſs or inſalubrity of aliments: as he, by the weight of bodies, after having fed on ſuch and ſuch meats, finds, that ſwine's fleſh, melons, and ſome other things, that he names (in the third ſection) do much hinder inſenſible perſpiration, and conſequently are unwholeſome; though, as I take it, it were not amiſs, that before ſuch obſervations be framed into general and eſtabliſhed aphoriſms, they were carefully made in bodies of differing ages, ſexes, and complexions, and with variety of circumſtances. But then again, preſuming theſe maxims to be judiciouſly framed, the ſame *Statica Medicina* makes it hopeful, that there may be unthought of methods found, whereby, by ways different from thoſe formerly uſed by phyſicians, a man may be much aſſiſted in the whole manner of ordering himſelf, ſo as to preſerve health, and to foreſee and prevent the approach of many diſtempers. And perhaps by ſuch unthought of ways, divers paradoxes of concernment to man's health may be made out, as the diligent *Sanctorius* to that obſervation propoſed in theſe words, *Semel aut bis in menſe facto exceſſu in cibo & potu, die ſequenti, licet ſenſibiliter non evacuet, minus ſolito perpendit annexus*, (in the following aphoriſm) addeth this important corollary: *Victus uniformis caret beneficio illorum, qui ſemel vel bis in menſe excedunt: expultrix enim à copia irritata excitat tantum perſpiratus, quantum ſine ſtatica nemo crederet*: 'If once in a month one 'eat or drink to exceſs, the day following, if 'he be weighed (though he hath ſuffered no 'ſenſible evacuation,) yet then he will weigh 'lighter than is uſual. A conſtant diet wants 'the help of thoſe, that once or twice in a 'month do exceed: for the expulſive faculty 'being oppreſſed by too great repletion, ſtirs 'up ſo much of perſpiration, as without the 'ſtaticks no one would believe.' And indeed experience hath informed us, that the promoting or ſuppreſſing of inſenſible tranſpiration, by which, in a day, the body may diſcharge it ſelf of four or five pounds of excrementitious matter, hath a much greater power to advantage or prejudice health, than is wont to be taken notice of: ſo that we ſee, that the ſtaticks, which, though long known, were thought uſeleſs to phyſick, may afford ſeveral important directions in reference to the preſervation of man's health; to which there are likewiſe other ways, whereby the naturaliſt may contribute. For he may alſo deviſe means, whereby to judge of the qualities of aliments, eſpecially drinks, in their reſpective kinds, and likewiſe of the temperature of the air in this or that place aſſigned. We ſhall, in one of the following eſſays, deſcribe to you a ſmall ſlight inſtrument, by the help of which, one, that is acquainted with this or that particular ſort of wine, may give a near gueſs, whether it be embaſed with water or not. And whereas in moſt hot countries, where water being the common drink, it is of great concernment to man's health to be able to make a good eſtimate of the ſalubrity of it; and whereas phyſicians are wont to think water, *cæteris paribus*, the better and purer the lighter it is; this inſtrument preſently manifeſts, without any trouble of weighing in ſcales, what among any waters propoſed is the heavieſt, and which the lighteſt, and what difference there is of gravity betwixt them. And this diſparity may ſometimes be ſo great, that I remember ſome of our Engliſh navigators tell us, that upon bringing home a ſort of water out of *Africa* into *England*, they found by the common way of ponderation, the African water in the ſame bulk to be about four ounces in the pound lighter than the Engliſh. And as the thickneſs or lightneſs of waters may be thus preſently diſcerned by this hydroſtatical way, ſo it is poſſible, by ſome chymical experiments, eaſily enough to diſcover

Sect. 3. Aph. 96.

The difference in tranſpiration betwixt the times after ordinary diet, and after exceſs, tried by the weighing of man's body.

Difference in the weight of waters.

That chymical experiments may discover other qualities in waters.

cover ſome other qualities, wherein waters, that are thought to be of the ſame nature, differ from each other: as we find, that very many pump-waters will not bear ſoap, as rain-waters, and the generality of ſpring-waters will do. Some water will not dye ſcarlet, or ſome other particular colour, becauſe they are ſecretly imbued with ſome kind of ſaline ſubſtance, that hath an operation it ſhould not have upon the ingredients imployed by the dyer. And I have ſometimes diſcovered a latent ſea-ſalt in water, where others ſuſpected no ſuch matter, by pouring into it a ſolution of good ſilver, made in aqua fortis. For as common ſalt, as well as the ſpirit of it, will precipitate the metal out of ſuch a ſolution, in the form of white calx; ſo it ſeemed rational to conceive, that in caſe the water I ſuſpected hath been imbued in its paſſage through the earth with a ſaline quality, though not conſpicuous enough to be taken notice of by the taſte, theſe ſaline corpuſcles diffuſed through the water would, though faintly, act their parts upon the diſſolved ſilver; and accordingly I found, that upon the mixtures of ſuch waters, and the metalline ſolution, there would immediately be produced a kind of whiteneſs (from ſome parts of the metal precipitated by the ſalt:) to avoid which, I have often been fain to uſe, in places where I met with ſuch waters, either rain-water, or that, which is freed from its common ſalt, by a ſlow diſtillation.

And as for the temperature of the air, which is acknowledged to be of exceeding great conſequence, both as to health, and as to the prolongation of life, and which is poſſibly yet of greater moment to both than moſt men imagine, the ſkilful naturaliſt's ſagacity, if it were imployed to that purpoſe, might probably find divers ways of diſcovering the qualities, and conſequently the ſalubrity and unhealthfulneſs of the air in particular places. For the diligent *Sanctorius* (in the ſecond ſection of this *Medicina Statica*) teacheth us, how to eſtimate the healthfulneſs and inſalubrity of the air, by the weight of thoſe men's bodies, that live in it. And beſides this (nice) way, we ſee, that by the late invention of weather-glaſſes, it is eaſy to diſcern, which of two neighbouring houſes, and which of two rooms in the ſame houſe, is the colder. And I remember I have ſometimes bethought my ſelf of a ſlight way (to be mentioned in one of the following eſſays) by the help of which it is not hard to determine, in which of two places propoſed the air is, *cæteris paribus*, the dryer or the moiſter; and to give alſo ſome gueſs, both how much at the ſame time the air of one place exceeds that of the other, and how the temperature of the air changeth in the ſame place, at ſeveral times, either of thoſe qualities. And that the differing operations of ſeveral airs, upon certain ſorts of fleſh hung in them, upon ſome fading colours, upon bodies ſubject to gather ruſt, or to be tarniſhed, and, in a word, upon divers other ſubjects, may be more conſiderable, than men ſeem yet to have taken notice of, I ſhall think it ſufficient to have intimated in this place; being deſirous to haſten to the following eſſay, (wherewith I am to conclude, what I have to offer to you concerning phyſick) that I may have the more time to employ on it.

That the naturaliſt may diſcover the qualities of particular airs.

ESSAY V.

Preſenting ſome Particulars, wherein Natural Philoſophy may be uſeful to the Therapeutical part of Phyſick.

The introduction.

AND now, *Pyrophilus*, the method, that we formerly preſcribed to our ſelves (a little after the beginning of the firſt eſſay) requires, that we conſider a while the Therapeutical part of phyſick, which is indeed that, whoſe improvement would be the moſt beneficial to mankind; and therefore I cannot here forbear to wiſh, that divers learned phyſicians were more concerned, than they ſeem to be, to advance the curative part of their profeſſion; without which, three at leaſt of the four others may prove indeed delightful and beneficial to the phyſician, but will be of very little uſe to the patient, whoſe relief is yet the principal end of phyſick; whereunto the phyſiological, pathological, and ſemeiotical parts of that art ought to be referred. There was a while ſince a witty doctor, who being aſked by an acquaintance of mine (himſelf an eminent phyſician, and who related this unto me) why he would not give ſuch a patient more generous remedies, ſeeing he grew ſo much worſe under the uſe of thoſe common languid ones, to which he had been confined, that he could not at the laſt but die with them in his mouth? briſkly anſwered, *Let him die if he will, ſo he die, ſecundùm artem.* I hope there are very few of this man's temper; but it were to be wiſhed, that there were fewer learned men, that think a phyſician hath done enough, when he hath learnedly diſcourſed of the ſeat and nature of the diſeaſe, foretold the event of it, and methodically employed a company of ſafe, but languid remedies, which he had often before found almoſt as unable to cure the patient, as unlikely to kill him. For by ſuch an unprofitable way of proceeding, to which ſome lazy or opinionated practiſers of phyſick (I ſay ſome, for I mean not all) have, under pretence of its being ſafe, confined themſelves, they have rendred their whole profeſſion too obnoxious to the cavils of ſuch empiricks, as he, that (as the Lord *Verulam* reports) was wont to ſay, your *European* phyſicians are indeed learned men,

men, but they know not the particular cures of diſeaſes; and (unreverently enough) to compare our phyſicians to biſhops, who had the keys of binding and looſing, and nothing elſe. Which brings into my mind what Monſieur *De Balzac* relates (in his witty French diſcourſe, of the court) of a phyſician of *Milan*, that he knew at *Padua*, who being content with a poſſeſſion of his ſcience, and, as he ſaid, the enjoyment of the truth, did not only not particularly enquire into the cure of diſeaſes, but boaſted, that he had killed a man with the faireſt method in the world: *E morto* (ſaid he) *canonicamante, è con tutti gli ordini.* And ſuch ſcoffs and ſtories are readily enough entertained by the major part of men, who ſend for phyſicians, not ſo much to know what ails them, as to be eaſed of it, and had not rather be methodically killed, than empirically cured. And it doth indeed a little leſſen even my eſteem of the great *Hippocrates*'s ſkill, to find mentioned in his writings ſo many of his patients, of whom he concludes, that they died. And I had much rather, that the phyſician of any friend of mine ſhould keep his patient by powerful medicines from dying, than tell me punctually when he ſhall die, or ſhew me in the opened carcaſs, why it may be ſuppoſed he lived no longer. But, *Pyrophilus*, my concern for mankind, and for the reputation of many excellent phyſicians, whoſe profeſſion ſuffers much by the want of either induſtry or charity, in ſuch as we have been ſpeaking of, hath diverted me longer than I thought from telling you, that I ſuppoſe it will be not very difficult to perſuade you, that this ſo uſeful therapeutical part of phyſick is alſo capable of being much improved by a knowing naturaliſt, eſpecially if he be an intelligent and expert chymiſt, as in this eſſay we will ſuppoſe him.

CHAP. I.

That the naturaliſt may invent medicines chymically prepared, more pleaſant than the ordinary Galenical ones.

SOME Paracelſian would, perhaps, ſet forth, how much more eaſy to be taken chymically-prepared medicines are wont to be, than thoſe loathſome and clogging Galenical potions, bolus's, &c. which are not only odious to the takers, but (which is much worſe) are to many ſo offenſive, that either the patients cannot get them down, or the incenſed ſtomach returns them by vomit, before they have ſtayed long enough in the body to do any more than diſtemper it. But I ſhall not much inſiſt on this, becauſe I think wholeſomeneſs to be much more conſiderable in a remedy than pleaſantneſs; though, I confeſs, I could wiſh, that phyſicians were more careful to keep patients from being almoſt as much troubled by phyſick, as by the diſeaſe; and to cure, according to the old preſcription, not only *citò* and *tutò*, but *jucundè* too: eſpecially conſidering, that, as we were ſaying, the loathſomeneſs of ſome medicines maketh the ſtomach reject them, before they can have performed their operations. And it is, I preſume, on this account as much as any other, that at *Oxford* learned and practical phyſicians, of your acquaintance, make very frequent uſe (on patients not feveriſh) of the reaſin of jalap, barely drawn with ſpirit of wine; ſince, as we have tried, ſix, eight, or ten, or more grains, of this almoſt inſipid reſin, being cleanly prepared, according to art, and with a little gum tragacanth, and half its weight of powdered cinnamon, or ſome ſuch thing made up, may be taken in the morning in form of pills, inſtead of a potion; and is wont to evacuate plentifully enough, and yet gripe the patient much leſs than common purges. But, as I ſaid, I ſhall not inſiſt on this. I might better commend the uſefulneſs of chymiſtry to the therapeutical part of phyſick, from hence, that it is probable, that even emptying medicines may, by the Spagyriſt's art, be ſo prepared, as not only to be leſs offenſive than common purges or vomits in the taking, but to be leſs painful in the working: as I have often obſerved, both in myſelf and others, that upon the taking of the clear, and not loathſome mineral waters of *Barnet*, though the medicine wrought with me ten or twelve times in a morning, yet it did neither pain me, or make me ſick, or diſorder me for the remaining part of the day, any thing near ſo much, as a common pill or potion, that had wrought but once or twice, would have done. And I ſhall elſewhere (God permitting) teach you a preparation of ſilver, whereof about three or four grains being made up (with any proper conſerve) into a little pill, is wont to make a copious evacuation of ſerum eſpecially (in bodies, that abound with it) without making the patient almoſt at all ſick, or griping him; inſomuch that I know ſome perſons, both phyſicians and others, with whom though this medicine work frequently in a day, and though (which is ſtranger) once taking of it will with ſome perſons work ſo for two or three, or more days ſucceſſively, yet they ſcruple not to go abroad and follow their buſineſs. And ſome, that take it, tell me, that when it works not with them, as for the moſt part, when it hath freed the body from ſuperfluous ſerum, it will ceaſe, and in ſome bodies will ſcarce purge at all, it neither puts them to pain, nor makes them ſick.

An inſtance in reſin of jalap, mineral waters and the Author's Pil. Lunares.

AND now I am ſpeaking of the painleſs ways of relieving the ſick, I ſhall add, that there is another way, whereby it is to be hoped, many patients may be reſcued from a great deal of pain; and that is, by finding out medicaments, that may in ſeveral diſtempers, that are thought to belong peculiarly to the chirurgeon's hand, excuſe the need of burning, cutting, trepanning, and other as well painful as terrible manual operations of chirurgery. *Helmont* tells us, that he knew a country-fellow, who cured all freſh wounds by a drink, made (as I remember) of burnt *Tilia*. I have informed you in another eſſay, of the cure I obſerved to be made of the exulcerated tumours of one ſick of the king's-evil, by the uſe of beer, altered by a little plant, that did not at all diſturb the taker. If we may believe *Helmont* and *Paracelſus*, *Præcipitatus Diaphoreticus*, taken at the mouth, doth cure, to uſe his own words, *Carcinoma, lupum, & quodlibet*

That the naturaliſt may find out inward medicines able to do chirurgical cures, proved by divers inſtances.

Helmont de febribus c. 14. *See alſo the ſame author in* Tract. quem vocat arcana Paracelſ. Et lib. de Febr. c. 14.

bet Æſthiomenum cacoëthes ulcus, ſive externum ſive internum. And if there be any truth in what hath been affirmed to me by ſeveral eye-witneſſes, as well phyſicians as others, concerning the *weapon-ſalve*, and *powder of ſympathy*, we may well conclude, that nature may perform divers cures, for which the help of chirurgery is wont to be implored, with much leſs pain to the patient, than the chirurgeon is wont to put him to. I know a very ingenious man, that is famous as well for his writings as for a remedy, wherewith he undertaketh to cure conſtantly the exulcerated cancers of women's breaſts, without any conſiderable pain: but having not yet had opportunity to make trial of that which I have lying by me, I ſhall only tell you he aſſures me, that this medicine is indolent, and mortifies the ulcerous parts as far as they are corrupted, without diſordering the party troubled with them; which I the leſs doubt becauſe, that (to add thus much on this occaſion) partly by the colour, *&c.* of this powder, and partly by his own confeſſion to me, it ſeems to be a dulcification of arſenick, firſt fixt with nitre, and then carefully freed from its corroſiveneſs, by very frequent diſtillations of freſh ſpirit of wine. I ſhall ere long have occaſion to teach you a drink, whereby exulcerated (but not cancerous) breaſts have been very happily cured. The learned *Bartholinus*, in his late *Obſervations*, mentions the cure of ſome hurts in the head, done without trepanning, in caſes, where that formidable and tedious operation is wont to be thought neceſſary. As for the terrible way of ſtopping the violent bleeding in great wounds, by ſearing the orifices of the veſſels with hot irons, it would be little needed, if we knew ſuch remedies, as that, which the inquiſitive *Petrus de Oſma*, in his *Curious Letter to Monardes from Peru*, mentions in this paſſage, which I find among his other obſervations: *Anno* (ſaith he) 1558, *in urbe D. Jacobi, quæ eſt in provincia Chyle, quidam Indi captivi ſuras ſibi amputârunt, & eas aſſas præ fame ederunt, & (quod mirabile dictu) cujuſdam plantæ folia vulneribus imponentes, illico ſanguinem ſiſtebant:* 'In the city of 'St. *James*, that is in the province of *Chyle*, 'certain captive Indians cut off the calves 'of their legs, and for hunger eat them, 'and (which is ſtrange) applying the leaves 'of a certain plant to their wounds, imme-'diately they ſtanch the blood.' I knew a rich man, extremely corpulent, who having long had a ſtrange kind of fiſtula in his breaſt, and having travelled from one country to another, to conſult with the ableſt chirurgeons, was at length brought to that paſs, that at a conſultation they reſolved, by opening his breaſt, to try, if they could track the winding fiſtula, and ſave his life: and as the inſtruments, for this ſad operation, lay upon the table, another famous chirurgeon caſually coming into the houſe, told the patient, that he had an art of curing fiſtulas without cutting them open, and without any conſiderable pain or trouble: whereupon the rich man offering him what he pleaſed for the cure, the chirurgeon quickly performed his promiſe, as the patient himſelf, who ſhewed me his breaſt, confeſſed to me, and that by the uſe of an almoſt indolent remedy, which he purchaſed of the chirurgeon, and which by his favour came to my hands: and that even very ill-conditioned fiſtulas may be cured without chirurgical operations, by medicines taken at the mouth, I ſhall e'er long have occaſion to ſhew you by a notable example.

Apud Monard. de ſimplic. medic. *pag.* 84.

In the mean time I ſhall add, that a man, whom I ſuppoſe you have often ſeen, having a while ſince received ſuch a kick of a horſe, as made the doctor and chirurgeon, that tended him, to conclude the part gangrenated, and the patient's condition, by the acceſſion of a violent fever, ſo deſperate, that they deſired to meddle with him no longer; a large doſe of Sir *Walter Raleigh*'s cordial, ſent him by an excellent lady you are nearly related to, not only freed him from his fever, and the delirium that attended it, but, to the wonder of all that obſerved it, reſtored the limb, that was concluded gangrenated, to its former ſoundneſs. *Sir Walter Raleigh's cordial.*

And to bring credit to all theſe relations, I ſhall crown them with that memorable paſſage of *Gulielmus Piſo*, of as great things, that he ſaw done by the illiterate Indians themſelves: *Memini* (ſays he) *in caſtris membra militum globulis ſclopetorum icta, & jamjam ab Europæis chirurgis, tam Luſitanis quàm Batavis, amputanda, barbaros recentibus gummi ſuccis & balſamis à ferro & igne liberâſſe, & feliciter reſtituiſſe. Oculatus itidem teſtis ſum in noſocomiis relicta ulcera & gangrenas ab illis, vel ſolo ſucco tabaci, curata:* 'I remember, that the limbs of 'ſoldiers wounded with gun-ſhot, to have been 'cut off by the advice of our European ſurge-'ons, both Dutch and Portugueſe, thoſe bar-'barous people by recent juices, gums, and 'balſams to have freed them from knife and 'cauteries, and happily cured them. I alſo am 'an eye-witneſs, that with the juice of tobacco 'alone, they have cured wounds given over 'by our ſurgeons.' *What great uſe the Indians make of the juice of tobacco.*

But, *Pyrophilus*, that the making of divers helps to recovery, leſs diſtaſteful, or leſs painful to the patients, is not the only, nor perhaps the greateſt ſervice that chymiſtry may do him that attempts the cure of diſeaſes, I ſhall now endeavour to manifeſt in ſome particulars.

CHAP. II.

That the ſearch of nature by chymiſtry in particular diſcovers the qualities of medicines.

And firſt, the ſkilful naturaliſt, eſpecially if a good chymiſt, may much aſſiſt the phyſician to diſcover the qualities of medicines, whether *ſimple* or *compound*; that the experiments of the Spagyriſts may much contribute to the examining thoſe many things themſelves prepare, you will, I preſume, eaſily grant. That alſo divers mineral waters are of the nobler ſort of medicines, is ſufficiently confeſſed on all hands; and it is known too, that the induſtry of chymiſts hath produced ſome good directions towards the diſcovery of the minerals predominant in divers medicinable ſprings: but I am much miſtaken, if they have not left much for others to do, which may be eaſily done. And I ſcarce doubt, but that by the various ways

ways, that might be propoſed, of trying what ſuch waters hold, and what ſaline or other qualities are predominant in them, not only the nature of thoſe medicinal waters, that are already uſed, might be more thoroughly underſtood; but undetected properties might in many others, that are now not taken notice of, be diſcovered; of ſome of which ways of examining mineral waters, I may elſewhere give you an intimation. And I have made ſeveral trials, that have, I confeſs, much inclined me to think, that the fault is rather in us, than either in nature or chymiſtry, that men do not, by the help of chymical experiments, diſcover more of the nature of divers medicaments, than hitherto they ſeem to have ſo much as aimed at. For though the abſtruſe endowments of ſpecificks will not, I fear, be learned in haſte, otherwiſe than by particular trials and obſervations; yet many ſimples have other qualities, which ſeem chiefly to reſide, though not in an elementary ſalt or ſulphur, yet in a part of the matter that ſeems of kin to a ſalt or ſulphur: ſuch as ſourneſs, ſaltneſs, a cauſtick or a healing faculty, abſterſiveneſs, and the like, upon whoſe account ſuch remedies ſeem chiefly to work in a multitude of caſes. And towards the inveſtigation of ſuch qualities, a chymiſt may oftentimes do much, without making all his trials in human bodies. But though, to illuſtrate this matter, I have ſometimes made ſeveral experiments, yet not having now my notes and obſervations at hand, I ſhall only mention a few things as they offer themſelves to my memory, reſerving the more diſtinct handling of this ſubject to another opportunity; and the rather, becauſe that till ſuch phænomena have been more diligently obſerved, and reduced to their diſtinct ſorts, I would have them looked upon but as hints to farther inquiries, not as ſufficient authority to ground general rules on.

THERE are ſome plants, whoſe juices, eſpecially when the ſuperfluous moiſture is exhaled or abſtracted, will, (ſome by the aſſiſtance of a gentle heat and filtration, and ſome, even of themſelves, in time which I remember, hath in ſome ſucculent plants amounted but to a very few hours) coagulate in part into a kind of ſalt, which, if you pleaſe, you may call eſſential: and by this nitro-tartareous ſalt (as it ſeems to be) thoſe vegetables, whoſe juice affords it (ſuch as are, if I miſtake not their names, parietaria, borrage, bugloſs, &c.) may be diſcriminated from thoſe many others, from whence it is not (at leaſt by the ſame way) to be obtained. And poſſibly alſo theſe ſalts may, to a heedful ſurveyor of them, appear to differ enough from each other in ſhape, taſte, or other obvious qualities, to deſerve to be ſorted into differing kinds.

Of the nitro-tartareous ſalt in ſome vegetables.

IF likewiſe we compare the eſſential ſalts and ſpirits of theſe plants, with thoſe of ſcurvy-graſs, brook-lime, and other vegetables, that are counted antiſcorbutical, and abound in volatile and ſaline parts; and if we alſo examine other plants, by divers chymical operations, and obſerve not only their diſpoſedneſs or indiſpoſition to yield ſpirits or oils by fermentation, or without it; but thoſe other particulars, wherein they will appear to agree with, or differ from each other: there is little doubt but ſuch trials will make them diſcover, to a conſidering naturaliſt, much of their natures and properties, and eſpecially of ſuch as depend chiefly upon the plenty or paucity of the ſaline, unctuous, ſour, ſpirituous, lazy, tenacious or volatile parts.

IT may be alſo obſerved, that the infuſion or decoction of ſome plants, as of brazil, ſenna, &c. will be heightened into a reddiſh colour, by putting alkalizate ſalts, as of tartar, or of pot-aſhes, in the water that extracts their tinctures: whereas acid ſpirits, at leaſt ſome of them, will much impair, if not deſtroy their colour; as a little aqua fortis will immediately turn a red tincture of brazil, made in fair water, into a pale yellow: whereas, on the other ſide, I have obſerved, that a ſmall quantity of a ſtrong ſolution of pot-aſhes, dropt into an infuſion of red-roſe leaves, hath preſently turned it into a muddy colour, that ſeemed to partake of green and blue, but was dark and dirty; whereas a little aqua fortis, or good ſpirit of ſalt poured into the ſame ſimple ſolution, did immediately turn it into a fine red, and ſo it would do the muddy mixture lately mentioned, if it were put to it in a far greater quantity. I obſerved alſo, that with a very ſtrong (though clear and well filtrated) lixivium of pot-aſhes, I could precipitate ſome part of the infuſion or decoction of red-roſes; which groſſer parts, when the mixture was filtrated through cap-paper, remained like a dirty coloured (though ſomewhat greeniſh) mud in the filtre; the fluid and finer part of the mixture paſſing through in the form of a liquor high coloured, almoſt like muſcadine.

Difference in operation between acid and alkalizate ſalts.

AND on this occaſion, I remember, that as galls, a very ſtiptick vegetable excreſcence, will yield a decoction, with which, and copperas, the common ink is made; ſo divers other plants, of notably aſtringent parts, may be employed to the like uſe: for, by caſting vitriol into a decoction either of oaken bark, or red-roſes, or even a bare infuſion of either log-wood, or ſumach, to name now no other plants of the like nature, I have preſently made a mixture, that might make a ſhift to ſerve for writing-ink; but whether all ſtiptick plants, or they only, will with vitriol make an ink, I refer to farther inquiry. And as a ſolution of vitriol, and the decoction of the above-mentioned plants, do precipitate each other to make ink; ſo I remember I have tried, that by diſſolving the cryſtals of pure ſilver (made the common way with aqua fortis, or ſpirit of nitre) in a good quantity of fair water, that the liquor having no colour of its own, the colours it produceth in other bodies may be the better obſerved, I found, that I could with this liquor precipitate out of the infuſions alone of ſeveral vegetables ſubſtances differingly coloured, according to their reſpective diſpoſitions. And ſo I have found, with leſs coſt, that *ſaccharum Saturni*, which ſeems to be a kind of vitriol of lead, whilſt it lies diſſolved in the ſame ſpirit of vinegar, which extracted it from the metal, being

Of ink made by the decoction of divers aſtringent plants, with a little vitriol.

Of ſome metalline precipitations.

being put to the bare infusion of log-wood, *lignum nephriticum*, red roses (to name those I now remember I made trial of) they will precipitate each other.

That sulphureous salts turn the expressed juices of vegetables into a green colour.

I MIGHT farther add, that I have tried, that sulphureous salts, such as oil of tartar, made *per deliquium*, being dropped into the expressed juices of divers vegetables, will in a moment turn them into a lovely green, though the vegetables were of colours differing from that, and from one another, (as I remember one of those vegetables, in which I expected, and found that change, was of a fine carnation.) And I could tell you, that though it be disputed, whether quick-lime have any salt dissoluble in water, and of what sort it is, the examen of that question may be much furthered, by trying, as I have done, that the water of quick-lime, well made, will precipitate a solution of sublimate made in fair water, and will presently turn syrup of violets (which is blue) if well mixed with it, into a fair green. Experiments, I say, of this nature I might easily annex; but having already set down divers of them in what I have written concerning colours, I shall refer you thither: and now only add this observation, that the investigation of divers medical qualities, even of animal substances, may be as much assisted by the naturalist, especially a chymist; as we elsewhere have by the distillation of the *calculus humanus* shewn, how much it differs from the stones, that are found in the earth. And if you take those hard concretions, found at certain times in the heads of craw-fishes, that are wont to be called *lapides cancrorum*, and commit some of them to distillation, and infuse some in vinegar, and others in old Rhenish-wine, or strong white-wine, you will probably discover something of peculiar in the nature of this concrete, of which I may possibly elsewhere make farther mention to you. And not only so, but in some animal substances, you may, by fit experiments, discover notable changes to be made, and their qualities to be much heightened, when the eye scarce perceiveth any change at all, as I have purposely observed, in keeping urine in close glasses, and a moderate heat for many weeks: for at the end of that time, the virtues, that depend upon its volatile salt, will be so heightened, that whereas upon putting spirit of salt to fresh urine, the two liquors readily and quietly mixed, dropping the same spirit upon digested urine, there would presently ensue a hissing and ebullition, and the volatile and acid salts would, after a while, concoagulate into a third substance, somewhat of the nature of sal-armoniack. And whereas the syrup of violets, formerly mentioned, being dissolved in a little fresh urine, seemed to be but diluted thereby, a few drops of the fermented urine tempered with it did presently turn into a deep green: and the same digested urine being dropped upon a solution of sublimate made in fair water, presently turned it white, by precipitating the dissolved mercury. With what (various) success we have likewise made upon some other parts of a human body, as well consistent as fluid, some trials, analogous to what we have recited of urine, I may elsewhere, perchance, take notice to you: but of such kind of observations I must give you but this hint at present.

Of the distillation of the calculus humanus, *and of the concretions, that are called* lapides cancrorum.

The changes in animal substances made by fermentation only, particularly in urine.

Of the mixture of spirit of salt with digested urine.

CHAP. III.

SECONDLY: by these and other ways of investigating the medical qualities of bodies, the naturalist may be enabled to add much to the *materia medica*; and that two several ways.

That the search of nature adds much to the materia medica.

FOR he may, by his several ways of trial, and by his chymical preparations discover, that divers bodies, especially of a mineral nature, that are as yet not at all imployed by physicians, at least internally, may be brought into use by them; and that others, that are naturally so dangerous, as to be used but in very few, and for the most part extreme cases, may with safety be more freely employed. Some modern chymists (as particularly *Glauberus*) have of late prepared remedies not unuseful out of zink or spelter. And I have already mentioned unto you an excellent medical use of silver, of which, prepared (as is there intimated) I have now this to add, that since I began to write of it to you, I met with a considerable person, who assures me, that she her self was by the use of it in a short time, cured of the dropsy, though, by reason of her having a body very corpulent, and full of humours, she have been thought more than ordinarily in danger of that stubborn disease. I have sometimes wondered, that there hath been so little care taken by physicians, and even by chymists, to investigate the qualities of mineral earths, and those other resembling bodies, that are, or may be plentifully enough digged up in most countries, though not the self-same in all; for however men are pleased to pass them slightly over, as if they were but elementary earth, a little stained, or otherwise lightly altered, I have seen great variety of them, that have been digged sometimes within the compass of a little spot of ground: and the differences of divers of them, both as to colour, taste, consistence, and other qualities, have been too great, not to make me suspect they were of very differing natures. And the true *bolus Armenus*, and the *terra Lemnia*, which is now brought us from the island, that gives it that name, (mark'd with a seal, which makes many call it *Terra sigillata*, though that name be for the same reason applied to the *terra Silesiaca*, and other medical earths) have been so esteemed, both by antient and modern physicians, as well against malignant diseases, and the plague it self, as against divers other distempers, that it is the more strange, that (since the greatest part of those two earths, that are now brought into our countries, have not, as the more skilful complain, the true marks of the genuine earths, whose name they bear) physicians have not been more careful to try, whether their own countries could not furnish them with the like, or as good, especially in regard some of the few attempts of that nature, that have of late times been made, may give them as much incouragement. For, not to

By imploying bodies hitherto not imployed.

Of remedies newly prepared out of zink.

The cure of the dropsy, by the pill lunaris.

Of the use of medical earths.

believe

believe the boaſts of the Sileſian *Johannes Montanus* (who paſſeth for the inventor of the *Terra ſigillata Sileſiaca Strigonienſis*) in the writing he publiſhed of the virtues of it, that it is gold prepared and tranſmuted, by provident nature, into an admirable medicine; I find that learned phyſicians prefer it before the Lemnian earth, that is now brought from *Turkey*. And the experienced *Sennertus* gives it this commendation, *Experimentis* (ſaith he) *multis jam probatum eſt, ejus inſignes eſſe vires contra peſtem, febres malignas, venenatorum animalium morſus, diarrhœam, dyſenteriam:* 'It is 'approved by many experiments, that its 'virtues are excellent againſt the plague, 'malignant fevers, the bitings of venemous 'creatures, the diarrhœa, and other fluxes.' What he adds, that the chymiſts name it *axungia ſolis*, brings into my mind (what I ſhall hereafter have occaſion to mention more particularly to you) that I had once brought me a certain earth, by a gentleman, that digged it up in this, or ſome neighbouring country, which, though it ſeemed but a mineral earth, did really afford, to a very expert trier of metals of my acquaintance, a not deſpicable proportion of gold. They have alſo found in *Hungary* an earth, which they call *Bolus Tockavienſis*, which is affirmed by *Crato* (in *Sennertus*) to melt in the mouth like butter, and to have all the other proofs of the true *Bolus Armenus*, and therefore is, by that judicious phyſician, preferred before the modern bole-armony, even that, which was brought out of *Turkey* to the emperor himſelf. And he relates, not only its having ſucceeded very well againſt catarrhs, but his having experimentally found it of great efficacy in the plague, that reigned in his time at *Vienna*. To which I ſhall add, that a very learned and ſucceſsful Engliſh doctor now dead did ſome years ſince, during a great plague, that then raged in the city, where he lived, find a vein of red earth, not very far from that town, and preſcribed it with very good ſucceſs in peſtilential fevers, as I was informed by an ingenious friend of his, that uſed to adminiſter it, and ſhewed me the place, where he digged it.

Epitome ſcientiæ naturalis, l. 2. c. 1.

Inſtances of gold and divers noble menſtruums drawn out of them.

I REMEMBER alſo, the experienced chymiſt *Johannes Agricola*, in his notes upon what *Poppius* delivers of *Terra ſigillata*, after having much commended the *Terra Sileſiaca* in divers diſeaſes, and equalled it to the beſt of *Turkey*, where he had travelled, relates one ſtrange thing of it, with many circumſtances, and in a way, as if he ſpoke upon his own trial; namely, that the ſpirit of *Terra ſigillata*, by which I think he means the *Strigonienſis*, doth, though ſlowly, diſſolve gold as well as an *aqua regis*, and that into a red ſolution; whence in two or three days the gold will fall of it ſelf into a very fine and ſubtile powder. And the ſame author tells us, that he hath ſeen another earth digged at the *Rheinſtran*, not far from *Weſterwaldt*, which was more inclinable to white than to yellow, which is preferable to the Sileſian, and gives more ſalt than it, and diſſolves ſilver better than other menſtruums; ſince, as he ſaith, the ſilver may thereby be eaſily made potable, and be prepared into a very uſeful medicine for the diſeaſes of the head. And for my part, I do not much wonder at the efficacy of theſe earths, when I conſider, that divers of them are probably imbued, as well as dyed, with mineral fumes, or tincted with mineral juices, wherein metal or minerals may lie, as the chymiſts ſpeak, *in ſolutis principiis*; in which form, having neither endured the fire, many of their uſefulleſt parts are more looſe and volatile, and divers of their virtues leſs locked up, and more diſpoſed to be communicative of themſelves, than they are wont to be in a more fixed or coagulated ſtate, or when they have loſt many of their finer parts by the violence of the fire.

Of medicines out of arſenick.

BESIDES, there are ſeveral mineral bodies, which, though perhaps they may not be of themſelves fit for the phyſician's uſe, may, by addition of ſome other convenient body, or by ſequeſtration of the more noxious parts, or by ſome ſuch other chymical preparation, as may alter the texture of ſuch minerals, be rendered fit to increaſe the *Materia Medica*. As I have known, that by a preparation of arſenick, with ſalt-petre, whereby ſome of the more volatile and noxious parts are driven away, and the remaining body ſomewhat fixed and corrected by the alkali of the nitre, it hath, by a farther dulcification with ſpirit of wine, or vinegar, been prepared into a kind of *balſamum fuliginis*, which wonderfully cured a phyſician of my acquaintance, as himſelf confeſſed to me, of dangerous venereal ulcers (divers of which penetrated even to the *meatus urinarius*) which had reduced him to great extremity.

And out of biſmutum.

AND though biſmutum have not, that I know, till very lately, been uſed, unleſs outwardly, and eſpecially for a coſmetick (hereafter to be taught you,) yet the induſtrious chymiſt, *Samuel Cloſſeus*, by calcination, and addition of ſpirit of vinegar, and *cremor tartari*, makes two medicines of it, which he highly extols in the dropſy; and (to reſerve for another place, what I have tried upon tin-glaſs) a very expert chymiſt of my acquaintance doth, by preparing it with common ſublimate (carried up by which, I remember, it hath afforded a very prettily figured body) make it into a white powder, like *mercurius vitæ*, which he aſſures me he finds, in the doſe of a few grains, to purge very gently, without being at all, as *mercurius vitæ* is wont to prove violently enough, emetick.

Apud Schroderum in pharmacop. l. 3. c. 18.

Dr. I. C.

Of the correction of poiſonous medicines.

2. BUT the naturaliſt may add to the *Materia Medica*, not only by inveſtigating the qualities of unheeded bodies, but alſo by gaining admittance for divers, that, though well enough known, are forborn to be uſed upon the account of their being of a poiſonous nature: for by digeſtion with powerful menſtruums, and ſome other ſkilful ways of preparation, the philoſophical ſpagyriſt may ſo correct divers noxious, nay poiſonous concretes, unfit in their crude ſimplicity for the phyſicians uſe, at leaſt in any conſiderable quantity, as to make them uſeful and effectual remedies. *Helmont*, who, though frequently extravagant in his theory of phyſick, doth often make no bad eſtimate of the power

of remedies, after having told us, that he adored and admired the clemency and wiſdom of God, for creating poiſons, gives this account of his ſo doing: *Nam venena* (ſaith he) *noluit nobis eſſe venena aut nocua. Nec enim mortem fecit, nec medicamentum exterminii in terra: ſed potius, ut parvo noſtri ſtudio mutarentur in grandia amoris ſui pignora, in uſuram mortalium, contra futurorum morborum ſævitiam. In illis nempe latitat ſubſidium, quod benigniora & familiaria ſimplicia recuſant aliàs. Ad majores & heroicos medentum uſus venena tam horrida ſervantur:* 'He made not venom to be our 'poiſon, for neither made he death nor any 'deletery medicament upon the earth; but ſo, 'that by a ſlight induſtry and endeavour of 'our own they might be turned into great 'pledges of his love, for the uſe of men againſt 'the cruelty of diſeaſes, which were in pro'ceſs of time to ariſe. For in thoſe venoms 'is the help, that more benign and familiar 'ſimples cannot yield; and thoſe more fright'ful poiſons are yet preſerved in nature for 'the more great and heroick uſes of phyſicians.' And though I would not forbid you, *Pyrophilus*, to think there is ſome hyperbole in the encomiums he here and elſewhere gives poiſonous ſimples; yet when I conſider, what great things are oftentimes performed by antimony, mercury, and opium, even in thoſe not over-ſkilful ways of preparing them, that are divers of them vulgarly uſed by chymiſts, eſpecially when the preparations are (which doth ſeldom happen) rightly and faithfully made; I can ſcarce think it very unlikely, that thoſe active ſimples may, by a more ſkilful way of ordering and correcting them, be brought to afford us very noble remedies. And the ſame examples may in part prevent the main objection, that I can foreſee in this caſe, which is, that whatever corrects poiſons, muſt, with their virulency, deſtroy their activity; for the above-named ſimples, though ſo prepared as to be medicines ſafe enough, have yet activity enough left them to let them be very operative, their energy being, by preparation, not only in part moderated, but in part ſo over-ruled, as to work after a more innocent manner: As in *bezoardicum minerale*, ſkilfully prepared, (for it very ſeldom is ſo) the laxative and emetick virulency of the antimony is changed into a diaphoretick, reſolving, and deoppilative power; which probably made the experienced *Riverius* (though counted a Galeniſt) ſo particularly recommend this medicine to phyſicians, which, if I be not miſtaken, may well be praiſed without being flattered. And *Helmont* ſupplies me with an eaſy experiment to our preſent purpoſe, by telling us, that aſarum, which when crude, doth, as is well known, provoke vomits, by a ſlight preparation (preſently to be mentioned) is ſo altered, that its virulency is changed, to uſe his expreſſion, *in deoppilans, diureticum tardarum febrium remedium*; which I the rather take notice of, becauſe I find, upon enquiry purpoſely made of ſome ingenious phyſicians of my acquaintance, that upon trial, they commend this preparation of *Helmont*'s, and confeſs, that by it the aſarum loſeth its emetick, and acquires a diuretical quality.

Helmont. de pharmac: & diſpenſ. modern. num. 46.

Helmont. tract. ſupra allegato, num. 46, 47.

The preparation of aſarum turns it from being emetick to be notably diuretical.

Now that all other animal and vegetable poiſons may be corrected, without loſing their force with their virulency, is the affirmation of *Helmont* concerning *Paracelſus*'s and his *ſal circulatum (majus.)* And as for vegetables, he elſewhere tells us, that the *Lapis cancrorum* reſolved in *formam*, as he ſpeaks, *priſtinæ lactis, habet remedium contra inclementias multorum vegetabilium vi laxante infamium:* 'That 'the *lapis cancrorum* reſolved into the form of 'its firſt milk affords an antidote againſt the 'violence of many vegetables, that are infa'mous for their being over-laxative.' And I remember, that I knew two phyſicians, the one of which affirmed to me, his having ſeen trial made (by the help of a noble menſtruum) of what *Helmont* here teacheth, and found it true; the other, a perſon ſevere, and apt enough to diſſent from *Helmont*, aſſured me, that with the volatile ſalt of tartar, he had ſeen vegetable poiſons, and particularly napellus, ſo corrected by a light digeſtion with it, that it loſt all its poiſonous qualities: for proof of which, he freely offered me, to take himſelf as much of that fatal herb, as would kill three or four men, (but at that time, and in that place, I could not get any of the plant to make the experiment with.) And though I ſhall ſay nothing now concerning *Helmont*'s *ſal circulatum*, yet as to the volatilization of the ſalt of tartar, what I have ſeen ſcarce permits me to doubt, that it is poſſible. And if I could now clearly acquaint you with my reaſons, you would perchance not wonder to find me inclinable to think, that ſome ſuch methods (perhaps a menſtruum) may be found to correct poiſonous ſimples, without rendring them ineffectual. And though it muſt be ſome very powerful corrective, whether ſalt or liquor, that ſhall be able to correct any ſtore of differing poiſons; yet it is not irrational to think, that divers particular concretes may be prepared without any ſuch abſtruſe or general corrective, ſome by one way of handling it, and ſome by another. And in ſuch caſes, ſkill in the natures of particular bodies to be managed, or lucky hits, may ſupply the place of a meliorating diſſolvent; of which *Helmont* affords me a conſiderable inſtance, where he teacheth, in the place lately quoted, that the emetick property of aſarum may be taken away, and the plant turned into a noble diuretick, only by boiling it while in common water. And whereas a wary man would be apt to ſuſpect, that this change is made but by the avolation of ſome ſubtile parts driven away by the heat of the boiling water, I find, that our author affirms, that though it be boiled with the like degree of fire, in wine, inſtead of water, it will not ſo loſe its violence. I have known white hellebore, opium, and ſome other noxious bodies, ſo prepared, as to be given not only harmleſly, but ſucceſsfully in ſuch quantities, as were they not ſkilfully corrected, would make them pernicious. We daily ſee, that the violent emetick and cathartick properties

Helmont. p. 466.

Helmont. de Litoſt. l. 7. c. 32.

Inſtances in ſome of the ſecret menſtruums.

That the proportion of aſarum is only the boiling it in common water.

Helm. in pharmacop & diſpenſ. modern. n. 46, 47.

That the boiling in wine alters not its violence.

That the emetick and cathartick properties of antimony are deſtroyed by calcination with ſalt-petre, and mercury ſublimate be deprived of its corroſiveneſs by bare re-ſublimations with freſh mercury.

ties of antimony, may ſingly, by calcination with ſalt-petre, be deſtroyed. And (which is though a known, yet a notable experiment among chymiſts) mercury ſublimate may be deprived of its deadly corroſiveneſs, and prepared into a medicine inoffenſive even to children, by bare re-ſublimations with freſh mercury. And to give you one inſtance more of what the knowledge of the effects of chymical operations, and of the diſpoſition of a particular body, may enable a man to do, in changeing the pernicious nature of it; I ſhall add, that the violently vomitive flowers of antimony, which our wonted, though ſumptuous and ſpecious cordials are ſo unable to tame, I can ſhew you (which perhaps you will think ſtrange) ſo corrected, without the addition of any thing beſides heat and ſkill, that in a treble doſe, to that wherein they are wont to be furiouſly emetick, we have not found them to work otherwiſe than gently by ſweat. But ſome more particulars applicable to our preſent purpoſe, you will meet with by and by.

A ſtrange correction of the flowers of antimony,

CHAP. IV.

THIRDLY, and now, *Pyrophilus*, that I am ſpeaking of the ſervice, that the naturaliſt may do phyſick, I muſt not pretermit, that he may aſſiſt the phyſician to make his cures leſs chargeable. For though to cure cheaply, be not properly, and in ſtrictneſs, any part of the end of the art of phyſick, which conſiders men's health, and not their purſe; yet it ought in charity, if not alſo in equity, to be the endeavour of the phyſician, eſpecially when he dealeth with patients, that are not rich. For not to ſay any thing of fees of phyſicians, which in ſome places are not very moderate, it is certain, that the bills of apothecaries, eſpecially in chronical diſeaſes, do often prove ſo chargeable, than even when the remedies ſucceed, by that time a poor patient is recovered, he is undone; and pays, for the prolongation of his life, that, which ſhould have been his livelihood. Whence it comes to paſs, that the more neceſſitous ſort of people are ever fain to languiſh unrelieved, for want of being able to purchaſe health at the apothecaries rate; or are deterred from applying themſelves to the phyſician, till their diſeaſes have taken too deep root to be eaſily, if at all, eradicated: and this oftentimes, not more through the fault of the apothecary, than of the doctor, who in his preſcriptions might, for the moſt part, eaſily direct things, that would be much more cheap, without being much leſs efficacious.

That the naturaliſt may aſſiſt the phyſician to make his cures leſs chargeable.

Now there are ſeveral particulars, wherein it may be hoped, that the naturaliſt may aſſiſt the charitable phyſician to leſſen the charge of his patients.

Inconveniences of ſtuffing receipts with a multitude of ingredients.

AND firſt, he may perſuade the phyſician to decline that more frequent than commendable cuſtom, of ſtuffing each *recipe* with a multitude of ingredients. It is not, that I approve the practice of ſome chymiſts, who too freely cenſure the compounding of ſimples; for I know, at ſome times, a complicated diſtemper requires in its remedy more qualities, than are, perhaps, to be met with in any of the known ſimples, that the phyſician hath at command (though one and the ſame ſimple may ſometimes anſwer divers indications; as a plant, that is hot and dry, may ſerve for a diſtemper that is cold and moiſt.) And I know too, that in ſome caſes to that ingredient, that is as it were the baſis of the medicine, other things muſt be added, either to correct its noxious qualities, or to allay its violence, or to ſerve for a vehicle to convey it to the part affected, or to make it eaſier to be taken by the patient, or to preſerve it from corruption, or for ſome ſuch like reaſon. But yet I think phyſicians may well be more ſparing, as to the number of the things preſcribed, than moſt of them uſe to be, both to ſave charges to their patients (upon which account it is, that I here mention it) and for other conſiderations. For the addition of needleſs ingredients adding to the bulk of the medicine, makes it but the more troubleſome to be taken, and the more apt to clog the ſtomach. And oftentimes the efficacy of the more uſeful ingredients, as well as their quantity in each doſe, is much abated, by their being yoked with thoſe, that are leſs appropriated, or leſs operative. Beſides, it ſeems a great impediment to the further diſcovery of the virtues of ſimples, to confound ſo many of them in compoſitions: for, in a mixture of a great number of ingredients, it is ſo hard to know, what is the operation of each, or any of them, that I fear there will ſcarce in a long time be any great progreſs made, in the diſcovery of the virtue of ſimple drugs, till they either be oftener imployed ſingly, or be but few of them imployed in one remedy. And beſides all this, whereas when one of theſe mixtures is adminiſtered, the phyſician expects but ſuch operations as are ſuitable to the quality, which he conceives will be predominant in the whole compound, ſeveral of the ingredients may have particular qualities that he dreams not of, which working upon a body, that the phyſician conſiders as ſubject only to the ſickneſs he endeavours to cure, may therein excite divers latent ſeeds of other diſtempers, and make new and unexpected commotions in the body. On which occaſion I remember, that whereas parſley is a very uſual ingredient of aperitive and diuretick decoctions and apozems, a famous and learned oculiſt tells me, he hath very often obſerved, that when he hath unawares, or for trial-ſake employed parſley, either inwardly, or even outwardly, to thoſe, that were troubled with great diſtempers in their eyes, he found the medicines, wherein that herb was but one ingredient among many, to cauſe either great pain or inflammation in the eyes. In confirmation of which, I ſhall add, that a while after having a ſlight diſtemper in my eyes, I one day found it upon a ſudden ſtrangely increaſed, without being able to imagine, whence theſe new ſymptoms proceeded, till at length, recalling to mind all I had done that day, I remembered, that at dinner I had eaten ſauce, wherein there was a pretty deal of parſley mixt with other things. And whereas in divers of theſe compoſitions

ſome

ſome noxious ingredients are allowed, upon a ſuppoſition, that their ill qualities will be loſt, by their being, as it were, tempered with the reſt; though this may ſometime happen, yet it would be conſidered, that in treacle (eſpecially at one age of it) the opium doth not, conſidering the ſmall proportion of it to the reſt of the ingredients, loſe much, if any of its power, by being mingled with ſixty odd other drugs; which compoſition poſſibly owes much of its virtue to that little opium. And perhaps one reaſon, why thoſe, that accuſtom themſelves to be ever and anon taking phyſick, though they often eſcape dangerous diſeaſes, (by preventing the accumulation of humours, and taking their ſickneſſes at the beginning) are yet almoſt ever troubled with one diſtemper or other, may be, that by the multiplicity of medicines they take into their bodies, divers things are excited to diſorder them, which otherwiſe would have lain quiet. I am not ignorant, that it may be alledged, that in compounded medicines, as treacle and mithridate, how many ſoever the ingredients be, they do ſo clog and temper one another's activity in the compoſition, that there reſults from them all one or more qualities fit for the phyſician's turn, and which is the thing he conſiders and makes uſe of. And I confeſs, that in ſome caſes this allegation doth not want its weight: for I conſider, that a decoction of galls, and a ſolution of copperas, though neither of them a-part be blackiſh, will, upon their mixture, turn to ink; and that when brimſtone, ſalt-petre, and coals, are well mingled together in a due proportion, they make gun-powder, a mixture, that hath qualities much more active than any of the ſever'd ingredients. But I fear, that when a multitude of ſimples are heaped together into one compound medicine, though there may reſult a new craſis, yet it is very hard for the phyſicians to know before-hand what that will be; and it may ſometimes prove rather hurtful than good, or at leaſt by the coalition, the virtues or the chief ingredients may be rather impaired than improved. As we ſee, that crude mercury, crude nitre, and crude ſalt, may be either of them ſafely enough taken into the body in a good quantity; whereas of ſublimate, conſiſting of thoſe three ingredients, a few grains may be rank poiſon. As for thoſe famed compoſitions of mithridate, treacle, and the like, though I cannot well, for the mentioned reaſons, commend the ſkill of thoſe, that firſt deviſed them; and though I think, that when one or two ſimples may anſwer the ſame indications, they may for the ſame reaſons be more ſafely employed; yet I would by no means diſcommend the uſe of thoſe mixtures, becauſe long experience hath manifeſted them to be good medicines in ſeveral caſes. But it is one thing, to employ one of theſe compoſitions, when trial hath evinced it to be a lucky one, and another thing to think it fit to rely on a huddle of ingredients, before any trial hath manifeſted what kind of compound they will conſtitute. And, in a word, though I had not the reſpect I have for *Matthiolus*, and other famous doctors, that deviſed the compoſitions, whereinto ingredients are thrown by ſcores, if not by hundreds, yet however I ſhould not reject an effectual remedy, becauſe I thought, that it proved ſo rather by chance, than any ſkill in the contriver: and I think a wiſe man may uſe a remedy, that ſcarce any but a fool would have deviſed.

ANOTHER thing, upon whoſe account the naturaliſt (whom we here ſuppoſe an expert chymiſt) may aſſiſt a phyſician to leſſen the expenſiveneſs of his preſcriptions, is by ſhewing, that in very many compoſitions, ſeveral of the ingredients, and oftentimes the moſt chargeable, whether they be proper or no for the diſeaſe, are unfit for the way of management preſcribed, and conſequently ought to be left out. I need not tell you, that ſince chymiſtry began to flouriſh amongſt us, very many of the medicines prepared in apothecaries ſhops, and commonly the moſt chargeable, are diſtilled waters, ſpirits, and other liquors: and he, that ſhall ſurvey the books and bills of phyſicians, ſhall find, that (very few perhaps excepted) the moſt uſual preſcription is to take ſuch and ſuch ingredients (for the moſt part numerous enough) and pouring on them either water or wine, if any liquor at all, to diſtil them *in balneo*, rarely in aſhes or ſand. But I confeſs, I have not without wonder, and ſomething of indignation, ſeen in the preſcriptions of phyſicians, otherwiſe eminently learned men, and even in the publick diſpenſatories, I know not how many things ordered to be diſtilled with others *in balneo*, which in that degree of heat will yield either nothing at all, as the fragments of precious ſtones, leaves of gold, prepared pearl, *&c.* or, if they do yield any thing, (for that hath not been yet, that I know of, evinced) do probably yield but a little naufeous phlegm, or at leaſt ſome few looſe parts, far leſs efficacious than thoſe, that require a ſtronger heat to drive them up; ſuch as ſugar, raiſins, and other ſweet fruit, bread, hartſhorn, fleſh prepared by coction, *&c.* which, though wont to be thrown away with the *caput mortuum*, oftentimes there retain their priſtine texture and nature, or at leaſt are almoſt as much more conſiderable, than that which they yielded in diſtillation, as a boiled capon is, than the liquor, that ſticks to the cover of the pot. And though as to ſome of theſe ingredients it may be thought, that they may yield even *in balneo* ſome of their uſeful parts, yet this can, with any probability, be ſuppoſed but of ſome ſuch ingredients. And even as to them it is but ſuppoſed, that they may yield ſomething in ſo mild a heat; and how that ſomething will be qualified, is but preſumed; at leaſt, by the analogy of the experiments vulgarly made, there ſeems ſo ſmall cauſe to expect, that theſe more fixed ingredients will add half ſo much to the virtue of the medicines, as they will to the coſt; eſpecially ſince, though it could be proved, or were probable, that fixed ſubſtances may communicate their virtues to wine or water, yet it would not follow, that thoſe impregnated liquors, diſtilled *in balneo*, will carry thoſe virtues with them over the helm. All which I have more largely proved

in

in another diſcourſe, where I ſhew, both that the nobler parts of many ingredients, wont to be diſtilled *in balneo*, do commonly remain in the *caput mortuum*; and that it is very unſafe to conclude always the virtues of diſtilled liquors from thoſe of the concretes, that afforded them.

BUT there is another way of putting unfit ingredients into medicines, by confounding thoſe in one compoſition, which, though perhaps they might a-part be properly enough imployed, do, when mixed, deſtroy or lock up the virtues of one another; and of this fault even famous chymiſts themſelves are but too often guilty. I know not how many proceſſes I have met with, wherein ſaline ſubſtances, of contrary natures, are preſcribed to be mingled, as if becauſe they were all of them ſaline, they muſt be fit to be aſſociated; whereas it is evident to any man, that conſiders as well as imploys the operations of chymiſtry, that there are ſcarce any bodies in the world, betwixt which there is a greater contrariety, than betwixt acid ſalts; and as well thoſe, that the chymiſts call volatile, as the ſpirits and ſalts of hartſhorn, blood, fleſh, and the like, as thoſe others, which are made of incineration, as ſalt of tartar, and of all burnt vegetables. So that oftentimes it happens, that by an unſkilful mixture two good ingredients are ſpoiled; as when vinegar, juice of lemons, juice of barberries, and the like, are preſcribed to be diſtilled with other ingredients, whereof the ſalt of wormwood or ſome other plant makes one: for then the acid and alcalizate ſalts working upon one another, grow more fixed, and yield *in balneo* but a phlegm; and ſo ſpirit of urine, which is highly volatile, and ſpirit of ſalt, which is alſo a diſtilled liquor, being mingled together, will, by their mutual operation, conſtitute a new thing, which in ſuch a heat as that of a bath, will yield a phlegm, leaving behind the nobler and active parts con-coagulated into a far more fixed ſubſtance, much of the nature of ſal-armoniack. And indeed where ſalts, eſpecially active ones, are made ingredients of mixtures, unleſs they be ſkilfully and judiciouſly compounded, it often happens, that they ſpoil one another, and degenerate into a new thing, if they do not alſo ſpoil the whole compoſition, and of divers uſeful ingredients compoſe one bad medicine.

That acid and alcalizate ſalts being mixed, grow thereby more fixed, and yield in balneo but a phlegm.

The ſame is obſerved of the mixture of the ſpirit of urine (by it ſelf highly volatile) and ſpirit of ſalt.

CHAP. V.

That the naturaliſt diſcovers the miſapplication and uſe of gems, and divers other coſtly ingredients.

ANOTHER way, by which the naturaliſt (ſkilled in chymiſtry) may help to leſſen the chargeableneſs of cures, is by ſhewing, that as to divers coſtly ingredients, wont to be employed in phyſick, there hath not yet been ſufficient proof given of their having any medical virtues at all, or that at leaſt as they are wont to be exhibited, either crude, or but ſlightly prepared in juleps, electuaries, *&c.* there is not any ſufficient evidence to perſuade us, that their efficacy is as much greater than that of many cheap ingredients, as their price is. I am not altogether of their mind, that abſolutely reject the internal uſe of leaf-gold, rubies, ſaphires, emeralds, and other gems, as things, that are unconquerable by the heat of the ſtomach: for as there are rich patients, that may, without much inconvenience, go to the price of the deareſt medicines; ſo I think the ſtomach acts not on medicines barely upon the account of its heat, but is endowed with a ſubtile diſſolvent (whence ſoever it hath it) by which it may perform divers things, not to be done by ſo languid a heat. And I have, with liquors of differing ſorts, eaſily drawn from vegetable ſubſtances, and perhaps unrectified, ſometimes diſſolved, and ſometimes drawn tinctures from gems, and that in the cold. But though for theſe and other conſiderations, I do not yet acquieſce in their reaſons, that laugh at the adminiſtration of crude gems, *&c.* as ridiculous; yet neither am I altogether of their adverſaries mind. For though I deny not the glaſs of antimony, which looketh like a kind of gem or ruby, will eaſily enough impart to liquors an emetick quality; yet I know too, there is great odds betwixt rubies and other gems (which will endure violent fires, and remain undiſſolved in divers ſtrongly corroſive liquors) and the glaſs of antimony, which is a body ſo far leſs compact and fixed, that ſpirit of vinegar it ſelf will work upon it, and a ſtrong fire will, in no long time, diſſipate it into ſmoke. But that, which I chiefly conſider on this occaſion, is, that it is one thing to make it *probable*, that it is *poſſible*, gold, rubies, ſapphires, *&c.* may be wrought upon by a human ſtomach; and another thing to ſhew both, that they *are wont* to be ſo, and that they *are* actually endowed with thoſe particular and ſpecifick virtues, that are aſcribed to them: nay, and (over and above) that theſe virtues are ſuch and ſo eminent, that they conſiderably ſurpaſs thoſe of cheaper ſimples. And I think, that in preſcriptions made for the poorer ſort of patients, a phyſician may well ſubſtitute cheaper ingredients in the place of theſe precious ones, whoſe virtues are not half ſo unqueſtionable as their dearneſs.

A difference betwixt the fixedneſs of a gem, and of glaſs of antimony.

WHAT ſtrange excellency there may be in the *aurum potabile*, made by a true *adeptus*, or by a poſſeſſor of the liquor alkaheſt, I ſhall not now diſpute, not knowing what powerful and radical diſſolvents, the profound ſkill of ſuch men (if any ſuch there be) may furniſh them with, to open the body of gold. But as for the attempts and practices of the generality of chymical phyſicians to make gold potable, beſides that their attempts to make their ſolutions volatile ſucceed ſo ſeldom, that even learned phyſicians, and chymiſts have pronounced the thing it ſelf unfeaſible; I confeſs, I ſhould much doubt, whether ſuch a potable gold would have the prodigious virtues its encomiaſts aſcribe to it, and expect from it. For I find not, that thoſe I have yet met with, deliver theſe ſtrange things, upon particular experiments duly made, but partly upon the authority of chymical books, many of which were never written by thoſe, whoſe names they bear. And others, I fear, commend *aurum potabile*, prepared after another-guiſe manner, than that we are now ſpeaking of, partly upon a preſumption, that if it be made volatile,

Concerning aurum potabile.

it must be strangely unlocked, and exalted to a mere spiritual nature; and partly upon rational conjectures (as they think them) drawn from the nobleness and preciousness of gold. But for my part, though I have long since bethought my self of a way, whereby I can, in a short time, and a moderate fire, make my menstruum bring over crude gold, in quantity sufficient to make the liquor look, at the first or second distillation, of a high golden colour; yet finding, that I could, by an easy art, quickly recover out of this volatile liquor, a corporal and malleable gold, I dare not brag, that my tincture (as an alchymist would call it) must needs do strange feats, because there is so noble a metal brought over in it. And if this or other preparations of *aurum potabile* prove good medicines, it would be farther inquired, whether the virtues may not in great part be rather attributed to the menstruum, than the gold, (that requiring a very subtile liquor to volatilize it) or to the association of the corpuscles of the gold, with the saline particles of the menstruum, into a new concrete, differing enough from gold, though never so well opened. And as for the nobleness and preciousness of this metal, that depends upon the estimation of men; whence in *America* the Indians, that abound with it, had not such a great value for it. And in divers countries, at this day, it is postponed to iron, or to copper, and hath rather a political (if I may so speak) than a natural virtue. Nor will it follow, that because it is the fixedest and preciousest of metals, that therefore it must be an admirable medicine: for we see, that diamonds, though they be the hardest of bodies, and very fixed ones, and in much greater esteem, *cæteris paribus*, than gold, are yet so far from being accounted highly medicinal, that they are commonly (though perhaps not so deservedly) reckoned among poisons. But I see I have digressed; that, which I chiefly aimed at, being to inculcate, that whether gold and gems, and the like precious ingredients, may be good medicines or no, it were a good work to substitute cheap ones for the poorer sort of patients; and that physicians are much to blame, who prize simples, as drugsters do, according as they are brought from remote countries, and are hard to come by; and cannot imagine, that what doth not cost much money in the shops, can do much good in the body; as if God had made provision only for the rich, or those people, that have commerce with *China* or the *Indies*: whereas indeed it may oftentimes happen, that what the chymists call their *caput mortuum*, and perhaps throw away as an useless *terra damnata*, may have as great virtues, as those nobler parts, as they call them, which they have extracted from it; and a despised simple, nay even an excrement or an insect, may in some cases prove nobler remedies, than those, that men call and think very noble bodies, not to say, than I know not how many extracts and quintessences.

Examples of great medicines drawn from unpromising bodies.

Of the efficacy of unpromising medicines.

I SHALL not trouble you with many instances to prove this doctrine, having more fully discoursed of it, in one part of another treatise. But yet some instances, I suppose, you will here expect, and therefore I shall present you with a few of those, that at present come into my mind.

WHEN the distillation of aqua fortis is finished, the *caput mortuum*, as deserving that name, is wont, by common distillers, to be thrown away; and I have seen whole heaps of it thrown by, as useless, by those, that make aqua fortis in quantity to sell it. And yet this despised substance doth, in common water it self, yield a salt, which being only depurated by frequent solutions and filtrations, is that famous *Panacæa duplicata*, or *arcanum duplicatum*, which that great virtuoso and knowing chymist, the Duke of *Holstein*, whose name it also beareth, thought worth purchasing at the rate of five hundred dollars, and of which the prince's experienced physician thus writes to the industrious *Schroder*: *Mille experimentis salis hujus efficaciam aula nostra comprobavit in melancholicis affectibus, febribus quibuscunque continuis & intermittentibus, calculo, scorbuto, &c. Quin & somnum conciliâsse præsertim in melancholicis non semel notavimus. Dosis à scrup. 1. ad scrup. 2. Libras aliquot quotannis absumimus:* 'Our 'court hath tried the efficacy of this salt in a 'thousand experiments in the diseases of me'lancholy, in all fevers, continuous and in'termittent, in the stone, scurvy, &c. Nay 'more, we have observed more than once, that 'it hath procured sleep, especially in persons 'melancholy. The dose is from one to two 'scruples; we use divers pounds of it in a 'year.' And another very skilful physician, that frequented that excellent prince's court, confirmed to me the same medicine's diuretick and deoppilative virtue. (But upon my own experience I can say little of it, having casually lost a great quantity I caused to be prepared to make trial with, before I had opportunity to imploy it.)

The Duke of Holstein's Panacæa duplicata is made of the vulgarly despised caput mortuum of aqua fortis.

Schroder. pharmacop. l. 3. c. 23.

BUT whereas in the *caput mortuum* of aqua fortis there remains pretty store of easily soluble salt, in the *caput mortuum* of vitriol, when not only all the oil is forced away by the fire, but all the fixed salt is exactly separated by water, there seems to remain nothing but a worthless *terra damnata*. And yet it is of this, that, as I shall teach you ere long, I make those colcothatine flowers, which are possibly a nobler medicine than either the oil, the spirit, or the salt of vitriol.

Flores Colcothatini are made of the caput mortuum of vitriol.

As for the bezoar-stone, which is so often prescribed by physicians, and so dearly paid for by patients, the experienced *Bontius*, a very competent witness in this case, (and whose account of the manner of its generation agrees the best, of any I have seen, with that I received from an intelligent person, that was imployed into *Persia* by the late king) hath in one place a passage concerning it; and elsewhere writes such things of the stone cut out of a man's bladder (though that, whilst crude, be despised as a thing vile and useless in physick) as may be justly applicable to our present purpose: *Cæterum* (saith he, speaking of the *Bezoar-stone*) *quantum ad hyperbolicas hujus lapidis virtutes & facultates portentosas non tantas in eo mille experientiis*

Bontius in c. 45. Garcia ab Orta. A comparison between the bezoar-stone and the stone cut out of man's bladder.

rientiis edoctus inveni: 'But for the exceeding 'and portentous virtues of the bezoar-ſtone I 'have found by a thouſand trials, that they 'are not ſo very great.' And elſewhere ſpeaking of thoſe contemptible and excrementitious ſtones, that are found in human bladders, *Nil porro* (ſaith he) *de his lapidibus addo, ne videar eos elevare, & lithotomos monere, ut vel cum periculo plures mortales ſecent. Hoc certè compertum habeo, lapidem in veſica hominis repertum, urinam & ſudores probè ciere, quod tempore ingentis illius peſtis, quæ anno* 1624 *&* 1625, *Leydam patriam meam, & reliquas Hollandiæ civitates miſerandum in modum vaſtabat, in penuria lapidis bezoartici nos exhibuiſſe memini, & ſudorificum (auſim dicere) melius & excellentius inveniſſe*, &c. 'I ſpeak no more of theſe ſtones, leſt 'I ſhould ſeem by my commendation of their 'virtues to provoke lithotomiſts to make diſ-'ſections at any rate. This I have moſt cer-'tainly experienced, that the ſtone found in 'man's bladder doth well provoke urine and 'ſweat. And particularly in the time of that 'plague, which in the years 1624 and 1625 'miſerably vexed ours, and all other the cities 'of *Holland*, for want of the bezoar-ſtone, I re-'member, I preſcribed this, and found it (let 'me tell you) a more great and excellent 'ſudorifick.'

Idem, c. 46. *Garcia ab Orta.*

Medicines out of ſoot.

SOOT is generally looked upon as ſo vile a thing, that we are fain to hire men to carry it away; and yet, as I elſewhere ſhew, that it is a body of no ignoble nature, ſo I muſt here tell you, that it is no unuſeful one in phyſick. And not to mention, that *Riverius* commends it crude to the quantity of a drachm in pleuriſies; I have tried, with the ſpirit of it well drawn, ſome things, that make me look upon it as a conſiderable liquor. And I know by their own confeſſions, that ſome medicines, even of eminent phyſicians, that paſs under other names, have the ſpirit of ſoot for their principal ingredient. I knew a not unlearned empirick, who was exceedingly cried up for the cures he did, eſpecially in difficult diſtempers of the brain, by a certain remedy, which he called ſometimes his *Aurum potabile* and ſometimes his *Panacæa*; and having obtained from this man, in exchange of a chymical ſecret of mine he was greedy of, the way of making this ſo celebrated medicine, I found, that the main thing in it was the ſpirit of ſoot, drawn after a ſomewhat unuſual, but not excellent manner; in which ſpirit, flowers of ſulphur were, by a certain way, brought to be diſſolved, and ſwim in little drops, that looked of a golden colour.

YOU will eaſily grant, *Pyrophilus*, that there are not any medicines to be taken into the body more cheap and contemptible, than the excrements of men and horſes, and than inſects; and yet that even theſe want not conſiderable medical virtues, we elſewhere ſhew. And (not to meddle with ſuch naſty things, as the groſſer ſort of human excrements, though they, outwardly applied either in powder or otherwiſe, do ſometimes perform ſtrange things,) the juice of horſe-dung, eſpecially of ſtone-horſes, being ſtrongly expreſſed (after the dung hath been a while ſteeped in ale, or ſome other convenient liquor, to facilitate the obtaining the juice, and to afford it a vehicle) doth oftentimes ſo powerfully relieve thoſe, that are troubled with the ſtoppage of urine, with wind, ſtitches, and even with obſtructions of the ſpleen and liver, that you, *Pyrophilus*, and I, know a great lady, who, though very neat, and very curious of her health, and wont to have the attendance of the ſkilfulleſt phyſicians, ſcruples not, upon occaſion, to uſe, as I have known her do, in ſilver veſſels, this homely remedy, and prefer it to divers rich cordials, and even to what ſome chymiſts are pleaſed to call *Eſſences* or *Elixirs*. And with the ſame remedy very many poor people were cured of the plague it ſelf, when it lately ſwept away ſo many thouſands in *Ireland* (and the doctors with the patients, as I was aſſured by a perſon who cured ſo many) as to invite men to ſecure themſelves that aſſiſtance, by refuſing the party the liberty to leave the town. But (to add that upon the by) this perſon, in exchange of a ſecret of mine, confeſſed to me, that the *arcanum*, which had cured ſuch numbers, and to which the juice of horſe-dung was a *ſuccedaneum*, was only a good doſe of the powder of fully ripe ivy-berries, which did uſually, as alſo the horſe-dung, work plentifully by ſweat, and which I preſently remembred to be one of thoſe few things, that *Helmont* commends againſt the plague.

The uſe of horſe-dung.

An arcanum of ivy-berries.

THE medical virtues of man's urine, both inwardly given, and outwardly applied, would require rather a whole book, than a part of an eſſay, to enumerate and inſiſt on: but referring you to what an induſtrious chymiſt hath already collected touching that ſubject, I ſhall now only add, that I knew an ancient gentlewoman, who being almoſt hopeleſs to recover of divers chronical diſtempers (and ſome too of theſe abſtruſe enough) was at length adviſed, inſtead of more coſtly phyſick, to make her morning-draughts of her own water; by the uſe of which ſhe ſtrangely recovered, and is, for aught I know, ſtill well. And the ſame remedy is not diſdained by a perſon of great quality and beauty, that you know; and that too after ſhe had travelled as far as the *Spaw* for her health's ſake. And I remember on this occaſion, that paſſing once through one of the remoter parts of *England*, I was viſited by an empirick, a well-wiſher to chymiſtry, but a novice in it, who preſſing me to communicate to him ſome eaſy and cheap preparation, that he might make uſe of among the country-people; I directed him to diſtil with a gentle heat a ſpirit out of urine, putrified for ſix or ſeven weeks on a dung-hill, or ſome analogous heat, but in well-cloſed glaſſes, or other glazed veſſels; and having rectified this ſpirit once or twice, that it might be rich in volatile ſalt, to give ten, twenty, or thirty drops of it in a convenient liquor for the pleuriſy, for moſt kind of coughs, and divers other diſtempers, as a *ſuccedaneum* to the eſſence of harts-horn. And a while after, this empirick returned me great thanks for what I had taught him: and I found by him and others, that he had cured ſo many with it, eſpecially of pleuriſies (a diſeaſe

Medicines out of man's body.

frequent

frequent and dangerous enough in that country) that this ſlight and ſeemingly deſpicable remedy had already made him be cried up for a doctor, and was like to help him to a comfortable ſubſiſtence.

Medicines out of blood.

GREAT ſtore of healthy men's blood is wont to be thrown away, as altogether uſeleſs, by chirurgeons and barbers, that let men blood (as is uſual in the ſpring and fall) for prevention of diſeaſes; and yet from a man's blood ſkilfully prepared, though without addition of any thing, ſave ſpirit of wine to keep it at firſt from putrifying, may be eaſily obtained a ſpirit and volatile ſalt, that have much the ſame virtues with thoſe of the newly mentioned ſpirit of urine, but more noble (as far as I can gueſs) than either that, or even ſpirit of harts-horn; as having performed in conſumptions, aſthma's, and other obſtinate caſes, ſuch things, as I, as well as others, could not but admire. But in this place, mentioning human blood only *in tranſitu*, I ſhall pretermit what I have obſerved about the preparation of it; yet leaving you a liberty to call for my obſervations upon a medicine, which perhaps is nobler, than the moſt coſtly and elaborate chymical remedies, that are wont to be ſold in ſhops, and which hath been almoſt alone excepted out of the cenſure made by a learned modern writer, of the medicines found out by chymiſtry:

The great effects of millepedes in the ſtone.

I SHALL add but one inſtance more, of the efficacy, that may be found in the moſt obvious and abject creatrues; and this inſtance is afforded me by thoſe vile inſects, commonly called in Engliſh, wood-lice, or ſows, and in Latin *millepedes*; which I have often both recommended to others, and taken my ſelf. What their virtue is againſt the ſtone, the world hath been informed by *Laurembergius*, who hath publiſhed a narrative, how by the uſe of them he was cured, even of the ſtone in the bladder; and he was invited to uſe them by credible information, that others had been cured of that diſeaſe, by the ſame remedy. And of late years in *England*, an empirick being much reſorted to, for the relief he gave in that tormenting ſickneſs, a phyſician, famous for his learned writings, wondring at what was done, was very curious (as himſelf afterwards told me) to find out the empirick's ſecret, and at length was ſo induſtrious as to diſcover, that it was a ſlight preparation of *millepedes*. But my having found them in my ſelf very diuretical and aperitive is not that, which chiefly recommends them to me; for I knew, and lived in the ſame houſe with a pious gentlewoman, much better ſkilled in phyſick, than her ſex promiſed, who having loſt the uſe of one eye by a cataract, and being threatned by the oculiſts with the ſpeedy loſs of the other, eſpecially in regard of her being very aged and corpulent, ſhe nevertheleſs did, for ſome years, to my wonder, imploy her eye to read and work with, without finding, as ſhe told me, any decay in it, or any increaſing danger of a ſuffuſion: and ſhe aſſured me, that her medicine was to bruiſe firſt five millepedes, then ten, then fifteen, then twenty, &c. (daily increaſing the number by five, till it had reached, if I miſtake not, fifty or ſixty) in white-wine (or ſmall-ale) and to drink upon an empty ſtomach the ſtrongly expreſſed liquor; and when I deſired to know, how ſhe came by this ſpecifick, ſhe anſwered me, that having made inquiries among all thoſe, both oculiſts and others, that ſhe thought might aſſiſt her againſt ſo ſad a diſtemper, ſhe was adviſed to the uſe of millepedes, by a woman, that not only much magnified their virtue in ſuch caſes as hers, but aſſured her (if I much miſ-remember not) that ſhe her ſelf had been cured by them, of no leſs than an incipient ſuffuſion in one or both of her eyes.

In ſuffuſions of the eyes.

[SINCE the writing of the former part of this page, relating what I newly told you to a very ingenious phyſician, he aſſures me, that being ſome years ſince in *Holland*, he there met with a woman, who was cured, as her ſelf confeſſed to him, of a real cataract, by the juice of millepedes, beginning with that of three at a time, and ſo increaſing to nine at once, and then gradually leſſening the doſe by one inſect each day, till ſhe were come back to three at a time; after which, ſhe gradually increaſed the doſe as before. And he adds, that this woman was adviſed to this medicine by an empirick, that was ſaid to have performed divers cures with the ſame medicine.]

And real cataracts.

[WHAT ſtrange things theſe ſame millepedes have done in the ſore, and even exulcerated, breaſts of women (provided they be not cancrous) though they be given without preparation only to the number of three at firſt, and ſo on to nine at once (which number may perhaps be uſefully increaſed) ſtamped with a little white-wine or beer, that the liquor ſtrained out may be drank in a draught of beer, morning and evening; during which time, linnen cloaths dipped in white-wine, and applied warm, are to be kept upon the breaſt; I may elſewhere have a fitter opportunity to relate. I ſhall now only ſubjoin, as a further proof of the great virtue, that may be even in vile and coſtleſs inſects, and that without any elaborate or chymical preparation, this memorable ſtory; that after all the trials I had made about theſe millepedes, I met with a young lady, who by divers ſtrangely winding and obſtinate fiſtulas, that had made themſelves orifices in many places of her body, was not only lamed, but ſo conſumed and weakned, that ſhe was ſcarce able to turn her ſelf in her bed; and this, notwithſtanding the utmoſt endeavours of the eminenteſt chirurgeons, both Engliſh and foreigners, that could be procured: but when both the hopes of her friends, and thoſe, that endeavoured to cure her, were loſt, ſhe was in a ſhort time not only freed from her fiſtulas, but recovered to a thriving condition of body, by the frequent uſe of an internal medicine, which, as both her parents, and the perſon, that taught it them, informed me, was only a drink (to be taken twice or thrice a day) made of a ſmall proportion of a couple of herbs, (very common, and not much more likely to do wonders in this caſe, than wormwood and mint;) and of three hundred of theſe millepedes well beaten (when their heads are pulled off) in a mortar,

In ſore breaſts and fiſtulas.

and

and tunned up with the herbs, and ſuſpended in four gallons of ſmall ale, during its fermentation. The wonderful efficacy of this medicine in this and many other caſes, which by occaſion of this cure were related to me, being almoſt wholly aſcribed to the millepedes, by the illuſtrious imparter of it, whoſe leave I have not yet, by naming him, to diſcloſe, that this is the ſecret he makes uſe of.

CHAP. VI.

That the naturaliſt diſcovers how much of the coſt and labour in making many chymical remedies may be ſpared.

ANOTHER way there is, whereby the naturaliſt may aſſiſt the phyſician to make the therapeutical part of phyſick leſs chargeable; and that is by ſhewing thoſe, that are wont to employ moſt chymical remedies, that much of the coſt and labour in many caſes might be ſpared. I am not altogether of their mind, that indiſcriminately cry down chymical preparations as exceſſively dear: for of many of thoſe that ſeem very dear, when bought by the pound or the ounce, a doſe may be cheap enough. As if, for inſtance, an ounce of precipitate of gold, and mercury, coſt ten times its weight of ſilver, under which rate I have bought it of honeſt men, that make it themſelves, yet that ounce containing 480 grains, (of which three or four may be a doſe) a taking of this dear powder may coſt far leſs than a doſe of many Galenical medicines, where the quantity, that is taken at once, makes up what is wanting in the coſtlineſs of the ingredients. But though this be the caſe of ſome chymical remedies, yet we muſt not deny, that many others are chargeable; and though perhaps not more ſo than many Galenical ones employed for the ſame purpoſes, yet if thoſe be dearer than they need be, that grievance ought to be redreſſed in chymical medicines, how juſtly ſoever the ſame thing may be imputed to Galenical ones.

A compariſon of chymical remedies with Galenical ones in point of cheapneſs.

Now there are two particulars, wherein the chymiſts, and thoſe phyſicians, that imitate them, are wont to be blameable in reference to this matter; the one their employing chymical preparations on all occaſions, even where ſimples or ſlight compoſitions might ſerve the turn; and the other is, their making many of their preparations more laborious, and conſequently more chargeable than needs.

Of the uſe and commendation of ſimples, even by the moſt able chymiſts.

As for the firſt of theſe: it is known there are divers chymiſts, and others, that practice phyſick, who ſo doat upon the productions of their furnaces, that they will ſcarce go about to cure a cut finger, with leſs than ſome ſpagyrical oil of balſam; and in ſlight diſtempers have recourſe to chymical, and perhaps to mineral remedies, which being, for the moſt part, ſuch as vehemently alter the body, eſpecially by heating and drying it, they do often more harm than good, when employed in caſes, that need not ſuch active medicines. And methinks thoſe, that practiſe, as if nature preſented us nothing worth the accepting, unleſs it be cooked and perfected by *Vulcan*, might conſider, that *Paracelſus* himſelf oftentimes employeth ſimples for the cure even of formidable diſeaſes. And though for particular reaſons I be inclinable enough to think, that ſuch ſearching and commanding remedies, as may be ſo much of kin to the univerſal medicine, as to cure great numbers of differing diſeaſes, will be hardly obtained without the help of chymical preparations, and thoſe perhaps of minerals: yet as to moſt particular diſeaſes, eſpecially when not yet arrived to a deplorable height, I am apt to think, that either ſimples, or cheap or unelaborate Galenical mixtures, may furniſh us with ſpecificks, that may perform much more than chymiſts are wont to think, and poſſibly be preferable to many of their coſtly magiſteries, quinteſſences, and elixirs. *Helmont* himſelf, a perſon more knowing and experienced in his art, than almoſt any of the chymiſts, ſcruples not to make this ingenious confeſſion: *Credo* (ſaith he) *ſimplicia in ſua ſimplicitate eſſe ſufficientia pro ſanatione omnium morborum:* 'I believe 'ſimples in their own ſimplicity are ſufficient 'for the curing of all diſeaſes.' And elſewhere he truly affirms, that there may be ſometimes greater virtue in a ſimple, ſuch as nature affords it us, than in any thing, that the fire can ſeparate from it. And certainly the ſpecifick properties of divers, if not moſt ſimples, are confounded and loſt by thoſe preparations, wherein that texture, which is the foundation of thoſe properties, is either deſtroyed by the fire, or changed by the taking away of ſome of the parts; or the adding of ſome other ſubſtance to it, with which compounded, it may conſtitute a new thing. The more judicious of the chymiſts themſelves do ſeveral of them now acknowledge, that the bare reducing of pearls to fine powder, affords a medicine much richer in the virtues of the pearls, than the magiſtery, prepared by diſſolving them in acid ſpirits, and precipitating them with oil of tartar, and afterwards ſcrupulouſly edulcorating them. And one may eaſily obſerve, that by making the magiſtery of harts-horn the ſame way, the virtues ſeem to be more locked up than they were in the crude horn; which may eaſily enough impart its virtue in the body, ſince fair water will reduce a good part of it into a jelly; whereas the magiſtery remains a fixed powder not eaſily diſſoluble, even in acid menſtruums; and, which thrown upon hot iron, will ſcarce ſend forth that ſtinking ſmoke, which argues the avolation of the ſaline and ſulphureous parts. I never knew any of the vulgar chymiſts eſſences or elixirs half ſo powerful a remedy to ſtanch blood, as a ſlight mixture of two drachms of hyoſcyamum, or henbane ſeed, and the like weight of white poppy-ſeeds, beaten up with an ounce of conſerve of red-roſes, into a ſtiff electuary; with which, given in the quantity of a nutmeg, or wall-nut, I have ſnatched ſome, as it were, out of the jaws of death; and with which an eminent phyſician, now dead, affirmed, that he, and the inventor of the remedy, had very frequently cured profuſe bleedings at the noſe; and in women, at other parts beſides. Nor did I ever ſee, to give an inſtance in a reſembling diſeaſe, ſuch wonderful effects againſt ſpitting and vomiting of blood, of the moſt elaborate chymi-

Helmont. Pharma. & Diſpenſat. Nov. p. 458.

Powder of pearl more operative than magiſtery.

So crude hartſhorn, than magiſtery.

An excellent ſimple medicine to ſtanch blood.

Another like medicine for ſpitting and vomiting of blood.

cal preparations, as I have of a ſlight ſyrup, made only of a convenient quantity of fine ſugar, and the ſtrongly expreſſed juice of twelve handfuls of plantane leaves, and ſix ounces of freſh comfrey-roots well beaten together; with which ſyrup, beſides what I have tried myſelf, two eminent phyſicians performed in that diſeaſe unuſual cures, though (for reaſons elſewhere mentioned) I forbear to name them, otherwiſe than by telling you, that one of them is that ingenious and friendly Dr. *T. C.* to whoſe ſkill both you and I owe ſo much.

BUT I conſider farther, that as oftentimes thoſe I am reaſoning with, make uſe of chymical remedies, when much more eaſily parable ones may ſuffice; ſo in divers caſes, where ſpagyrical medicines are proper enough, their preparations of them are more tedious and expenſive than is neceſſary. There are more than a few, who ſeldom preſcribe, and ſeldomer eſteem a chymical proceſs, that is to be perfected in leſs than many weeks; as if a chymical medicine, like an embryo, muſt needs be an abortive, if it be produced in leſs than ſo many months. And as if in preparations the virtue depended leſs on the ſkilfulneſs, than the elaborateneſs, they ſeem to eſtimate the efficacy of remedies by the time and pains requiſite to prepare them, and dare not think, that a medicine can quickly cure, that was not long a making; as indeed theirs (eſpecially where cohobations and digeſtions, till they have ſuch and ſuch effects upon the matter to be wrought on by them, are preſcribed) are many of them far more toilſome and tedious than thoſe, that have but read ſuch proceſſes, without working them, are apt to ſuſpect. And this is the humour of divers, not only as to thoſe ſtable medicines, that ought always to be found ready in apothecaries ſhops, but even as to thoſe, that are deſigned for particular caſes, and perhaps acute diſeaſes; in which emergencies, if a phyſician had no other remedies than thoſe he muſt make according to ſuch proceſſes, it would, I fear, too often happen, that before the medicine could be ready, the patient would either be paſt the need of it, or paſt the help of it. And that, which oftentimes increaſeth the tediouſneſs of chymical proceſſes, is the unſkilful preſcriptions of thoſe, that deviſe them. It is not unuſual in chymiſts writings to meet with proceſſes, wherein the matter to be prepared, is expoſed to I know not how many ſeveral ſucceſſive operations: but if you ſhould aſk, why ſuch a thing ſhould be, for inſtance, rather precipitated, than exhaled *ad ſiccitatem*; or why ſuch or ſuch an operation is to be uſed after ſuch another, rather than before it; nay, perhaps, if one ſhould demand, why ſome of thoſe operations ſhould be uſed at all, the deviſers of thoſe unſkilful proceſſes would poſſibly as ſoon be able to finiſh their operations, as to give a ſatisfactory anſwer. Nay, ſometimes they lengthen their proceſſes by operations, ſo injudiciouſly preſcribed, that they croſs one another; and the chymiſt vexeth himſelf, and the matter he works upon, to leave it at laſt no better, if not a worſe, medicine than he found it; of this we have already given an inſtance in the common magiſteries.

That many times chymiſts, by their tedious and injudicious preparations, alter the medicine, and make it worſe.

BUT I lately met with another example of it, in the writings of a famous, modern chymiſt; where, to purify the fixed ſalt of vegetables to the height, after I know not how many ſolutions, filtrations and coagulations (which alone would abundantly ſerve the turn) he preſcribes the diſſolving them in aqua fortis; after which, he ſaith, they will become very pure and cryſtalline, and not ſo eaſily reſoluble in the air: of which I make no doubt; for divers years before I met with his proceſs, I have, with the fixed ſalts of more than one kind of vegetable, by joining them with aqua fortis, and after a while exhaling the ſuperfluous moiſture, made good inflammable ſalt-petre; by which you may eaſily gueſs, how judiciouſly the ſolution in aqua fortis is preſcribed only as a farther depuration, and how fit ſuch authors are to be credited, when they aſcribe to theſe cryſtalline ſalts the ſeveral virtues (and thoſe improved too) of the reſpective vegetables, from which the alkalies were obtained. And indeed, as to thoſe exact depurations, which ſome chymiſts ſo ſtrictly require in all their preparations, though their proceſſes be oftentimes hereby made incredibly tedious, I will willingly allow, nay aſſert, that in ſome caſes, and eſpecially in the making of powerful menſtruums, which by their activeneſs and penetrancy are to unlock other bodies, chymiſts do rather err in making their depurations leſs exquiſite than they ſhould, than on the other hand. Yet in many other caſes, ſuch exact refining and ſubtiliation of a remedy is not ſo neceſſary as they imagine; and ſometimes too may do more harm than good, by ſequeſtering thoſe parts of a ſimple, as *fæces*, which concurred with the finer parts to that determinate texture, whereon the ſpecifick virtues of it did principally depend: but of this, more elſewhere. And therefore I ſhall here preſent you with two or three inſtances, to ſhew you, that remedies, at leaſt as noble, as ſuch vulgar chymical ones, as are moſt tedious and coſtly, may be prepared in a ſhorter time, and cheap enough to be fit for the uſe of the poor.

So the diſſolving the ſalts of vegetables in aqua fortis, to make them pure and cryſtalline, alters their virtues, and makes them inflammable as ſalt-petre.

AND to comply, *Pyrophilus*, with your curioſity to know the preparations of thoſe chymical medicines, that I do the moſt familiarly imploy, the three following inſtances ſhall be of ſuch, namely, the *flores colchotharis*, the *balſamum ſulphuris craſſum*, and the *eſſentia cornu cervini*, that you may ſee what ſlight and eaſy preparations afford the remedies, whoſe effects you have ſo often heard of, if not alſo ſeen.

THE firſt of theſe is the ſame powder, which paſſeth under the name of *ens Veneris*; which appellation we gave it, not out of a belief, that it equals the virtues aſcribed by *Helmont*, to what he calls the true *ignis Veneris*, but partly to diſguiſe it a little, and partly upon the account of the occaſion, whereon it was firſt found out; which was, that an induſtrious chymiſt (whom you know) and I, chancing to look together upon that tract of *Helmont's*

Helmont's which he calls *Butler*, and to compare it ſomewhat attentively with other paſſages of the ſame author, we both reſolved to try, whether a medicine, ſomewhat approaching to that he made in imitation of *Butler*'s ſtone, might not be eaſily made out of calcined vitriol: and though upon trials we found this medicine far ſhort of what *Helmont* aſcribes to his, yet finding it no ordinary one, we did, for the mineral's ſake it is made of, call it *ens primum Veneris*.

The preparation and virtues of ens Veneris.

THE preparation, in ſhort, is this: Take good *Dantzick* vitriol (if you cannot get Hungarian or Goſlarian) and calcine it till the calx have attained a dark-red, or purpliſh-colour; then, by the frequent affuſion of boiling, or at leaſt warm water, dulcify it exactly: and having freed it as well as you can, from the ſaline parts, dry it thoroughly, and after mix it exquiſitely, by grinding, or otherwiſe, with an equal weight of pure ſal armoniack, very finely powdered. Put this mixture into a glaſs retort, that may be but a third part filled with it, and ſubliming it in a ſand-furnace, by degrees of fire, for ten or twelve hours, towards the latter end increaſing the fire, till the bottom of the retort (if you can) be brought to be red-hot. That which is ſublimed muſt be taken out, and if it be not of a good yellow, but pale, (which uſually happens for want of an exact commiſtion of the ingredients) it may be returned to the reſidue, mingled better with it again, and ſublimed once more. The yellow or reddiſh ſublimate may be ſublimed a ſecond time, not from the *caput mortuum*, but by it ſelf; but if you re-ſublime it oftener, you may, though you will think that ſtrange, impair the colour and the ſublimate, inſtead of improving them. The doſe is from two or three grains to ten or twelve (in ſome bodies it may be increaſed to twenty or thirty, without danger) in diſtilled water, or ſmall-beer, or other convenient vehicles: it may be given at any time upon an empty ſtomach, but I moſt commonly give it at bed-time. It works, when it works ſenſibly, by ſweat, and ſomewhat by urine. That it is a potent ſpecifick for the rickets, I think I ſcarce need tell you, *Pyrophilus*, whoſe excellent mother and aunt, together with ſome phyſicians, to whom I alſo gave it ready prepared, have cured perhaps a hundred, or more, children, of that diſeaſe, divers of whom were looked upon, as in a deſperate condition. I give it alſo in fevers, and other diſtempers, to procure ſleep, which it uſually doth, where it is wanting. In the head-ach likewiſe, in which, if the diſeaſe be inveterate, the remedy muſt be long continued; with the like admonition it hath done wonders *in ſuppreſſione menſium obſtinata*. In the worms it hath ſometimes done ſtrange things; and for provoking of appetite, I remember not, that I have either taken or given it without ſucceſs. And though I ſeldom take (for I often give more) above two or three grains of it at a time, yet in that ſmall doſe it uſually proves diaphoretical to me the next morning.

BUT the experiments we have had of the ſeveral virtues and efficacy of this medicine, would be here too tedious to recite, and therefore I ſhall now paſs them by; though, if you require it, I ſhall not be backward to ſet you down, by way of obſervations, moſt of the caſes wherein I or my friends have given it, and of the principal cures that have been performed by it. In the mean time, becauſe this exalted colcothar, being given in ſo ſmall a doſe, may prove, if it be rightly and dexterouſly prepared, what *Helmont* ſaith of his imitation of *Butler*'s drif, *a medicine for the poor*, and yet requires more care, not to ſay ſkill, to prepare it well, than by the bare reading of the proceſs you will imagine; I ſhall, to gratify your charity, annex to the end of this eſſay (for to inſert them here would make too prolix a digreſſion) as many of the particulars relating to the preparation of it, as I can readily meet with among my looſe notes. And leſt you ſhould think me a mountebank for want of knowing in what ſenſe it is, that I commend this and the other particular medicines, I ſhall likewiſe, to thoſe obſervations, ſubjoin a declaration of my meaning in ſuch particulars, and of the ſenſe, wherein I deſire you ſhould underſtand what you meet with in the praiſe of remedies, either in this eſſay, or any other of my writings, which I hope it will be ſufficient, to give you this advertiſement of, once for all.

THE next medicine, I am to mention to you, is the *balſamum ſulphuris*, which being made but with groſs oils, drawn by expreſſion, may be called *craſſum*, to diſtinguiſh it from the common and thinner balſam of ſulphur, that is made with the diſtilled oil or ſpirit of turpentine.

The preparation and virtues of the balſamum ſulphuris craſſum.

THIS balſam is made in an hour or leſs, without a furnace, only by taking to one part of good flour of brimſtone, four or five times as much (in weight) of good expreſſed oil, either of olives, or nuts, or poppy-ſeeds, and boiling the former in the latter, in a pipkin half filled with both, till it be perfectly diſſolved into a blood-red balſam. But as eaſy as this preparation ſeems (and indeed is) to them, that have often made it, it will not at firſt be ſo eaſy to make it right. For the fire, which ought to be of well kindled coals, muſt be kept pretty quick, and yet not over-quick, leſt the oil boil over, or do not well diſſolve the flower of ſulphur, but turn them with its ſelf into a clotted and almoſt liver-coloured maſs. And to avoid theſe inconveniences, and the aduſtion of the matter, ſpecial care muſt be had to keep it conſtantly ſtirring, not only whilſt the pot is over the fire, but after it is taken off, till it be quite cold. You may, if you think fit, diſſolve this ſimple balſam in chymical oil of aniſe-ſeeds, or any other eſſential oil, like to advance its efficacy in this or that particular diſtemper; but thoſe oils being generally very hot, I moſt commonly preſcribe the balſam without thoſe additions, eſpecially if long digeſtion have ſomewhat leſſened the offenſiveneſs of the ſmell, which though no peculiar fault of this preparation, being common to ſulphureous medicines, is yet the chief inconvenience of it. I will not reſolutely affirm, that this is the very *balſamum ſulphuris Rulandi*, of which that author relates ſuch wonderful

things

things in his Centuries; but if it be not the ſame, it is ſo like it, and ſo good, that I doubt not but by peruſing thoſe Centuries, you may find divers uſes of it, that I have not made trial of. And in coughs, old ſtrains, bruiſes, aches, (and ſometimes the incipient fits of the gout itſelf) and eſpecially tumours, ſome of your friends can inform you, that it doth much greater things, than moſt men would expect from ſo ſlight and eaſy a preparation; and indeed greater than I have ſeen done by very coſtly and commended balſams and ointments, ſold in apothecaries ſhops. And in thoſe obſervations, I lately told you, you might command, you will find, that this balſam outwardly applied hath cured ſuch obſtinate tumours, as men either knew not what to make of, or what to do with them, of which ſkilful phyſicians, to whom I gave it to make trial of in difficult caſes, can bear me witneſs; though it ought ſufficiently to endear this balſam to us both, that it was the means of reſcuing your fair and virtuous ſiſter *F.* from a dangerous conſumption. In outward application it is to be well warmed, and to be chafed into the part affected, which ſhould be afterwards kept very warm, or elſe lint dipt in it may be kept upon the place. Inwardly ſome drops of it may be given at any time, when the ſtomach is not full; either rolled up with ſugar, or mingled with any convenient vehicle. But as for the particulars, that concern the preparation of this balſam, you will find thoſe I can readily meet with among my looſe papers, annexed, with the notes concerning *ens Veneris*, to the end of this eſſay.

The preparation and virtues of eſſence of harts-horn.

And therefore I ſhall now proceed to mention the third medicine, which you have often heard of, under the name of eſſence of harts-horn; but which is indeed only the ſimple, but well purified and dephlegmed ſpirit of it. And though men are pleaſed to imagine, by the effects this remedy often produces, that I have ſome myſterious or elaborate way of preparing it, yet, to deal ingenuouſly with you, the chief thing I have done to bring it into credit, is the teaching ſome phyſicians and apothecaries a ſafe and eaſy way of making it. For whereas before, thoſe, that went about to diſtil it, commonly uſed, as the apothecaries are wont to do in what they make of the ſame matter, ſhavings or raſpings of hartſhorn, and diſtilled it with a ſtrong and naked fire, the fugitive and ſubtile ſpirits were wont to come over in that plenty, and with that impetuoſity, as to break the glaſſes to pieces, whereby apothecaries, and even chymiſts were diſcouraged from drawing the ſpirit; and they not having it in their ſhops, its virtues remained unknown. Whereupon, conſidering, that if it were only broken on an anvil into pieces of about the bigneſs of one's little finger, beſides that this way of comminution would be far leſs chargeable than raſping, the fumes would not be driven out ſo faſt: and conſidering too, that a violent fire was requiſite, not to diſtil the ſubtile ſpirit, but to drive over the groſs and heavy oil; I thought it was needleſs to take pains to force that over, which not being (that I obſerved) uſed in phyſick, would coſt me further pains to ſeparate it again. And therefore, trying to diſtil hartſhorn, in naked retorts, placed but in ſand, I found I could diſtil two or three pound at a time, and obtain from each of them, almoſt, if not quite, all the ſpirits and volatile ſalt, which I afterwards ſeparated from the reddiſh and lighter oil, and freed them from phlegm and feculencies by a couple of rectifications, made in tall glaſſes, and with very gentle heats, (commonly of a lamp-furnace.) The doſe may be from eight, or ten drops of the ſpirit, or grains of the ſalt, to ſix times the quantity of either, in warm beer, or any vehicle that is not acid, except milk. Finding it to be a medicine of an attenuating, reſolving, and diaphoretical nature, and one that much reſiſts malignity, putrefaction, and acid humours, (whence being mingled with ſpirit of vinegar, and the like ſour juices, it deſtroys their acidity,) I direct it (*præmiſſis univerſalibus*) in fevers, coughs, pleuriſies, obſtructions of the ſpleen, liver, or womb, and principally in affections of the brain, as ſtoppages of the head, feveriſh deliriums, and even *in phrenetide*. And ſince I wrote a good part of this eſſay, I had an experiment of it in a child, who being, by many violent convulſion-fits, reduced to a deſperate condition, was recovered by one doſe of five or ſix drops of this ſpirit that I ſent it. It is true, that I have another medicine, that is more elaborate and coſtly, and more properly bears the name of *eſſentia cornu cervi*, which I more value than this: but I cannot communicate that, without prejudicing a third perſon, and an excellent chymiſt, who makes great advantage of it. But this I can tell you, that moſt of the cures, for which my preparation of hartſhorn hath had the good fortune to be eſteemed, have been performed with the above deſcribed ſimple ſpirit and ſalt, with which ſome ſkilful phyſicians and other ingenious perſons, who had it from me, have within theſe few years ſaved ſo many lives, that I am inclined to think, I have done no uſeleſs piece of ſervice, in bringing ſo happy a medicine into requeſt, eſpecially with thoſe, that have ſkill and opportunity to make better uſe of it than I. But, *Pyrophilus*, I find I have detained you ſo long with ſo prolix a mention of the three above deſcribed remedies, that I ſhould think it requiſite to make you a ſolemn apology; but that I hope your charity will as well invite you to pardon the fault, as mine induced me to commit it.

CHAP. VII.

That mechanicks and other experimental learning may teach how to leſſen the charge of cures, by making more convenient furnaces, demonſtrated in divers particulars.

A FOURTH way of leſſening the charges of cures may be this; that whereas the dearneſs of very many medicines proceeds from the chargeableneſs of thoſe chymical operations, whereby they are wont to be prepared, it is to be hoped, that a greater meaſure of ſkill in phyſiology, and other experimental learning, will ſuggeſt cheaper and better ways of doing many things in chymiſtry, than are, as yet, uſually practiſed.

And thoſe thrifty expedients, I conceive, may be of ſeveral kinds, of which I ſhall at preſent

preſent mention, and that but tranſiently, three or four.

AND firſt, I doubt not but chymiſts may be taught to make better furnaces, for ſeveral purpoſes, than thoſe, that have been hitherto moſt uſed among them. For profeſſed chymiſts having been for the moſt part unacquainted enough with many other parts of learning, and particularly with the mechanicks, their contrivances of furnaces and veſſels have been far enough from being as good, as knowledge in mechanicks and dexterity in contrivances might, and, I doubt not, hereafter will, ſupply them with; whether as to the ſaving of fuel, or to the making the utmoſt uſe of the heat afforded by the fuel they do employ, or as to the intending heat to the height, or as to the regulating heat at pleaſure.

IT is ſomewhat wonderful, as well as pleaſant, to ſee, how many veſſels may be duly heated by one fire (perhaps no greater than common diſtillers employ to heat one veſſel) if the furnace be ſo contrived, as that the flame may be forced to paſs in very crooked and winding channels towards the vent or vents, and the heat may be ſkilfully conveyed to ſeveral parts of the furnace, according to the exigency of the work it is to do. And as for the intention of heat, I remember I have had odd effects of it, by the contrivance of a certain furnace, that held but very few coals, and to which I uſed no bellows. But though, by this way, I could vitrify ſometimes the very crucibles, and thought poſſibly I could, with a ſlight alteration, melt down the ſides of the furnace themſelves; yet a diſciple of *Cornelius Drebell*, and a very credible perſon, aſſured me, that he knew a way of furnaces, that was yet fitter to bring heat to the ſuperlative degree; and that he himſelf, the relator, could by the mere force of fire in his furnace, bring Venetian talc to flow; which is more, I confeſs, than ever I have been able to do, either in mine, or thoſe of the glaſs-houſe. But experience hath aſſured me, it is eaſy to make a furnace give that heat as expeditiouſly enough, and in other reſpects very conveniently to cupel both gold and ſilver, without the leaſt help of bellows. That alſo furnaces may be ſo ordered, as that the heat may be better regulated, than that in our ordinary ones, I may elſewhere ſhew you cauſe to believe; and in the mean time I ſhall only tell you, that I look upon the ſkill of intending and remitting heat at pleaſure, and eſpecially the being able to keep a gentle heat long and equal, as a thing of much greater moment, both as to phyſick and philoſophy, than chymiſts are wont to think, (the powerful effects of conſtant and temperate heats, being as yet known to few, ſave thoſe, that have made trial of them.) And with lamp-furnaces well ordered, divers things may be done in imitation of nature; ſome friends of mine having, as ſeveral of them aſſure me, in ſuch furnaces brought hen-eggs to manifeſt animation. That alſo furnaces may be ſo built, as to ſave much of the laborants wonted attendance on them, may appear by the obvious invention of athanors, or furnaces with towers, wherein the fire is for many hours, (perhaps for twenty-four, or forty-eight) ſupplied with a competent proportion of coals, without being able to burn much faſter than it ſhould. And that in many caſes the labour of blowing may be well ſpared, and the annoyance of mineral fumes in great part avoided by an eaſy contrivance, is evident by thoſe furnaces, which are blown by the help of a pipe, drawing the air, as they commonly ſpeak, either at the top, as in *Glauber*'s fourth furnace, or at the bottom, or for want of room, upwards, I have ſometimes tried. To which may be added, that the caſting of the matters to be prepared upon quick coals, as *Glauber* preſcribes in that, which he calls his firſt furnace, is, in ſome caſes, a cheap and expeditious way of preparing ſome minerals, though his method of making ſpirit of ſalt in that furnace would not ſucceed, according to his promiſe with me, and ſome of my acquaintance. And there are other more commodious contrivances, by caſting ſome things upon the naked fire, which invites me to expect, that there will be ſeveral good expedients of employing the fire to chymical operations, that are not yet made uſe of, nor perhaps ſo much as dreamed of.

AND as furnaces, ſo the veſſels, that more immediately contain the thing to be prepared, are queſtionleſs capable of being made more durable, and of being better contrived, than commonly they are. Good uſe may be made of thoſe earthen retorts, that are commonly called *Glauber*'s ſecond furnaces, in caſe they be made of earth, that will endure ſtrong fires, and in caſe there be a better way to keep in the fumes, than that he propoſes of melted lead, which I have therefore often declined for another, as having found it liable to ſuch inconveniences as I elſewhere declare.

BUT for materials that are cheap, and to be diſtilled in quantity, as woods, hartſhorn, *&c.* the way is not to be deſpiſed, and is, as we may elſewhere have occaſion to ſhew, capable of improvement; though in ſome caſes this kind of veſſel is inferiour to thoſe tubulated retorts, that were of old in uſe, and mentioned by *Baſilius Valentinus*, and from which *Glauber* probably deſumed that, which we have been ſpeaking of. The utility of the way of ſealing glaſſes hermetically, and of the invention, that now begins to be in requeſt, of ſtopping the bottles, that contain corroſive and ſubtile liquors with glaſs ſtopples, ground fit to their necks, inſtead of corks, together with ſome other things, not now to be mentioned, keep me, that I ſcarce doubt, but that if we could prevail with the glaſs-men and the potters, to make veſſels of glaſs and earth exactly, according to directions, many things in chymiſtry might be done better and cheaper than now they are; and ſome things may be then done, that with the forms of veſſels now in uſe cannot be done at all. And if that be true, which we find related in *Pliny*, and with ſome other circumſtances in *Dion Caſſius*, of a more ingenious than fortunate man, who, about his time, was put to death for having made malleable glaſs; as the truth of that

Glaſs-ſtopples fitteſt for corroſive liquors.

ſtory, if granted, would ſhew the retrieving that invention a thing not to be deſpaired of; ſo he, that could, now chymiſtry is ſo cultivated, find again the way of making glaſs malleable, would be, in my opinion, a very great benefactor to mankind, and would enable the virtuoſi, as well as the chymiſt, to make ſeveral experiments, which at preſent are ſcarce practicable: and ſome chymiſts would perhaps think the attempt more hopeful, if I tell them firſt, that I remember *Raymund Lully* expreſly reckons it among three or four of the principal virtues he aſcribes to the philoſopher's ſtone, that it makes glaſs malleable; and then, that an expert chymiſt ſeriouſly affirmed to me, that he met with an *adeptus*, who, among other ſtrange things, ſhewed him a piece of glaſs, which the relator found, would endure and yield to the hammer. But what my own opinion is concerning this matter, and what are the (uncommon) inducements I have to be of it, I muſt not here declare.

AND on this occaſion, I remember I have ſeen an inſtrument of tin or pewter, for the drawing of ſpirit of wine (which you know is one of the chargeableſt things that belongs to chymiſtry) ſo contrived, that whereas in the ordinary way much time, and many rectifications are requiſite to dephlegm ſpirit of wine; one diſtillation in this veſſel will bring it over from wine it ſelf, ſo pure and phlegmleſs, as to burn all away. And I remember, that the ancient French chymiſt, in whoſe laboratory I firſt ſaw one of theſe inſtruments, told me, that it was invented not by any great alchymiſt or mathematician, but by a needy Pariſian chirurgeon. And now I ſpeak of ſpirit of wine, I ſhall add, that as the charges of chymiſtry would be very much leſſened, if ſuch ardent ſpirits could be had in plenty, and cheap; ſo I think it not improbable, that in divers places there may be found, by perſons well ſkilled in the nature of fermentation, other vegetable ſubſtances far cheaper than wine, from which an inflammable and ſaline ſulphureous ſpirit, of the like virtue, for diſſolving reſinous bodies, drawing tinctures, *&c.* may be copiouſly obtained. For not only it is known, that cider, perry, and other juices of fruits will afford ſuch a ſpirit; and that moſt grains, not very unctuous, as barley, wheat, *&c.* will do the like, but other berries, that grow wild, as thoſe of elder, will yield a vinous liquor. And in the *Barbadoes* they make a kind of wine, even of roots, (I mean their *Mobby*, which they make of potatoes; as I have alſo, for curioſity's ſake, made bread of the ſame roots;) nay, even ſome ſorts of leaves, ſuch a liquor may be obtained. For I have obſerved roſes, well fermented, to yield a good ſpirit very ſtrongly taſted, as well as inflammable. And as to the preparing of pure ſpirit of wine it ſelf, I know ways (and one of them cheap) that may exceedingly ſhorten the time, and pains of dephlegming it: but that being to be done otherwiſe, than by any peculiar contrivance of furnaces or glaſſes, I reſerve it for a fitter place, in one of the following eſſays.

That inflammable ſaline ſulphureous ſpirits may be drawn from other ſubſtances cheaper than wine.

AND as more expedient and thrifty ways than the vulgar ones, of making chymical furnaces and veſſels, may be deviſed; ſo it is to be hoped, that a ſkilful naturaliſt may find cheaper ways of heating the chymiſt's furnaces, or diſtilling in his veſſels, (either by finding combuſtible materials, not formerly in uſe in the places where we work, or by making thoſe already imployed fitter for uſe) by bringing them, by ſome cheap alterations, either to give a greater, or a more durable heat; or to be leſs offenſive by their ſmokes or ſmells; or elſe by diſcovering ſome cheap way of doing, in ſome caſes, without fire, what was wont to be done by it.

Inſtances in divers particulars, how the naturaliſt may find cheaper ways of heating the chymiſts furnaces.

WE ſee, that in ſome places, eſpecially here in *England*, where charcoal was only burnt in furnaces, pit-coal is ſubſtituted in its room. And at this day there are ſeveral of thoſe, that make aqua fortis in great quantities, that diſtil it with ſuch coals, which coſt nothing near ſo much as thoſe made with wood. And experience hath informed me, that even in other ſorts of furnaces, the ſame fuel may be employed, provided the bars of the grates be ſet wider aſunder, and a little charcoal be mingled with it for the better kindling: and ſince of late years pit-coal have been found in ſeveral places among us, where they were not formerly known to be, it ſeems not improbable, that many other countries may afford chymiſts, and the reſt of their inhabitants, the like advantage, if ſearch were duly made, by boring of the ground, by the obſervations of the waters, and the ſteams of places ſuſpected, and by other ways of inquiry, that a ſkilful man might direct. But becauſe the abundant ſmoke of pit-coal uſes to be very offenſive, and the ſmaller coals eaſily run through the grates, and becauſe of other inconveniences, there hath been a way found out of charring theſe coals, and thereby reducing them into coherent maſſes, of a convenient bigneſs and ſhape, and more dry and apt to kindle. And theſe, though quantity for quantity, their price be little inferiour to that of charcoal, yet thoſe, that conſume great proportions of coals, tell me they find them almoſt as cheap again, in regard they will not only laſt much longer, but give (eſpecially near at hand) a far more intenſe heat. And therefore it muſt be a very uſeful thing to chymiſts, to ſhew a way of charring ſea-coals, without the help of thoſe pots, which make them of the price they now bear. And that it is not only poſſible, but very eaſy, I could quickly ſhew you, if it would not prejudice an induſtrious laborant, whoſe profeſſion being to make chymical medicines in quantity, obliges him to keep great and conſtant fires, and did put him upon finding a way of charring ſea-coal, wherein it is, in about three hours or leſs, without pots or veſſels, brought to charcoal; of which having, for curioſity ſake, made him take out ſome pieces, and cool them in my preſence, I found them upon breaking to appear well charr'd, and much thereof in ſhew not unlike a marcaſite. And that, which was very convenient in this contrivance, was, that whilſt the pit-coal was charring, it afforded him a very intenſe heat to melt or calcine the minerals, he had

Of charring coals, ſo that while it chars, it gives an intenſe heat, fit to melt or calcine minerals.

had occaſion to expoſe to it: And he confeſt to me, that by this method, he ſaved three parts in four of the charges the keeping ſuch great and conſtant fires, with common charcoal, would coſt him. In *Holland* likewiſe, they have a way of charring peat, (which is a combuſtible turf, that they dig under ground;) and a ſkilful diſtiller, that much employed it, commends it to me, as a very good fuel, even for chymical fires: which I therefore mention, becauſe the way of charring peat is not yet brought into ſeveral countries, where peat is digged up; and probably, it would be found in divers regions, where it is yet unknown, if due ſearch were made for it. To which I may add, that it is not unlike, that ſome countries may afford ſuch combuſtible materials fit for chymical furnaces, as have not, as yet, been ſo much as named by mineraliſts: as I remember I have ſeen, and had, a ſort of coals, ſome of which looked like marchaſites, that burned clear with a good flame, and had this convenient quality for the chymiſt's uſe, that they were not apt, like the common pit-coals, to ſtop the grates with their cinders, but burnt to whitiſh aſhes, almoſt like charcoal made of wood; and yet gave ſo great a heat, that an induſtrious chymiſt of my acquaintance, who kept many things conſtantly at work, found it worth while to have them brought him, above a day's journey, on horſes backs.

Of charring peat.

BUT it is not impoſſible, that when men grow better naturaliſts, they may find ways of exciting heat, enough for many chymical operations, without the help of fire, and conſequently, without the conſumption of fuel. We find, that by the attrition of hard bodies, conſiderable degrees of heat may be produced, not only, in combuſtible materials, as wood, and the like, (which would therefore be improper to be here inſiſted on;) but in others alſo, and particularly in iron and ſteel, one may by attrition ſoon produce a ſmart heat, as you may quickly try, by nimbly filing a piece of iron, with a rough file, or ſwiftly rubbing, though but a few minutes, a thin piece of ſteel againſt a board. And whether ſome contrivance may not be found, by the help of cheap engines moved by water, or otherwiſe, to produce a durable heat in iron veſſels, fit to digeſt in, we may elſewhere have farther occaſion to conſider; but this is known, that from ſome ſucculent plants a liquor may be drawn, only by expoſing them in glaſſes, purpoſely contrived, to the beams of the ſun. And there is nothing more common, than for chymiſts to make their digeſtions by the warmth of horſe-dung, whereby they might alſo (as ſome analogous trials incline me to think) conveniently enough diſtil ſome fermented liquors; eſpecially if the way were improved by the ſkilful addition of quick-lime, and ſeaſonable aſperſions of water. And I doubt not, but many cheap materials might, by a few trials, be found, whereby portable digeſting furnaces, without fire, (if I may ſo call them) might be made, without the the ill ſmell and naſtineſs, which diſcommends the uſe of horſe-dung. For not only we ſee, by what happens in the ſpontaneous heating of malt, and ſome other familiar ſubſtances, that probably moſt ſorts of grains and berries, fit for fermentation, may be brought to yield, for a good while, a heat great enough to putrify or digeſt with: but I have, ſeveral years ago, by many trials found, that I could, by invironing glaſſes with refuſe hay, well preſſed down, and equally wetted throughout, produce for divers days ſuch a heat, as made me decline the employing of horſe-dung; and yet (which is the chief thing, for which I mention this) the quantity of hay was ſo ſmall, that in all my trials I found not, that the hay did of it ſelf, though kept cloſe enough, take fire, as elſe is uſual in ricks of hay not ſufficiently dried, where the quantity, and conſequently the weight, that preſſes the lowermoſt parts cloſe together, is conſiderable.

Of digeſtion and diſtillation without fire.

BUT farther, in divers operations, where an actual fire is requiſite, it may be hoped, that knowing men may diſcover ways of ſaving much of the fire, and making ſkill perform a great part of the wonted office of heat. To obtain the ſpirit of freſh urine, you muſt diſtil away near nine parts of ten, which will be but phlegm, before the ſpirit or volatile ſalt will (and that ſcarce without a pretty ſtrong heat) regularly riſe. And there are ſeveral chymiſts, that to this day make uſe of no better way of diſtilling urine; but he, that knows, how putrefaction opens many bodies, may eaſily ſave himſelf the expence of ſo much fire. For if you let urine ſtand well ſtopped, for eight or ten weeks, the ſaline and ſpirituous parts will ſo extricate themſelves, that the ſpirits, that before ſtayed behind the phlegm, will now, even with the gentleſt heat, riſe up firſt, and leave the phlegm behind. And on this occaſion I ſhall teach you, what I do not know to have been mentioned by any writer; namely, that even of freſh urine, without digeſtion or putrefaction, I can, by a very cheap and eaſy way, make ſubtile and penetrant ſpirit aſcend, firſt, even in a gentle heat. And I am wont to do it, only by pouring urine, how freſh ſoever, upon quick-lime, till it ſwim ſome fingers breadth above it, and then diſtilling it as ſoon as I pleaſe. But I did not find, upon many trials, that this ſpirit, though even without rectification very ſtrong and ſubtile, would coagulate ſpirit of wine, like that of putrified and fermented urine; though perhaps for divers other purpoſes it may be more powerful.

Ways of diſtilling ſpirit of urine.

Of diſtilling it with lime without fermentation.

That ſo diſtilled, it doth not coagulate ſpirit of wine, as in the uſual diſtillation.

AND here I ſhall advertiſe you, that whereas I juſt now took notice, that there was a pretty ſtrong fire requiſite to force up the ſalt of unfermented urine out of that part, which, after the abſtraction of the phlegm, remains of the conſiſtence of honey; trial hath informed me, that the volatile ſalt may out of the thick liquor be obtained, better and more pure, with eaſe, and with a ſcarce credibly ſmall heat, barely by tempering the urinous extract with a convenient quantity of good wood-aſhes, whereby (for a reaſon elſewhere to be conſidered) the volatile part of the ſalt of urine is ſo freed from the groſſer ſubſtance, that with ſtrange facility it will aſcend fine and white, to the top of very tall glaſſes. But of the differing

ing preparation of urine, more perhaps elſewhere. I now proceed to tell you, that I think it not unlikely, that even bodies, which are more groſs and ſluggiſh, may, by the affuſion of ſuch menſtruums, as human induſtry may find out, be far more eaſily, either, volatilized or unlocked, than common chymiſts are wont to think. For I know a liquor, not very rare among chymiſts, by whoſe help I have, often enough, diſtilled ſpirit of nitre (whoſe diſtillation requires much about the ſame violence of fire with that of aqua fortis) even in a moderate heat of ſand, and without a naked fire. This ſpirit may eaſily enough be brought over, even in a head and body: and for a wager, I could obtain a little of it without any fire or outward heat at all. And I remember alſo, that having once digeſted a certain menſtruum, for a very ſhort time, upon crude antimony, and abſtracted it, in a very gentle heat of ſand; the liquor not only brought over ſome of the antimony in the form of red flowers, ſwimming in it, and united other parts of the mineral, with it ſelf, in the tranſparent liquor; but the gentle heat raiſed to the top of the retort divers little maſſes of a ſubſtance, that were very tranſparent, like amber, which were inflammable, and ſmelt, and burnt blue, juſt like common ſulphur: and yet the menſtruum, which was eaſily again recoverable from the antimony, was no ſtrong corroſive, taſting, before it was poured on, not much unlike good vinegar.

Of the power of good menſtruums in facilitating diſtillation.

But beſides all the ways above mentioned of ſaving the chymiſt either time, or fire, or labour; I deſpair not, that divers others, yet unthought on, will be in time found out by the induſtry of ſkilful men, taking notice of the nature of things, and applying them to chymical uſes; as we ſee, that by amalgamations with mercury, the calcination of gold and ſilver may be much eaſier performed, than by a long violence of fire. And (if it be true, what *Helmont* and *Paracelſus* tell us, of their immortal liquor alkaheſt) medicines far nobler, and otherwiſe more difficult to make, than thoſe hitherto in uſe among the chymiſts, may be prepared with greater eaſe, and expedition, and with far leſs expence of fire, than the nature of the metals, and other concretes to be opened by it, would let a vulgar chymiſt ſuſpect. However, I ſee no great cauſe to doubt, that there may be menſtruums found, that will much facilitate difficult operations; ſince, not to mention again the liquor I lately told you would work ſuch a change on nitre, (and, I might have added, on ſome other compact bodies,) it is very like, there may be menſtruums found, that will not be ſo ſpoiled by a ſingle operation, made with them, as our vulgar ſaline ſpirits are wont to be. For I have tried, that a menſtruum, made by the bare diſtillation of good verdigreaſe, will not only draw, as I have formerly told you, a tincture of glaſs of antimony, or perform ſome other like operation for once, but being drawed off from the diſſolved body, or the extraction, will again ſerve, more than once, for the like operation upon freſh materials.

That the calcination of gold is facilitated by amalgamations with mercury.

The power of verdigreaſe diſtilled in drawing tinctures of glaſs of antimony, &c.

The fifth, and laſt way, *Pyrophilus*, that I intend to mention, of leſſening chymical expences, is, that the naturaliſts may probably find out ways of preſerving ſome chymical medicines either longer or better than thoſe ways that are uſual. But of this preſervation of bodies being like, as I formerly intimated, to have elſewhere further occaſion to treat; I ſhall now only ſay, that the purified juices, liquid extracts, robs, and other ſoft medicaments, made of plants, may be conſerved far cheaper, as well as better than with ſugar, (which clogs moſt men's ſtomachs, and otherwiſe diſagrees with many conſtitutions) in caſe *Helmont* ſay true, where he tells us, that for a ſmall piece of money he can, for I know not how long, preſerve whole barrels of liquor. And a way he intimates, of fuming liquors with ſulphur, I have already told you, is a very good way of keeping them uncorrupted; provided, that (though he preſcribes it not) they be ſix or ſeven ſeveral times (ſeldomer or oftener, according to the quantity or nature of the liquor) well impregnated with that imbalming ſmoke; to which purpoſe it is convenient to have two veſſels, to pour from one to the other, that whilſt the liquor is ſhaking in the one, the other may be well filled with ſmoke. Whereto I ſhall only ſubjoin this ſecret, which a friend of mine practiſes, in preſerving the fumigated juices of herbs, (as I elſewhere inform you, I do to preſerve other things) with a ſucceſs, that I have ſomewhat wondred at; which conſiſts, in adding to the thick liquor to be preſerved, a due, but ſmall proportion of the white coagulum, (which I elſewhere mention) made of the pure ſpirits of wine and urine.

That the naturaliſt may find out ways to preſerve medicines longer and better than is uſual.

Of fuming liquors with ſulphur.

And adding a little of the white coagulum made of the pure ſpirits of wine and urine.

But I have made this excurſion too prolix, and therefore I ſhall only add as a general admonition, that we are not, by the common practice of vulgar chymiſts, to eſtimate what knowing naturaliſts, ſkilled in mechanical contrivances, may be able in time to do, towards the making chymical remedies, as well more cheap as more effectual: and indeed, to make them more effectual, is the beſt way to make them more cheap.

For, *Pyrophilus*, after all the ways, that I have mentioned, whereby the charges of the therapeutical part of phyſick may be leſſened; I muſt advertiſe you, both, that I make no doubt, but that there may be others found, which either through want of ſkill or leiſure I have pretermitted, and that I have not yet named the principal of all; which is, that the deep inſight into natural philoſophy may qualify him, that hath it, by ſeveral ways, and eſpecially by diſcovering the true cauſes and ſeats of diſeaſes, to find out ſuch generous and effectual remedies, (whether ſpecifick, or more univerſal arcana) as by quickly freeing the patient from his diſeaſe, may exempt him from needing either much phyſick from the apothecary, or many chargeable viſits from the doctor, or chirurgeon. Thus the rich merchant I mentioned, in one of the former eſſays, to have been freed, by a ſpecifick, from the gout; and the young Lady cured of her fiſtula's, by the infuſion of millepedes;

That the moſt principal way of leſſening the charge of cures would be the finding out new and more effectual remedies.

might

might well, in the ordinary way, have ſpent, even ſuppoſing them thrifty, an hundred times more upon phyſicians and phyſick, than the potent and nimble remedies, whereby they were ſo happily recovered, coſt them.

[To which I ſhall add, by way of confirmation, both of this, and of what I lately told you, concerning the efficacy, that may be, even in ſlightly prepared ſimples, what I came to learn, ſince the writing of the former part of this eſſay; namely, that a young lady, who (though of great birth, is yet of far greater beauty and virtue, whom I preſume I need not name to you) having been long troubled with an almoſt hereditary epileptical diſtemper, and after having been wearied by courſes of phyſick preſcribed her by the famouſeſt doctors, that could be procured, without at all mending but rather growing worſe, ſo that ſometimes, ſhe would have, in one day, eight or ten of ſuch diſmal fits, as you and I have ſeen her in; was cured only by the powder of true miſletoe of the oak, given as much as would lie upon a ſix-pence, early in the morning, in black cherry-water, or even in beer, for ſome days near the full moon. And I am aſſured, partly by the patient herſelf, and partly by thoſe, that gave her the medicine, that though it had ſcarce any other ſenſible operation upon her, and did not make her ſickiſh, eſpecially when ſhe ſlept upon it; yet after the firſt day ſhe took it, ſhe never had but one fit. And this remedy an ancient gentleman, who, being caſually preſent, when ſhe ſuddenly fell down as dead, gave it her, profeſſed himſelf to have conſtantly cured that diſeaſe with it, when he could procure the right ſimple, which is here exceeding ſcarce. And what further experiment ſome friends of yours have ſucceſsfully made, I may elſewhere have occaſion to relate.]

An hiſtory of a radicated epilepſy, that was cured by the powder of miſletoe of the oak.

To which I ſhall only add, that one of the ſkilfulleſt methodiſts I ever knew, having had much ado to preſerve a young couſin of yours from a very dangerous cough, by a long courſe of phyſick; the party, at the beginning of the next winter, falling into a relapſe more threatning than the firſt diſeaſe, was reſcued from it in two or three days, by not many more takings of a ſpecifick ſent her, made of nothing elſe but hartſhorn prepared, as I lately taught you. And if ſuch ſlight medicines, conſiſting, each of them, but of a ſingle ſimple, not elaborately prepared, may ſometimes (for I ſay not always) perform ſuch ſpeedy cures even in chronical diſtempers; what may not be hoped from the *arcana majora* (ſuch as *Paracelſus*'s *Laudanum*, ſo praiſed by *Oporinus* himſelf, and *Butler*'s *Driff*, ſo extolled by *Helmont*) when the ſkilfulleſt preparations of the nobleſt ſimples ſhall come to be known by learned and judicious men, intelligent in the theory of phyſick, and eſpecially verſed in the hiſtory of diſeaſes? And though *Riverius* were none of the greateſt naturaliſts, or, at leaſt, chymiſts; yet if in his *Obſervations*, and elſewhere, he flatter not his own *Febrifugum*, how many patients did that one ſpecifick reſcue from quartans, that would elſe probably have proved as chargeable as tedious?

BUT, *Pyrophilus*, having ſaid ſo much, that I fear you have thought it tedious, to ſhew, that a naturaliſt, ſkilled in chymiſtry and the mechanicks, may aſſiſt the phyſician to make his cures leſs chargeable, it is high time, that after ſo long an excurſion, I proceed to conſider, in what other particulars he may be a benefactor to the phyſician's art.

CHAP. VIII.

FIFTHLY, then, that the naturaliſt's ſkill may improve the pharmaceutical preparations of ſimples, by ſeveral ways partly touched already, and partly to be, either, added or farther treated of; the great variety of new remedies, wherewith the laboratories of chymiſts have furniſhed the ſhops of apothecaries, may convincingly inform you. To which I muſt take the liberty to add, (and that upon ſerious conſideration,) That *the chymical preparations, hitherto common in Diſpenſatories, are, as to the generality of them, far enough from being the moſt dextrous, or noble, that can be deviſed.* For our vulgar chymiſtry (to which our ſhops owe their venal ſpagyrical remedies) is as yet very incomplete, affording us rather a collection of looſe and ſcattered (and many of them but caſual) experiments, than an art duly ſuperſtructed upon principles and notions, emergent from ſevere and competent inductions, as we have elſewhere endeavoured more particularly to manifeſt. And therefore, till the principles of chymiſtry be better known, and more ſolidly eſtabliſhed, we muſt expect no other, than that very few vulgar chymical remedies ſhould be of the nobleſt ſort; and that in the preparation of many others, conſiderable errors ſhould be wont to paſs unheeded, and faults groſs enough, be apt to be miſtakenly committed. But of this ſubject we may elſewhere have divers occaſions to entertain you; and our ſingle eſſay, *of the Chymical Diſtinctions of Salts*, will perhaps diſcover to you no ſmall miſtakes, in the preparation of divers applauded vulgar medicines. For it is not the elaborateneſs, but the ſkilfulneſs of preparations, that produceth the noble remedies; and a few teeming principles well known and applied will enable a man with eaſe to make better remedies, than a great many furnaces and glaſſes, though never ſo well contrived, and though very uſeful in their kind. To make this out in ſome meaſure, I ſhall name ſome ſuch inſtances, as may withal confirm what I formerly delivered in this eſſay, touching the poſſibility and uſefulneſs of correcting either poiſonous, or otherwiſe very noxious ſimples. I never knew opium ſo much corrected by ſaffron, cinnamon, and other aromatical and cordial drugs (wherewith it is wont to be made up into laudanum) nor by the moſt tedious tortures of *Vulcan*, as I have known it by being a while digeſted in wine, impregnated with nothing, but the weight of the opium of pure ſalt of tartar, as we elſewhere more fully declare. (A much nobler laudanum may be made by adding to the opium, inſtead of the ſalt, two or three appropriated ſimples, and by due fermentations and digeſtions of them with it.) And for that

Other proofs, that the naturaliſt's skill may improve the pharmaceutical preparation of ſimples.

Of the beſt ways to correct opium.

violent vomiting-medicine, by chymiſts flatteringly enough called *mercurius vitæ*, a whole pound of cordial conſerves, or liquors, will not ſo well moderate its evacuating force, as the keeping it continually ſtirring in a flattiſh and well-glazed earthen veſſel, placed over a chafing-diſh of coals, till it emit no more fumes, but grow of a greyiſh colour: which I am very credibly informed to be the preparation of *mercurius vitæ purgans*, oftentimes mentioned and commended by the famous practitioner *Riverius*, in his *Obſervations*. A not unlike, but far more ſudden, correction of that active powder, I elſewhere teach. And as for thoſe operative minerals, quickſilver, and antimony, though long experience of their churliſh and untractable nature has made many of the warier phyſicians and chymiſts ſhy to meddle with either of them ſingle; yet theſe concretes, which ſeem ſo incorrigible, may, by being barely (in the gradual diſtillation of butter of antimony) ſublimed up together in a cinnabar, and then that cinnabar, ſix or ſeven times reſublimed *per ſe*, be united into a medicine, that not only is not wont to work, either upwards or downwards, but of which I have known ſafely taken, even in ſubſtance, to the doſe of many grains; and a few drachms of which, infuſed in a pound or two of wine, hath made it of that inoffenſive efficacy (taken, in the quantity of a ſpoonful or two, daily upon an empty ſtomach) that, if it ſtill ſucceed as well as we have obſerved it two or three times to do, we may think, that our having thus acquainted you with the virtue of this unlikely remedy, (though we have alſo met with it, even in printed books) may make you amends for all the reſt of this tedious diſcourſe. I once knew a ſlight (but altogether new and tedious, as well as philoſophical) preparation of ſalt of tartar correct and tame ſuch poiſons, as ten times the quantity of the higheſt vulgar antidotes, or cordials, would (I was confident) ſcarce have ſo much as weakened: and I have known by the ſame prepared ſalt, dexterouſly ſpecificated by ſimples, the virtues of ſome vegetables ſo exalted, that, without any cathartick or emetick operation, they have (if many patients, of whom I had caſual opportunities to inquire of the effects of thoſe remedies upon them, do not miſ-inform me) proved more effectual in taming divers ſtubborn diſeaſes, than *crocus metallorum*, *mercurius vitæ*, (as it is abuſively called) and thoſe other dangerous remedies, which make the vulgar wont to ſay of chymiſts, that they quickly either cure their patients, or kill them. And to let you ſee, *Pyrophilus*, by one plain, and yet noble inſtance, that the knowledge of the ſpecifick qualities of things, ſkilfully applied to preparations, may perform, with eaſe, what neither coſtly materials, nor elaborate proceſſes are able to effect; give me leave to inform you, that, whereas chymiſts and phyſicians have not been able by infuſing the true glaſs of antimony (made *per ſe*) in ſpirit of wine, or the richeſt cordial liquors, nor yet by torturing it after ſeveral tedious and artificial manners, to deprive it of its emetick quality; that vomitive faculty, of antimonial glaſs, may be corrected by ſo ſlight a way, as that of digeſting it with pure ſpirit of vinegar, till the menſtruum be highly tinged. For if you gently abſtract all the liquor, and on the remaining yellow or red powder you digeſt well dephlegmated ſpirit of wine; you may after a while obtain a noble and not emetick tincture; of which though *Baſilius Valentinus* preſcribes but five or ſix drops for a doſe, yet a domeſtick of mine having, out of curioſity, taken to the quantity of thirty drops at a time, he found it not at all vomitive. And this tincture we the rather mention, becauſe, not only *Baſilius Valentinus*, but other ſkilful perſons, highly extol it for ſeveral diſeaſes.

Of the beſt way of correcting of mercurius vitæ.

An excellent medicine made of thoſe churliſh minerals, quickſilver and antimony.

Ways to take away the vomitive faculty of antimonial glaſs.

See his Currustriumphalis antimonii.

And let me add, *Pyrophilus*, (and be pleaſed to mark well what I tell you) that by bare reiterated digeſtions, and fermentations, there may be prepared, out of many vegetables, ſaline and ſulphureous eſſences (whoſe bulk is exceeding ſmall, in proportion to the concretes whence they are extracted) which will keep many years, as I can ſhew you ſome above three years old, and contain more of the craſis (if I may ſo call it) of the ſimple, than the vulgar vegetable waters, ſpirits, extracts, or ſalts, hitherto extant in laboratories and ſhops. But there is ſo great a length of time required to the preparation of theſe efficacious juices, that my ambulatory condition of life hath not allowed me to furniſh my ſelf with many of them.

And, *Pyrophilus*, if you will not diſbelieve a perſon, for whom you have ſo juſt an eſteem, as you have for that ingenious, and experienced, Monſieur *L. F.* who was the French King's chymiſt, when you knew him at *Paris*; I can preſent you with a yet nobler inſtance, to perſuade you, that, if ſkill be not wanting, a ſingle herb, without any violence of fire, may, by other ways, than are in uſe among chymiſts, be eaſily enough brought to afford medicines, endowed with ſome nobler virtues than any of the moſt compounded, coſtly, and elaborate medicines, whether minerals or others, that are to be met with among vulgar chymiſts. This efficacious part of the plant, whence it is obtained, *Paracelſus* calls the *primum ens* of the plant, that yields it: but though, indeed, I have found the way of preparing it much plainer, and better delivered, than is uſual in his writings, at the end of his book *De Renovatione & Reſtauratione*; yet I freely acknowledge, that I ſhould ſcarce have thought it worth the trial, if it had not been for what the experienced chymiſt above-mentioned affirmed to me, upon his own obſervations, concerning it, partly, becauſe I am not wont to be forward, ſo much as to try long proceſſes upon *Paracelſus*'s credit, and partly, becauſe what he calls *Sal Solutum*. ſeemed to me ſomewhat ambiguous. Since in the ſame page, teaching to draw the *Ens primum* of gold and antimony, he makes not uſe of ſea-ſalt, but of (a ſalt of an incomparably higher nature) his *Sal circulatum:* and in the proceſs immediately preceding ours, to make the *Ens primum* of emeralds, he preſcribes the calcining them *in ſale ſoluto*, which agrees far better with his *Sal circulatum*, than with any ſolution

A new and excellent way to get the primum Ens, or eſſence, of ſome vegetables.

ſolution of ſea-ſalt; which ſeems very unlikely to be able to calcine, and, as he ſays it muſt, diſſolve emeralds. But the way, that our French chymiſt told me he uſed, was in ſubſtance this: Gather, in a convenient ſeaſon and time of day, balm, for inſtance, or ſome other fit herb, (for experience hath taught, both him and me, that all herbs are not fit, by this way, to be reduced into liquors) and having beaten it well, in a marble mortar, to a ſoft maſh, placed in a bolt-head hermetically ſealed, to digeſt forty days in a dunghill, or ſome analogous heat; then, opening the veſſel, take out the matter, which will be far more liquid than before, from which, having ſeparated the groſſer parts, you muſt digeſt it in a gentle bath, that the yet remaining groſſer parts may ſubſide; to which, being filtrated, you muſt, according to him, (for I find not that *Paracelſus* requires it) join the fixed ſalt of the groſſer parts above mentioned, dried and calcined. To this prepared liquor, you muſt add equal parts of the liquor of good ſea-ſalt well purified, and then melted, and ſuffered to run *per deliquium*. This liquor, being alſo ſealed up in a convenient glaſs, muſt be expoſed to the ſun for about ſix weeks; at the end of which time there will ſwim at the top of it the *primum Ens* of the plant in a liquid form, tranſparent, and either green or red, or, perhaps, of ſome other colour, according to the nature of the plant. And though *Paracelſus* preſcribes but celandine, and balm, to be uſed, yet having inquired of our chymiſts, he told me, he had made ſuch *prima Entia* of ſcrophularia, and, as I remember, of one or two other herbs. But that, which makes me thus, particularly, take notice of theſe kind of medicines, is, that not only *Paracelſus* aſcribes to the *primum Ens* of balm, (or celandine) the power of renovating them, that uſe ſo much of it in good wine as will give it a tincture, early every morning; till, firſt of all the nails of their fingers, then thoſe of their toes, afterwards their hair, and teeth, fall off; and laſtly, the ſkin be dried and exchanged for a new one. But your ingenious acquaintance aſſured me ſeveral times, and once in the preſence of a famous phyſician, and another virtuoſo, to whom he appealed, as knowing the truth of what he ſaid; that an intimate friend of his, whom he named to me, having, after the above mentioned manner, prepared the *primum Ens* of balm, to ſatisfy himſelf the better of its effects, made the trial upon himſelf, and took of it, according to the preſcription, for about a fortnight: long before which his nails, both of hands and feet, began to looſen themſelves from the ſkin, (but without any pain) which at length falling off, of their own accord, this gentleman keeps yet by him in a box for a rarity; but would not purſue the trial any further, being ſatisfied with what he had found, and being in no need of ſuch phyſick. But having given of the ſame medicated wine, for ten or twelve days, to a woman, that ſerved in his houſe, and was near ſeventy years of age, without letting her know, what he expected it ſhould do; her *purgationes menſtruæ* came upon her again in a ſufficiently great quantity to frighten her ſo much, that he durſt proſecute the experiment no further. And when I aſked, why he made no trial upon beaſts; it was anſwered, that though he had but little of the medicine, yet he put apart an old hen, and moiſtening her food with ſome drops of it for a week, about the ſixth day ſhe began to moult her feathers by degrees, till ſhe became ſtark naked: but before a fortnight was paſt, ſhe began to regain others, which when they were come to their full growth, appeared fairer, and better coloured than the firſt: and he added, that, beſides that her creſt was raiſed, ſhe alſo laid more eggs, than ſhe was wont. And as to the *primum Ens* of the greater *ſcrophularia*, by the relator himſelf, though he aſcribed not to it any renovating power, as to that of balm or celandine; yet he aſſured me, he had found it ennobled by other great and extraordinary virtues. But of this kind of preparation, I might ere now poſſibly have been able to give you a better account, if, in my trials about them, I had not met with ſome unhappy accidents, which I hope my next attempts will eſcape: which if they do, I may poſſibly, with an account of them, ſend you one of ſome attempts to prepare the like medicines another and ſhorter way, together with a conſideration, whether *Paracelſus* and others deſervedly call ſuch accidents, as the above-mentioned change of nails, hair, and even of teeth, a real renovation or rejuveniſcence.

The influence of theſe prima Entia to cauſe renovation or rejuveniſcence.

IT is likewiſe a way of preparation, differing enough from thoſe, that are common among chymiſts, which *Helmont* (as he ſays out of commiſeration to the ſick) delivers, where he teaches that, which he calls the *Via Media* of making the *Elixir Proprietatis*, of which he gives us this commendation: *Hoc medicamine tam quartanam, quàm continuam ſtatim abſolvi. Adeò ut qui nectu ſuſceperat ſacroſanctum viaticum, & olei extremam unctionem, me in prandio convivam circa lectum habuerit.* And though many think, that he has rather fraudulently than rightly ſet the proceſs down; yet experience has invited me to abſolve him in this particular. (Though I muſt tell you, that becauſe a languid heat is not ſufficient to make a ſpirituous liquor aſcend, and circulate as he requires; it is not every chymiſt, that will, eſpecially in his firſt trials, avoid the breaking of the glaſſes, or at leaſt the burning of the materials, to which accidents this preparation is very obnoxious, if it be not as well watchfully as ſkilfully made.) And though for my part I have ſcarce uſed this elixir but as a cordial; yet I know ſome very expert phyſicians, that have given it with great ſucceſs in divers difficult caſes, and particularly a friend of the younger *Helmont*'s gives it ſo ſucceſsfully, that partly his patients, and partly others, that have tried it, have ſometimes taken of him, at a great rate, whole pounds in a year or two; and yet I know by his own confeſſion, that beſides the ſkill he employs in making it dexterouſly, he adds nothing but one ingredient, to which, I confeſs, I am not apt to aſcribe any conſiderable part of the efficacy of the medicine; which, when made, he

In tractatulo cui titul. Sequuntur quædam imperfectiora, of Helm. Via media of Elixir Proprietatis.

And the perfuming it with muſk and amber.

he ſometimes perfumes by cohobations with muſk and amber.

A commendation of Helmont's medicines.

AND, *Pyrophilus*, that you may not wonder, that I, who think much of *Helmont*'s theory ſcarce intelligible, and take great exceptions at many things in his writings, ſhould yet now and then commend medicines upon his authority; I muſt here confeſs to you once for all, that (always excepting his extravagant piece, *De magnetica vulnerum curatione*,) I have not ſeen cauſe to diſregard many things he delivers, as matters of fact, provided they be rightly underſtood; having not found him forward to praiſe remedies without cauſe, though he ſeem to do it ſometimes without meaſure, and having more than once, either known, or even had conſiderable effects of medicines he commends, which one of the happieſt practitioners I have met with, and one not laviſh in extolling chymical remedies has ſolemnly aſſured me, he has generally, though not always, found more than ordinarily effectual. And upon occaſion of this odd preparation of the *Elixir Proprietatis*, I ſhall add, that, ſince experience ſhews us, by what is daily done in chymical laboratories, that upon the operation of the fire upon ſeveral concretes, ſubſtances of nature oftentimes very differing both from the body, that afforded them, and from one another, may be obtained; as the oils, and fixt ſalts even of cold plants, or hot; ſince alſo, by the mixture of active bodies new concretes, endowed with new qualities, may be produced; as we ſee, that *ſaccharum Saturni* emergeth from the conjunction of lead, with the acid ſalt, diſtilled vinegar; and ſince the ſame concrete, according to the differing manners, after which it is handled, may acquire differing qualities, as is clear in the various medicines, afforded us by quickſilver, and by antimony, according as each of them is ordered; I cannot but think, that if chymiſtry did no more than aſſiſt us, by the reſolution of bodies, to extricate their more active parts, and partly by ſuch reſolutions, and partly by aſſociating bodies together, to alter the former texture of nature's productions, or preſent us with new concretes of new textures; by this very means, if men want not curioſity, and induſtry to vary and proſecute experiments, there muſt neceſſarily ariſe ſuch a ſtore of new and active medicines, that, in all probability, many of them will be found endowed with ſuch virtue, as have not been, at leaſt in that degree, met with in the uſual medicines, whether ſimple or compound, to be bought in apothecaries ſhops; and conſequently, even without any notable diſcovery, or improvement of principles, chymiſts (even as matters now ſtand with them) may conſiderably add to the pharmaceutical part of phyſick. But if the operations of chymiſtry were ſeriouſly inquired into, and throughly underſtood, I make little doubt, but by a ſkilful application of them, and eſpecially by a ſeries of them, in a rational and orderly way, ſucceeding one another, there may be found out a great many preparations of remedies, both very differing from the common ones, and far more noble than they. And to make this ſeem probable, I need but repeat ſome of the examples formerly mentioned; to which I ſhall add now, that experience has informed me, there is a way, whereby firmer conſiſtent ſubſtances, belonging to the bodies of animals, may, without the addition of any extraneous matter, and without any violence of heat, be reduced almoſt totally into liquor: and if I much miſremember not, theſe liquors, without any violence of heat, afford their ſpirituous and ſaline parts, in a very gentle heat, and that before their phlegm. And I muſt peculiarly inculcate this, that if we had but a few potent menſtruums, to diſſolve and unlock bodies with, I ſcarce know what might not be done in chymiſtry. But when I ſpeak of noble menſtruums, I mean not ſuch, as work like the generality of corroſives, and the like acid or ſaline liquors, which work but upon few kinds of bodies, and ſoon coagulate, or exantlate themſelves by working, and thereby become unfit for future operations; but I mean ſuch, as either are ſeparable with all their efficacy from the diſſolved body; as is ſaid of the alkaheſt, or ſuch ſaline or other piercing liquors, as not being preciſely, either acid, urinous, or alcalizate, can diſſolve a great variety of concretes, without having their virtue, I ſay not impaired, but deſtroyed thereby; and unlock mineral bodies, far more than vulgar menſtruums, (as for inſtance by volatilizing them, or elſe making them irreducible, or working the like grand changes in them;) and if it be not quite ſeparated from the diſſolved body, is yet ſo friendly to human nature, as to be free from either fretting, or other ſuch dangerous and offenſive qualities, and rather to be of it ſelf a powerful medicine. I ſhould therefore exhort both you, and ſuch other ingenious perſons, as wiſh the advancement of chymiſtry, and phyſick, (I might poſſibly add natural philoſophy too) to apply their chymical attempts, chiefly to the finding out of noble menſtruums: for by being poſſeſſor but of one of theſe, a man may be able to do a great number of things, that otherwiſe are not to be performed. As one of our ordinary goldſmiths, by the knowledge he hath of aqua-fortis, can make many uſeful experiments about ſilver and gold, that, before that menſtruum was found out, all of his profeſſion in the world were never able in many ages to compaſs. Nor do I much wonder at that advice, which *Helmont* gives thoſe, that aim at the improvement of phyſick, in theſe words: *Quod ſi ad iſtud ignis arcanum non pertingatis* (he was ſpeaking of a prodigious, not to ſay incredible liquor) *diſcite ſaltem, ſalem tartari reddere volatilem, ut hujus medio veſtras ſolutiones perficiatis. Qui etſi ſua ſoluta anaticè homogenea deſerat, digeſtus in nobis; illorum tamen aliquot vires mutuatus eſt, quas intra defert, plurimorun morborum domitrices:* 'But if 'you come not to that arcanum of *Pyrotechny*, 'learn at leaſt to make the ſalt of tartar volatile, 'that by means of it you may perfect your ſo-'lutions. Which though it leave thoſe things, 'which it diſſolveth, equally homogeneous, be-'ing digeſted in us; yet it borroweth ſome of 'their virtues, which it carrieth along with it 'ſelf

Of the power of chymiſtry.

Of the power of noble menſtruums particularly.

Helm. De Febr. cap. 5. num. 26.

Helmont. de ſign. c. 17. verſ. finem.

'ſelf to overcome diſeaſes.' For concerning this ſalt, he not only elſewhere ſays, *Dicam ſaltem pro ingenuis, quod ſpiritus ſalis tartari, ſi unicornu, argentum, hydrargyrum, lapides cancrorun, vel aliquod è ſimplicibus diſſolverit, nedum febrim, ſed & plures affatim morbos ſanet, &c.* 'I will ſpeak it for their ſakes, who 'are ingenious, that the ſpirit of ſalt of tartar, 'if it diſſolveth unicorn's horn, ſilver, quick-'ſilver, crabs eyes, or other like ſimples, it 'will cure not only fevers, but other diſeaſes 'in great abundance.' But in another place he gives us, together with ſome account of its way of working, this great and comprehenſive commendation of it: *Mirum ſanè*, ſays he, *quantum ſal tartari, vel unicum, volatile factum, non præſtiterit: nam omnem è venis amurcam detergit & obſtruentium contumaciam, diſpergitque apoſtematum ſuſcepta conciliabula. De hoc ſalis (& non olei) ſpiritu, verum eſt illud Paracelſi, quod quocunque non attigerit, vix alius potentior perveniet*: 'It is a wonder what 'the very ſalt of tartar alone being made vola-'tile will perform; for it cleanſes the veins of 'all the feculencies and the cauſes of contu-'macious obſtructions, and doth diſperſe the 'congregated matter of apoſtems. Of this 'ſpirit of the ſalt (and not of the oil) is that 'ſaying of *Paracelſus* true, that whither this 'medicine cannot reach, there is ſcarce any o-'ther more powerful, that ſhall reach it.' Theſe paſſages I ſhould not think worth tranſcribing and laying together, but I find, that beſides the concurrent teſtimonies of *Helmont*, *Paracelſus*, and *Baſilius* in praiſe of this ſalt, the generality of the more inquiſitive chymiſts, without excepting the more ſober and judicious, do, by the various and painful, though fruitleſs attempts they have made to volatilize ſalt of tartar, conſpire in acknowledging it a thing highly worth labouring for; nor do I for my part ſee (whatever ſome ſay to the contrary, and however I have indeed found it more difficult, than perhaps a novice in chymiſtry would think) it ſhould be impoſſible; for I have more than once, with eaſe enough, made gold it ſelf volatile, though it be confeſſed to be the fixedeſt body in the world, and conſequently more fixed than ſalt of tartar, which in an open veſſel may be in time made to fly away by a vehement fire. And I have likewiſe, by an unuſual method, that I have elſewhere delivered, more than once obtained from a mixture of crude tartar, and two or three mineral bodies, good ſtore of true volatile ſalt, which I could ſee no juſt cauſe not to think afforded by the tartar. But I muſt confeſs this may be rather a volatile ſalt of tartar, than ſalt (that is alkali) of tartar made volatile; and therefore the principal thing I mention it for, is to ſhew you, that tartar it ſelf, by an unuſual way of management, may be brought to afford an unuſual kind of ſalt. But this I can tell you, that an ingenious acquaintance of mine, whom notwithſtanding my wonted diſtruſts of chymiſts, I durſt credit, affirmed to me, that he had himſelf ſeen a true and real *Sal tartari volatile*, made of alkali of tartar, and had ſeen ſtrange things done with it, inſomuch that he believed moſt of the things, that *Helmont* delivers of it. For my part I am inclined to think, that ſalt of tartar may be made volatile, (whether in the form of a ſublimate or a liquor) by more ways than one, though not all of them near equally good. And whereas one of the beſt (if not the very beſt) of the ways of volatilizing it, ſeems to do it principally with ſpirit of wine, and the great difficulty of that way conſiſts in bringing this ſpirit to aſſociate with the ſalt; I have ſeen ſalt of tartar of my own brought to that paſs, which great Virtuoſi have long in vain attempted to bring it unto, namely, to flow readily upon a red-hot iron, and alſo to take fire, and burn with a conſpicuous flame, beſides that when it had been dried by a ſmart fire, to drive away any parts, that did not firmly adhere to it, it would yet readily diſſolve in high rectified ſpirit of wine, which you know ſalt of tartar will not otherwiſe do; not to mention the change of its alkalizate taſte, and other leſſer alterations: but what I can farther ſay of this matter, I muſt not declare in this place.

Helm. de ſcholar. humoriſm. paſſ. decept. c. 2. num. 89.

The power of ſal tartari volatilized.

Of the poſſibility of volat. lizing it.

AND, *Pyrophilus*, that you may not be, as many other Virtuoſi, diſcouraged from labouring for noble menſtruums, by the confident perſuaſion of many, who believe *Angelus Sala* and *Guntherus Billychius*, (whom I deny not to have been learned men, do not take to have been great maſters of chymical *Arcana*) fit to determine with authority what can, and what cannot be done by chymiſtry; leſt, I ſay, you ſhould be, by ſuch men's inconſiderate ſeverity, brought to deſpair of ever ſeeing any noble menſtruum, that is not ſharp to the taſte, nor of any of the three peculiar kinds of ſaline liquor; (acid, as aqua fortis; urinous, as the ſpirits of blood, urine, and other animal ſubſtances; nor alcalizate, as oil of tartar *per deliquium*:) I ſhall aſſure you, that to my own knowledge there is in the world a kind of menſtruum, that conſiſts of a pure cryſtalline ſubſtance, that is made by the fire, and as truly ſaline as ſalt of tartar it ſelf; which ſtrange ſalt, though well purified, and readily diſſoluble, as well in dephlegmed ſpirits of wine, as common water, and though it be totally volatile (whence you may gueſs of how ſaline a nature it is) and alſo be either way reducible to a noble menſtruum, does really taſte ſweet; I mean not in the chymical ſenſe, by want of ſourneſs, (as when they ſay, that the *calces* of corroded and precipitated things are dulcified by frequent ablutions) but by a poſitive ſweetneſs. And whereas the vulgar ſaline menſtruums, (which alone ſeem to have been known to *Sala* and *Billychius*) are ſo ſpecificated, if I may ſo expreſs it, that what an acid menſtruum diſſolves, an alcalizate or an urinous will precipitate, *& è converſo*; and whichſoever you chooſe of theſe three ſorts of menſtruums, one of the other two will diſarm and deſtroy it; I have found by trial, not only that a red tincture of glaſs of antimony, being drawn with a menſtruum, that was but a degree to this liquor, I could not precipitate it like our common tinctures, either with ſpirit of urine, or an alcalizate ſolution. But that (which is far more conſiderable) though it would readily mix with acid

That there may be other menſtruums beſides ſuch as are acid, urinous, or alkalizate.

How theſe ſeveral diſarm and deſtroy one another, and what an acid menſtruum diſſolves, an urinous or alkalizate doth precipitate.

Of a menstruum like to all these.

spirits, as oil of vitriol, with volatile and urinous spirits, as spirits of urine it self, and with alcalizate solutions; yet would neither of these three make any ebullition at all with it, or seem to work at all upon it. But of such matters, no more at present.

CHAP. IX.

That chymistry it self (much more physiology) is capable of affording a new and better methodus medendi.

YOU will perhaps expect, *Pyrophilus*, that treating of the advantages, that may accrue to the therapeutical part of physick, from a more accurate knowledge of natural philosophy, I should tell you with the chymist, that chymistry it self, and much more physiology in its full extent, is not only capable of improving the pharmaceutical part or preparations for remedies, (for that we confessed already;) but also of affording us a new and much better *methodus medendi*, or skill of using the helps, that nature or art hath provided against diseases. And indeed the physician's art is so difficult, and a man must know so many things, to be, though not tolerably, yet perfectly skilled in it, that it may, without disparagement to physicians, be thought yet capable of being improved, if not of being reformed. *Hippocrates* begins his aphorisms with a complaint, that life is short, but art long. And *Paracelsus* himself, though he say after his boasting manner, *Ars est longa, vita brevis, ubi autem donum finis* (as he speaks) *est, ibi ars est brevis, vita verum longa, si arti conferatur:* 'Art is long, life is short. But where 'the end is by gift, there art is short, and 'man's life long, if it be compared to art.' Yet expounding the same words a little above, he saith, *Itaque Hippocrates meritò de eo conqueritur: nam & affectis ipsius idem accidit: ars medica consistit in philosophia, astronomia, alchymia, & physica; meritò igitur dici potest artem esse longam. Multum enim requiritur temporis, ad quatuor has columnas medicinæ discendas & perscrutandas.* 'Therefore *Hippocrates* had 'reason to make the complaint, for it even 'happened to his followers according to his 'words. The art of medicine consists in 'philosophy, astronomy, chymistry, and phy-'sicks; and therefore it may truly be said, that 'the art is long: for there is much time re-'quired, thoroughly to learn and search these 'four pillars of medicine.' *Celsus*, who hath been styled *Hippocrates Latinorum*, doth more than once call physick a conjectural art, as particularly in that place, where he saith, *Est enim hæc ars conjecturalis, neque respondet ei plerumque non solum conjectura, sed etiam experientia:* 'For this art is conjectural, and not 'only conjecture, but experience it self doth 'not always answer.' And well might these great men acknowledge their art to be difficult, since the two instruments (as *Galen* calls them) of finding arts, being judgment and experience, *Hippocrates* gives this character of them; ἡ δὲ πεῖρα σφαλερὴ, ἡ δὲ κρίσις χαλεπὴ· 'Expe-'perience is uncertain and fallacious, judg-'ment is difficult to be made.' And that experience may be uncertain without the theory of physick, he, that so much builds upon experiments, *Paracelsus* himself, seems to confess; where expounding the words of *Hippocrates*, he saith, *Hoc modo se habuit medicina in principio; ut nullam theoriam habuerit, sed solùm experientiam hoc laxare, hoc constipare, quomodo autem & cur, id ignoratum fuit: ideo unus salvatus est, alter perditus, nunc autem, &c.*' 'And 'this was the fashion of medicine in the begin-'ning, that it had no theory, only experience, 'that such a thing was laxative, such a thing 'astringent: but how, or why they were so, 'that was not found out; and therefore one 'was healed, another perish'd: but now, &c.' And concerning the critical part of physick (to allude to *Hippocrates*'s expression) *Galen*, who exercised his reason so much about it, tells us that, *per rationem judicium haudquaquam facile exsistit, sed, si quid aliud, maximam habet difficultatem:* 'By reason it is not easy in a disease 'to give judgment, but it is as difficult as any 'thing imaginable.' And to affirm the difficulty of finding the best way of imploying reason to the cure of diseases, not only by the authority of *Galen*, but his arguments; let me inform you, that after having told us, how difficult a thing, and how rarely to be found is that reason, which considers, and determines what on every occasion is to be done, *Neque enim* (adds he) *si veritas esset inventu facilis, tot ac tanti viri in ea quærenda occupati, in tam contrarias sectas fuissent unquam dispertiti:* 'For 'if the truth were easy to be found, so many 'and so excellent men, as have made it their 'business to find it, had never been divided 'into so many sects and opinions.' And *Paracelsus*, whatever he often elsewhere boastingly affirmeth of himself, yet handsomely enough both expresseth and confesseth the difficulty of being a good physician, in one of his *Prefaces* to the Students of Physick; where he says, *Non titulus, non eloquentia, non linguarum peritia, nec multorum librorum lectio (etsi hæc non parum exornant) in medico consideranda, sed summa rerum ac mysteriorum cognitio, quæ una facile aliorum omnium vices agit. Rhetoris quidem est disertè posse loqui ac persuadere, atque judicem in suam sententiam trahere. Medici autem effectuum genera, causas ac συμπτώματα novisse, & iis insuper sagacitate ac industriâ pharmaca applicare, atque pro cujuslibet ingenio ac ratione vel cunctis mederi:* 'It 'is not a title, nor eloquence, nor skill in 'the tongues, nor the reading of many books '(though these are ornaments) which are to be 'considered in a physician; but a prime know-'ledge of matters and mysteries, which alone 'may stand in the stead of all the rest. It is 'the part of a rhetorician to speak eloquently, 'to be able to persuade, and to draw the judge 'to his own party. It is the part of a phy-'sician to know the several sorts of diseases, 'their causes and symptoms, and then with 'skill and industry to apply medicines and 'to make cures of them all, according to their 'several natures and fashions.' But though, *Pyrophilus*, after the acknowledgments made by such great men of the almost insuperable difficulty of their art, you would perhaps think it no great presumption, if a man should attempt to innovate in any part of it, and consequently

Lib. 2. c. 6.

In præfat. lib. 1.

In Commentar. Aphoris. 2.

Paracelsus *in his* Preface to *his* Bertheona, *or* Chirurgia minor.

ſequently even in the *methodus medendi*: yet, *Pyrophilus*, I am much too young, too unlearned, and too unexperienced, to dare to be dogmatical in a matter of ſo great moment. And the phyſicians are a ſort of men, to whoſe learned writings on almoſt all ſubjects, the commonwealth of learning is ſo much beholden, that I would not willingly diſſent from them, about thoſe notions in their own profeſſion, wherein they ſeem generally to agree; and do very much diſapprove the indiſcreet practice of our common Chymiſts and Helmontians, that bitterly and indiſcriminately rail at the methodiſts, inſtead of candidly acquieſcing in thoſe manifeſt truths, their obſervations have enriched us with, and civilly and modeſtly ſhewing them their errors, where they have been miſtaken. And yet, *Pyrophilus*, ſince divers of the eminenteſt methodiſts themſelves have more than once ingeniouſly acknowledged to me, and ſeriouſly deplored with me, in the compleatneſs of their art, (which perhaps made that learned prince, the late king, tell them, that they were at beſt but good gueſſers;) and ſince about divers particular diſeaſes we have obſerved, the method of ſome of the moſt reputed doctors of *England* (which yet, I think, is as well ſtored with learned men of that profeſſion, as any part of *Europe*) not only differing, but repugnant to each other; I ſuppoſe we may, without diſreſpect to their profeſſion, diſſent from the moſt of them about thoſe caſes, about which they are reduced to diſagree ſo much among themſelves. And it would be worth an impartial diſquiſition, whether, ſince the *methodus medendi* ought to be grounded on, and accommodated to, the doctrine of diſeaſes, the new anatomical diſcoveries formerly mentioned, and others not yet publiſhed, do not, by innovating divers things in pathology, require ſome alterations and amendments in the *methodus medendi?* But in this particular, I dare yet affirm nothing; and therefore ſhall proceed to obſerve to you, that the unuſual efficacies of new remedies may probably make the method of curing more compendious, becauſe (as I lately alſo intimated) one medicine may be ſo richly qualified, as to anſwer ſeveral intentions, which, in the common way, require diverſity of helps and remedies. Thus, for inſtance, in the cure of the king's-evil; by the received method, the phyſician muſt propoſe to himſelf ſeveral ſcopes (ſuited to ſeveral indications) and proſecute them ſucceſſively with diſtinct and appropriated remedies. But I have (as I formerly alſo told you to another purpoſe) known a ſingle ſpecifick ſimple, (namely, *Paronychia folio rutaceo*) given only in ſmall beer, in not very many days, without any ſenſible evacuation, waſte the peccant humour, appeaſe the pains (which before were very great) and diſcuſs the unbroken tumours, and heal the broken ones. Thus, according to the known method, the great remedy in pleuriſies is copious blood-letting, which is ſtrictly preſcribed, even to aged perſons and teeming women, by the famouſeſt of our practitioners; and, I confeſs, not irrationally where the phyſician is furniſh'd but with vulgar remedies: and yet by ſome Helmontian medicines, we have known pleuriſies cured even in young men, without phlebotomy, and our ſelves, ſome while ſince, made a ſucceſsful trial of that nature in a young gentleman not unknown to you: which I mention not, with *Helmont*, to reject, or ſo much as to diſparage phlebotomy in this diſeaſe, (for ſo it be moderate and ſeaſonable, experience ſhews it frequently proves uſeful) nor, as if we had obſerved all *Helmont*'s boaſted remedies (though for the moſt part good ones) to be conſtantly ſucceſsful; but to give you an inſtance of the truth of what I was ſaying before, that new and more generous remedies may ſo far alter the received *methodus medendi*, as to make divers of its preſcriptions unneceſſary. Of this truth, *Pyrophilus*, another inſtance might be afforded by the rickets, a new and abſtruſe diſeaſe, at leaſt as is ſuppoſed; and ſometimes ſo ſtubborn, that one of the famouſeſt phyſicians in *Europe*, (whom I think I need not name) hath not been able of late to cure it in ſeveral of his own children. And yet, I ſuppoſe, you may have heard that excellent perſon, your mother, ſeveral times mention her having performed divers cures (ſome of them improbable enough) of this diſeaſe, barely by that ſlight preparation of colcothar, lately taught you, and preſented her by us; and by which (we having made and diſtributed, at her deſire, a conſiderable quantity of it) ſeveral other perſons have freed children from that diſfiguring ſickneſs: of which, but few months ſince, your little couſin *D.* being almoſt paſt hope, was a while ſince brought out of danger, by God's bleſſing upon ſome of the ſame remedy, wherewith we preſented her mother, together with our perſuaſions to try it in her own child, as ſhe had ſucceſsfully done on the children of divers others. And yet this remedy (to add that upon the by, in favour of ſomething to be ſaid anon) works almoſt inſenſibly, ſave that in many bodies it is, eſpecially at firſt, diaphoretick. And this property of that remedy minds me to add, that it would not be amiſs for phyſicians, to conſider, whether or no (however, bleeding, purging, vomiting, iſſues, glyſters, ſcarifications, and thoſe other painful ways of evacuation, be not, however chymiſts are too bitterly and undeſervedly wont to reject them, to be altogether condemned and laid aſide, yet) there may not in ſome particular diſeaſes and bodies be found more gentle, and yet effectual ways of diſcharging nature of that which offends her, than thoſe painful and debilitating ones, which we have mentioned, (without the uſe of one of the chief of which, namely, phlebotomy, we ſee that almoſt all kinds of diſeaſes are cured in children.) The contributing to render the ways of cure leſs painful and weakening, would gratify ſo great a part of thoſe, who may need phyſick, that I hope, you will eaſily pardon my ſpending ſome pages to that purpoſe. I conſider then, that oftentimes the peccant matter, though very offenſive by its qualities, is much leſſer than is ſuppoſed, in quantity, and might, if we were but maſters of ſpecifick remedies, either be breathed out by inſenſible tranſpiration,

Inſtances to prove, that the unuſual efficacies of new remedies may alter and make the method of curing more compendious; in the king's evil.

Pleuriſies.

In the rickets.

tranſpiration, or carried off by ſweat or urine, without tormenting or weakening the patient, by thoſe other copious evacuations of groſſer matter, which are always troubleſome and painful enough, though not always eſſential. Nay, that even in chirurgery it ſelf, if thoſe, that practiſe it, were as knowing as nature has been bountiful, there would not be ſo often a neceſſity, as it is commonly ſuppoſed there is, of mutilating or tormenting the patient to recover him, you cannot doubt, unleſs you will deny what *Gulielmus Piſo* affirms, upon his own obſervation, of the cures done by the illiterate Indian empiricks. The paſſage you have ſeen already; but to it he adds ſo notable and ingenious an acknowledgment, that I cannot but honour him for it, and be willing to make way for the credibility of a good part of what we are hereafter to deliver, in this diſcourſe, by premiſing it: *Immo* (continues he) *ex venenatorum fungorum aliorumque toxicorum eſu, ſolo potu infuſi recentis radicis Jaborandi in inſtanti à letho vindicatos, me aliiſque Galeni nepotibus haud parum pudore ſuffuſis, poſt tot alexipharmacorum & theriacalium antidotalium irritos conatus. Ita ut poſtea ejuſmodi collegas barbaros ſubinde mihi adjungi paſſus ſim, non adeo quidem noſtratium valetudinem ad tactum arteriarum moderari, quam dictis modis conſiliis copiam præbere ſolitos.* 'Nay, I ſaw divers, as it were in an 'inſtant, redeemed from death, who had 'been poiſoned by the eating of venomous 'muſhrooms and other unwholeſome things, 'only by drinking a recent infuſion of the root 'Jaborand, whilſt my ſelf and other of *Galen*'s 'diſciples bluſh'd to ſee the ineffectual endeavours of all our alexipharmaca, treacles, and 'other antidotes: ſo that afterwards I ſuffered 'my ſelf to be joined in conſultation with thoſe 'barbarous collegues, not ſo much to be arbiters of the condition of our men by their 'pulſe, as to give their aſſiſtance and counſel 'in the forementioned way, *viz.* the preſcribing of proper medicines.' Thus far he: which premiſed, let us proceed to conſider, more particularly, ſome of the leſs painful ways of freeing men from diſeaſes.

CHAP. X.

That great cures may be done by outward applications.

THAT great cures may be done by bare outward applications, you will ſcarce deny, if you diſbelieve not the relations, which are made us, by learned men, concerning the efficacy of the *lapis nephriticus* only, bound upon the pulſes of the wriſts (chiefly that of the left hand) againſt that ſtubborn and anomalous diſeaſe the ſtone: and that, which gives the more credit to theſe relations, is, that not only the judicious * *Anſelmus Boëtius de Boot* ſeems to prize it, but the famous *Monardes* profeſſeth himſelf not to write by hearſay of the great virtues of this Indian ſtone, but to have made trial of it himſelf upon perſons of very high quality. And that which is related by † *Monardes* is much leſs ſtrange, than thoſe almoſt incredible things, which are with many circumſtances delivered of that ſtone, by the learned chymiſt ‖ *Untzerus*. And although it muſt be acknowledged, that ſome ſtones that go under the name, have been ineffectually applied in nephritick diſtempers, yet the accurate *Johannes de Laet* himſelf furniſheth us with an anſwer to that objection, informing us, that many of thoſe nephritick ſtones (which differ much in colour, though the beſt are wont to be greeniſh) although not at all counterfeited, or ſophiſticated, are of little or no virtue. But that yet there are ſome others of them, which can ſcarce be diſtinguiſhed from the former, but by trial upon nephritick perſons, which are of wonderful efficacy; as he himſelf hath more than once tried in his own wife. *Garcias ab Orto* (Lib. 1. cap. 53.) mentions a ſtone, found in *Balagat* called *Alaqueca*; of which he tells us, that though it be cheap, *Hujus tamen virtus* (to uſe his own words) *reliquarum gemmarum facultates exuperat, quippe qui ſanguinem undiquaque fluentem illico ſiſtat.* 'The virtue of this ſtone is much above that 'of any other gems; for it ſtops the flux of 'the blood in any part.' *Monardes* (cap. 35.) relates the great virtues of a ſtone againſt hyſterical ſuffocations, and concludes, *Cum uteri ſuffocationem imminentem præſentiunt, adhibito lapide ſubito levantur, & ſi eum perpetuo geſtant (hyſterici) nunquam ſimili morbo corripiuntuur, exempla hujuſmodi faciunt, ut his rebus fidem adhibeam.* 'When the women perceive a fit 'of the mother coming upon them, by apply-'ing this ſtone they are immediately eaſed; 'and if they always wear it, they are never 'troubled with thoſe fits more. Of this they 'make faith, by many inſtances.' The ſame author, in the next chapter, treating of the *lapis ſanguinaris*, or blood-ſtone, found in new *Spain*, (having told us, that the Indians do moſt confidently believe, that if the fleſh of any bleeding part be touched with this ſtone, the bleeding will thereby be ſtanched) adds this memorable obſervation of his own; *Vidimus nonnullos hæmorrhoidum fluxu affictos remedium ſenſiſſe, annulos ex hoc lapide confectos in digito continue geſtando; nec non & menſtruum fluxum ſiſti.* 'We have ſeen ſome, that were 'troubled with the flux of the hæmorrhoids, 'who found remedy by wearing rings made of 'that ſtone continually on their fingers, and 'the monthly flux is ſtaid by the ſame way.' And of the formerly mentioned *lapis porcinus*, the experienced *Bontius* (having mentioned how the Indians give the wine, wherein it hath been ſteeped, againſt the diſeaſe called *Cholera*; which is as much, and as juſtly feared, by the iſlanders of *Java*, as the plague is in *Holland*) adds this memorable paſſage: *Prægnantibus tamen hic lapis non bene datur; nam abortum provocare adeo certum eſt, fœminæ Malaicæ mihi retulerint, ut ſi quando menſtrua eorum purgatio non bene procedat, ſi ſaltem hunc lapidem manu geſtent, juvamentum ſe inde ſentire.* 'This ſtone 'is not proper for thoſe, who are with child, for 'it is ſo ſure to cauſe abortion, that the women 'of

Franciſcus Bernius, Donzellinus, Erneſtus Burgravius; *who commend it upon their own experience, beſides very many, that commend it in general terms.*

* *De Lapid. & Gem.* Lib. 2. cap. 11. † *Nicolaus Monardes de ſimplic. Ind. Hiſt. à. ſeu tit.* 20. ‖ *De Nephrit.* Lib. 1. c. 24. where he hath nine or ten *Obſervationes raræ & inauditæ de Lap. Nephritico.* Of the efficacy of *Lapis Nephriticus* and other *appenſa. De Gem. & Lapidibus*, Lib. 1. c. 23.

'of *Malaica* told me, that if at any time their 'monthly evacuations were obſtructed, that if 'they only carried this ſtone in their hands, they 'found remedy thereby.' And the relations, *Pyrophilus*, that I may in another place preſent you with, concerning the wonderful ſtone, formerly mentioned, with which your grandfather performed ſuch eminent cures, (particularly of the ſtone, in the Lord of *Falkland*, then deputy of *Ireland*, and others, to whoſe backs it was applied) will, I ſuppoſe, make you the more readily give credit to the relations of the authors we have newly mentioned.

Helm. de lyth. c. 2. What *Monardes* mentions of the virtue of the *lapis ſanguinaris*, to cure hæmorrhoidal fluxes, puts me in mind of a yet much ſtranger thing, which *Helmont* affirms; namely, that he could make a metal, of which if a ring were worn, the pain of the hæmorrhoids would be taken away, in the little time requiſite to recite the Lord's prayer; and within twenty four hours the hæmorrhoids themſelves, as well internal as external, how protuberant ſoever, would vaniſh, and the reſtagnant blood would (as he ſpeaks) be received again into favour, and be reſtored to a good condition. The ſame ring he alſo commends in the ſuffocation and irregular motion of the womb, and divers other diſeaſes: but if *Paracelſus* be in any caſe to be credited in an unlikely matter, we may think, by his very ſolemn proteſtations, that he ſpeaks upon his own experience, that he had a ring made of a metalline ſubſtance, by him called *electrum*, (which, by his deſcription, ſeems to be a mixture of all the metals joined together under certain conſtellations) which was of a far greater virtue than this of *Helmont*; for, *Hoc loco* (ſays he) *non poſſum non indicare admirandas quaſdam vires virtuteſque electri noſtri, quas fieri his noſtris oculis videmus, adeoque cum bona veritatis conſcientia proferre atteſtarique poſſumus. Vidimus enim hujus generis annulos, quos qui induit, hunc nec ſpaſmus convulſit, nec paralyſis corripuit, nec dolor ullus torſit, ſimiliter nec apoplexia, nec epilepſia invaſit. Et ſi annulus hujuſmodi epileptici digito annulari, etiam in paroxyſmo ſæviſſimo, incertus fuit, remittente illico paroxyſmo, æger à lapſu illico reſurrexit, &c.*

Paracelſ. in Archidox. Magic. lib.

'In this place I cannot but relate the admirable virtues of our electrum, which I have obſerved with my own eyes, and therefore can atteſt with a good conſcience. For we ſaw rings of it, which he that wore neither felt cramp, nor palſy, nor other pain. He was ſubject to no fits of apoplexy, nor epilepſy, inſomuch that if one of theſe rings were put upon the ring-finger of a perſon actually in any vehement fit of the falling ſickneſs, that fit would immediately aſſuage, and the perſon as ſoon come to himſelf.' But to take notice of ſome other outward remedies. To our preſent theme belongs that noble cure, performed by the famous and experienced *Fabricius ab Aquapendente*; who tells us, that he cured a man of a *ſcirrhus lienis*, and a dropſy, by the long uſe of ſponges, moiſtened with common lime-water, and then expreſſed and worn upon the ſpleen; notwithſtanding the muſcles of the abdomen, and all the other parts, that lie betwixt the applied ſponge and the part affected. And to this we may add the ſtrange cures mentioned by *Kircherus*, and confirmed to me by a learned eye-witneſs, to be frequently performed, of very dangerous diſeaſes, in that cave near *Rome*, where the patient being expoſed ſtark naked, and tied hand and foot upon beds of ſtraw; and being by the ſulphureous vapour of the place, and ſometimes their own fear, caſt into a ſweat, are licked well by a great number of peculiar kind of ſerpents that inhabit that grotta. Moreover, we oftentimes ſee agues cured by amulets and applications to the wriſts, and I myſelf was, about two years ſince, ſtrangely cured of a violent quotidian, which all the wonted method of phyſick had not ſo much abated, by applying to my wriſts a mixture of two handfuls of bay-ſalt, two handfuls of the freſheſt Engliſh hops, and a quarter of a pound of blue currants, very diligently beaten into a brittle maſs, without the addition of any thing moiſt, and ſo ſpread upon linen cloth, and tied about the wriſts. And with the ſame remedies (which yet we have obſerved ſometimes to fail) have divers others been cured, both of quotidian and tertian agues: nay, an eminent phyſician gave me, lately, thanks, for the great effects he had found of it, even in continual fevers.

Of ſtrange cures performed near Rome *in the ſerpentine grotta.*

De operat. chirurg. p. 1. c. 15.

The cures of the dropſy and ſcirrhus lienis by the external application of ſponges dipt in lime-water.

Of the operations of ſulphur, cantharides, quick-ſilver, and tobacco externally applied.

AND here, *Pyrophilus*, I ſhall not ſcruple to acquaint you with my having ſometimes wiſhed, that phyſicians had been a little more curious to make obſervations and trials of the diſtinct operations of various bodies outwardly applied. For I conſider, that, in ſome of them, the ſubtile corpuſcles, (which ſeem to inſinuate themſelves into the pores of the body, and into the maſs of blood, with little or no alteration) have much the like operations with the body, whence they exhale, taken in at the mouth. As we ſee in ſome preparations of ſulphur, which have like vertues, inwardly given, and outwardly applied; and more manifeſtly in *Cantharides*, which I have found, by external application, to work ſtrangely upon the bladder, as that they excoriated it when taken into the body; and yet more manifeſtly in quick-ſilver, which by inunction may be made as well to ſalivate, as if it were ſwallowed down. And an eminent phyſician lately complained to me, that waſhing a child's ſcabby head with a decoction of tobacco, to kill and dry up the ſcabs, the boy was made thereby both ſick and drunk. And learned men aſſure us, that by ſome catharticks outwardly applied, thoſe may be purged, that will not ſwallow phyſick. But other medicines there are, which, before they get into the maſs of blood, are much altered, either in ſtraining through the fleſh and membranes of the body, or in the digeſtions they paſs through in the ſtomach, and elſewhere. And theſe may have very differing effects, inwardly given, and outwardly applied; as in the formerly mentioned inſtance of hops, currants, and ſalt, neither any of the ingredients inwardly given, nor the mixture hath been (that I know of) noted for any febrifugal virtues. So likewiſe turpentine and ſoot, that inwardly taken are good for quite

Inſtances in divers medicines, which have differing effects inwardly given, and outwardly applied.

other diſeaſes, (as pleuriſies, and obſtructions of the kidneys) outwardly applied are the main ingredients of pericardiums, extolled againſt agues. And millefolium or yarrow, beſides the virtues it hath inwardly againſt diſeaſes of quite other natures, being worn in a little bag upon the tip of the ſtomach, was (as himſelf confeſt to me) the ſecret againſt agues, of a great lord, who was very curious of receipts, and would ſometimes purchaſe them at very high rates. And a very famous phyſician of my acquaintance did ſince inform me, that he had uſed it with ſtrange ſucceſs. I know alſo a very happy phyſician, who aſſures me, that he hath very often cured, both in himſelf and others, the chilblains, when they come to be broken, by barely ſtrowing on the ſore parts the fine powder of quinces thinly ſliced and dried. And who knows, what unexpected operations divers other bodies may have, when outwardly applied, if various trials of that nature were ſkilfully made; eſpecially ſince we ſee, that (for reaſons elſewhere to be conſidered) ſome bodies ſeem to have quite contrary operations, when outwardly applied and inwardly taken? For we ſee, that ſpirit of wine does, in ſeveral caſes, allay the inflammation of the external parts, which given inwardly would quickly inflame the body. And our often commended *Piſo*, ſpeaking of a choice remedy for thoſe diſtempers of the eyes, that uſed to trouble men in *Braſil*, adds, *Idem quoque præſtat maniphera, ex radice mandihoca, quæ licet pota venenoſa habeatur* (as we formerly noted out of his and other teſtimonies) *oculis tamen prodeſt, viſumque emendat.* And if the ſimples, to be outwardly applied, be ſkilfully prepared, that may much vary and improve their operations. As we ſee, that vitriol, which is made of copper, or iron corroded by, and coagulated with acid ſalts, hath outwardly divers virtues, which crude copper has not either outwardly or inwardly. And gold diſſolved in aqua regis, and precipitated with oil of tartar, is inwardly, as far as I can diſcover, gently purgative; yet the ſame *aurum fulminans* being calcined with twice or thrice its weight of flowers of brimſtone, till the *flores* be burnt away, is known to be much commended by chymiſts, and others, for a diaphoretick. But though, as to any outward virtues of the ſame powder, phyſicians and chymiſts are wont to be ſilent, yet probably it may have very great ones, as well as quite differing from thoſe it has, being taken at the mouth. For I know a perſon, that being grievouſly tormented with exulcerated hæmorrhoids, a very expert chymiſt of my acquaintance, not knowing what elſe to do, applied to the part affected an ointment conſiſting only of *aurum fulminans*, prepared and fixed by a ſlight and familiar way (which you may command) and made up with a little oil of ſweet almonds into a requiſite conſiſtence; and though preſently, upon the application of the remedy, the pain for a quarter of an hour hugely increaſed, yet ſoon after it abated, and the hæmorrhoids the next day were cloſed, and the day after went away; nor has the patient ever ſince (that is, for ſome years) been troubled with any thing of relapſe. And the ſame phyſician aſſures me, that with the like remedy [illegible] found a ſtrange effect in venereal ulcers. And perhaps to this may be referred what has been found by ſome friends of mine, that phlegm of vitriol, and *ſaccharum Saturni*, which not only inwardly given are ſaid much to cool the blood, but outwardly applied are good for burns and hot humours, do yet potently diſcuſs cold tumours. But leſt you ſhould ſay, that this diverſity may proceed (at leaſt in part) from the corpuſcles of differing natures, that may be imagined in the forementioned medicines; I ſhall return to what I was diſcourſing of before, and take notice of the efficacy of ſome other external remedies.

That preparation may much improve ſimples, which are outwardly applied.

Inſtances in divers preparations of gold.

An ointment made of aurum fulminans for the hæmorrhoids and venereal ulcers.

[SINCE the beginning of this eſſay, I ſaw a luſty and very ſprightful boy, child to a famous chymical writer, who, as his father aſſured me and others, being by ſome enemies of this phyſician's, when he was yet an infant, ſo bewitched, that he conſtantly lay in a miſerable torment, and ſtill refuſing the breaſt, was reduced, by pain and want of food, to a deſperate condition, the experienced relater of the ſtory remembering, that *Helmont* attributed to the *electrum minerale immaturum Paracelſi* the virtue of relieving thoſe, whoſe diſtempers come from witchcraft, did, according to *Helmont*'s preſcription, hang a piece of this noble mineral about the infant's neck, ſo that it might touch the tip of the ſtomach; whereupon preſently the child, that could not reſt in I know not how many days and nights before, fell for a while aſleep, and waking well, cryed for the teat, which he greedily ſuckt, from thenceforth haſtily recovering, to the great wonder, both of his parents, and ſeveral others, that were aſtoniſhed at ſo great and quick a change. And though I am not forward, to impute all thoſe diſeaſes to witchcraft, which even learned men father upon it; yet it is conſiderable in our preſent caſe, that whatſoever were the cauſe of the diſeaſe, the diſtemper was very great and almoſt hopeleſs, and the cure ſuddenly performed by an outward application, and that of a mineral; in which compacted ſort of bodies, the finer parts are thought to be more locked up.]

The cure of a perſon eſteemed bewitched, by an appended mineral.

AMONG the proofs of the efficacy of appended remedies, we muſt not pretermit the memorable examples, that are delivered by the judicious *Boetius de Boot*, concerning the virtues of that ſort of jaſper, which is blood-red throughout the whole body of the ſtone, not being mingled with any colour: *Teſtari poſſum* (ſays he) *me, qui alias lapidibus & gemmis tantas vires, quantas vulgus ſolet, non tribuo, credibile vix, de jaſpidis viribus, obſervaſſe. Nam cum ancilla fluxu menſtruorum ita laborâſſet per aliquos dies, ut nullo modo ſiſti poſſet, jaſpidem rubram impolitam & rudem femori alligari juſſi. Alius (in eadem domo) cum in pede vulneratus eſſet, nec ſanguinis fluxus cohiberi poſſet, admoto lapide, extemplo impeditus fuit, licet vulnus non tegeretur.* To theſe he adjoins a much more memorable example, of a maid he cured at *Prague*, who had been for ſix years ſick of an hæmorrhagy ſo vehement, that there ſcarce ever paſt a week, in which ſhe did not ſeveral times bleed,

The power of the jaſper to ſtanch blood.

De Lapid. & Gem. l. 2. cap. 102.

bleed, neither could ſhe be relieved by any remedies, though ſhe had long uſed them, till ſhe was quite tired with them: wherefore our author ſetting them aſide, lent her a jaſper, of whoſe virtue in ſuch caſes he had made good trial, to hang about her neck, which when ſhe did, the flux of blood preſently ceaſed, and ſhe afterwards, for curioſity ſake, oftentimes laying aſide the ſtone, and, as often as ſhe needed it, applying it again, obſerved, that whereas the flux of blood did not preſently return upon the abſence of the jaſper, but after divers weeks, yet upon the hanging it on again it would preſently be ſtopt; ſo that ſhe could not aſcribe the relief to any thing but the ſtone, by which our author tells, that at length ſhe was quite cured. And ſpeaking of the praiſes given by others to green jaſper ſpeckled with red, he concludes, *Sed ego, quod multoties expertus ſum, refero.* But amongſt the operations of outwardly appended medicines, I have ſcarce met with a ſtranger than that, which the experienced *Henricus de Heer* mentions in the fourteenth of thoſe obſervations which he truly ſtiles rare, namely, that a woman, who had by an unſkilful midwife the bladder lacerated, and thereby been ſubject to a perpetual *incontinentia urinæ*, and had been reduced conſtantly to wear a ſilver pipe, was perfectly helped, by wearing, as a gipſy had taught her, a little bag hung about her neck, containing the powder made of a live toad, burnt in a new pot. Which relation I the rather mention, not only becauſe the author having tried the remedy upon a merchant, to whom an unſkilful lithotomiſt had left the like diſeaſe, found it preſently to ſucceed; but becauſe having been very deſirous to have further trial made of ſo odd a remedy, by a curious phyſician, he lately gave me this account of it, that though in one or two it had failed, yet having given ſome of the powder to an exquiſite perſon, known to us both, he aſſured him it had ſucceeded in two or three. (And the diſeaſe is too unfrequent, to give occaſion to have the remedy often tried.) And the phyſician adds, that one of thoſe patients tells him (the phyſician) that though her infirmity were occaſioned by a *laceratio veſicæ*, yet the remedy helps her, as long as ſhe wears it about her, in caſe ſhe renew the powder, when the virtue of it begins to decay; but that (which is remarkable to our preſent purpoſe) if ſhe leaves it off a while, ſhe finds the diſeaſe return. The ſame *Henricus ab Heer*, among his freſhly commended obſervations, has another of a little lady, whom he concludes to have been caſt into the ſtrange and terrible diſtemper, which he there particularly records, by witchcraft. Upon ſo ſevere an examination of the ſymptoms made by himſelf, in his own houſe, that if, notwithſtanding his ſolemn profeſſions of veracity he miſ-relate them not, I cannot but wonder he ſhould confidently impute ſo prodigious a diſeaſe to ſome ſupernatural cauſe. But though the obſervation, with its various circumſtances, be very well worth your peruſing; yet that, for which I here take notice of it, is, what he adds about the end of it, concerning his having cured her, after he had in deſpair of her recovery ſent her back to her parents, by an outward medicine, namely, an ointment, which he found extolled againſt pains produced by witchcraft, in a Dutch book of *Carrichter's*: (where alſo I remember I met with it, ſet down a little differing from what he delivers.) Of which wonderful ointment, the ingredient that he found ſo extremely difficult to procure, namely, the miſletoe of hazel, being in *England* not ſo rare, but that I have more than once got it, and found, as he intimates, very green, and (what he mentions not) extremely bitter, I could wiſh, that thoſe, that have the opportunity, would make trial. For beſides what *Carrichter* delivers, and our author relates of it, a learned phyſician did highly commend it to the judicious *Gregorius Horſius*. And though if we allow it to cure bewitched patients, the virtue, that may be in external remedies, will be made ſo much the more conſpicuous; yet ſuppoſing the diſeaſes to be, though ſtrange, yet but natural, we cannot but allow, that there may be a wonderful efficacy in an outward remedy, ſince it was able, only by anointing the joints, and thoſe pained parts with it, to cure a radicated diſeaſe, attended with ſuch wonderful and horrid ſymptoms. And after this it may ſeem but little, what elſe would appear a ſtrange thing, which *Helmont* affirms of a plaiſter he had, wherewith he tells us, that he ſafely cured hundreds of quartans, even autumnal, without relapſe: elſewhere he ſaith, that he made his plaiſter, (for by the circumſtances I preſume he means no other,) of a few reſolving and abſterſive things, and adds, that it never failed him, but only that in fat perſons it ſucceeded more ſlowly. And yet in theſe, and the like ways of curing diſeaſes, though approved, if not alſo commended, by eminent phyſicians both ancient and modern, there is no ſenſible evacuation made of peccant humours, which perhaps materially remain in the body, and may, by the effluvia of theſe remedies, be deprived of their former qualities, and made ſo far obſequious to nature, that ſhe is able, if need be, to eaſe her ſelf of them by ſweat, urine, or undiſcerned tranſpiration.

Helmont cured quartans by a plaiſter.

Helmont. De Febr. cap. 14. verſ. finem.

Cap. 17. in fine.

AND that the peccant humours remain for a while materially in the body (the diſeaſe ſometimes being removed) may appear by the cures, which we ſee now and then performed of agues by ſudden frights; by which no diſcernible evacuation is made of humours, though probably ſome conſiderable change be thereby produced in the temper of the maſs of blood, or in the texture of the morbifick matter (as phyſicians call it;) as ſeems probable, both from divers other things mentioned here and there in this eſſay, and particularly from the lately recited paſſage of *Helmont*, where he takes notice of the rectifying of the peccant, and by nature rejected blood, without any ſenſible evacuation, upon the wearing of his ring. I knew a gentleman, a ſtrong and reſolute man, who had been long a ſoldier, and attained the higheſt ſort of military imployments; notwithſtanding which, he was ſtrangely fearful of rats, and could not endure the ſight of them: this gentleman having been long troubled with an obſtinate

Diſeaſes cured by frights.

obſtinate quartan, and travelled with it into ſeveral countries, without being able to find any cure for it, coming at length accidentally and ſuddenly into a place, where a great rat was in a corner, whence he could not fly from the gentleman, he furiouſly leaped upon him (yet without biting him) and thereby putting him into a fright, which freed him from the ague, that long had importuned him. And the experienced *Salmuth* tells us, in a pleaſant obſervation, of one, who was cured even of the gout by a fright. For this man having his feet and hands covered with a poultis, made of turneps, flower and milk, and being left in his chair in a low room, was, whilſt his ſervants were all gone into the garden, aſſaulted by a ſow, who finding the door open, and invited by the ſmell of the cataplaſm, came to devour it; and ſtriving to do ſo, flung the ſick man and the chair to the ground, and put him into ſuch a fright, that our author tells us, that very day his pains decreaſed, and continued leſſening by degrees, till at length they wholly left him, without ever returning to trouble him again. There are divers inſtances, that diſcover what great changes may be produced in the body, without taking in any thing viſibly at the mouth. And on the other ſide, a good air alone doth often, in conſumptions and other diſeaſes, perform what hath in vain been expected from the uſe of emptying phyſick. It were to be wiſhed, that we had, among our European phyſicians, the phyſick books of thoſe of *China*; for though our doctors are much more learned men than theirs, yet probably their writings and their practice may teach us ſomething that is new, and ſomething making for our preſent purpoſe. For the famous Jeſuit *Semedo* informs us, that the books of our phyſicians having not yet been brought to *China*, they are inſtructed in their art by abundance of their own writings; and that though in their practice they do not let blood (as the learned **Varenius* tells us, that neither do the Japonian doctors) or ſet cupping-glaſſes, though they uſe no ſyrups, nor potions, nor any iſſues, but are herbaliſts, uſing nothing but herbs, roots, fruits, ſeeds, &c. yet phyſick (to uſe our author's words) *is in a very good condition in* China, (as *Almeida* alſo tells us, that the phyſicians are much eſteemed in *Japan*;) and of the ſkill of ſome of the Chineſes in that art, he gives us in the ſame chapter ſome conſiderable inſtances. And though, as we ſaid, it is very likely, that their doctors are much inferiour in point of learning to ours; yet it is conſiderable, that in ſo vaſt, ſo civilized, and ſo populous a country, phyſick can be practiſed with reputation, without the uſe of thoſe evacuations, which are here ſo frequently made in phlebotomy, potions and iſſues. Nor ſhould we only expect ſome improvement to the therapeutical part of phyſick, from the writings of ſo ingenious people as the Chineſes; but probably the knowledge of phyſicians might be not inconſiderably increaſed, if men were a little more curious to take notice of the obſervations and experiments ſuggeſted partly by the practice of midwives, barbers, old women, empiricks, and the reſt of that illiterate crew, that preſume to meddle with phyſick among our ſelves; and partly by the Indians and other barbarous nations, without excepting the people of ſuch part of *Europe* it ſelf, where the generality of men are ſo illiterate and poor, as to live without phyſicians. For where phyſick is practiſed by perſons, that never ſtudied the art of it in ſchools, or books, many things are wont to be raſhly done, which, though perhaps prejudicial, or even fatal to thoſe, on whom they are tried, may afford very good hints to a learned and judicious obſerver: beſides, where the practitioners of phyſick are altogether illiterate, there oftentimes ſpecificks may be beſt met with. For ſuch perſons being wont, for want of ſkill in phyſick, and particularly the art of mixing ſimples, and in that of varying their remedies according to circumſtances, do almoſt wholly rely upon ſpecificks; whoſe virtues, from their practice, may be ſometimes better gathered, than from that of ſkilful phyſicians, in regard that thoſe empiricks (beſides that they aſſiſt not with any ſkill in the *methodus medendi* the virtues of their remedies) are wont, for the reaſons newly mentioned, to try obſtinately, and to the uttermoſt, the effects of their few ſpecificks. And the nature of their medicines may be the better known, in regard they are not wont to blend them, as learned men but too often do, with many other ingredients, whoſe mixture, as we formerly noted, either alters their nature, or makes it difficult to determine (as *Galen* himſelf in a like caſe confeſſeth, *Nam, ut verum fateamur, hæc difficilis quoque res eſt & rara inventu, cùm poſt multa remedia adhibita ægrotanti, quod ex iis in cauſa fuiſſe dicitur, ut melius pejuſve habeat*) whether the effect be aſcribed to what is given for the ſpecifick, or to ſome other of the ingredients, or to the whole compound as ſuch. The experienced *Bontius*, in his excellent little tract *de Medicina Indorum*, doth more than once confeſs, that it is very undeſervedly, that the Europeans look upon the Eaſt-Indians as Barbarians. And even of thoſe among them, that are ignorant of other things, he hath this paſſage; *Hinc etiam fit, quod homines cæteris rebus idiotæ tam exactam herbarum & ſtirpium nanciſcantur ſcientiam, ut ſi vel doctiſſimus Pavius, noſtri ævi botanicorum princeps, è mortuis reſurgens huc veniret, miraretur ſe ab hiſce hominibus barbaris doceri poſſe.* And *Linſchoten* in his voyages, ſpeaking of that famous mart of the *Eaſt-Indies*, the city of *Goa*, where the Vice-roy and the Archbiſhop reſided, and he himſelf lived: Theſe heatheniſh phyſicians, ſaith he, mentioning thoſe of *Goa*) do not only cure their own nations and country-men, but even the Portugals alſo; for even the Vice-roy himſelf, the archbiſhop, and all the monks and friars, do put more truſt in them than in their own country-

countrymen, whereby they get great ſtore of money, and are much honoured and eſteemed. I have not now the leiſure to acquaint you with what I might alledge, to confirm this truth out of the practices of the illiterate natives of ſome not yet ſufficiently civilized part of *Ireland*, and the inhabitants of ſome other places, where phyſicians have not yet ſettled: but I ſhall mind you of the confeſſion of *Celſus*, where ſpeaking of phyſick, *Hæc nuſquam* (ſaith he) *non eſt: ſiquidem etiam imperitiſſimæ gentes herbas aliaque prompta in auxilium vulnerum morborumque noverunt.* And I wiſh, that other learned men would imitate the commendable example, not only of *Proſper Alpinus*, who wrote a treatiſe *de Medicinâ Ægyptiorum*, and of *Jacobus Bontius*, in his *Medicina Indorum*, but of *Gulielmus Piſo*, who hath lately preſented the world with the rude way of curing, uſed by the Braſilians themſelves, in his new and curious books *de Medicina Braſilienſi*, in the beginning of the ſecond of which, he much confirms what we have been delivering, in the enſuing paſſage: *Quemadmodum multa in tam craſſa Barbarie cruda vel corrupta arteque hippocraticâ indigna reperiuntur, ſit etiam nonpauca utiliſſima antiquitatem redolentia, quæ vel eruditiſſimos medicos ad urnas medicinæ ſubjiciunt, obſervanda occurrunt. Quippe cum multarum artium rudimenta vel ab ipſis animantibus brutis (quibus benigna mater natura arte inſita imprimis curandis morbis deſtitui noluit) ad nos redundare fatendum ſit; quis dubitet ab his mortalibus, licet remotiſſimis à dogmaticâ & rationali medendi arte, non plurima nobiliſſima at ſecreta remedia atque antidota, medendi morbos veteribus incognitos quotidiè ad poſteros derivari? quibus paulatim ad manum traditis, & tandem quaſi in ſuccum & ſanguinem à rationalibus converſis doctorum ſcholæ & libri ſuperbiunt?* And to this agrees very well that grave ſaying of our experienced *Harvey*, to the very learned Doctor *Ent: Nulla gens tam barbara eſt, quæ non aut fortuitò, aut inevitabili quadam neceſſitate coacta, aliquid in uſum communem adinvenerit, quod nationes alias humaniores latuit.* Nor ſhould we diſdain the remedies of ſuch illiterate people, only becauſe of their being unacquainted with our theory of phyſick. For though I will not ſay, as the old empiricks wittily enough did in that paſſage of *Celſus*, *Requirere etiam, ratio idem doceat quod experientia, an aliud? Si idem, ſupervacuum eſſe, ſi aliud, etiam contrarium.* But leſt we ſhould by too great reliance on the Galenical, or other ancient opinions, neglect uſeful remedies, becauſe preſented by perſons, that ignore them, and perhaps too hold opinions contrary to them; I ſhall leave you to conſider, what is in the perſon of the ſame empirical ſect, repreſented by *Celſus*, where having ſpoken of the darkneſs of the cauſes of things, and the uncertainty of the theorems of phyſick: *Ac nihil iſtas cogitationes* (ſaith he) *ad medicinam pertinere, eo quoque diſci, quod qui diverſa de his ſenſerint, ad eandem tamen ſanitatem homines perduxerint. Id enim feciſſe, quia non ab obſcuris cauſis neque à naturalibus actionibus, quæ apud eos diverſæ erant; ſed ab experimentis, prout cuique reſpondeant, medendi vias traxerint, ne inter initia quidem ab iſtis quæſtionibus deductam eſſe medicinam, ſed ab experimentis, &c.* For though this ſentence aſcribes too little to reaſon, yet there is ſomething in it, that deſerves to be conſidered; eſpecially ſince we obſerve not, that the late anatomical diſcoveries of the motions of the chyle and lymphatick liquor, by formerly unknown ways, in newly detected veſſels, hath yet made men cure diſeaſes much better than before. Not that I think, that anatomical and pathological diſcoveries will not, in proceſs of time (when the *hiſtoria facti* ſhall be fully and indiſputably made out, and the theories thereby ſuggeſted, clearly eſtabliſhed) highly conduce to the improvement of the therapeutical part of phyſick; but yet this obſervation may make it the more reaſonable to beware of relying ſo much upon the yet diſputable opinions of phyſicians, as to deſpiſe all practices, though uſually ſucceſsful, that agree not with them: for of ſuch our author ſpeaks well, *In omnibus ejuſmodi cogitationibus in utramque partem diſſeri poſſe, itaque ingenium & facundiam vincere: morbos autem non eloquentiâ ſed remediis curari; quæ ſi quis elinguis uſu diſcreta benè norit, hunc aliquanto majorem medicum futurum, quam ſi, ſine uſu, linguam ſuam excoluerit.* And *Paracelſus* ſpoke well too, if he ſpoke truly, when in one of his prefaces, ſpeaking to thoſe, whom he invited to hear him expound his books of phyſick and chirurgery at *Baſil*; *Illos tamen* (ſaith he of his formerly mentioned books) *non aliorum more ex Hippocrate aut Galeno, aut quibuſlibet emendicatos, ſed quos ſumma rerum doctrina, experientia atque labore aſſequutus ſum, proinde ſi quid probaturus, experimenta, ac ratio, auctorum loco, mihi ſuffragantur.*

Celſ. præfatione ad Lib. 1.

A comparison of the empirick part of phyſick with the rational.

IT would, *Pyrophilus*, I fear, be tedious to trouble you here with all, that I have met with in good authors, applicable to my preſent ſubject, and the deſign I have been proſecuting in favour of external remedies: but yet one paſſage there is, which doth ſo notably confirm what we have delivered, as well touching the efficacy of ſimple medicines, as the great cures, that may, in divers caſes, be performed by outward applications, that I muſt not here omit the mentioning of it; as I find the epiſtle written out of *Peru* to the inquiſitive *Monardes*, in theſe words: *In urbe Poſto, ubi aliquot annis vixi, omnis generis morbos Indus quidam curabat ſolo cujuſdam plantæ ſucco artubus & parti affectæ illito. Ægros deinde ſtragulis egregiè tegebat ad ſudorem provocandum: ſudor è partibus illitis emanans merus ſanguis erat, quem linteis pannis abſtergebat, atque ita in curatione pergebat, donec ſatis ſudaſſe putaret, optimis interea cibis eos alens. Eo remedio multi morbi deplorati curabantur, imo ægri juniores & robuſtiores ab ejus uſu fieri videbantur, ſed neque pretio, neque precibus, neque minis unquam efficere potuimus, ut eam plantam nobis demonſtraret:* 'In the city *Poſto*, where 'I lived certain years, a certain Indian cured 'all ſorts of diſeaſes by the juice of one plant 'alone, wherewith he anointed the limbs and 'any other part particularly affected, and then 'covering them warm with blankets, provoked 'ſweat. The ſweat, that came from the parts 'ſo daubed, was meer blood, which he wiped off

Petrus de Oſma in epiſt. ad Monard. quæ extat in libello de ſimplicibus medicamentis ex Occidentali India delatis.

'off with linnen cloths, and ſo he proceeded 'until he thought they had ſweat enough. In 'the mean time he gave them diet, that was 'moſt nouriſhing. With this remedy many 'deſperate diſeaſes were cured, and the ſick 'perſon upon the uſe of this phyſick improv-'ed, ſo as to appear younger and luſtier after 'it. But we could never prevail, neither by 'money, nor intreaty, nor foul means, upon 'him to ſhew us the plant.'

CHAP. XI.

Of other extraordinary medicines, which work by magnetiſm, tranſplantation, &c.

BUT, *Pyrophilus*, beſides ſuch external medicines, as work after the manner of thoſe I have heretofore mentioned, we may poſſibly without abſurdity, provided we do it without credulity, inquire, whether there may be yet a ſort of others, that operate in a more wonderful and extraordinary way? And it would not perhaps be altogether unworthy the experiment, to try, whether or no there may not ſometimes be performed, ſuch cures, as are wont to paſs either for fabulous or magical; ſome of them being to be done without exhibiting, or applying any thing immediately to the patient, and others by ſome ſuch unknown ways as thoſe, which chymiſts call, either magnetiſm, or tranſplantation: ſuch as are the cures reported to be performed by the weapon-ſalve and ſympathetick powder, and ſuch as is that cure of the yellow jaundice (mentioned with ſome verification by *Paracelſus*) wherein ſeven or nine cakes (for it muſt, forſooth, be an odd number) are made up with the newly emitted and warm urine of the patient, and the aſhes of aſhwood, and buried for ſome days in a dunghill. For it is not only by the eaſy and ſuperſtitious vulgar, that the poſſibility of performing ſuch cures, by tranſplantation, or ſome other magnetical way (as they pleaſed to call it) hath been believed. For within the compaſs of my own ſlender reading, I find, that divers eminent phyſicians have both made uſe of, and commended magnetical remedies.

The cure of an ulcer in the bladder by ſympathetick powder.

WHAT is to be thought of the ſympathetick powder, I confeſs I am as yet in doubt; but however I ſhall take this occaſion to inform you, that a very honeſt gentleman, whom his pen has made known to a great part of the learned men and virtuoſi in *Europe*, complaining often to me, that though he were much troubled with that ſad diſeaſe, the ſtone in the bladder, yet he was more inceſſantly tormented with an ulcer he had in the ſame part, (all the ſearching medicines, that he took to diſſolve, as he hoped, the ſtone, exaſperating the ulcer:) I one day adviſed him to make uſe of the powder of ſympathy, upon ſome of the ulcerous matter he voided with his urine; the remedy being ſuch, as, if it had a magnetick virtue, might do him good; and if it had none, could not prejudice him. A while after, I received, both from him in a letter, and from his phyſician, very great thanks for the advice; the patient having, ſince the uſe of the powder, been eaſed of the diſtinct pain he was put to by the ulcers; and this relief laſted, if I miſremember not, above a year, and how much longer I know not. But I ſhall not inſiſt either upon this, or upon the teſtimonies and relations of *Paracelſus*, *Helmont*, *Goclenius*, *Burgravius*, nor even the modern Roman doctor, *Servius*, nor any of the other authors, that do profeſſedly take upon them the defence of the weapon-ſalve, by reaſon of what we have elſewhere to write to you, by way of examination of that ſalve, and the ſympathetick powder, though I deny not, in ſome trials I have found them available; yet beſides what I have newly related, I have ſeen ſometimes ſomething follow upon the uſe of ſympathetick powder, that did incline me to think, that ſometimes it might work upon cures. But I ſhall alledge ſomething of more unexpected credit; and firſt *Dominicus Panarola*, now profeſſor of phyſick at *Rome*, in his newly divulged *Faſciculus Arcanorum*, preſents us two inſtances to our preſent purpoſe, in theſe words: *Mira*, (ſays he) *quotidie reperiuntur in medicina ad confirmationem operis, quod doctiſſimus phyſicus, Petrus Servius* (the ſame we lately mentioned) *complevit de unguento armario, ſciendum eſt quod pecia ſanguine imbuta ſub cineribus calidis poſita menſes ſiſtit, experimento pluries comprobato: quinetiam magiſter meus Petrus Caſtellus* (whoſe name his late *Anatomy of the Civet Cat*, and other writings have made famous) *aiebat ſe expertum fuiſſe hæmorrhoides, ſi tangantur tuberoſa radice chondrilla ſiccari, ſi chondrilla ſiccetur; corrumpi verò, ſi corrumpatur: quapropter ſub camino exſiccanda ponitur poſt hujuſmodi tactum chondrilla tuberoſa.* 'Wonderful things are daily found out 'in phyſick to the confirmation of the operation 'of the learned naturaliſt *Petrus Servius*'s wea-'pon-ſalve. For he aſſured us, that a piece of 'cloth dipt in the blood, and put under hot 'aſhes, ſtops the monthly flux; the experiment 'having been often proved. And my maſter 'Petrus Caſtellus affirms, as he found by expe-'rience, that the hæmorrhoids, if they were 'touched with the tuberous root chondrilla, did 'dry away, if the chondrilla dried, and did run 'to corruption, if the chondrilla was corrupted. 'And therefore, after ſuch touching of the hæ-'morrhoids, the chondrilla was uſually put to 'dry in the chimney.' The learned *Salmuth*, in his obſervations, furniſhes us with an example of a moſt violent pain of the arm, removed by tranſplantation: they did beat up red corals with oaken leaves, and having kept them on the part affected 'till ſuppuration, they did in the morning put this mixture into an hole bored with an augur in the root of an oak, reſpecting the eaſt, and ſtopt up this hole with a peg, made of the ſame tree: from thenceforth the pain did altogether ceaſe; and when they took out the amulet, immediately the torments returned ſharper than before. A great and excellent lady (a near kinſwoman, *Pyrophilus*, of yours and mine) and very far from credulous, confeſſed to me, as did her ſervants alſo, that with the above-mentioned remedy of aſhes and urine, ſhe was not only once cured of the yellow jaundice, by a friend of hers, that had obſerved, that ſhe had been fruitleſly vexed by a tedious courſe of phyſick, preſcribed by the famouſeſt doctor then in *England*, but that afterwards relapſing into that ſame diſeaſe, ſhe had cured herſelf by the ſame

The effects of weapon-ſalve, and other magnetical remedies.

Panarol. Faſc. arcan. 1.

Centur. 3. *obſervat.* 34.

ſame remedy. I remember, that being ſome years ſince brought almoſt to the brink of the grave, by a ſudden effuſion of blood within my body, from which, without a ſignal mercy of God, I ſhould not have recovered; among other men ſkilled in phyſick that came to aſſiſt me in that danger, I was viſited by a Galeniſt of much repute, whoſe pale looks inviting me to inquire, what it was that ailed him, he anſwered me, That he had not long before been deſperately ſick of an obſtinate maraſmus, which, notwithſtanding all the remedies he could uſe, did daily ſo conſume him, that he appeared but a ſkeleton; whereupon having found the uneffectualneſs of ordinary remedies, and being hopeleſs of being relieved by them, he reſolved to try a ſympathetick medicine, which I remember my ſelf to have met with in *Hartman*. He took then an egg, and having boiled it hard in his own warm urine, he with a bodkin perforated the ſhell in many places, and then buried it in an ant-hill, where it was left to be devoured by the emmets; and as they waſted the egg, he found his diſtemper to leſſen, and his ſtrength to increaſe, inſomuch that he now conceived his diſeaſe to have quite left him.

Obſervations of the tranſplantation of diſeaſes.

Riverius *cent.* 4. *obſerv.* 63.

THE experienced *Riverius* in his laſt obſervations (newly publiſhed ſince his death) has two notable examples to our preſent purpoſe. For firſt he tells us, that the eldeſt drughter of a great officer in *France* was ſo tormented with a paronychia for four days together, that the pain made him paſs the night ſleepleſs: whereupon having, by *Riverius*'s order, put her finger into a cat's ear, within two hours ſhe was delivered from her pain, and her whole hand, which before was tumid, unſwelled again, except the finger, which it ſelf was out of pain.

Riverius *cent.* 4. *obſerv.* 19.

The other caſe was of a counſellor's wife, who by the ſame remedy was cured of a panaritium (which had for four days vext her) in a much ſhorter time than the other; namely, within a quarter of an hour. But that which chiefly makes theſe ſtories pertinent to our preſent occaſion, is this notable circumſtance, that in both the caſes, the cat was ſo manifeſtly put to pain, that *Riverius* thought it had attracted to itſelf the morbifick matter, from which it freed the patient. For in the former of theſe two caſes, the cat loudly complained of the pain he felt; and the other was, in that ſhort time the cure was performing, put to ſo much pain in his ear, that two men were hardly able to hold him faſt, he ſtruggled ſo forcibly. And theſe two relations of *Riverius* may, though there be ſome diſparity in the caſes, give ſome countenance to what might otherwiſe be diſtruſted in the obſervations of the induſtrious *Petrus Borellus*; where he ſays, *Podagra mirè levatur, ſi catelli cum podagrico recumbant, morbum enim contrahunt, adeò ut vix incedere queant; ager verò levamen ſuſcipit.* 'The gout is 'ſtrangely eaſed, if puppies lie with the perſon, 'that hath the gout; for they contract the 'diſeaſe ſo as not to be able to go, but the 'patient thereby finds eaſe.' Which perhaps he may have been induced to write, by the ſtory that goes of that odd chymiſt, *Robert Fludd*'s having tranſplanted the gout of one of his patients, by making him often ſleep with a dog, that was fond of him, who thereby became ſubject to ſuch periodical fits of the gout, as the maſter had been troubled with.

In hiſtoriar. & obſerv. 3. *medico-phyſic. cent.* 3. *obſerv.* 28.

[AND ſince I begun this chapter, and met with theſe objections, diſcourſing of this matter with a judicious perſon, well ſkilled in phyſick, and whom his learned writings have made eminent, he told me, that he had, not very many months ſince, ſeen a cure by tranſplantation, performed on the ſon of one, that was wont to make chymical veſſels for me. And becauſe the obſervation is conſiderable, that there might be no miſtake in it, he has pleaſed to ſet it me down in writing (atteſted with his annexed name) which enables me to preſent it to you in his own words: *N. N.* of *N.* potter, had a ſon, who was long ſick of the king's-evil, which ſwelled much, and broke into ſores at laſt, which he could by no ordinary means heal. The old man had then a dog, which took an uſe of licking the ſores; which the dog continued ſo long, till he waſted the very kernels of ulcers, that were knit in with the veins, and perfectly cured the ſore, but had the ſwelling tranſplanted to himſelf, ſo that he had thereupon a great ſwelling, that aroſe and continued on his throat. The lad was thereby freed, ſo continued to be till 1660, and for aught I know is ſo this day. This I ſaw, being there at that time to view the clays, and beſpeak retorts of the old man. *]

AND to confirm the credibility, as well as increaſe the number of our magnetical ways of cure; I ſhall add, that Sir *Francis Bacon* himſelf records, with great ſolemnity, his own having been freed, not only from very many new warts, but from one almoſt as old as he, by a piece of lard with the ſkin on it, which after having rubbed upon them, was expoſed out of a ſouthern window to putrefy. And therefore though the vanity and ſuperſtition of the authors, that ſpeak of magnetick remedies, and the impertinent circumſtances, that are uſually preſcribed, as neceſſary to their effectualneſs, do generally and juſtly enough make ſober men deſpiſe, or at leaſt ſuſpect ſuch unlikely ways of cure; yet in conſideration of inſtances lately produced (to which we may perhaps elſewhere add ſome others) and becauſe divers men, as well phyſicians as others, have ſeriouſly aſſured me of their having been ſome

Cent. X. *exp.* 997.

* Some years ſince the preſent eſſay was written, I lighted on the 66th obſervation of the induſtrious *Bartholinus*, 3d cent. and the 53d obſervat. of his 6th century; in both which places giving inſtances of the tranſplantation of diſeaſes, he mentions, beſides ſome of thoſe examples delivered by us, divers others; for which I am willing to refer you to the alledged places: only in the laſt of theſe obſervations delivering ſomething as upon his own knowledge, (which he does not in the reſt of the inſtances) that much confirms what we have mentioned concerning *Fludd*. We ſhall annex it in his own words: *In catello Mileſio avi noſtri materni, quem jam olit in ædibus ſuis avunculus meus ſuſpiciendus M Jacobus Finckius Phyſ. P. P. & academiæ noſtræ ſenior, evidentius hæc patuit trahendi facultas. Colico dolore torquebatur avunculus, canis ventri impoſitus, quum incaluiſſet, urgebat exitum, vomuit vehementer, & tormina colica avunculi remiſerunt. Ancilla ejuſdem in dolore dentium eundem canem genis appoſuit, ſenſitque levamen, ſed canis dolorum impatientia hinc inde curſitare & latrare. Idem expertus eſt ſcriba in colli tumore.*

ſome of them eye-witneſſes, and others, performers of ſuch cures; I am apt to think it fit, that a ſevere indeed, but yet further trial be made of phyſical experiments of this kind. And I cannot but commend the curioſity of Dr. *Harvey*, who, as rigid a naturaliſt as he is, ſcrupled not often to try the experiment mentioned by *Helmont*, of curing ſome tumours or excreſcencies, by holding on them for a pretty while (that the cold might throughly penetrate) the hand of a man dead of a lingring diſeaſe; which experiment the doctor was not long ſince pleaſed to tell me, he had ſometimes tried fruitleſly, but often with good ſucceſs. Nor doth the grand objection againſt ſuch experiments, namely, that ſuch or ſuch a perſon, having once made trial of them, found them not ſucceed, ſeem at all to me, alone, of weight enough to make ſuch experiments, or thoſe other improbable ones formerly mentioned, totally rejected. Becauſe, if they really do ſometimes ſucceed, though ſometimes they chance to fail, yet that poſſibility of their ſucceeding may ſufficiently evince, that there are really in nature medicines, that work after that extraordinary manner. And I ſee no reaſon, why it ſhould be more required of thoſe medicines, that work at diſtance from the patient, (or at leaſt are not taken at mouth, or injected otherwhere) only by ſubtile effluvia, that they ſhould always cure, than it is exacted of vulgar remedies, from which we might reaſonably expect more conſtant effects, becauſe of their being either inwardly given, or more immediately, or at leaſt, more durably applied to the patient. And if rhubarb be juſtly affirmed to be an excellent medicine in looſeneſſes, though we daily in *Ireland* ſee many ſwept away of thoſe diſeaſes, in ſpight of the uſe of rhubarb and mirabolans, with other aſtringent remedies to boot: and if quickſilver be, not unreaſonably, by moſt of our phyſicians, eſteemed and employed as an effectual remedy againſt venereal diſeaſes, becauſe it ſometimes removes them, though *Fernelius*, *Montanus*, and many other learned authors tell us, as they ſay upon their own experience, that (though it often palliate thoſe diſtempers) it very ſeldom cures them: nay, and if diaphoreticks are ſtill eſteemed ſuch by the generality of phyſicians, though few ſudorificks will cauſe ſweat in all bodies, and ſcarce any in ſome bodies; I ſee not, why theſe remedies, that work, as it were, by emanation, may not deſerve the name of medicines, if they ſometimes unqueſtionably ſucceed, though they ſhould not always prove ſucceſsful ones; nor why they ſhould, notwithſtanding their ſometimes not ſucceeding, be laid aſide; eſpecially ſince theſe ſympathetical ways of cure are moſt of them ſo ſafe and innocent, that though, if they be real, they may do much good, if they prove fictions they can do no harm; unleſs by accident, as in caſe the patient ſhould ſo ſingly rely on them, as to neglect (which he need not all) other helps to recover.

The ſometimes not ſucceeding of magnetical medicines no ſufficient cauſe to abandon their uſe.

CHAP. XII.

BUT you will now perhaps demand, *Pyrophilus*, how the naturaliſt, as ſuch, can contribute to the credit or advancement of the mentioned ways of curing diſeaſes, without the wonted weakning and painful evacuations? In anſwer to this queſtion, I muſt put you in mind, that it would be no new thing for naturaliſts, not profeſſedly phyſicians, to treat of this ſubject; and that the naturaliſt may afford good hints to the practitioner of phyſick, both upon divers other accounts already touched upon, and by trying upon brutes variety of hitherto untried medicaments or remedies, and by ſuggeſting to him both the events of ſuch trials, and alſo what hath been already obſerved about the cures of diſeaſes incident to beaſts. For though (as we formerly told you) there are ſome things, that are not equally poiſonous, as others not equally ſafe, to man, and to ſome brutes, ; yet there are other beaſts, eſpecially dogs, and monkeys, whoſe bodies are, by many poiſons, affected almoſt like thoſe of men. And ſince, according to the rule, *Periculum faciendum eſt in vili anima*, many things may be very well tried on ſuch creatures, that we dare not at firſt venture to try on men; we may give dogs poiſons, only to try the virtue of our antidotes; and we may give them wounds, to make trial of the efficacy of the weapon-ſalve and ſympathetick powder; ſince divers of my friends (as I have intimated above) aſſure me, that they have ſome of them ſeen, and others performed cures of horſes, lamed by pricking, by ſticking the nails, that hurt them, into weapon-ſalve; which, for that very uſe, among others, ſome of them are wont to carry about them in ſilver-boxes. When oxen and ſuch like cattle are troubled with that diſeaſe, which makes them continually turn about in one place, (and is therefore called the turning-evil, or ſturdy) a common remedy here in *England*, as graziers that make uſe of it inform me, is to caſt down and tie faſt the ſick beaſt, and then to open his ſkull a good way, (or, if need be, take off a round piece of it over the place ſuppoſed to be affected) and at the open place to take out a little bag or bladder, which is uſually found to lie near the membranes of the brain, and to be full of water and blood, and then leiſurely to heal up the hurt. And this cure is much commended, as both common and eaſy, by our experienced *Markham*. In goats likewiſe, that are much ſubject to the dropſy, the huſband-man ventures to ſlit, and let out the water under the ſhoulder. And divers hazardous operations in ſurgery, ſuch as are arteriotomy, the exſection of the ſpleen, and other parts, were, or ſhould have been firſt attempted upon brutes, and then practiſed on human bodies. And in imitation of theſe, it is likely, that divers other experiments, of good uſe in ſurgery, may be diſcovered for the relief of man, without endangering him in proſecuting ſuch diſcoveries. And to ſay nothing of the known practice of ſpaying ſwine, and bitches; in the neighbourhood of a country-houſe of mine, in the weſt of *England*, and probably in divers other parts, ſome experienced ſhepherds have an odd way of caſtrating male ſheep, eſpecially lambs, when they are grown ſo old, that it is thought dangerous to geld them

Inſtances of divers cures upon brutes, and how theſe are applicable to men.

them the common way. A ſervant of mine, that deals much in cattle, and had lately divers ſheep ſwigged (as they call it) after this manner, tells me, that it is thus done: the beaſt, on whom the operation is to be performed, being held by a ſtrong man with his belly upwards, another man draws a ſtring, as firmly as he can (tying it with a knot or two, to prevent its yielding or ſlipping off) about the teſticles, as if he meant, by drawing that ſtring, to cut them off; and then anointing the part with a little freſh butter, or ſome ſuch like thing, he lets the ram go to feed; which, for the moſt part (notwithſtanding the anguiſh of this ligature) he will begin to do in a ſhort time: And within two or three days, the teſticles, being by the ſtrict ligature denied the nutriment and ſpirits, that were wont to be conveyed to them, will grow ſo rotten, as either, together with the ſtring, to fall off, or be very eaſily pull'd off, ſometimes ſtinking very rankly like carrion. And even among thoſe things, that are already practiſed by farriers, ſhepherds, and graziers, there are many ſuch things, as we have newly mentioned, which may ſerve either to inrich or illuſtrate the way of curing human bodies: their ignorance and credulouſneſs, together with the liberty and meanneſs of thoſe creatures they phyſick, give them leave to venture on any thing, having made them try upon horſes, and cattle, many ſuch things, as phyſicians dare not try upon men and women. And among thoſe many extravagant things, ſome, as it often happens, have ſucceeded ſo proſperouſly, as to deſerve to be conſidered by the ſkilfulleſt phyſicians; ſome of whom might, without diſparagement to their profeſſion, do it an uſeful piece of ſervice, if they would be pleaſed to collect and digeſt all the approved experiments and practices of the farriers, graziers, butchers, and the like, which the ancients did not deſpiſe, but honoured with the titles of *Hippiatrica*, and *Veterinaria*; and among which, if I had leiſure, divers things may be taken notice of, which might ſerve to illuſtrate the *methodus medendi*. As to give you but one inſtance, which lately occurred to me, the uſefulneſs of letting blood in ſome caſes, which is ſo ſeverely condemned by many chymiſts, and the efficacy of a ſmall, if ſeaſonable, evacuation, which can ſcarce be conceived to do more than alter the courſe of the blood, may be illuſtrated by the ſtaggers in horſes, and the cure of it. For I have ſeen a coach-horſe, ready to drop down dead of his diſeaſe upon the high-way, by having his gums rubbed with the coach-whip, till the blood appeared, relieved almoſt in a moment ſo much, that though he were not well able to ſtand before, yet he was immediately able to go on, and draw the coach with his fellows

That the handling of phyſical matters was anciently thought to belong to the naturaliſt. Celſus *in præf. l. 1.*

CHAP. XIII.

THE next thing we are to obſerve to you, *Pyrophilus*, and on which its nature and importance will ingage us ſomewhat long to inſiſt, is this; that the handling of phyſical matters was anciently thought to belong to the naturaliſt; as we are clearly informed by the judicious *Celſus*, in that memorable paſſage, where he ſpeaking of the origin of phyſick, *Primo* (ſays he) *medendi ſcientia ſapientiæ pars habebatur; ut morborum curatio & rerum naturæ contemplatio ſub iiſdem authoribus nata ſit: ſcilicet his hanc maxime requirentibus, qui corporum ſuorum robora, inquieta cogitatione nocturnaque vigiliâ minuerant.* 'At the firſt, phyſick was accounted part of philoſophy, ſo that 'the cure of diſeaſes, and the contemplation 'of nature, did both ariſe under the ſame au'thors; thoſe being moſt ſet upon medical 'inquiries, which had made their bodies infirm 'by diſquieting thoughtfulneſs, and nocturnal 'watchings.' He adds, that many of the profeſſors of philoſophy, eſpecially *Pythagoras*, *Empedocles*, and *Democritus*, and that *Hippocrates* (whom ſome think to be the diſciple of the laſt named) was the firſt, that ſever'd phyſick from philoſophy, and made it a diſtinct diſcipline. And this apology for the enſuing diſcourſe being thus premiſed to it, I ſhall further anſwer, that I ſhould perhaps be obliged to exceed the limits of an eſſay, if I ſhould in this diſcourſe inſiſt on every thing, upon whoſe account the naturaliſt may aſſiſt the phyſician, if he be barely a *medicus* to cure diſeaſes, which that you may the more readily believe, I ſhall ſelect and proſecute ſome of theſe things in the remaining part of this eſſay.

That the rejecting ſpecificks, becauſe they make no viſible evacuation, is irrational.

AND firſt I ſhall repreſent to you on this ſubject, that the account, upon which phyſicians are wont to reject, if not deride, the uſe of ſuch ſpecificks, as ſeem to work after a ſecret and unknown manner, and not by viſibly evacuating peccant humours (or by other ſuppoſedly manifeſt qualities) being generally this; That they ſee not, how the promiſed effects can well be produced by bodies, that muſt work after ſo peculiar and undiſcerned a manner; this being, I ſay, the great thing, that hinders phyſicians from endeavouring to find, or ſo much as being willing to make uſe of remedies of this ſort, the naturaliſts may do much towards the removal of this impediment, by ſhewing out of ſuch things, as may be met with or performed within the macrocoſm, that ſuch, or at leaſt as ſtrange operations, as are aſcribed to theſe ſpecificks, are not without example in nature; and conſequently ought not to be rejected, barely as being impoſſible. And indeed the phyſiology, wherewith phyſicians as well as others are wont to be imbued in the ſchools, has done many of them no ſmall diſſervice, by accuſtoming them to groſs apprehenſions of nature's ways of working. Whence it comes to paſs, that not a few even learned doctors will never expect, that any great matter ſhould be performed in diſeaſes, by ſuch remedies, as are neither obvious to the ſenſe, nor evacuate any groſs, or at leaſt ſenſible matter. Whereas, very great alterations may be wrought in a body, eſpecially if liquid, as is the blood and peccant humour, without the ingreſs or egreſs of any viſible matter, by the inteſtine commotion of the parts of the ſame body acting upon another, and thereby acquiring a differing motion, location, (if I may

ſo ſpeak) or figure, which, with the other qualities and effects reſulting thence, may alter the motion and texture of the liquor, and thereby produce great changes in the body that harbours it. How much an unperceived receſs of a few ſubtile parts of a liquor may alter the nature of it, may be gueſſed at, by the obvious change of wine into vinegar; wherein upon the avolation (or perhaps but the miſplacing) of ſo little of the ſpirituous and ſulphureous part, that its preſence, abſence, or new combination with the other parts is not diſcernable to the eye, the ſcarce decreaſed liquor becomes of a quite differing nature from what it was. And though in *England* this degeneration be not wont to be ſo ſuddenly performed, by reaſon of the coldneſs of the climate, yet in hotter countries the change is much more ſpeedily made. As in *Braſil*, the above mentioned *Piſo* informs us, that the expreſſed juice of the ſugar-canes, which by coction, and farther ordering, would be certainly brought to ſugar, will of it ſelf keep ſweet but about four and twenty hours, and then begin to ſour, and be altogether unfit to make ſugar of, though very fit to turn into good vinegar. And this I find confirmed by a modern and applauded French writer, in his deſcription of ſome parts of the *Weſt-Indies*, inhabited by his nation: and relations of the ſame ſort, concerning the haſty ſouring of ſome other liquors in *America*, I have had from our Engliſh travellers and planters. And in the *Eaſt-Indies*, *Linſchoten* tells us of a change much more ſudden: for ſpeaking of the formerly mentioned *Sura*, or liquor, afforded by the wounded coco tree; 'The ſame 'water (ſays he) ſtanding but one hour in the 'ſun is very good vinegar, and in *India* they 'have none other.' And that even very hurtful liquors (and why not then ſome peccant matter in the body?) may after the like manner change their nature, may appear by what we have formerly mentioned, and is unanimouſly affirmed by credible writers of ſeveral nations, concerning the juice of mandioca, which, being poiſon, when it is firſt expreſſed, does in a few hours, by fermentation, purge it ſelf, and loſe its pernicious nature. That alſo by the bare ingreſs of ſome ſubtile and not viſible matter, ſuch inteſtine commotions may be excited in liquors, may appear by the ſouring, which has been often obſerved upon great thunders to happen, not only to wines, but to other vinous liquors alſo; as I lately received from a great maſter of variety of liquors a complaint, that by ſome thunder, which happened here a few weeks ſince, almoſt all the beer and ale in the neighbourhood was ſpoiled. And I remember, that when I returned out of *Italy* through *Geneva*, there happened in that place an earthquake; upon which, the citizens complained, that much of their wine was ſoured, though I, that lodged in the higheſt part of the town, ſaw nothing to make me believe, that the bare ſuccuſſion of the earth was capable to produce ſo great and ſudden an alteration in the wine.

That great changes may be made by only miſplacing, without any evacuation of the parts.

Lib. 4. cap. 10.

The making of vinegar is an inſtance of this truth, eſpecially in the Indies.

chap 56.

See Piſo, l. 1.

In the effects of thunder and earthquakes.

THAT ſuch inviſible corpuſcles may paſs from amulets, or other external remedies, into the blood and humours, and there produce great changes, will ſcarce ſeem improbable to him, that conſiders, how perſpirable, according to *Hippocrates*, a living body is; and that a vegetable and animal bodies, whoſe texture is more looſe and open, may well be ſuppoſed to ſend forth expirations, ſince even divers minerals are found to do the like; as may appear by the odorable ſteams of rubbed brimſtone, and amber, by the corpuſcles, which perform the magnetick operations, by the emetick quality imparted to liquors by the glaſs of antimony, and by *crocus metallorum* barely infuſed in them, without ſenſibly loſing any thing, either of their bulk or weight; and by the virtue of killing worms, wherewith wine, and even water has been, not only by *Helmont*, but by divers other phyſicians, obſerved to be enriched, after a quantity of quick-ſilver has been for ſome hours ſhaken in it, though without any ſenſible deperdition of the ſubſtance of the mercury. And indeed I have ſomewhat wondered, that many learned modern phyſicians, either out of an affected ſeverity, or perhaps animoſity againſt chymiſts, overlook, or even deride, all operations of this nature; ſince I remember *Galen* himſelf not only confirms the like doctrine, by his reaſons and authority, but delivers a very ſtrange example of it; for, under the title of *Glychyſida*, treating of peony, he thus diſcourſes: *Eſt præterea omnino reſiccatoria; Eapropter haud deſperaverim eam ex collo pueris ſuſpenſam merito comitialem morbum ſanare. Equidem vidi puellum quandoque octo totis menſibus morbo comitiali liberum, ac poſtea fortuna cum quod à collo ſuſpenſum erat decidiſſet, protinus denuo convulſione correptum, rurſuſque ſuſpenſo in locum illius alio, inculpatè poſtea egiſſe. Porro viſum eſt mihi ſatius eſſe rurſum id collo detrahere, certioris experientiæ gratiâ: id cum feciſſem, ac puer iterum eſſet convulſus, magnam recentis radicis partem ex collo ejus ſuſpendimus, ac deinceps prorſum ſanus effectus eſt puer, nec poſtea convulſus eſt. Rationabile itaque erat, aut partes quaſpiam à radice defluentes, ac deinde per inſpirationem attractas, affectos ita locos curare, aut aërem à radice aſſiduè mutari & alterari. Nam hoc pacto ſuccus Cyrenaïcus collumellam phlegmone affectam juvat, & melanthion frictum palam catarrhos & coryzas deſiccat. Si quis id in calidum linteum rarum liget, aſſidueque calorem ex eo per inſpirationem in nares attrahat. Quin etiam ſi pluribus linis, & maximè marinæ purpuræ, collo viperæ injectis, illis viperam præfoces, eaque poſtea cujuſpiam collo obvincias, mirifice profueris tum pariſthmiis tum omnibus iis, quæ in collo expullulant:* 'Beſides, 'it is altogether drying; and therefore I ſhould 'not deſpair, that it, being hung about childrens 'necks, might cure the falling-ſickneſs in them. 'I truly ſaw a lad, that ſometimes would be 'eight whole months free from the falling-'ſickneſs, and then, when by chance this fell 'from off his neck, he became immediately ſur-'prized with a fit; and again, hanging another 'root in its place, he would continue well. 'Therefore, for experiment ſake, I thought 'good to take it again from his neck, which 'when I had done, and found, that the lad fell 'into

Divers inſtances to prove, that inviſible corpuſcles may paſs from amulets, and cauſe great alterations in the juices of a man's body.

De Simp. Med. facultatibus, l. 6.

Galen's example of peony-root, &c.

'into his former convulſions, we took a great 'piece of a green root, and hung it about his 'neck, and from that time he continued well, 'and felt no more convulſions. It was there-'fore moſt probable, that either certain parts 'did exhale from the root, and were drawn 'into the body by inſpiration, which did ſo 'work upon the affected parts; or that the 'ambient air was continually changed and al-'tered by the root: for after this manner the '*ſuccus Cyrenaicus* cures the *phlegmone* upon 'the *uvula*; ſo catarrhs and other rheums are 'dried up by melanthium, if it be tyed up 'warm in fine linnen, and the hot fume of it 'be drawn up into the noſtrils by inſpiration. 'Nay, if you ſtrangle a viper with divers ſorts 'of threads, and eſpecially with the ſea-purple, 'and then you tye thoſe threads about the neck 'of your patient, you ſhall cure the ſwelling of 'the almonds of the ears, and all other ſwel-'lings in the neck.' Nay, that ſuch inviſible bodies, by paſſing through groſſer ones, and thereby changing the motion and nexus or juncture of their parts, may produce laſting alterations in the textures (though it be a paradox) ſeems not at all to me impoſſible. For we find the moſt fluid body of quickſilver has been ſometimes, (I ſay ſometimes) and therefore may, without ſenſible increaſe of bulk, be coagulated by a metalline exhalation, ſo as to be cut like lead, and to retain that ſolidity, till by ſome art or other it be reduced to its priſtine fluidneſs. You may be inclined to think, that the hard and ſolid body of iron has a permanent alteration made in its texture, if you hold a needle during a competent time near the pole of a vigorous loadſtone without touching it. For the magnetical effluvia (as may very probably be conceived) will ſo diſpoſe the parts of the neareſt extreme of the needle, as that they ſhall admit the ſteams, that come from one of the poles of the loadſtone, and not thoſe that come from the other: whereas by ſkilfully holding it to the contrary pole of the ſame ſtone, the internal pores, and conſequently the texture of the needle, will preſently be quite otherwiſe diſpoſed, in reference to the magnetical effluvia; as we more fully declare in another eſſay, where we ſhall, I ſuppoſe, alſo perſuade you, that the effects of the loadſtone are performed by ſubtle bodies iſſuing from, or paſſing through it. What we have in the former diſcourſe told you concerning our having at pleaſure changed the poles of a load-ſtone, by help of the magnetical effluvia of the earth, may let you ſee, that in ſtones alſo ſuch alterations are poſſible to be made. And in the next eſſay ſave one, we ſhall give you another inſtance pertinent to our purpoſe. For if you heat a ſlender piece of ſteel (as a graver, or the like) red hot, and ſuffer it to cool leiſurely in the air, it will continue flexible enough, and of ſo ſoft a texture, that you may eaſily make impreſſions on it with any hardned ſteel: but if, inſtead of cooling it thus ſlowly, you knock it into ſuch a dry body, as we ſhall there name to you, it will immediately grow ſo hard, as to be brittle. Which alteration, whether it be reſolved to proceed from the particular effluvia of the body, into which it is knocked, or barely from the ingreſs of the corpuſcles of cold, (if any ſuch there be) it will be however an inſtance not unfit for our purpoſe. And thoſe, *Pyrophilus*, that are converſant in glaſs-houſes, may eaſily obſerve, that glaſs acquires a more or leſs brittle texture, according as (to ſpeak in the glaſsmen's language) it is baked. For if, after glaſſes are blown, they be quickly carried into the open air, they wont to be much more ſubject to break, than thoſe, that after they are faſhioned, are placed in a kind of very long oven, (which is wont to be built over the furnace, wherein the materials, whereof the glaſs is made, are kept in fuſion) and are by ſlow degrees refrigerated, and not till after ſome hours expoſed to the open air: for whether this difference of brittleneſs, and conſequently of texture, be aſcribed to the interrupted tranſcurſion of ſome etherial matter, through the pores of the glaſs, or to the inſinuations of the atoms of the cold; or to this, that the particles of the glaſs agitated by the heat were ſurprized by the cold, before they could make an end of thoſe motions, which were requiſite to their diſpoſing themſelves into the moſt durable texture; it is evident enough, that it is by no groſs or viſible body, that this permanent difference of texture is produced. Of the like to which we may elſewhere give you examples in ſome other concretes. That alſo in an human body great alterations may be made by very ſubtile effluvia, appears evidently, not only by the inſtances we have formerly given of the efficacy of ſome outwardly applied remedies, but by divers other things; as that many are purged by the bare odour of potions; of which I have been aſſured, upon his own obſervation, by the experienced town-phyſician of *Plimouth*, Dr. *D.* and of which *Salmuth*, in his Obſervations, gives us an inſtance in a young gentlewoman, whom he ſaw more happily purged by the odour of a potion, drank by her ſiſter, than ſhe was that took the medicine. And the ſame author tells us of one Dr. *Pfeil*, an eminent phyſician, who was wont, when he had a mind to be purged, to go into ſome apothecaries ſhop, where electuaries electively purging were preparing, to which having a while ſmelt, they would by their odour, after his return home, work with him ſix or ſeven times, as if he had ſwallowed the medicine it ſelf. And *Henricus ab Heer*, in the twenty ninth of his formerly commended Obſervations, tells us of a woman, that not only was wont to be copiouſly purged by drinking beef-broth, but having by a fall broken her leg, uſed no other cathartick, than the bare odour of that ſort of broth. And very obſervable to our purpoſe is the operation of the air, all along the ridge of the high mountain of *Peru*, called *Pariacaca*, of which the learned Jeſuit *Joſeph Acoſta* relates, that though he went as well prepared as he could, to withſtand the operations uſually produced in travels, by that piercing air; yet when he approached to the top of the mountain, he was (notwithſtanding all his proviſion) ſurprized with ſuch fits, and pangs of ſtriving and caſting

Of purging by the order of potions.

Cent. 3. Obſer. 4.

Cent. 3. Obſer. 8.

Lib. 3. cap. 9.

Of the purging and vomiting quality of the air of the mountain Pariacaca.

ing, as he thought he ſhould caſt up his heart too; having, after meat, phlegm, and choler, both yellow and green, in the end with overſtriving caſt up blood; and continued thus ſick for three or four hours, till he had paſſed into a more temperate air than that of the top of the mountain; which runs about 500 leagues, and has every where, though not equally, this diſcompoſing property, having operated upon ſome of his companions, as well downwards as upwards. A greater proof of the power of the ſteams upon the body may be taken from the propagation of infectious diſeaſes, which being conveyed by inſenſible effluvia, from a ſick into a healthy body, are able to diſorder the whole oeconomy of it, and act thoſe ſad tragedies, which phyſicians do ſo often unſucceſsfully endeavour to hinder. But you will ceaſe to doubt, that corpuſcles, though ſo ſmall as to be below the ſenſe, ſhould be able to perform great matters upon human bodies, if you conſider, what alterations may be therein produced by the bare actions of the parts upon one another. This may appear by the effects of ſeveral paſſions of the mind, which are often excited by the bare, if attentive, thoughts of abſent things. In obſtinate grief and melancholy, there is that alteration made in the diſpoſition of the heart, and perhaps ſome other parts, by which the blood is to circulate, that the lively motion of that liquor is thereby diſturbed, and obſtructions and other not eaſily removed diſtempers are occaſioned. The bare remembrance of a loathſome potion does oftentimes produce in me (and I doubt not, but the like thought may have the like operation in many others) a horrour, attended with a very ſenſible commotion of divers parts of my body, eſpecially with a kind of convulſive motion, in or about the ſtomach. And what power the paſſions have to alter and determine the courſe of the blood, may appear yet more manifeſtly in modeſt and baſhful perſons, eſpecially women, when meerly upon the remembrance or thought of an unchaſte, or undecent thing, mentioned before them, the motion of the blood will be ſo determined, as to paſs ſuddenly and plentifully enough in the cheeks (and ſometimes other parts) to make them immediately wear that livery of virtue (as an old philoſopher ſtyled it) which we call a bluſh. And even by joy, if great and ſudden, I not long ſince ſaw in perſons of both ſexes, not only the cheeks and forehead, but it left (as to the lady) even the neck and ſhoulders dyed of that colour. And that paſſions may not only alter the motion of the juices of the body, but likewiſe make ſome ſeparation and evacuation of them, may appear in grief, which is wont, eſpecially in women, to make all the commotions requiſite to weeping; whereby oftentimes a conſiderable quantity of briny liquor is excluded at the eyes, under the form of tears, by which divers (eſpecially hyſterical) perſons are wont to find themſelves much refreſhed, though with ſome it fares otherwiſe in teeming women. Alſo that vehement deſire we call longing may well be ſuppoſed to produce great alterations in the body of the mother, which leaves ſuch ſtrange and laſting impreſſions upon that of the infant; ſince it is the mother only, and not at all the infant, that conceives thoſe importunate deſires.

The power of ſteams ſeen in the infectious effluvia.

Of alterations made by the paſſions of the mind.

CHAP. XIV.

THERE are many inſtances to be met with in phyſicians books, to ſhew, that imagination is able ſo to alter the imagining perſon's body, as to work ſuch a diſpoſition in the ſpirits, blood and humours of it, as to produce the determinate diſeaſe that is exceſſively feared. And I remember, that ſoon after the laſt fair lady *R.* died of the ſmall-pox, I chanced to meet one of her ſiſters, with her maſk on, amongſt ſome other perſons of high quality, and wondering to ſee her ſit maſk'd in ſuch company, her huſband (who was preſent) told me, that his wife having been happily brought to bed ſome while before her ſiſter fell ſick, he had carefully kept the knowledge of her ſickneſs from his wife; leſt the kindneſs, that was betwixt them two, might prejudice her in the condition ſhe was in: but that after a while, a lady unawares making mention in her hearing of her ſiſter's ſickneſs, ſhe immediately fancied, that ſhe ſhould have it too, and accordingly fell ſick of that diſfiguring diſeaſe, whoſe marks obliged her for a while to wear a maſk. Nor is it in women only, but even in men, that conceit may produce ſuch real and laſting effects. For many authentick hiſtories record examples of thoſe, in whom exceſſive grief or fear has made ſuch a change in the colour of their hair in a night, as nature would otherwiſe have ſcarce made in divers years. And I remember, that being about four or ſix years ſince, in the county of *Cork*, there was an Iriſh captain, a man of middle age and ſtature, who coming with ſome of his followers to render himſelf to your uncle *Broghill*, who then commanded the Engliſh forces in thoſe parts, upon a publick profer of pardon to the Iriſh, that would then lay down their arms, he was caſually, in a ſuſpicious place, met with by a party of the Engliſh, and intercepted. And my brother being then abſent upon a deſign, he was ſo apprehenſive of being put to death by the inferiour officers, before your uncle's return, that that anxiety of mind quickly changed the colour of his hair after a peculiar manner: of which I (being then at that caſtle of your uncle's, whereunto he was brought) had quickly notice given me, and had the curioſity to examine this captain, and found, that the hair of his head, had not (as in the inſtances I had met with in hiſtories) uniformly changed its colour, but that here and there certain peculiar tufts and locks of it, whoſe baſes might be about an inch in diameter, were thus ſuddenly turned white all over: the reſt of his hair (of which you know the Iriſh uſe to wear good ſtore) retaining its former reddiſh colour.

Divers inſtances of the power of imagination.

An inſtance of the hair of the head changed in colour upon a ſudden fear.

[You will miſtake my deſign, *Pyrophilus*, if you conclude from what I have ſaid, concerning the power of effluvia to work upon the body, that I am either ſo much an Helmontian, as to condemn the uſe of all thoſe remedies, that make ſuch more groſs evacuations

(if I may ſo call them) as are made by vomit, ſiege, and the like; or that I would have you, or am my ſelf ſo credulous, as to believe all the virtues, that are even by eminent writers aſcribed to the remedies called Specificks. For (to mention here but this) we have obſerved, that the hopes built upon even excellent ſpecificks, unleſs they be of ſuch a reſolving and abſterſive nature, as to be able to make way for themſelves into the receſſes of the body, are oftentimes diſappointed, where ſome emetick or cathartick remedy has not been firſt uſed to free the ſtomach and guts from thoſe viſcous humours, which obſtructing the firſt paſſages, much enervate the virtue of the remedy, if they do not altogether deny it acceſs to the innermoſt parts of the body. That then, which I aim at, is firſt to keep you from being prejudiced by the confidence of ſome learned doctors, who laugh at the very name of ſpecificks, and will not allow any diſeaſe to be curable, but by viſible evacuations of ſtore of what they call peccant matter; and next to give you cauſe to think, that ſuch ſpecificks, as men of judgment and credit do recommend upon their own experience, ought not to be rejected without trial, upon the bare account of their not being either laxative or vomitive, ſudorifick, or diuretical; nay, not ſo much as for this, that they are not endowed with any eminent degree of any manifeſt quality, ſuch as heat, cold, dryneſs, odour, taſte, aſtriction, and the like; nor able perchance to work any conſiderable alteration in a healthy human body. For I conſider the body of a living man, not as a rude heap of limbs and liquors, but as an engine conſiſting of ſeveral parts ſo ſet together, that there is a ſtrange and conſpiring communication betwixt them, by virtue whereof, a very weak and inconſiderable impreſſion of adventitious matter upon ſome one part may be able to work on ſome other diſtant part, or perhaps on the whole engine, a change far exceeding what the ſame adventitious body could do upon a body not ſo contrived. The faint motion of a man's little finger upon a ſmall piece of iron, that were no part of an engine, would produce no conſiderable effect; but when a muſket is ready to be ſhot off, then ſuch a motion being applied to the trigger by virtue of the contrivance of the engine, the ſpring is immediately let looſe, the cock falls down, and knocks the flint againſt the ſteel, opens the pan, ſtrikes fire upon the powder in it, which by the touch-hole fires the powder in the barrel, and that with great noiſe throws out the ponderous leaden-bullet, with violence enough to kill a man at ſeven or eight hundred foot diſtance. And that alſo the engine of an human body is ſo framed, as to be capable of receiving great alterations from ſeemingly ſlight impreſſions of outward objects, upon the bare account of its particular contrivance, may appear by ſeveral inſtances, beſide thoſe, which may belong to this argument in the foregoing part of this eſſay. When a man goes ſuddenly out into the ſun, it often happens, that thoſe beams, which light upon the head, and would not in ſo ſhort a time have any diſcernible effect on the leaſt hair of it, do almoſt in a moment produce that ſtrange and violent motion in the head, and almoſt all the body, which we call ſneezing. Men, that from the top of ſome pinnacle, or other high and ſteep place, do look down to the bottom of it, are at firſt very apt by the bare proſpect, (which yet conveys nothing into the body, but thoſe images, if yet there intervene corporeal ones in ſenſation of viſible objects, that enter the eye) to become ſo giddy, that they are reduced to turn away their eyes from the precipice, for fear of not being able to ſtand upon their legs. And many, that looked fixedly upon a whirlpool, or upon a very ſwift ſtream, have had ſuch a vertiginous motion thereby impreſſed on their ſpirits, that they have been unable to keep their bodies upright, but have fallen into the water they gazed on. And it is no leſs remarkable, that when a man is ſomewhat diſcompoſed at ſea, and yet not enough to vomit freely; the ſeamen are wont to adviſe him to look from the ſide of the ſhip upon the water, which ſeeming ſwiftly to paſs by the veſſel, has upon the gazer the operation of a rapid ſtream, and by making him giddy, haſtens and facilitates his vomiting; as I have ſometimes tried upon my ſelf, when I had a mind for health's ſake to be put into a fit of ſea-ſickneſs. If a perſon be very tickliſh, and you but gently ſtroke the ſole of his foot with the top of a feather, that languid impreſſion on the bottom of the foot ſhall, whether he will or no, put all thoſe muſcles and other parts into motion, which are requiſite to make that noiſe, and to exhibit that ſhape of the face (ſo far diſtant from the feet) which we call laughing; and ſo the gentle motion of a ſtraw, tickling the noſtrils, is able to excite ſneezing. Moſt men may obſerve in themſelves, that there are ſome ſuch noiſes, as thoſe made by the grating of an ungreaſed cart-wheel upon the axle-tree, or the tearing of coarſe paper, which are capable of ſetting the teeth on edge, which yet cannot be done without exciting a peculiar motion in ſeveral parts of the head. I had a ſervant, who ſometimes complained to me of a much more remarkable and unfrequent diſorder; namely, that when he was put to whet a knife, that ſtridulous motion of the air was wont to make his gums bleed. *Henricus ab Heer* (in his twenty ninth obſervation) records a ſtory of a lady, to whom he was ſent for, who upon the hearing of the ſound of a bell, or any loud noiſe, though ſinging, would fall into fits of ſounding, which was ſcarce diſtinguiſhable from death; and we may confirm, that this diſpoſition depended upon the texture of her body, in reference to material ſounds, by what he ſubjoins, that having well purged her, and giving her for two months the *Spaw*-waters, and other appropriate remedies, he thoroughly cured her. And it often enough happens, that when a woman is in a fit of the mother, another hyſterical perſon ſtanding by, is, by reaſon of a peculiar diſpoſition of her body, ſoon infected with the like ſtrange diſcompoſure. And to ſhew you, that a diſtempered body is both an engine, and alſo an engine diſpoſed to receive alterations

How the author's diſcourſe concerning the power of effluvia ought to be underſtood.

That the particular ſtate and diſpoſition of the engine of an human body is conſiderable as to the effects of theſe impreſſions.

from ſuch impreſſions as will make none on a ſound body, let me put you in mind, that thoſe ſubtile ſteams, that wander through the air before conſiderable changes of weather diſcloſe themſelves, are wont to be painfully felt by many ſickly perſons, and more conſtantly by men, that have had great bruiſes or wounds in the parts, that have been ſo hurt; though neither are healthy men at all incommodated thereby, nor do thoſe themſelves, that have been hurt, feel any thing in thoſe ſound parts, whoſe tone or texture has not been altered or enfeebled by outward violence. I have known ſeveral alſo (and the thing is obvious) whoſe bodies and humours are ſo framed and conſtituted, that if (as men commonly ſpeak) they ride backward in a coach, that motion will make them giddy, and force them to vomit. And it is very ordinary for hyſterical women to fall into ſuch fits as counterfeit epilepſies, convulſions, and I know not what violent diſtempers, by the bare ſmell of muſk and amber, and other ſtrong perfumes, whoſe ſteams are yet ſo far from having great, much leſs ſuch effects in other human bodies, that almoſt all men, and the generality even of healthy women, are not affected by them, unleſs with ſome innocent delight. And that even on men, odours (how minute and inviſible bodies ſoever) may ſometimes have very great power, may be gathered from the ſtory told us by *Zacutus Luſitanus*, of a fiſherman, who having ſpent all his life at ſea, and being grown old there, and coming to gaze upon a ſolemn reception made in a maritime town, to *Sebaſtian* king of *Portugal*, was, by the perfumes plentifully burnt, to welcome the king, immediately caſt upon the ground thereby into a fit, which two phyſicians judged apoplectical, and phyſicked him accordingly, till three days after the king's chief phyſician, *Thomas à Vega*, gueſſing at the cauſe of the diſeaſe, commanded him to be removed to the ſea-ſide, and covered with ſea-weeds, where, within four hours, the maritime air and ſteams began to open his eyes, and made him know thoſe, that were about him, and within not many days reſtored him to health. We may alſo conjecture, how much the alteration produced in the body by ſickneſs may diſpoſe it to receive ſtrong impreſſions from things, that would not otherwiſe much affect it, by this; that even a man in perfect health, and who is wont to drink cold without the leaſt harm, may, when he has much heated himſelf by exerciſe, be caſt by a draught of cold drink into ſuch ſudden, formidable and dangerous diſtempers, as, did not daily experience convince us, we ſhould ſcarce think poſſible to be produced in a body, free from morbid humours, by ſo familiar a thing as a cup of ſmall-beer or water: inſomuch that *Benivenius* relates a ſtory of one, who after too vehement exerciſe drinking a glaſs of very cold water fell into a ſwoon, that was quickly ſucceeded by death. And yet, to add that, on this occaſion, in bodies otherwiſe diſpoſed, a large draught of cold water, drunk even without thirſt, may very much relieve the drinker, and prevent great fits of the mother, and partly of the ſpleen, eſpecially upon ſudden frights; to which purpoſes, I know ſome hyſterical ladies, that find in this remedy, as themſelves aſſure me, more advantage, than one would eaſily imagine.

In Pr. med. adm. l. 3. Obſervat. 99.

AND (farther) to ſhew you, that the engine we are ſpeaking of, is alterable, as well for the better as for the worſe, by ſuch motions of outward bodies, as, in themſelves conſidered, are languid, or at leaſt may ſeem deſpicable in reference to ſickneſs or recovery; let me call upon you to conſider a few, not unobvious, things, which may alſo ſerve to confirm ſome part of what has hitherto been delivered.

The effects of the moſs growing on a human ſkull in ſtanching blood.

[THE true moſs growing upon a human ſkull, though I do not find experience warrant all the ſtrange things ſome chymical writers attribute to it for the ſtanching of blood, yet I deny not, but in ſome bodies it does it wonderful enough. And I very well know an eminent Virtuoſo, who has aſſured me, as his phyſician likewiſe has done, that he finds the effects of this moſs ſo conſiderable upon himſelf, that after having been let blood, his arm falling to bleed again, and he apprehending the conſequences of it, his phyſician, who chanced to be preſent, put a little of the abovementioned moſs into his hand; which, barely held there did, to the patient's wonder, ſtanch his blood, and gave him the curioſity to lay it out of his hand, to try, whether the moſs were the cauſe of the blood's ſo oddly ſtopping its courſe; whereupon his arm, after a little while, beginning to bleed afreſh, he took the moſs again into his hand, and thereby preſently ſtanch'd his bleeding the ſecond time: and, if I miſremember not, he added, that he repeated the experiment once more with the like ſucceſs. The ſmoke of burnt feathers, or tobacco blown upon the face of an hyſterical woman, does oftentimes almoſt as ſuddenly recover them out of fits of the mother, as the odour of perfumes did caſt them thereinto.]

Burnt feathers, or the ſmoke of tobacco removes hyſterical fits.

AND now I ſpeak of cures performable by fumes, it brings into my mind, that a friend of yours and mine, and a perſon of great veracity, profeſſes to have ſtrangely cured dyſenteries by a way uſual enough; which is to make the patient ſit over a chair or ſtool cloſe on the ſides, and perforated below, ſo that the *anus* and the neighbouring parts may be expoſed to the fumes of ginger, which muſt be thrown upon a pan of embers, placed juſt under the patient, who is to continue in that poſture, and to receive the fume, as long as he can endure it without too much fainting. And when I mentioned one of the cures, that was thus performed, to one, that is looked upon as a maſter of chymical arcana againſt diſeaſes; he preferred before it (as he ſays upon experience) the ſhavings of hartſhorn uſed after the ſame manner; and the remedy ſeems not irrational. But if in this diſtemper, the actual heat applied to the above-mentioned part of the body concur not to the effect, we may too, warrantably enough, add, that cures may be performed by far more minute corpuſcles than thoſe of ſmoke, inſinuating themſelves from without into the body. For I know a very dexterous goldſmith, who, when he over-

Cures of dyſenteries by fumes.

heats himſelf, as he often unawares does at hammering of plate, is ſubject to fall into gripings of the belly, which lead to fluxes; but his uſual and ready cure is, as ſoon as conveniently he can, to heat his anvil, and ſit upon it for a great while together, heating it hot again, if there be need. But to return to our medicinal ſmokes, it is known, that ſome find more good againſt the fits of the colick, by the clyſters of the ſmoke of tobacco, than by any other phyſick they take; ſo that I know wealthy perſons, that relying upon the benefit they find by this remedy, have left off ſending for their phyſicians to eaſe them of the colick. And indeed, when I conſider what an odd concrete even common ſoot is, and that many concretes, by being reſolved into ſmoke, may be either more or otherwiſe unlocked, than they would be by the ſtomach of a man, (ſo that I may elſewhere entertain you of the great heightening of ſome emetick and cathartick ſimples in their operation, by their being reduced into ſmoke) and that alſo probably the operation of ſome fumes and odours may be much changed and improved by their not getting into the body by the mouth, but other parts; I am inclinable to think, that there might be made further uſe of them, if phyſicians pleaſed, than hitherto has been. For I have made ſuch trial of the virtue of ſulphureous ſmoke, to preſerve ſome liquors, as I was much pleaſed with. And not only *Paracelſus*, but *Helmont* highly extols, as a grand ſpecifick in fits of the mother, the ſmoke of the warts, that grew upon the legs of horſes, conveyed to the parts ſuppoſed to be primarily affected. And I remember, that lately I met with a gentleman curious and intelligent, who, as himſelf aſſured me, was by the ſcurvy and ill-conditioned ulcers, and other obſtinate diſtempers, brought ſo low, that he was ſcarce able to turn himſelf freely in his bed, and thereupon reſolved againſt taking any more phyſick, partly out of deſpair of recovery, and partly of wearineſs of the tedious courſes of phyſick the doctors had in vain made him paſs through: but that ſome of his friends bringing him a certain ſurgeon, whom they affirmed to have ſtrangely cured many deſperate diſtempers, by ways very unuſual and not troubleſome to the patient, this gentleman was content to put himſelf into his hands; the ſurgeon promiſing, that he would not give him any other phyſick, but now and then a cup of ſack by way of cordial; his way of cure being to fumigate the patient very well every morning with a certain ſmoke, which that gentleman thinks, by what he took notice of, in the powder that yielded it, to have been ſome vegetable, ſubſtance. And with this remedy in a ſhort time he grew perfectly well, and came home a while ſince in very good health, from a voyage, which the confuſions of his own country invited him to make as far as the *Eaſt-Indies*. This ſurgeon, whoſe name I cannot hit upon, dying ſuddenly, his ſecret (which was tried upon divers others beſides this gentleman) is, for aught we know, dead with him.

And by ſitting on a hot anvil.

Cures of the colick by glyſters of the ſmoke of tobacco.

Of other cures done by ſmokes.

[But as for the efficacy, that may be found in appropriated fumes and ſteams, we have more than once, by barely unſtopping and holding under her noſe a ſmall phial of highly rectified ſpirit of ſal-armoniack, or even of hartſhorn, almoſt preſently recovered a young beauty, I need not name to you, out of ſtrange fits, that were wont to take her more ſuddenly than thoſe of the falling-ſickneſs, and were looked upon as epileptical, though perchance they were not merely ſo. To which I ſhall add, that a lady, that both you, *Pyrophilus*, and I know and love very well, though ſhe have been long ſubject to violent and tedious fits of the head-ach, and though that diſtemper hath been much increaſed by a great concuſſion of her head, occaſioned by the overturning of a coach, yet ſhe is wont preſently to be relieved, barely by holding her head a pretty while over a ſtrong decoction of tea, and breathing in the ſteams of it.]

And now I am diſcourſing of cures made by ſteams, or other ſeemingly ſlight means, I muſt not pretermit a thing ſo remarkable, that if it were more generally known in *Europe*, I ſhall think it ſomewhat ſtrange to find it ſo little reflected on by phyſicians; and that is, the conſtant and almoſt ſudden ceaſing of the plague, how raging ſoever, in the almoſt incredibly populous city of *Grand Cairo* in *Egypt* towards the latter end of *June*, about which time in moſt countries in our hemiſphere it is wont to ſpread faſteſt, and be moſt rife. The truth of this is atteſted by ſo many travellers of ſeveral nations, that it were injurious to doubt of it; and not only the dexterous Mr. *R.* whom you well know, and who lived at *Cairo*, has confirmed to me the truth of it, but the learned *Proſper Alpinus*, who both was an excellent phyſician, and ſpent many years in *Egypt*, gives us this particular account of it: *Peſtis Cayri atque in omnibus locis Ægypti invadere eos populos ſolet ineunte Septembri menſe, uſque ad Junium: his enim omnibus menſibus, à Septembri ad Junium uſque, peſtis aliunde per contagium illuc aſportata eam gentem invadere ſolet.* And after a few lines, *Junio verò menſe, qualiſcunque & quantacunque ſit ibi peſtilentia, ſole primam cancri partem ingrediente, omnino tollitur, quod multis planè divinum eſſe non immeritò videtur: ſed quo etiam valde mirabile creditur, omnia ſupellectilia peſtifero contagio infecta tunc nullum contagii effectum in eam gentem edunt; ita ut tunc ea vobis in tutiſſimo & tranquilliſſimo ſtatu reducatur ex ſummè morboſo: atque morbi particulares, ſporadici à Græcis vocati, tunc apparere incipiunt, qui nuſquam gentium tempore peſtis apparebant.* 'The plague at *Grand Cairo*, 'and in all parts of *Ægypt*, is wont to invade 'the inhabitants from the beginning of the 'month *September* until *June*: for in all theſe 'months, from *September* unto *June*, the plague 'from other nations is brought thither, and is 'wont to infect that nation. But in the month 'of *June*, of what nature and how great ſoever 'the peſtilence be, when the ſun firſt enters *Cancer*, it is immediately removed; which thing 'many (and that not without reaſon) take to 'be a particular mercy of God. But (what 'is more admirable) all houſhold-ſtuff, however infected with the contagion of the diſ-

Of the ſudden ceaſing of the plague at Grand Cairo in June.

De medicina Ægyptiorum. lib. 1. cap. 17.

'eaſe,

'eaſe, at that time ſhews no effect of any contagion, ſo that then the whole nation paſſes 'into a moſt ſecure and healthy condition, 'from a morbid and dangerous; and then 'thoſe diſeaſes, which are called by the Greeks '*Sporadici*, begin to appear, which in no part 'of the world are ſeen to be rife together with 'the plague.' And in the next chapter, inquiring at large into the cauſes of this wonder, he denies it to proceed from the increaſe of the *Nile*, which happens to be coincident in point of time with the extinction of the plague, becauſe that the infection ceaſeth before the ſwelling of the river is conſiderable; and aſcribeth it rather to the alteration of the air, produced by the northerly winds, which then begin to blow, and ſome other circumſtances: ſpeaking of which, *Hæc* (ſaith he) *per id temporis incipiunt obſervari, à quibus fortaſſe non immeritò cauſam extinctionis peſtis morboſique in ſalubrem ſtatum mutationis pendere arbitror: quando nulla alia ex conſervatricibus cauſis, quas vulgus medicorum res non naturales appellat, aëre excepto, ibi eo tempore appareat, in quam morboſi ſtatus in ſalubrem mutationem referre poſſumus: ideo neceſſarium erit hujuſce mutationis cauſam aëris mutationi acceptam referre, &c.* *Ibidem, c. 18.*

'Theſe things are firſt obſerved about that 'time. From which, I think, and perchance 'not without reaſon, the cauſe of the extinction 'of the plague, and the change of the ſtate 'from morbid to wholeſome doth depend; 'for no other of the conſervative cauſes, which 'are wont to be called by phyſicians *res non-naturales*, appeareth then, beſides the air: to 'which we may refer this change from diſeaſe 'to healthineſs; and therefore we muſt refer 'this change to the change of the air.' Upon this inſtance, *Pyrophilus*, I have preſumed the longer to inſiſt, becauſe (if you duly reflect on it) you will, I ſuppoſe, diſcern, that it much credits and elucidates a great part of what hath been delivered in divers of the foregoing leaves, concerning the poſſibility of nature's doing great matters againſt diſeaſes, without the help of groſs and ſenſible evacuations.

CHAP. XV.

That human body may be altered by ſuch motions, as act in a groſs and meerly mechanical manner, proved by divers inſtances.

AND ſince we have repreſented a human body as an engine, we ſhall add, that it may be altered both for the better and for the worſe, by ſuch bare motions or impulſes of external bodies, as act but in a groſs and confeſſedly mechanical manner. For it is known, that out of ſuch ſpeedily killing (unleſs ſeaſonably remedied) diſtempers, as fits of ſwooning, patients of either ſex are often recovered without any inward medicine, by being barely pinched in ſeveral places. I, that have endured great and dangerous ſickneſſes, have ſcarce ever found any ſo violent for the time, as that, which the bare motion and ſmell of a ſhip and ſea-air hath put me into, eſpecially in rough weather, till I was ſomewhat accuſtomed to navigation; and yet this violent and weakning ſickneſs, as it was not produced by a peccant humour in the body, ſo it was quickly removed by the air, and quiet of the ſhore, without the help of phyſick. And the like may be obſerved more ſuddenly in the newly mentioned inſtances of thoſe, in whom the bare agitation of a coach will produce ſuch violent fits of vomiting, and ſuch faintneſs, that I have known ſome of them apprehend they ſhould preſently die; ſo the bare ceſſation of that diſcompoſing motion ſoon relieved them. We ſee in our ſtables, what operation the currying of them carefully hath upon our horſes. And *Helmont* ſomewhere tells us, that himſelf, as I remember, could, by the milk of an aſs, tell, whether ſhe had been that day diligently curried or no; and ſo conſiderable an alteration in milk ſhould methinks ſtrongly argue, that a great one is in the blood or other juice, of which the blood is elaborated, and conſequently in divers of the principal parts of the body muſt have preceded it. But to prefer our conſideration from the bodies of beaſts to thoſe of men, it is remarkable what *Piſo* confeſſeth, the illiterate Braſilian empiricks are able to perform with frictions, even as unſkilfully as they order them: *Mira equidem, tum tuendæ ſanitatis ergo, cum in pleriſque morbis ſanandis, frictione & unctione frequenti incolæ præſtant, illam frigidioribus, & chronicis, hanc in acutioribus adhibentes. Quæ remedia lubenter advenæ imitantur, &, ut par eſt, ex legibus artis hæc & plura medendi empiricorum genera moderantur.* *Hiſtor. Nat. Med.* lib. 2. cap. 5. p. 33.

'The inhabitants do 'ſtrange things, both in preſerving health and 'in curing diſeaſes, by friction and unction, 'uſing the firſt in cold and chronical, the latter in acute diſeaſes. And ſtrangers, who 'arrive there, are, as they ought, willing to 'imitate their ways of phyſick, and by rules of 'art to preſide and moderate theſe ways of 'empirical healing.' And as *Galen* himſelf highly extols a ſkilfull application of cupping-glaſſes in the colick; ſo *in Braſil* they find, that the like remedy is ſtrangely ſucceſsful: for *Cholera ſicca*, ſaith our candid *Piſo* in another place, *eiſdem ferè remediis* (of which he had been ſpeaking) *curatur, maximè ſi regioni hepatis corneæ cucurbitulæ applicentur. De quibus merito hoc teſtor, quod Galenus de ſuis cucurbitulis, quas in colico affectu incantamenti inſtar operari tradidit.* *Idem* cap. 11.

'*Cholera ſicca* is cured by the ſame remedies, 'eſpecially if their horny cupping-glaſs be ap'plied to the region of the liver, of which I 'muſt atteſt the ſame thing, that *Galen* doth 'of cupping-glaſſes; which he affirmed to 'work as miraculouſly, as if their operation 'had depended on enchantment.'

WE ſhall add, for further confirmation, that notwithſtanding all the horrid ſymptoms, that are wont to enſue upon the biting of that poiſonous ſpider, the *Tarantula*, that laſting and formidable diſeaſe, which often mocks all other remedies, is by nothing ſo ſucceſsfully oppoſed, as by muſick; ſome determinate tune or other, which proves ſuitable to the particular nature of the patient's body, or that of the poiſon producing there ſuch a motion, or determination of ſome former motion of the ſpirits, or the humours, or both, as by conducting the ſpirits into the nerves and muſcles inſervient to the motion of the limbs, doth make the patient leap and dance, till he have put himſelf into a ſweat, that breathes out much of the virulent

The inſtances of the cure of the Tarantula by muſick particularly modified.

virulent matter, which hath been probably fitted for expulſion, by ſome change wrought in its texture or motion, or thoſe of the blood, by the muſick. For if ſweat and exerciſe, as ſuch, were all that relieved him, why might not ſudorificks, or leaping without muſick, excuſe the need of fidlers? which yet is ſo great, that *Kircher* informs us, that the Apuleian magiſtrates are wont to give ſtipends, at their publick charge, to ſuch, to relieve the poor by their playing. And not only he hath the memorable ſtory of *Robertus Pantarus*, a Tarantine nobleman, whoſe diſeaſe being not known to proceed from the biting of a ſpider, could by no remedies be cured; he was at length, even upon the point of death, ſuddenly relieved, and by degrees reſtored to perfect health by the uſe of muſick: but *Epiphanius Ferdinandus*, in his accurate obſervations concerning thoſe bitten with the tarantula, together with *Mathiolus*, and other authors, bear witneſs thereunto by reſembling narratives. Now that a ſound (not barely as a ſound, but ſo modified) may powerfully operate upon the blood and ſpirits, I, who am very muſically given, have divers times obſerved in myſelf, upon the hearing of certain notes. And it might be made probable, both by that, which we have formerly ſaid of the effect of ſkreaking upon the teeth and gums, and by the dancing fit, into which not every muſical ſound, though never ſo loud, but ſome determinate tune is wont to put the bitten patient. But it may be more manifeſtly proved, by the following teſtimony of our inquiſitive Jeſuit, wherein he affirms, that the ſpiders may, as well as thoſe they have bitten, be made to dance by tunes ſuited to their peculiar conſtitutions. *

Muſurg. lib. 9. cap. 4.

AND this I the leſs wonder at, becauſe *Epiphanius Ferdinandus* himſelf not only tells us of a man of 94 years of age, and ſo weak, that he could not go, unleſs ſupported by his ſtaff, who did, upon the hearing of muſick after he was bitten, immediately fall a dancing and capering like a kid; and affirms, that Tarantula's themſelves may be brought to leap and dance at the ſound of lutes, ſmall drums, bagpipes, fiddles, *&c.* but challenges thoſe, that believe them not, to come and try, promiſing them an ocular conviction: and adds, what is very memorable and pleaſant, that not only men, in whom much may be aſcribed to fancy, but other animals being bitten, may likewiſe, by muſick, be reduced to leap or dance: for he ſaith, he ſaw a waſp, which being bitten by a Tarantula whilſt a lutaniſt chanced to be by; the muſician playing on his inſtrument, gave them the ſport of ſeeing both the waſp and ſpider begin to dance: annexing, that a bitten cock did the like.

CHAP. XVI.

Divers inſtances of the ἰδιοσυγκρασίαι, *or peculiar averſion of particular perſons from particular things, and of the commotions made in the body thereby.*

I MIGHT alſo, *Pyrophilus*, confirm what I told you, when I ſaid, that ſickneſs may produce ſuch an alteration in the fabrick of the body, as to make it capable to be very much affected, as well for the better as for the worſe, by ſuch things, that would not ſcarce at all effect it if it were ſound, from the conſideration of thoſe many and ſtrange ἰδιοσυγκρασίαι, or peculiarities, to be met with in ſome perſons in ſickneſs and inhealth. For though many of theſe differences between healthy men are not likely to be greater, than may be obſerved between the ſame man, when well, and himſelf as the oeconomy of his body may be diſcompoſed by ſome diſtemper; yet we often ſee, that ſome perſons have the engine of their body ſo framed, that it is wonderfully diſordered by ſuch things, as either work not at all on others, or work otherwiſe on them; as it is common enough for men to be hugely diſturbed, and ſome of them to fall into fits of trembling and ſwooning, upon the ſight or hearing of a cat. And to ſuch an affection I know a very eminent commander obnoxious, your late unkle, the laſt Earl of *Barrymore*, a very gallant nobleman, and who did his country great ſervice in the Iriſh wars, had the like apprehenſion for tanſey. I cannot ſee a ſpider near me, without feeling a notable commotion in my blood, though I never received harm from that ſort of creature, and have no ſuch abhorring againſt vipers, toads, or other venomous animals. You know an excellent lady (married to a great perſon, that hath more than once governed *Ireland*) whoſe antipathy to honey, which is much talked of in that country, hath diſplayed it ſelf upon ſeveral occaſions; notwithſtanding which, her experienced phyſician imagining, that there might be ſomething of deceit in her averſion, took an opportunity to ſatisfy himſelf, by mixing a little honey with other ingredients of a remedy which, he applied to a very ſlight and inconſiderable cut or ſcratch, which ſhe chanced to get on her foot; but he ſoon repented of his curioſity, upon the ſtrange and unexpected diſorder, which ceaſing upon the removal of that, and application of other ordinary remedies, ſatisfied him, that thoſe ſymptoms were to be imputed to the honey, and not the bare hurt. The ſame excellent lady, I remember, complained to me, that when ſhe was troubled with coughs, all the vulgar pectoral and pulmonick remedies did her no good, ſo that ſhe could find relief in nothing but either the fume of powdred amber, taken with convenient herbs in a pipe, or that *Balſamum ſulphuris*, which we have already taught you in this eſſay.

[I KNOW a perſon of quality, tall and ſtrong made,

* *Ubi ſonatores, qui muſica ſua hoc malum etiam publicis magiſtratus ſtipendiis ad pauperum remedium ſolatiumque conducti curare conſueverunt, ad curas patientium certius facilinſque accelerandas; primo ex infectis quærere ſolent ubi, quo loco, aut tempo, aut cujus coloris Tarantula erat, a quo morſus ipſis ſit inflictus. Quo facto indicatum locum protinus, ubi frequentes numero atque omnis generis Tarantulæ retium texendorum laboribus incumbunt, accedere ſolent medici citharœdi, variaque tentare harmoniarum genera: ad quæ (mirum dictu) nunc has nunc illas ſaltare non ſecus ac duorum polychordorum æqualiter concinnatorum, perſonatione illæ chordæ, quæ ſimiles ſibi fuerint tono, & æqualiter tenſæ moventur, reliquis immotis, ita ut pro ſimilitudine & conditione Tarantularum, nunc has nunc illas ſaltare comperiunt. Cum verò ejus coloris Tarantulam, quæ à patiente indicata fuerit, in ſaltum prorumpere viderint, pro certiſſimo ſigno habent, modulum ſe habere verum & certum, humori veneno τῷ ταραντίζοντος proportionatum, & ad curandum aptiſſimum, quo ſi utantur, infallibilem curæ effectum ſe conſequi aſſueverunt.* Kircher. Muſurg. lib. 9. part. 2. cap. 4.

made, who lately aſked my opinion, whether, when he had need of a vomit, he ſhould continue to make uſe of coffee, in regard it wrought ſo violently with him: this gave me the occaſion, as well as curioſity, of inquiring particularly both of himſelf and his lady, concerning this odd operation of coffee upon him; and I was told, that an ordinary wine-glaſs full of the uſual warm decoction of coffee boiled in common water, was wont, within about two hours, to prove emetick with him, and before noon did give him eight, ten, or ſometimes twelve vomits, with ſo much violence, that he was leſs affected by the infuſion of *Crocus metallorum*, or other uſual emeticks, and therefore was deliberating, whether he ſhould not change coffee for ſome of them, though finding its operation very certain, he had for ſome years accuſtomed himſelf to take that vomit. And that, which is alſo remarkable in this matter, is, that he tells me, that ſcarce any vomit is more troubleſome to him to take, than that above mentioned is grown of late, ſo that even the odour of coffee, as he paſſeth by coffee-houſes in the ſtreet, doth make him ſick; and yet that ſimple is to moſt men ſo far from being vomitive, that it is by eminent phyſicians, and in ſome caſes not without cauſe, much extolled as a ſtrengthener of the ſtomach. And this very gentleman himſelf uſed it a pretty while againſt the fumes, that offended his head, without finding any vomitive quality at all in it.]

THE books of ſober and learned phyſicians afford us examples of divers ſuch, and of much more ſtrange peculiarities, and likewiſe of ſuch perſons, who having deſires of certain things very extravagant, and even abſurd, (ordinarily not only improper, but hurtful to their diſtempers) have been cured by the uſe of them, of very dangerous and ſometimes hopeleſs diſeaſes: of which kind of cures I may alſo elſewhere tell you what I have obſerved, and ſome credit may be brought to ſuch relations, by what we ordinarily ſee more greedily devoured (without much harm) by longing women, and maids troubled with the green-ſickneſs.

That ſince the body receives ſuch alterations from ſuch unlikely things, there is no juſt arguing againſt ſpecificks, becauſe they operate not by any obvious qualities.

BUT now, *Pyrophilus*, ſince the engine of an human body thus appears to be ſo framed, that it is capable of receiving great alterations from ſuch unlikely things as thoſe we have been mentioning; why ſhould we haſtily conclude againſt the efficacy of ſpecificks, taken into the body, upon the bare account of their not operating by any obvious quality, if they be recommended unto us upon their own experience by ſober and faithful perſons? and that ſcarce ſenſible quantities of matter, having once obtained acceſs to the maſs of blood (which is very eaſily done by the circulation) may, by the contrary and ſwift motion, and by the figure of the corpuſcles it conſiſts of, give ſuch a new and unnatural impediment or determination to the motion of the blood, as to diſcompoſe either its texture, or that of the heart, brain, liver, ſpleen, or ſome ſuch principal part of the body, (as a ſpark of fire reduceth a whole barrel of gunpowder, to obey the laws of its motion, and become fire too; or as a little leaven is able, by degrees, to turn the greateſt lump of dow into leaven) need be manifeſted by nothing, but the operations of ſuch poiſons, as work not by any of thoſe (which phyſicians are pleaſed to call) *Manifeſt Qualities*. For though I much fear, that moſt of thoſe, that have written concerning poiſons, ſuppoſing that men would rather believe than try what they relate, have allowed themſelves to deliver many things more ſtrange than true; yet the known effects of a very ſmall quantity of opium, or of arſenick, of the ſcarce diſcernable hurt made by a viper's tooth, and eſpecially of the biting of a mad dog, (which ſometimes, by leſs of his ſpittle than would weigh half a grain, ſubdues a whole great ox into the like madneſs, and produceth truly wonderful ſymptoms both in mens bodies and beaſts) are ſufficient to evince what we propoſed.

AND that man's body may be as well ſometimes cured, as we ſee it too often diſcompoſed, by ſuch little proportions of matter, may (not now to mention the queſtionable virtues aſcribed to many antidotes) be gathered from that experiment, ſo common in *Italy* and elſewhere, of curing the invenomed biting of ſcorpions, by anointing the bitten and tumid place with common oil, wherein ſtore of ſcorpions have been drowned and ſteeped. And a reſembling example of the antidotal virtue, wherewith nature hath enriched ſome bodies, is given us by the above commended *Piſo*, in his *Medicina Braſilienſis*, where (treating of the antidotal efficacy of the famous Braſilian herb *Nhanby*, eaten upon an empty ſtomach) he adds this memorable ſtory; That he himſelf ſaw a Braſilian, who having caught an over-grown toad, and ſwelled with poiſon (ſuch a one as Braſilians call *Cururu*) which uſeth to be as big again as the European toad, and deſperately venomous (which perhaps our toads are not) he preſently killed him, by dropping on his back the juice of the flowers and leaves of that admirable plant. And you may remember, that the ſame author formerly told us, in effect, that as great and ſalutary changes may be produced even in human bodies, where he relates, that he had known thoſe, that had eaten ſeveral ſorts of poiſon, ſnatched in a trice from imminent death, by only drinking ſome of the infuſion of the root he calls *Jaborandi*; and this, after I know not how many alexipharmaca and theriacal antidotes had been fruitleſly adminiſtred.

YOU will perchance tell me, *Pyrophilus*, that theſe three or four laſt inſtances are of poiſonous diſtempers and their antidotes; not of ordinary diſeaſes, and their ſpecifick remedies. But to this I have a double anſwer: and firſt, many of thoſe diſtempers, that proceed from poiſon, are really diſeaſes, and both called by that name, and treated of as ſuch, by phyſicians. And indeed they may well look upon them but as diſeaſes, exaſperated by a virulent malignity, which yet appears to be not always eaſily diſtinguiſhable from that of diſeaſes, that proceed not from poiſon, by this, that otherwiſe the phyſicians of princes and great men, if, after having

conſidered

conſidered all the inward parts of their diſ-bowelled patients, could not ſo often doubt and diſpute, as they do, whether or no poiſon were acceſſary to their death. And *Piſo* (who learnt divers of their deteſtable ſecrets from the Braſilians) relates, That ſome of them are ſo ſkilful in the curſed art of tempering and allaying their poiſons, that they will often hinder them from diſcloſing their deleterial nature for ſo long a time, that the ſubtile murderers do, as unſuſpectedly as fatally, execute their malice or revenge. Theſe diſeaſes indeed are wont to differ in this from ſurfeits, and other reſembling ordinary diſeaſes; that in the one, the venomous matter, that produceth the diſeaſe, is at firſt much more ſmall, than in the other the morbifick matter is wont to be. But the activity of this little quantity of hoſtile matter doth make it pernicious; that the diſorders it produceth in the body, being much greater than that of ordinary ſickneſſes is, the cure of ſuch diſtempers is the fitter to manifeſt how powerfully nature may be ſuccoured by remedies, that work not by firſt or ſecond qualities, ſince ſuch are able to deliver her from diſeaſes heightned by a peculiar and venomous malignity.

To this firſt I ſhall ſubjoin my next, which is, That divers paſſages of the former diſcourſe (eſpecially what we have related concerning the cure of agues, of the rickets, and of the king's-evil) may ſatisfy you, that even of ordinary diſeaſes (ſome at leaſt) may be as well cured by ſpecificks, as thoſe produced by poiſon are by antidotes.

You may alſo ſay, *Pyrophilus*, 'But what 'if a recommended ſpecifick do not only ſeem 'unable to produce the promiſed effect, but have 'qualities, which according to our notions of 'the nature of the diſeaſe, ſeem likely to conſpire 'with it and increaſe it?'

I anſwer,

What is to be done, when the ſpecifick ſeems likely to increaſe the diſeaſe.

FIRST, That though it is better for the patient to be cured by a raſhly and unſkilfully given medicine, than to die under the uſe of the moſt ſkilfully adminiſtred phyſick; yet that the phyſician, who loſeth his patient, after having done all, that his art preſcribed to ſave him, deſerves more commendation than he, that luckily chanceth to cure his patient by an irrational courſe. And therefore in ſuch a caſe as you put, *Pyrophilus*, I think the phyſician ought to be very well ſatisfied, as to the matter of fact, before he venture to try ſuch a remedy; eſpecially if more ordinary and unſuſpected means have not been imployed and found ineffectual: for it is not one lucky cure, that ought to recommend to a wary phyſician the uſe of a remedy, whoſe dangerous quality ſeems obvious, whereas its virtue muſt be credited upon report.

BUT then, ſecondly, If the phyſician be duly ſatisfied of the efficacy of the remedy, upon a competent number and variety of patients, I ſuppoſe he may, without raſhneſs, make uſe of ſuch remedies, at leaſt where ordinary medicines have been already fruitleſly tried.

CHAP. XVIII.

THAT you may ceaſe to wonder at my daring to ſay this, *Pyrophilus*, I muſt offer to you three or four particulars.

A diſquiſition concerning the ordinary method of phyſick.

AND firſt, it is manifeſt to thoſe that are inquiſitive, that the true nature and cauſes of ſeveral diſeaſes are much leſs certain, and much more diſputed of amongſt the doctors themſelves, than thoſe that are not inquiſitive imagine: nor is the method of curing divers particular diſeaſes more ſettled and agreed on, that depending chiefly upon the knowledge of thoſe cauſes, which, as I was ſaying, are controverted. It is not, that I am either an enemy to method in phyſick, or an undervaluer of it; but I fear the generality of phyſicians (for I intend not, nor need all along this eſſay ſpeak of them all) have as yet but an imperfect method, and have by the narrow principles they were taught in the ſchools, been perſuaded to change their method rather to the barren principles of the Peripatetick ſchool, than to the full amplitude of nature. Nor do I find, that phyſicians have yet done ſo fit a thing, as ſeriouſly (and with the attention, which the importance of the thing deſerves) on the one ſide, to enumerate and diſtinguiſh the ſeveral cauſes, that may any whit probably be aſſigned, how the phænomena of that diſordered ſtate of the human body, which we call a diſeaſe, or its ſymptoms, may be produced; and on the other ſide, by how many and how differing ways the phænomena may be removed, or the diſeaſes they belong to deſtroyed: and if this were analytically and carefully done, I little doubt, but that men's knowledge of the nature and cauſes of diſeaſes, and the ways of curing them, would be leſs circumſcribed, and more effectual than now it is wont to be. And I am apt to think, that even methodiſts would then find, that there are divers probable, if not promiſing methods (proper to divers caſes) which ways they yet overlook. And though in a right ſenſe it be true, that the phyſician is but nature's miniſter, and is to comply with her, who aims always at the beſt; yet if we take them in the ſenſe thoſe expreſſions are vulgarly uſed in, I may elſewhere acquaint you with my exceptions at them, and in the mean time confeſs to you, that I know not whether they have not done harm, and hindered the advancement of phyſick, faſcinating the minds of men, and keeping them from thoſe effectual courſes, whereby they may potently alter the engine of the body; and by rectifying the motion and texture of its parts, both conſiſtent and fluid, may bring nature to their bent, and accuſtom her to ſuch convenient courſes of the blood and other juices, and ſuch fit times and ways of evacuating (what is noxious or ſuperfluous, *&c.*) as may prevent or cure divers ſtubborn diſeaſes, more happily than the vulgar methodiſts are wont to do.

AND indeed, it is ſcarce to be expected, that till men have a better knowledge of the principles of natural philoſophy, without which it is hard to arrive at a more comprehenſive theory of the various poſſible cauſes or diſeaſes, and of the contrivance and uſes of the parts of the body, the method which ſuppoſes this knowledge ſhould be other than in many things defective, and in ſome erroneous; as I am apt to think, the vulgar method may be ſhewn to be, as to ſome particular diſeaſes.

Of

Of this I may perhaps elſewhere acquaint you more particularly with my ſuſpicions, and therefore I ſhall now only mention the laſt obſervation of this kind I met with, which was a gentleman, you and I very well know, who being for ſome months much troubled with a difficulty of breathing, and having been unſucceſsfully treated for it by very eminent phyſicians, we at laſt ſuſpected, that it was not the lungs, but the nerves, that ſerved to move the diaphragm and other organs of reſpiration, upon whoſe diſtemper this ſuppoſed aſthma depended; and accordingly, by a taking or two of a volatile ſalt of ours, which is very friendly to the *Genus nervoſum*, he was quickly freed from his troubleſome diſtemper, which afterwards he was fully perſuaded did not proceed from any ſtuffing up of the lungs. To be ſhort, how much eſteem ſoever we have for method, yet ſince that it ſelf and the theories whereon men ground it, are, as to divers particular diſeaſes, ſo hotly diſputed of, even among eminent phyſicians, that in many caſes a man may diſcern more probability of the ſucceſs of the remedy, than of the truth of the received notion of the diſeaſe; in ſuch abſtruſe caſes methinks it were not amiſs to reflect upon that reaſoning of the ancient empiricks (though on a ſomewhat differing occaſion) which is thus ſomewhere expreſſed by *Celſus: Neque ſe dicere conſilio medicum non egere, & irrationabile animal hanc artem poſſe præſtare, ſed has latentium rerum conjecturas ad rem non pertinere; quia non interſit, quid morbum faciat, ſed quid tollat.* 'Nor doth he ſay, that a phyſician 'needs nothing of counſel or deliberation, or 'that an irrational man may profeſs this art; 'but that thoſe conjectures of hidden things 'are nothing to the purpoſe. Becauſe it mat- 'ters not what cauſeth the diſeaſe, but what 'removes it.' And as the controverted method in the above mentioned diſeaſes is not yet eſtabliſhed or agreed on in the ſchools themſelves, ſo divers of thoſe, that are wholly ſtrangers to thoſe ſchools, do yet, by the help of experience and good ſpecificks, and the method their mother-wit does, according to emergencies, prompt them to take, perform ſuch conſiderable cures, that *Piſo* ſticks not to give this teſtimony to the utterly unlearned Braſilian empiricks: *Interim*, ſays he, *ſeniores & exercitatiores eximii ſunt botanici, facilique negotio omnis generis medicamina ex undiquaque in ſylvis conquiſitis conficiunt. Quæ tanta ſagacitate interne & externe illos adhibere videas, præcipue in morbis è veneno natis, ut quis illorum manibus tutius & ſecurius ſe tradat, quam medicaſtris noſtris ſciolis, qui ſecreta quædam in umbra nata atque educata crepant perpetuo, & ob has rationales dici volunt.* 'In the mean time, the 'Braſilian botaniſts make all ſorts of medi- 'cines of ſimples they find every where in the 'woods: which they make with ſo great ſaga- 'city, and apply them both internally and ex- 'ternally, eſpecially to diſeaſes that ſpring from 'venom, that a man may more ſecurely give 'himſelf over to their hands, than to our un- 'ſkilfull phyſicians, who brag much of ſecrets 'they have learnt in private, and for the know- 'ledge of theſe will be called rationals in phy- 'ſick.'

Hiſt. Nat. & Med. lib. 2. pag. 23.

SECONDLY, There are divers medicines, which, though they want not ſome one quality or other, proper to increaſe the diſeaſe, againſt which they are adminiſtred, are yet confidently uſed by the moſt judicious doctors, becauſe that they are ſo inriched with other qualities, whereby they may do much more good than their noxious qualities can do harm: as in a malignant feaver, though the diſtemper be hot, and though treacle and ſome other antidotal ſudorificks be hot alſo, yet they are uſefully adminiſtred in ſuch diſeaſes, becauſe the relief they bring the patient, by oppugning the malignity of the peccant matter, and perhaps by eaſing him of ſome of it by ſweat, is more conſiderable than the harm they can do him, by increaſing for a while his heat.

Inſtances of ſome medicines which are condemned for noxious, and yet have proved uſeful.

THE very experienced *Bontius*, chief phyſician to the *Dutch* plantation in the *Eaſt-Indies*, in his *Methodus medendi Indica*, treating of the ſpaſmus, which (though here unfrequent) he reckons among the endemical diſeaſes of the *Indies*, commends the uſe of *Quercetanus*'s laudanum, of philonium, and principally of an extract of opium and ſaffron, which he deſcribes and much extols: and leſt his readers ſhould ſcruple at ſo ſtrange a preſcription, he adds this memorable paſſage to our preſent purpoſe: *Fortaſſis* (ſays he) *ſciolus quiſpiam negabit his remediis, propter vim ſtupefactivam ac narcoticam nerviſque inimicam, eſſe utendum. Specioſa quidem hæc prima fronte videntur, ſed tamen vana ſunt. Nam præterquam quod calidiſſima hujus climatis temperies requirat, certiſſimum eſt in tali neceſſitate, ſine his ægrum evadere non poſſe. Adde, quod nos tam ritè opium hic præparamus, ut vel infanti innoxiè detur: & ſanè (ut verbo abſolvam) ſi opiata hic nobis deeſſent in morbis calidis his graſſantibus fruſtra remedia adhiberemus, quod etſi imperitis durum, ex progreſſu tamen me nil temerè dixiſſe patebit.* 'Perchance 'ſome ſcioliſt in phyſick may affirm, that theſe 'things may not be uſed, by reaſon of the 'narcotick and ſtupefactive property. But 'theſe pretences are as vain in effect as ſpecious 'at firſt ſight: for beſides that the hot temper 'of this country requires it, it is ſure, that 'without theſe remedies there can be no cure. 'Add, that here we prepare opium ſo well, that 'you may give it to an infant. And truly, 'if in hot diſeaſes we had no opiates, we ſhould 'in effect find, that the uſe of all other medi- 'caments would prove altogether vain and 'fruitleſs.'

Cap. 2.

THE drinking freely, eſpecially if the drink be cold water, is uſually (and in moſt caſes, nor without much reaſon,) ſtrictly forbidden, as very hurtful for the dropſy; and yet thoſe, that frequent the *Spaw*, tell us of great cures performed by pouring in plenty of waters into the patient's already diſtended belly. And I know a perſon of great quality and virtue, who being by an obſtinate dropſy, beſides a complication of other formidable diſeaſes, brought to a deſperate condition, was adviſed to drink *Tunbridge*-waters, when I happened to be there, by her very ſkilful phyſician; who told

told me, that the doctors having done all their art could direct them unto, in vain, ſhe would be cured by death, if ſhe were not by theſe waters; from whence (the weather proving very ſeaſonable for that ſort of phyſick) ſhe returned in ſo proſperous a condition of recovery, as exacted both his and my wonder. That the decoction of ſo heating a ſimple as guaiacum would be looked upon by the generality of phyſicians, both Galeniſts and Chymiſts, as a dangerous medicine in phthiſical and other conſumptions, you will eaſily grant: and yet ſome eminent phyſicians, and (particularly Spaniards) tell us of wonderful cures they have performed in deſperate ulcers of the lungs, by the long uſe of this decoction, notwithſtanding its manifeſtly and troubleſomely heating quality. And I know a phyſician eminently learned, and much more a methodiſt than a chymiſt, who aſſures me, that he has made trial of this unlikely way of curing conſumptions with a ſucceſs, that has much recommended theſe paradoxical Spaniards to him. It is alſo believed, and not without cauſe, by phyſicians, that mercury is wont to prove a great enemy to the *genus nervoſum*, and often produces palſeys, and other diſtempers of the brain in the nerves: and yet one of the exacteſt and happieſt methodiſts I know, has confeſt to me, that mercurial preparations are thoſe, which he uſes the moſt ſucceſsfully in paralytical and the like diſtempers of, what phyſicians call, the *genus nervoſum*. And on this occaſion I remember, that a gentlewoman being confined to her bed by a dead-palſey, that had ſeized on one ſide of her body, a phyſician eminent for his books and cures, giving her a doſe of a certain preparation of mercury, corrected with a little gold, which I put into his hands for that purpoſe, was pleaſed to bring me word, that by the firſt taking of the powder, which wrought but gently by ſiege, without either vomits or ſalivation, ſhe was enabled the ſame or the next day to quit her bed, and walk about the room.

Of the uſe of guaiacum for conſumptions, and mercury for palſies.

THIRDLY, there are many things, which ſeem to be againſt reaſon, whilſt they are barely propoſed and not proved, for which we afterwards diſcern very good reaſon; when experience having ſatisfied us they are really true, has both invited us, and aſſiſted us, to inquire into their cauſes. Of this we have elſewhere given divers not medical inſtances in our eſſay *concerning improbable truths*: and I could eaſily enough, if I durſt be tedious, give you ſome medical illuſtrations of the ſame truth. But I dare now only invite you to conſider this one thing, which may be of great uſe to explicate many others, both in natural philoſophy, and in phyſick too; which is, that there are divers concretes, ſome of them, as to ſenſe, ſimilar, or homogeneous, whoſe differing parts are endowed with very differing and ſometimes contrary qualities. And this not only appears in the chymical analyſis of bodies made by the fire, where the difference of what chymiſts call the ſeparated principles of concretes, is often very manifeſt and great, but even in divers bodies, that have not been reſolved by the violence of the fire; as is evident in rhubarb taken in ſubſtance, whoſe ſubtiler parts are purging, and its terreſtrial aſtringent. Nay, if thoſe parts, which do in much the leſs quantity concur to the conſtitution of the concrete, do but meet with a body diſpoſed to receive their impreſſions, it is very poſſible, that they may work more powerfully on it than the other parts of the ſame concrete, of which the eye judgeth it altogether to conſiſt.

That there are divers concretes as to ſenſe, ſimilar, whoſe different parts have contrary qualities; as rhubarb and oil-olive.

THIS I have made out to ſome ingenious men, by ſhewing, that though ſallad-oil be generally reputed to conſiſt of fat and unctuous particles, and therefore to be a great reſiſter of corroſion; yet it contains in it ſharp and piercing parts, which meeting with a diſpoſed ſubject, do more powerfully operate, than the purely oleaginous ones. As we endeavoured to evince, by keeping for a ſhort while, in a gentle warmth, ſome pure oil-olive, upon a quantity of filings of even crude copper: for from them the liquor extracted an high tincture betwixt green and blue, like that, which ſuch filings would have given to diſtilled vinegar, which, according to chymiſts notions, obtains that colour, by making with its acid and corroſive ſalt a real ſolution of ſome part of the copper, as may appear by the recoverableneſs of the metal out of it. Another proof or two of the acrimony of ſome of the parts of oil, we may elſewhere give you. But now we ſhall rather confirm our anſwer to your queſtion, by two or three examples of cures performed by unlikely remedies.

I WENT once to viſit an ingenious Helmontian, whom I found ſick on his bed; and having by the ſymptoms of his diſeaſe diſcerned it to be a pleuriſy, I talked with him of ſeaſonably opening a vein, but he was reſolved againſt it; and told me he would cure himſelf by a remedy, which at firſt ſeems as likely to increaſe ſuch a diſeaſe as phlebotomy is to cure it; namely, by the uſe of *Helmont's laudanum opiatum*, which in effect did in three or four days cure him, and ſince, he, without bloodletting, cured ſome others with it: which I the leſs wonder at, becauſe of my having obſerved, that opium (with which unſkilful men ſeldom tamper without danger) if duly corrected and prepared, proves ſometimes a great reſolver, and commonly a great ſudorifick; inſomuch, that I have known it make a perſon copiouſly ſweat, who often complained to me, that other diaphoreticks had no ſuch operation on him.

Of improbable cures, viz. of a laudanum opiatum.

I HAVE oftentimes ſeen coughs ſtrangely abated by the uſe of a remedy, which I have not long ſince told you how I prepare; and with which (I remember) in a pretty child you, *Pyrophilus*, know, and who is now very well, I was ſo happy as to repreſs in a few hours a violent cough, that threatned her with ſpeedy death; and yet this medicine has ſo eminent a ſaltneſs, that the tongue can ſcarce ſuffer it: and how much the uſe of ſalt things, is by many phyſicians condemned in coughs, (and indeed in many caſes not without reaſon) I need not tell you. And with exceedingly piercing eſſence or ſpirit of man's blood, I have known, notwithſtanding its being very ſaline, and its manifeſtly

Of curing coughs and conſumptions by ſaline medicines.

manifeſtly heating the patient, eſpecially for the firſt four or five days, ſtrange things performed, even in a deplorable and hereditary conſumption. This, *Pyrophilus*, brings into my mind ſomething, that, it may be, you will think odd; which is, that having had occaſion to adviſe, for a perſon of high quality, with a very ancient Galeniſt, that in his own country was looked upon as almoſt an oracle, and particularly in reference to phthiſical conſumptions, which was there a vulgar diſeaſe; he confeſſed to me, that although his having fallen into it himſelf, made him very ſolicitous to find a cure for it; and though he had, in his long and various practice, made trial of great variety of methods and remedies for the cure of that diſeaſe, yet that, with which he cured himſelf, and afterwards the generality of his chief patients, was principally ſulphur melted and mingled in a certain proportion to make it fit to be taken, in a pipe, with beaten amber or a cephalick herb. The particular circumſtances of his method I cannot now ſet you down, not having by me the paper, wherein they were noted; but, if I miſtake not, the herb, with which he mingled the brimſtone of flour of ſulphur, was colts-foot or betony; and I well remember, that what he looked upon as the chief and ſpecifick remedy in his way of curing, was the ſmoke of the ſulphur; the other ingredients being added, not ſo much for their being proper enough for the diſeaſe, as their helping to fill the pipe, and thereby to allay the pungency, wherewith the ſmoke, if afforded by a pipe filled with brimſtone alone, would be qualified. But yet this ſulphureous ſmoke is ſo predominant in the remedy, that he uſed to have a ſyrup in readineſs to relieve thoſe, whom the acrimony of the fumes ſhould make very ſore, and perhaps bliſter on the one ſide of their mouths, or throats; which accident he provided for, by that cooling and healing ſyrup, without being thereby diſcouraged from proſecuting the cure with the ſame remedy; wherewith a perſon, very curious and rich, has ſolemnly aſſured me, that himſelf has cured divers conſumptions, and particularly in a lady, even in health very lean, that he named to me, as being one I then knew. Now we know, that phyſicians generally, and in moſt caſes juſtly, forbid acid things to thoſe, that have exulcerated or tender lungs; and how highly acid and piercing the ſmoke of ſulphur is, the chymiſts can beſt tell you, who, by catching it, and condenſing it in glaſſes ſhaped almoſt like bells, obtain from it that very corroſive liquor, which readily diſſolves iron, being the very ſame, that is commonly called *Oleum ſulphuris per campanam:* and yet it ſeems, that either the theory of conſumptions is miſunderſtood, or that the drying quality of the ſulphureous ſteam, and its great power to reſiſt putrefaction, and as it were embalm the lungs and ſeaſon the blood, are conſiderable enough to account for the harm, which its acidity may do.

Of the curing phthiſical conſumptions by the acid ſmoke of ſulphur.

EELS are ſo commonly eaten by perſons of both ſexes, without being taken notice of for any quality, except their crudity, that one would ſcarce believe ſuch a ſtinking and odious medicine, as that of their livers and galls, dried ſlowly in an oven, ſhould be more proper for any thing, than to make the taker vomit: and yet *Helmont* in divers places ſpeaks of the medicine, as if it had kept multitudes of women from dying of hard labour. And ſince him, *Panarola* in his *New Obſervations* highly extols it. And I knew a very famous empirick, who had very few other ſecrets, and ſcarce any one ſo great to get reputation and money by. And I remember alſo, that ſome years ſince I had occaſion to give it to the wife of a very ingenious phyſician, of whom the midwives and her huſband almoſt deſpaired, and (as ſhe afterwards told me her ſelf) each doſe made her throws (which before had left her) return; and at length ſhe was ſafely delivered, ſhe ſcarce knew how. But I found double the doſe preſcribed by *Helmont* requiſite to be uſed at laſt, and that the quantity of a walnut of the powder of theſe livers given in Rheniſh or white-wine, and when the ſtomach was moſt empty, was no more than ſuch a caſe required.

The uſe of the livers and galls of eels in expediting the hard labour of women.

SCORPIONS being venomous creatures, to ſuffocate and infuſe them in oil, might ſeem the way to make it poiſonous; if experience did not aſſure us, that this oil is ſo far from being ſuch, that it cures the invenomed bitings of ſcorpions; which effect, now that the phyſicians find it upon trial to be true, they confeſs to be rational; and aſcribe it, how juſtly I now examine not, to the attraction of the poiſon received into the body by that, which is outwardly applied to the hurt. And *Piſo* informs us, that amongſt the Braſilians, whoſe country is ſo much infeſted with venomous creatures, *it is the moſt general cure* to draw out the poiſon, by applying to the hurt the beaten body of the beaſt, that gave it. As likewiſe in *Italy*, they account the cruſhing of the very ſcorpion, that has bit a man, upon the bitten place, for a moſt ſpeedy and effectual remedy. And I remember, that here in *England* the old man, whom you have ſeen going about with vipers, toads, *&c.* to ſell, told me, that when he was dangerouſly bitten by a viper, and all ſwelled by the poiſon of it; a great part of his cure was the outward application of venomous creatures, ſtamped till they were brought to a conſiſtence fit for that purpoſe.

The unlikely cure of venom by oil of ſcorpions.

THAT fluxes are the general and endemical diſeaſes in *Ireland*, I need not tell you; and yet I remember, that having occaſion to conſult the ancienteſt and moſt experienced phyſician of that nation, Dr. *F.* about the cure of it, he aſſured me, that though during his very long practice he had found divers remedies very proſperous, ſome on one ſort of patients, and ſome on another; yet the medicine he moſt relied on, was this: To take unſalted butter, and boil it gently till a pretty part was conſumed; ſkimming it diligently from time to time, whilſt it ſtands over the fire; and of this butter melted, to give now and then a conſiderable quantity, according as the patient is able to bear it. A remedy, which, at the firſt propoſal, may ſeem more likely to put a man into a flux, than to cure him of one. And yet the

And of fluxes by freſh butter melted.

ſame

ſame remedy, which, he ſuppoſed to benefit by mitigating the ſharp humours, and preſerving the entrails from their corroſion, was afterwards much commended to me by another ancient *Iriſh* phyſician, who was eſteemed among the doctors the next in eminency to him that I have named.

CHAP. XIX.

I SHOULD not here, *Pyrophilus*, add any thing to what I have already ſaid above in favour of the uſe of even odd ſpecificks, but, that finding at every turn, that the main thing, which does (really or in pretence) prevail with many learned phyſicians (eſpecially in a famous univerſity you have viſited abroad) to reject ſpecificks, is, that they cannot clearly conceive the diſtinct manner of the ſpecificks working; and think it utterly improbable, that ſuch a medicine, which muſt paſs through digeſtions in the body, and be whirled about with the maſs of blood to all the parts, ſhould, neglecting the reſt, ſhew it ſelf friendly to the brain (for inſtance) or the kidneys, and fall upon this or that juice or humour rather than any other. But to this objection, which I have propoſed as plauſible as I can readily make it, I ſhall at preſent but briefly offer, according to what has been hitherto diſcourſed, theſe two things.

That it is very hard to give an intelligible explication of the operation of electives, and other common medicaments, which are not ſpecifics, 280, 281.

AND firſt, I would demand of theſe objectors a clear and ſatisfactory, or at leaſt an intelligible explication of the manner of working of divers other medicaments, that do not paſs for ſpecificks; as how rhubarb purges choler, and hellebore melancholy rather than other humours; how ſome medicines, that have endured a ſtrong fire, as *Antimonium diaphoreticum*, and *Bezoardicum minerale* well made, are yet oftentimes ſtrongly ſudorifick; why the infuſion of *Crocus metallorum* or of glaſs of antimony, though it acquire no pungent, or ſo much as manifeſt taſte, whereby to vellicate the palate or the tongue, are yet violently both vomitive and cathartick; and how mercury, which is innoxiouſly given in many caſes crude to women in labour and others, does eaſily acquire, beſides many other more abſtruſe medicinal qualities, not only an emetick or purgative, but a ſalivating faculty. For I confeſs, that to me, even many of the vulgar operations of common drugs ſeem not to have been hitherto intelligibly explained by phyſicians, who are yet, for aught I have obſerved, to ſeek for an account of the manner, how diureticks, how ſudorificks, how ſarcoticks, and how many other familiar ſorts of medicines, which thoſe, that conſider them ſlightly, are wont to think they underſtand thoroughly, perform their operations. Nay, I much queſtion, whether the generality of phyſicians can yet give us a ſatisfactory account, why any ſort of medicine purges in general: and he, that in particular will ſhew me, where either the peripatetick, or Galenical ſchools, have intelligibly made out, why rhubarb does particularly purge choler, and ſenna more particularly phlegm, *erit mihi magnus Apollo*. For I ſee not how from thoſe narrow and barren principles of the four elements, the four humours, the four firſt qualities (and the like) effects, far leſs abſtruſe than the operations of purging medicines, can ſatisfactorily be deduced. Nor can I find, that any thing makes thoſe phyſicians, that are unacquainted with the philoſophy, that explains things by the motions, ſizes, and figures of little bodies, imagine they underſtand the account, upon which ſome medicines are purgative, others emetick, *&c.* and ſome purgative in ſome bodies, vomitive in other, and both purgative and vomitive in moſt; but becauſe they never attentively inquire into it.

BUT (which is the next thing I have to repreſent) if we duly make uſe of thoſe fertile and comprehenſive principles of philoſophy, the motions, ſhapes, magnitudes and texture of minute parts of matter; it will not perhaps be more difficult to ſhew, at leaſt in general, that ſpecificks may have ſuch operations, as are by the judicious and experienced aſcribed to them, than it will be for thoſe, that acquieſce in the vulgar principles of philoſophy and phyſick, to render the true reaſons of the moſt obvious and familiar operations of medicines. And though the ſame objection, that is urged to prove, that a ſpecifick cannot befriend the kidneys, for example, or the throat rather than any other parts of the body, lies againſt the noxiouſneſs of poiſons to this or that determinate part; yet experience manifeſts, that ſome poiſons do reſpect ſome particular part of the body, without equally (if at all ſenſibly) offending the reſt: and we ſee that cantharides in a certain doſe are noxious to the kidneys and bladder, quickſilver to the throat, and the glandules thereabouts, ſtrammonium to the brain, and opium to the animal ſpirits and genus nervoſum. And if you call to mind, what we have formerly deduced to make it out, that a human body is an engine, and the medicines operate in it as finding it ſo; we need not think it ſo ſtrange, that there being many ſtrainers, if I may ſo call them, of differing textures, ſuch as the liver, ſpleen, and kidneys, and perhaps divers local ferments reſiding in particular parts, and a maſs of blood continually ſtreaming through all the parts of the body, a medicine may be quickly, by the blood, carried from any one part to any other, and the blood, or any humour mingled with it, may be as eaſily carried to the medicine, in what parts ſoever it be; and the remedy thus admitted into the maſs of blood may, in its paſſage through the ſtrainers, be ſo altered, either by leaving ſome of its parts there, or by having them altered by the abovementioned ferments, or by being aſſociated with ſome other corpuſcles, it may meet with in its paſſage; whereby the ſize, or figure, or motion of its ſmall parts may be changed; or, in a word, it may by ſome of thoſe many other ways, which might, if this eſſay were not too prolix already, be propoſed and deduced, receive ſo great an alteration, in reference either to ſome or other of the ſtrainers, or other firmer parts of the body, or to the diſtempered blood, or ſome other fluid and peccant matter, that it needs not ſeem impoſſible, that by that time the medicine (crum-

That poiſons do reſpect particular parts, and therefore medicines may do it.

General explications of the manner, how theſe operations of ſpecificks may proceed.

bled

bled as it were in minute corpuſcles) arrives at the part or humour to be wrought upon, it may have a notable operation there. I mean *part* as well as *humour*, becauſe the motion, ſize, or ſhape of the medicinal corpuſcles in the blood, though not by ſenſe diſtinguiſhable from the reſt of the liquor they help to compoſe, may be ſo conveniently qualified, as to ſhape, bulk, and motion; as to reſtore the ſtrainers to their right tone or texture, as well as the blood to its free and natural courſe; by reſolving and carrying away with them ſuch tenacious matter, as ſtuffed or choaked up the ſlender paſſages of the ſtrainer, or at leaſt ſtraitned its pores, or vitiated their figure. And the ſame ſanative corpuſcles may perchance be alſo fitted to ſtick to, and thereby to ſtrengthen ſuch fibres of the ſtrainers, or ſuch other firmer parts of the body, as may need congruous corpuſcles to fill up their little unſupplied cavities.

MEATS, that are ſalt, and tartareous, whilſt they are whirled about in the maſs of blood, may by the other parts of that vital liquor be ſo diluted and kept aſunder ſo, as not to be offenſive to any part: when they come to be ſeparated by the parenchyma of the kidneys, from the ſweeter parts of the blood, that did before temper and allay them, they eaſily, by their ſaline pungency, offend the tender ureters and membranous bladders of thoſe, that are troubled with the ſtone or ſtrangury. And perchance it is upon ſome ſuch account, that cantharides are more noxious to the bladder than to other parts of the body. And as ſalt meat thus grows peculiarly offenſive to the reins and bladder; ſo a ſpecifick, diſpoſed to be diſſolved, after a peculiar manner, may, in the body, either preſerve or acquire, as to its minute parts, a friendly congruity to the pores of the kidneys, liver, or other ſtrainers equally, when diſtempered; as I formerly obſerved to you, that new-milk ſweetned with ſugar-candy, though it be not wont ſenſibly to affect any other part of the body, nor would have ſenſibly affected the kidneys themſelves, had they not been diſordered; yet after the troubleſome operation of cantharides, it had a very friendly effect upon the diſtempered parts. Thus a ſpecifick for one diſeaſe may be reſolved in the body into minute particles of ſuch figure and motion, that being fit to ſtick to other corpuſcles of peccant matter, which, by their vehement agitation, or other offenſive qualities diſcompoſe the body and make it feveriſh, may allay their vehement motion, and by altering them, as to bigneſs and ſhape, give them new and innocent qualities, inſtead of thoſe noxious ones they had before.

ANOTHER ſpecifick may diſſolve the groſs and ſlimy humours, that obſtruct the narrow paſſages of the veins; as I have obſerved, that ſpirit of harts-horn, which powerfully opens other obſtructions, and reſolves ſtuffing phlegm in the lungs, will alſo, though more ſlowly, reſolve prepared flowers of ſulphur, crude copper, and divers other bodies; and alſo it may, by mortifying the acid ſpirit, that oftentimes cauſes coagulations in the blood, reſtore that vital liquor to its fluidity and free circulation, and thereby remove divers formidable diſeaſes, which ſeem to proceed from the coagulation or ropineſs of the blood; and, on the other ſide, the minute parts of ſome ſpecificks againſt a contrary diſeaſe may ſomewhat thicken and fix the too thin and agitated parts of the blood, or of ſome peccant matter in it, by aſſociating themſelves therewith; as the nimble parts of pure ſpirits wine, and thoſe of high rectified ſpirit of urine, will concoagulate into corpuſcles, bigger and far leſs agile. And the ſame ſpirit of wine it ſelf, with another liquor I make, will preſently concoagulate into a kind of ſoft, but not fluid ſubſtance. Nor is it ſo hard to conceive, that a ſpecifick may work upon a determinate part or humour, and let the others alone: as if you put, for inſtance, an egg into ſtrong vinegar, the liquor will operate upon and diſſolve all the hard ſhell, and yet leave the tender ſkin untouched. And if you caſt coral into the common rectified ſpirit of tartar, the far greater part of the liquor, though ſtrong and ſpirituous, will remain unaltered thereby, and may be, *integris viribus*, abſtracted from it; but the coral will preſently find out, or rather be found out by acid or acetous particles, and by incorporating it ſelf with them, take away their ſharpneſs: as in ſome caſes coral has been obſerved to do to ſour humours abounding in human bodies, thoſe humours being eaſily, by the circulating blood, brought (in their paſſage) to the coral, whilſt it perhaps remains in the ſtomach or guts. And though the circulation of the blood be ſufficient to bring, little by little, the acid particles of that liquor in its paſſages through the veſſels to work upon coral; yet in other medicines the operation may be more nimble, the remedy quickly diffuſing it ſelf through the maſs of blood, to ſeek, as it were, and deſtroy the acid parts, which it meets with blended with the reſt of the liquor. As ſpirit of urine being, inſtead of coral, put into the above mentioned ſpirit of tartar, will not (that I have obſerved) faſten it ſelf to the ſpirituous nor the phlegmatick parts of the liquor, but only to the acid ones, which it will mortify or deprive of their ſourneſs by concoagulating with them. And I ſee not, why it ſhould be more inconceivable, that a ſpecifick ſhould have a peculiar virtue to free the body from this or that peccant humour, and a benign congruity to the diſtempered ſpleen or liver, than that ſome cathartick ſhould purge electively, and ſome antidotes have peculiar virtues againſt ſuch poiſons, whoſe malignity particularly invades the brain or kidneys, or ſome other determinate part: the former of which the phyſicians, we reaſon with, ſcruple not to teach; and the latter of which is taught us not by them only, but by experience too.

That vinegar will operate on the ſhell, and not upon the other parts of the egg; with like inſtances of ſpecifick operations.

[OF the credibility of ſpecifick, and of the efficacy even of ſome unlikely ones, we might eaſily enough preſent you with more proofs and examples: but theſe may poſſibly be ſufficient for our preſent purpoſe; eſpecially if you duely conſider, that as phyſick had owed its beginning to experience, ſo thoſe, that practiſe it, muſt enlarge and rectify their principles according

That phyſick, as it begun by experience, ſo it muſt be enlarged and rectified by the new diſcoveries of experience.

according to the new diſcoveries, which are made from time to time of the operations and power of the productions whether of nature or of art. This conſideration I thought to inſiſt upon in my own expreſſions; but finding lately the ſame notion, which I had, to have been long ſince that of the ancient empiricks, I will ſum up what I meant to ſay, in their words, as I find them wittily delivered by *Celſus*, in that excellent preface, where having ſpoken in their ſenſe of the origin of phyſick, he continues, *Sic medicinam ortam, ſubinde aliorum ſalute, aliorum interitu pernicioſa diſcernentem à ſalutaribus: repertis deinde medicinæ remediis, homines de rationibus eorum diſſerere cœpiſſe; nec poſt rationem, medicinam eſſe inventam, ſed poſt inventam medicinam, rationem eſſe quæſitam.* 'Such was 'the origin of phyſick: by the recovery of 'ſome, and the death of others, it firſt made 'diſtinction between things ſovereign to heal, 'and things which are improper and deadly. 'And thus the remedies being found out, 'men began to diſpute of the reaſons of them. 'Nor was the art of medicine found out by the 'light of reaſon; but, medicine being found, 'the reaſon began to be inquired into.' And leſt the miſtaken name of empirick ſhould make you undervalue ſo uſeful a conſideration, which not the nature of their ſect, but that of the thing, ſuggeſted to them; I ſhall add, in favour of what we have delivered concerning experienced, though otherwiſe unlikely remedies, that it is a ſentence aſcribed to *Ariſtotle* (and, in my opinion, one of the beſt, that is aſcribed to him) *Ubi res conſtat, ſi opinio adverſetur rei, quærendam rationem, non rem ignorandam.* 'Where the matter is certain, if it 'be againſt the common opinion, the reaſon 'muſt be ſought, and not the matter of fact 'ſcrupled.'

AND certainly, *Pyrophilus*, though there be ſcarce any ſort of men, whoſe credulity may do the world more miſchief than that of phyſicians; yet perhaps, neither nature, nor mankind is much beholden to thoſe, that too rigidly, or narrowly, circumſcribe, or confine the operations of nature, and not ſo much as allow themſelves or others to try, whether it be poſſible for nature, excited and managed by art, to perform divers things, which they never yet ſaw done, or work by divers ways, differing from any, which by the common principles, that are taught in the ſchools, they are able to give a ſatisfactory account of.

TO the many things, which you may be pleaſed to apply to this purpoſe out of the precedent diſcourſe, divers others may be added, if, without tiring you, they may be now inſiſted on. It would ſcarce have been believed ſome ages ſince, by thoſe, that knew no other than vegetable purges and vomits, that a cup made of a concrete, inſuperable by the heat of human ſtomachs, ſhould, by having for a while, wine, or any ſuch other liquor, barely poured on it, to make an infuſion, without any ſenſible diminution of its own bulk or weight, and without any ſenſible alteration made in the colour, taſte or ſmell of the wine, communicate to it a ſtrongly emetick and cathartick virtue, and prove oftentimes vomitive, even when put up in the clyſters; and yet that this is performable by antimony, ſlightly prepared with ſalt-petre, or without addition, melted into a tranſparent glaſs, is commonly known to thoſe, that are not ſtrangers to the operations of the antimonial cup, and of the glaſs made of the ſame mineral. And much more ſtrange is that, which is affirmed by inquiſitive phyſicians upon their own trial of the common *crocus metallorum*, or ſomewhat corrected antimony wont to be ſold in ſhops; namely, that a few drachms of it, infuſed into ſome ounces of wine, will make the liquor work ſo ſtrongly, as if ſix or eight times the quantity had been ſteeped in it.

That the operations of the antimonial cup, glaſs of antimony, and crocus metallorum, would not have been credited in ancient times.

THOSE that believe, that all diaphoreticks muſt conſiſt of ſubtile, ſapid, and fugitive parts, as if only ſuch were eaſily ſeparated from each other, and agitated by the gentle heat of a human body, will ſcarce expect, that any body could, in a moderate doſe, be a good ſudorifick, that is ſo fixt as to be able to perſiſt divers hours in a good fire. And yet that *Antimonium diaphoreticum* is ſuch a concrete, is now very well known to many beſides chymiſts.

THAT a ſtone, and a ſtone too ſo fixed, that it will ſuſtain the violence of reverberated fire, and is conſequently very unlikely to be much wrought upon, or digeſted by the heat of a human ſtomach, ſhould be capable of agglutinating together the parts of broken bones, would ſeem impoſſible to many; but it is very well known to thoſe, that have made trial of the efficacy of the *Lapis oſſifragus*. For though I have ſometimes wondered at the fixedneſs of this ſtone above others in the fire, yet being for ſome days ſucceſſively drunk in wine, or aqua ſymphyti, to the quantity of about half a drachm, or more, it doth ſo wonderfully cement together the parts of broken and well-ſet bones, that it deſerves the name it commonly hath in the ſhops of *Oſteocolla*, and hath wonders related of it by ſeveral eminent, not only chymical, but Galenical writers.

Divers other inſtances alike incredible.

IT is almoſt incredible what *Quercetan* relates, of what himſelf ſaw done with it as to the cure of broken bones, without much pain, or any of the uſual grievous ſymptoms, within four or five days; ſo that to the ſtupendous virtue he aſcribes to this ſtone, both inwardly given, and outwardly applied in the form of a pultis, with only beaten geranium and oil of roſes or olives, he thinks fit to annex theſe words: *Quod incredibile videri poſſet, niſi præter me innumerabiles alii oculati & idonei teſtes extarent.* And indeed theſe need good proof to make a wary man believe ſo ſtrange a thing, ſince ſurgeons obſerve, that nature is wont to be forty days in producing a callus to faſten together the pieces of a broken bone. But to make this the more credible by the teſtimony of authors more Galenically inclined, *Mathiolus* relates, that in many the bones having been very well ſet (which circumſtance he requires as neceſſary) have had their broken parts conglutinated within three or four days. And not only that moſt experienced ſurgeon *Fabricius Hildanus* uſed it much in fractures,

with only a little cinnamon and ſugar to make it pleaſant; but the learned *Sennertus*, who ſomewhere calls its virtue admirable, thinks it requiſite, in his ſurgery, to give us this caution of it: *Verum in juvenibus, & iis qui boni ſunt habitus, callum nimis auget; quapropter cautè & non niſi in adultioribus exhibendus.* The warrantableneſs of which caution, and conſequently the ſtrange efficacy of oſteocolla, was, I remember, confirmed to me not long ſince by a ſkilfull phyſician, who hath particularly ſtudied its nature, and related to me, that ſome years ſince his mother, having by a fall broken her leg near the knee, had too ſuddenly, by the overmuch uſe of this ſtone, a callus produced in the part much bigger than he expected or deſired.

Fab. Cent. 3. Obſer. 90.

Lib. 5. part. 5. Cap. 1.

He that, before the ſalivating property of mercury was diſcovered, ſhould have told phyſicians of the deſpondent temper of theſe, we are now diſcourſing with, that beſides the known ways of diſburthening nature, (namely, by vomit, ſiege, urine, ſweat, and inſenſible tranſpiration) there were a ſort of remedies, that would make very large evacuations by ſpittle, and thereby cure divers ſtubborn diſeaſes, that had been found refractory to all ordinary remedies, would certainly have been more likely to be derided than believed by them; ſince no known remedy, beſides mercury, hath been, that I remember, obſerved to work regularly by ſalivation. For though ceruſs of antimony have been obſerved to make men, of ſome conſtitutions, apt to ſpit much, yet it works that way too languidly, to deſerve the name of a ſalivating remedy, and probably oweth the quality it hath of inclining to ſpit, to the mercurial part of the antimony, (wherewith the regulus, it is made of, abounds;) and therefore the greater their experience of the effects of medicinal operations ſhould be ſuppoſed to be, the greater indiſpoſition it would give them to credit ſo unallied a truth. And yet the reality of the fluxing property of quickſilver is long ſince grown paſt queſtion, and hath been found ſo uſeful in the cure of the moſt radicated and obſtinate venereal diſtempers, that I ſomewhat wonder thoſe phyſicians, that ſcruple not to employ as boiſterous ways of cure, have not yet applied it to the extirpation of ſome other diſeaſes; as ulcers of the kidneys, conſumptions, and even palſies, *&c.* wherein I am apt to think it may be as effectual, as in thoſe produced by luſt, and much more effectual than vulgar remedies, provided that the exceeding troubleſome way of working of ſalivating medicines be better corrected, than it is wont to be in the ordinary medicines employed to produce ſalivation, which they do with ſuch tormenting ſymptoms, that they are ſcarcely ſupportable. But if purified quickſilver be dexterouſly precipitated by a long and competent digeſtion, with a due proportion of refined gold, experience hath informed us, that the ſalivating operation of it may be performed with much leſs uneaſineſs to the patient. And that ſuch mercurial medicines, wherein the quickſilver is well corrected by gold, may produce more than ordinary effects, we have been inclined to believe, by the trials, which we procured by learned phyſicians to be made in other than venereal diſeaſes, of a gently working precipitate of gold and mercury, of which we may elſewhere ſet you down the proceſs.

[And now I am upon the diſcourſe of the peculiar operations of mercury, and of unuſual ways of evacuation, I am tempted to ſubjoin an odd ſtory, which may afford notable hints to a ſpeculative man, as it was related to me both in private, and before illuſtrious witneſſes, by the formerly commended chymiſt of the French king: he told me then a while ſince, that there is yet living a perſon of quality, by name Monſieur *de Vatteville*, well known by the command he hath or had of a regiment of *Switzers* in *France*, who, many years ago following the wars in the Low Countries, fell into a violent diſtemper of his eyes, which, in ſpite of what phyſicians and ſurgeons could do, did in a few months ſo increaſe, that he loſt the uſe of both his eyes, and languiſhed long in a confirmed blindneſs; which continued till he heard of a certain empirick at *Amſterdam*, commonly known by the name of *Adrian Glaſmaker* (for indeed he was a glazier) who being cried up for prodigious cures he had done with a certain powder, this colonel reſorted to him, and the empirick having diſcourſed with him, undertook his recovery, if he would undergo the torment of the cure; which the colonel having undertaken to do, the ſurgeon made him ſnuff up into each noſtril about a grain of a certain mercurial powder, which in a ſtrangely violent manner quickly wrought with him almoſt all imaginable ways, as by vomit, ſiege, ſweat, urine, ſpitting, and tears, within ten or twelve hours that this operation laſted, making his head alſo to ſwell very much: but within three or four days after this ſingle taking of the draſtick medicine had done working, he began to recover ſome degree of ſight, and within a fortnight attained to ſuch a one, that he himſelf aſſured the relater, he never was ſo ſharp-ſighted before his blindneſs. And the relater aſſured me, that he had taken pleaſure to obſerve, that this gentleman, who is his familiar acquaintance, would diſcern objects farther and clearer than moſt other men. He added, that Monſieur *de Vatteville* told the relater, he had purchaſed the way of making this powder of the empirick, and had given it to an eminent ſurgeon, one *Benoeſt* (an acquaintance of the relater's) by whom he had been cured of a muſket-ſhot, that had broken his thigh-bone, when the other ſurgeons would have proceeded to amputation; and that this *Benoeſt* had with this powder, adminiſtred as before is related, cured a gentlewoman of a cancer in the breaſt. All which, and more, was confirmed to the relater by the ſurgeon himſelf. But in what other ſtubborn and deplorable caſes they uſe this powder, I do not particularly remember. The preparation of it, which a chymiſt did me the favour to tell me by word of mouth, as a thing himſelf had alſo made, was in ſhort this: that the remedy was made by precipitating quickſilver with good oil of vitriol, and ſo making a turbith, which is afterwards to be dulcified by abſtracting

A ſtrange cure of blindneſs by a mercurial powder.

abſtracting twenty or twenty five times from it pure ſpirit of wine, of which freſh muſt be taken at every abſtraction. But I would not adviſe you to commend ſo furious a powder to any, that is not a very ſkilfull chymiſt and phyſician too, till you know the exact preparation, and particular uſes of it; the reaſon of my mentioning it here, being but that, which I expreſſed at the entrance upon this narrative.]

CHAP. XX.

Of univerſal medicines.

YOU will perchance wonder, *Pyrophilus*, that having had ſo fair an opportunity as the ſubject of his eſſay afforded me, of diſcourſeing to you about the univerſal medicine, which many Paracelſians, Helmontians, and other chymiſts talk of ſo confidently; I have ſaid nothing concerning the exiſtence, or ſo much as the poſſibility of it. But till I be better ſatisfied about thoſe particulars than yet I have been, I am unwilling either to ſeem to believe what I am not yet convinced of, or to aſſert any thing, that may tend to diſcourage human induſtry; and therefore I ſhall only venture to add on this occaſion, that I fear we do ſomewhat too much confine our hopes, when we think, that one generous remedy can ſcarce be effectual in ſeveral diſeaſes, if their cauſes be ſuppoſed to be a little differing. For the theory of diſeaſes is not, I fear, ſo accurate and certain, as to make it fit for us to neglect the manifeſt or hopeful virtues of noble remedies, wherever we cannot reconcile them to that theory. He that conſiders what not unfrequently happens in diſtempered bodies by the metaſtaſis of the morbifick matter, (as for inſtance, how that, which in the lungs cauſed a violent cough, removed up to the head may produce, as we have obſerved, a quick decay of memory and ratiocination, and a palſy in the hands and other limbs) may enough diſcern, that diſeaſes, that appear very differing, may eaſily be produced by a peccant matter of the ſame nature, only variouſly determined in its operations by the conſtitution of the parts of the body where it ſettleth: and conſequently it may ſeem probable to him, that the ſame ſearching medicine, being endowed with qualities deſtructive to the texture of the morbifick matter, where-ever it finds it, may be able to cure either all, or the greateſt part, of the diſeaſe, which the various tranſlation of ſuch a matter hath been obſerved to beget. Moreover, it oftentimes happens, that diſeaſes, that ſeem of a contrary nature, may proceed from the ſame cauſe variouſly circumſtanced; or (if you pleaſe) that of divers diſeaſes, that may both ſeem primary, the one is but ſymptomatical, or at moſt ſecondary in relation to the other; as a dropſy and a flow fever may, to unſkilful men, ſeem diſeaſes of a quite contrary nature, (the one being reputed a hot and dry, the other a cold and moiſt diſtemper) though expert phyſicians know they may both proceed from the ſame cauſe, and be cured by the ſame remedy. And in women experience manifeſts, that a great variety of different diſtempers, which by unſkilful phyſicians have been adjudged diſtinct and primary diſeaſes, and have been, as ſuch, unſucceſsfully dealt with by them, may really be but diſguiſed ſymptoms of the diſtempers of the mother or *genus nervoſum*; and may by remedies, reputed antihyſterical, be happily removed. To which purpoſe I might tell you, *Pyrophilus*, that I, not long ſince, knew a practitioner, that with great ſucceſs uſed the ſame remedies (which were chiefly volatile and reſolving ſalts) in dropſies, and in (not, ſymptomatical, but) eſſential fevers. And our ſelves have lately made ſome experiments of not much unlike nature, with a preparation of hartſhorn, of equal uſe in fevers and coughs, both of them primary. I might on this occaſion recur to divers of the remedies formerly mentioned in ſeveral places of this eſſay; ſince divers of them have been found effectual againſt diſeaſes, which, according to our common theory, ſeem to be little of kin one to another: and by telling you what I have obſerved concerning the various operations of *Helmont's laudanum*, of our *ens veneris*, and even of a medicine deviſed by a woman, the lady *Kent's* powder, I might illuſtrate what I have lately delivered: but it is high time for me to paſs on to another ſubject; and therefore I ſhall rather deſire you, in general, to conſider, whether or no ſeveral differing diſeaſes, and even ſome commonly ſuppoſed to be of contrary natures, be not yearly cured by the *Spaw* waters in *Germany*.

That the ſame matter may cauſe divers diſeaſes.

And the ſame medicine cure them.

AND to aſſiſt you in this inquiry, I ſhall addreſs you to the rare obſervations of the famous and experienced *Henricus ab Heer*, and to his *Spadacrene*; in the eighth chapter of which, he reckons among the diſeaſes, which thoſe waters cure, catarrhs, and the diſtempers, which (according to him) ſpring from thence; as the palſy, trembling of the joints, and other diſeaſes of kin to theſe, convulſions, cephalalgiæ, (I name them in the order, where I find them ſet down) hemicraniæ, vertigo, redneſs of the eyes, of the face, the eryſipelata, ructus continui, vomitus, ſingultus, obſtructions, and even ſcirrhus's, if not inveterate, of the liver and ſpleen, and the diſeaſes ſpringing thence; the yellow jaundice, *melancholia flatulenta ſeu hypochondriaca*, dropſies, gravel, ulcers of the kidneys, and carunculæ *in meatu urinario*, gonorrhœas, and reſembling affections, elephantiaſis or the leproſy, *fluor albus mulierum*, cancers and ſcirrhus's of the womb, fluxes and even dyſenteries; the worms (though very obſtinate, and ſometimes ſo copious as to be voided in his preſence, even with the urine) ſterility, and not only the ſcabies in the body and neck of the bladder, and clammy pituitous matter collected therein, beſides ulcers in the ſphincter of it: but he relates, upon the repeated teſtimony of an eminent perſon, that he names, and one whom he ſtyles *vir omni fide digniſſimus*, that this party being troubled with a very great ſtone in his bladder; and having had it ſearched by divers lithotomiſts, before he came to the *Spaw*, did, by very copiouſly drinking theſe waters, find, by a ſecond ſearch made by thoſe artiſts, that this ſtone was much diminiſhed the firſt year, and (by the ſame way of trial) that it was ſo the ſecond year. And of the cures of theſe diſeaſes, the phyſician mentions in the

An inſtance in the waters of the Spaw.

ſame

ſame chapter, as to many of them, particular and remarkable inſtances; and in the beginning of the next chapter, having told his readers, that he expects they ſhould ſcarce believe theſe waters can have ſuch a variety of virtues, *Cæterum*, ſays he, *ſi in Spaa maturè & conſtantibus naturalibus, vitalibuſque facultatibus venerint; aquaſque quo dicemus modo biberint, indubitè quæ dixi vera eſſe fatebuntur.* And though we be not bound to believe (nor doth he affirm it) that the *Spaw*-waters do univerſally cure all the afore-mentioned diſtempers; yet it is very much, and makes much for our preſent purpoſe, that they ſhould in ſo many patients cure moſt of theſe diſtempers, and leſſen, if not cure, the reſt. And we may ſomewhat the better credit him, becauſe even where he reckons us the virtues of the *Spaw*, he denies it ſome, which other phyſicians aſcribe to it. And it is very conſiderable, what he ſubjoins in theſe words: *Pauciſſimos enim vel nullos Spadæ incolas capitis doloribus, cardialgiâ, calculo, obſtructionibus renum, hepatis, lienis, meſaraicarum, laborantes invenies; ictericos, hydropicos, podagricos, ſcabioſos, epilepticos, quod ſciam, nullos:* 'You will find very few of thoſe, who 'dwell at the *Spaw*, who are troubled with 'the head-ach, ſtone, obſtructions of the kid-'neys, liver, ſpleen, or meſaraick veins; none 'at all, who were troubled with the jaundice, 'dropſy, gout, itch, or falling-ſickneſs.' But that, which I moſt deſire you to take notice of, is, that beſides all the above-mentioned diſeaſes, I find, that he aſcribes to theſe waters the virtues of curing ſuch, as are counted of a contrary nature, and are thought to require contrary remedies. For beſides that, he expreſly affirms, in the beginning of the eighth chapter, that theſe waters being endowed with the virtues both of hot and cold minerals, they cure both hot and cold affections, in the ſame patients, and in differing bodies, and that contrary effects are performed by them; he hath, after ſome pages, this paſſage, which may go for an illuſtrious proof of that he hath aſſerted: *Inter cætera* (ſaith he, ſpeaking of the *Spaw*-waters) *menſibus movendis in primis idonea, quod millies experientia comprobavit: et tamen nimium ecrum fluxum quovis alio medicamento felicius ſiſtit.* 'Among other qualities, it moveth the month-'ly evacuations, as hath been proved by a thou-'ſand trials: and yet it ſtops the immoderate 'flux of them more happily than any other 'medicine.'

THESE teſtimonies, *Pyrophilus*, of our experienced author would perhaps obtain the more credit with you, if you had ſeen what I lately had the opportunity to obſerve in a hot and dry ſeaſon, at our own *Tunbridge*-waters in *Kent*, when I was there to drink them. And therefore I ſhall again invite you not only to conſider, whether one potent remedy, ſuch as it may be, may not be able to cure variety of diſeaſes, and ſome ſuppoſed to be of contrary natures; but whether or no divers perſons, on whom the received *methodus medendi* hath been long and fruitleſly employed, be not by their tired and deſpondent phyſicians themſelves ſent thither, and there cured of their abſtruſe and obſtinate diſeaſes, by remedies prepared by nature without the aſſiſtance of art: for if you duly reflect on this conſpicuous obſervation, and conſider, how much it is poſſible for art to meliorate and improve moſt (eſpecially mineral) remedies, afforded us by nature, you would probably dare to hope, that medicines might be prepared of greater efficacy, and applicable to more diſeaſes, than they, who think the more received theory of diſeaſes (from which yet very eminent phyſicians, in divers particulars, ſcruple not to recede) incapable of being rectified; and that judge of all remedies by them, that are publickly venal in apothecaries ſhops, will allow themſelves ſo much as to hope.

Of the reaſon and deſign of the author's diſcourſe concerning the Methodus medendi. *and his deſcending to other particulars, which may be thought improper for him.*

IF now you demand, *Pyrophilus*, If I think that every particular, which hath contributed to ſwell this diſcourſe into a bulk ſo diſproportionate to that, which the title of an eſſay promiſed, to directly belong to the art of phyſick? I ſhall leave it to the judicious *Celſus* (whom learned men have ſtyled the Roman *Hippocrates*) to anſwer for me, and he will tell you, that *quanquam multa ſint ad ipſas artes non pertinentia, tamen eas adjuvant excitando artificis ingenium.* I ſuppoſe I need not remind you, *Pyrophilus*, that it was not my deſign, in what hath been repreſented, to ſubvert thoſe principles of the *methodus medendi*, from which no ſober phyſicians themſelves recede, and in which they unanimouſly acquieſce; and that I much leſs intend to countenance thoſe venturous empiricks, who, without any competent knowledge of anatomy, botanicks, and the hiſtory of diſeaſes, think receipts or proceſſes alone can enable them to cure the ſickneſſes they know not, and who would perſuade men to lay by, as needleſs, a profeſſion, of whoſe uſefulneſs to mankind, we may elſewhere have occaſion to diſcourſe. No, *Pyrophilus*, without peremptorily aſſerting any thing, I have but barely repreſented the notions I have mentioned concerning the *methodus medendi*, as things probable enough to deſerve to be impartially conſidered; that in caſe they prove fit to be declined, they may appear to have been rejected, not by our ſuperciliouſneſs or lazineſs, but (after a fair trial) by our experience: and in caſe they ſeem fit to be approved, they may prove additional inſtances of the uſefulneſs of natural philoſophy to phyſick. Which uſefulneſs, *Pyrophilus*, if I have in any conſiderable meaſure been ſo happy as to make out, I ſhall not think the time (and much leſs the pains) I have beſtowed upon that theme, miſſpent. For, I muſt confeſs to you, *Pyrophilus*, that to me it ſeems, that few things ought more to endear to us the ſtudy of natural philoſophy, than that (according to the judicious ſentence of our *Celſus*, *Rerum naturæ contemplatio*, ſaith he, *quamvis non faciat medicum, aptiorem tamen medicinæ reddit:*) 'The contem-'plation of nature, though it maketh not a 'phyſician, yet it fits him to learn phyſick:' A deeper inſight into nature may enable men to apply the phyſiological diſcoveries made by it, (though ſome more immediately, and ſome leſs directly) to the advancement and improvement of phyſick.

AND

AND I well enough know, *Pyrophilus*, that inſtead of writing the eſſay to ſuch a one as you, if I ſhould write it to the more critical and ſeverer ſort of readers, they would be apt to think, both that it is impertinent for me, who do not profeſs to be a phyſician, to treat prolixly of matters medicinal; and that it may appear ſomewhat below me, in a book, whoſe title ſeems to promiſe you philoſophical matters, to inſert I know not how many receipts. But I ſhall not ſcruple to tell ſuch a perſon as *Pyrophilus*, that ſince my method required, that I ſhould ſay ſomething to you of the therapeutical part of phyſick, I thought, that Chriſtianity and humanity it ſelf obliged me not to conceal thoſe things, which, how deſpicable ſoever they may ſeem to a ſpeculative philoſopher, are yet ſuch, as, beſides that ſome of them may perhaps afford improveable hints touching the nature of remedies, if not alſo of diſeaſes, experience hath encouraged me to hope, that others may prove uſeful to the ſick. And as for the inſerting of receipts, even in books of philoſophical ſubjects, I have not done it altogether without example. For not only *Pliny*, a perſon of a great dignity as well as parts, and friend to one of the greateſt Roman emperors, hath left us in a book, where he handles many philoſophical matters, ſtore of particular receipts; but our chancellor, the Lord *Verulam*, hath not diſdained to record ſome. And as for that induſtrious benefactor to experimental knowledge, the learned and pious *Merſennus*, his charity made him much more fearful to neglect the doing what good he could to others, than to venture to leſſen his reputation by an *indecorum*, that in a mathematical book, and in a chapter of arithmetical combinations, he brings in not only a remedy againſt the eryſipelas, but even a medicine for corns, where he tells us, that they may be taken away, by applying and daily renewing for ten days, or a fortnight, the middle ſtalk, that grows between the blade and the root (for that I ſuppoſe he means by the unuſual word *thallum*) of garlick, bruiſed. Nor is it without examples, though ſomewhat contrary to my cuſtom in my other writings, that in this, and the four precedent eſſays, I have frequently enough alledged the teſtimonies of others, and divers times ſet down proceſſes or receipts, not of my own deviſing. For even among profeſſed and learned phyſicians, ſcarce any thing is more common, than on ſubjects far leſs of kin to paradoxes, than moſt of thoſe I have been diſcourſing of, to make uſe of the teſtimonies and obſervations of other approved writers, to confirm what they teach. And not now to mention the voluminous books of *Schenkius Scolzius*, that famous and experienced practitioner *Riverius* himſelf hath not been aſhamed to publiſh together a good number of receipts, given him by others, under the very title of *Obſervationes communicatæ*: and *Henricus ab Heer* hath, among his *Obſervationes oppido raræ*, divers receipts, that came from mountebanks, and even gypſies. And therefore I hope, that you, who know, that it is not after every body, that I would ſo much as relate an obſervation, or mention a medicine, as thinking them probable, will eaſily excuſe one, that hath much fewer opportunities, than a profeſſed phyſician, to try remedies himſelf; if treating of ſubjects not ſo familiar, I chooſe to countenance what I deliver by the teſtimonies of ſkilful men, and if I ſcruple not to preſerve in theſe papers ſome not deſpicable remedies, as well of abler men, as of my own, that otherwiſe would probably be loſt. But of this practice I may elſewhere have occaſion to give you a more full apology, by ſhewing, how much it may conduce to the enriching and advancement of phyſick; an art, with whoſe praiſes I could long entertain you, if I were at leiſure (and durſt allow my ſelf) to exhauſt common places.

AND yet give me leave to tell you, that man is ſo noble a creature, and his health ſo requiſite to his being able to reliſh other goods; and oftentimes alſo to the comfortable performance of what his conſcience, his country, his family, his neceſſities, and perhaps his allowable curioſity challenge from him, that I wonder not ſo much at thoſe antient heathens, that, being polytheiſts and idolaters, thought themſelves obliged, either to refer ſo uſeful an art, as that of phyſick, to the gods, or godlike perſons; or to add thoſe, that excelled in ſo noble a faculty, to the number of thoſe they worſhipped. For my part, *Pyrophilus*, a very tender and ſickly conſtitution of my own (much impaired by ſuch unhappy accidents as falls, bruiſes, *&c.*) hath, beſides (as I hope) better motives of compaſſion, given me ſo great a ſenſe of the uneaſineſſes, that are wont to attend ſickneſs, that I confeſs, if I ſtudy chymiſtry, it is very much out of hope, that it may be uſefully imployed againſt ſtubborn diſeaſes, and relieve ſome languiſhing patients with leſs pain and trouble, than otherwiſe they are like to undergo for recovery. And really, *Pyrophilus*, unleſs we will too groſly flatter our ſelves, we can ſcarce avoid both diſcerning and deploring the ineffectualneſs of our vulgar medicines, not only Galenical, but chymical, (for an active body may yet be but a languid remedy.) For beſides that many, that recover upon the uſe of them, endure more for health, than many, that are juſtly reckoned among martyrs, did for religion; beſides this, I ſay, we daily meet with but too many in the caſe of that bleeding woman, mentioned in the goſpel, of whom it is ſaid, that ſhe had ſuffered many things of many phyſicians, and had ſpent all that ſhe had, and was nothing bettered, but rather grew worſe. And therefore I reckon the inveſtigation and divulging of uſeful truths in phyſick, and the diſcovering and recommending of good remedies, among the greateſt and moſt extenſive acts of charity, and ſuch, as by which a man may really more oblige mankind, and relieve more diſtreſſed perſons, than if he built an hoſpital. Which perhaps you will not think raſhly ſaid, if you pleaſe but to conſider, how many the knowledge of the ſalivating, and other active properties of mercury, and of its enmity to putrefaction and diſtempers ſpringing thence, have cured of ſeveral diſeaſes; and conſequently how many more patients,

Mark v. 26.

tients, than have recovered in the greateſt hoſpital in the world, are obliged to *Carpus*, and thoſe others, whoever they were, that were the firſt diſcoverers of the medical efficacy of quickſilver. And for my own particular, *Pyrophilus*, though my youth and condition forbid me the practice of phyſick, and though my unhappy conſtitution of body kept divers remedies from doing me the ſame good they are wont to do others; yet having more than once prepared, and ſometimes occaſionally had opportunity to adminiſter medicines, which God hath been ſo far pleaſed to bleſs on others, as to make them relieve ſeveral patients, and ſeem (at leaſt) to have ſnatched ſome of them almoſt out of the jaws of death; I eſteem my ſelf, by thoſe ſucceſſes alone, ſufficiently recompenſed, for any toil and charge my inquiries into nature may have coſt me. And though I ignore not, that it is a much more faſhionable and celebrated practice in young gentlemen, to kill men, than to cure them; and that miſtaken mortals think it the nobleſt exerciſe of virtue to deſtroy the nobleſt workmanſhip of nature, (and indeed in ſome few caſes the requiſiteneſs and danger of deſtructive valour may make its actions become a virtuous patriot) yet when I conſider the character given of our great maſter and exemplar, in that ſcripture, which ſays, *That he went about doing good, and healing all manner of ſickneſs, and all manner of diſeaſes among the people*; I cannot but think ſuch an imployment worthy of the very nobleſt of his diſciples. And I confeſs, that if it were allowed me to envy creatures ſo much above us as are the celeſtial ſpirits, I ſhould much more envy that welcome angel's charitable imployment, who at ſet times diffuſed a healing virtue, through the troubled waters of *Betheſda*, than that dreadful angel's fatal imployment, who in one night deſtroyed above a hundred and fourſcore thouſand fighting men. But of the deſireableneſs of the ſkill, and willingneſs to cure the ſick, and relieve not only thoſe, that languiſh in hoſpitals, but thoſe that are rich enough to build them, having elſewhere purpoſely diſcourſed, I muſt now trouble you no longer on this theme, but implore your much-needed pardon, for my having been (beyond my firſt intentions) ſo troubleſome to you already.

That this employment is better than the more faſhionable of deſtroying valour.

Acts x. 38. Mat. iv. 24. Joh. v. 14. 2 Kings xix. 35. *The angel's charitable employment at Betheſda more deſireable than his, who deſtroyed in one night 180,000 fighting men.*

AN APPENDIX TO THE FIRST SECTION of the SECOND PART.

Advertiſements touching the following APPENDIX.

I SCARCE doubt, but it will be expected, that I ſhould annex to the foregoing treatiſe thoſe receipts and proceſſes, which ſeem to be here and there promiſed in it: But I deſire it may be conſidered, that ſome paſſages, which an unattentive reader may have miſtaken for abſolute promiſes, are indeed but profers conditionally made to a particular perſon; and ſo not engaging me, till the condition (which was his deſiring the thing mentioned to him) be on his part performed. And as for the other things, which every reader may ſuppoſe to be promiſed him, I have at hand this general excuſe; that at leaſt I promiſed nothing to the publick, whatever promiſes I may have made in the foregoing Eſſays, having together with them been addreſſed to a private friend. And I have two or three ſpecial reaſons to inſiſt on this excuſe; for divers of my choicer books and papers having not long ſince unhappily miſcarried through the negligence of ſome men, and fraud of others, it is not now poſſible for me to retrieve ſome of the things I was maſter of, when I promiſed them. And then to reviſe carefully all the papers, that remain in my hands, of affinity with the paſt treatiſes, would take up more time, than is allowed me by other ſtudies and employments, which I think of greater moment, or at leaſt wherein I am much more concerned, than to give this book at preſent a full or accurate Appendix.

BUT though I might, upon theſe and other reaſons, wholly excuſe my ſelf from the trouble of adding any appendix; yet becauſe the communicating of good medicines is a work of charity, and thoſe unpoliſhed and immethodical notes, that may perchance diſparage an author, may yet relieve many a patient; I am willing to do what my occaſion will permit: and finding among my papers many looſe ſheets, concerning ſpirit of harts-horn, blood, *&c.* written divers years ſince to a friend, I chuſe rather to publiſh them juſt as I find them with *Pyrophilus*'s name, employed in convenient places, and to add ſome unpromiſed receipts in ſtead of thoſe, that are loſt, than be altogether wanting to what may be expected from me. I know,

know, that what I deliver concerning ſome of the following preparations, may by ſeverer criticks be thought ſomewhat unaccurate, and I confeſs I am of that mind my ſelf; but meeting with theſe collections in looſe ſheets among my old papers, I muſt either publiſh them as I find them, or take the pains to poliſh and contract them; which would require more time, than I can at preſent afford them. And much leſs can I ſtay to ſubjoin the hiſtories of the particular cures performed by the medicines, whoſe preparations I ſet down, though divers of them would not perhaps appear inconſiderable. But if I find by the entertainment of theſe papers, that it will be worth while to reviſe or enlarge them, I may, God permitting, be invited to do it, and either ſupply the things, that are here deficient, out of after obſervations, or papers now out of the way, or make amends for their omiſſion in ſubſtituting better things.

It will not at all ſurprize me, if ſome readers think me too prolix in delivering the preparations of harts-horn, ens Veneris, *&c.* with ſuch particular and circumſtantial obſervations. But my deſign being to gratify and aſſiſt thoſe that would make and uſe the remedies I recommend, the experience I have had of the difficulties moſt men find in the preparing things by the direction of chymical proceſſes not very expreſly ſet down, makes me apt to hope, that (I ſay not the great phyſicians or chymiſts, who may, if they pleaſe, leave them unperuſed; but) thoſe, for whom I principally intend my directions, will think my having made them ſo particular a very excuſable fault. And I make the leſs difficulty to ſuffer ſuch things, as perhaps I judge to be, in compariſon of others, but trifles, to paſs abroad; becauſe finding of late years, that many perſons of quality of either ſex, who ſcarce read any other than Engliſh books, have (as I hope) out of charity, or curioſity, or both, begun to addict themſelves to chymiſtry, and venture to be tampering with ſpagyrical remedies; it may not be unſeaſonable to ſupply them with ſome preparations, that may both ſave them time and charges, and put them upon the uſe of remedies, which, without being languid, are, if any thing diſcreetly given, ſafe and innocent, and wherein a little error either in the making or the adminiſtring will be far leſs prejudicial to the ſick, than if it were committed in the more vulgar, oftentimes, either falſly or obſcurely preſcribed) preparations they are wont to make of acid ſalts, mercury, antimony, and other minerals; whoſe activity for the moſt part makes them need to be ſkilfully prepared and judiciouſly given.

N. B. [As far as I could conjecture by the diſcourſe I had with the owner of the receipt, by aſhes of glaſs he means the ſuperfluous ſaline ſubſtance, which the glaſs-men are wont to call *Sandiver*; but becauſe he did not explain himſelf ſo clearly, and we know not yet a way of burning glaſs to aſhes, I think it will be moſt adviſeable to ſubſtitute the wood-aſhes, which in the receipt it ſelf towards the cloſe of it are appointed for a ſuccedaneum.]

To the 497th Page.

[*Where the Vertues of the* Pilulæ Lunares *are touched at.*]

The great benefit, that has redounded to many patients, from the uſe of the ſilver pills, here briefly mentioned, and commended, invites me to communicate, as a conſiderable thing, the preparation of them, of which I do not pretend to be the inventor; having, divers years ſince, learned it by diſcourſing with a very ancient and experienced chymiſt, whoſe name, that I do not mention, will perhaps ſeem ſomewhat ſtrange to thoſe readers, that have obſerved me not to be backward in acknowledging my benefactors in point of experiments; and therefore I hold it not amiſs to take this opportunity of declaring once for all, that it were oftentimes more prejudicial than grateful to one, that makes an advantage by the practiſe of phyſick, to annex in his life-time his name to ſome of his receipts or proceſſes; becauſe that when a man has once got a repute for having a ſpecifick in any particular diſeaſe or caſe, his patients, and their friends will hardly

hardly forbear to apply themſelves to him for that medicine, though the ſame medicine, but not known to be the ſame, ſhould be made uſe of by a ſtranger, or divulged in a printed book; moſt patients being not apt to rely upon medicines, that come only that way recommended; whereas if it were known, that the printed receipt is the ſelf-ſame, which the phyſician employs, not only other phyſicians would quickly make as much advantage of it as he, but many patients would think themſelves by that diſcovery diſpenſed with, in point of good huſbandry, from going to any phyſician at all, as knowing before-hand the beſt preſcription they are like to receive from him, The proceſs of the *Pilulæ lunares* is this:

The preparation of the Pilulæ lunares.

TAKE of the beſt refined ſilver as much as you pleaſe, diſſolve it into a ſufficient quantity of cleanſed ſpirit of nitre, or aqua fortis; then evaporating away the ſuperfluous moiſture, let the reſt ſhoot into thin cryſtals: theſe you may in ſome open-mouthed glaſs place in ſand, and keep in ſuch a degree of heat, that by the help of very frequently ſtirring them, the greateſt part of the more looſe and ſtinking ſpirits of the menſtruum may be driven away, and yet the remaining cryſtals not be brought to flow: theſe cryſtals of ſilver you muſt counterpoiſe with an equal weight of cryſtals of nitre; and firſt diſſolving each of them apart in diſtilled rain-water, you muſt afterwards mingle the ſolutions, and abſtract or ſteam away the ſuperfluous moiſture, till the remaining maſs be dry; which you muſt keep in an open glaſs, expoſed to ſuch a temperate heat of ſand, that the matter may not melt (which you muſt be very careful of) and that yet the adhering corroſive ſpirits of the menſtruum might be driven away. And to both theſe ends you muſt from time to time ſtir the maſs, that new parts of it may be expoſed to the heat, and new ones to the air, till you cannot deſcry in the remaining white powder any offenſive ſcent of the ſpirit of nitre, or of the aqua fortis. And laſtly, you muſt take the crumb of good white bread, made with a little moiſture into a ſtiff paſte, and exactly mingle with the newly mentioned magiſtery or powder as much of this paſte, as is neceſſary to give it the conſiſtence of a maſs of pills, which you may thence form at pleaſure, and preſerve in a well-ſtopped glaſs for uſe.

N. B. FIRST, the ſilver employed in this operation ought to be very pure and more exquiſitely refined, than much of that is wont to be, which here in *England* is bought for fine ſilver; for if the copper, wherewith ſilver-coins are wont to be alloyed, be not carefully ſeparated upon the cupel, it may, being turned by the acid menſtruum into a kind of vitriol, when it is taken into the body, either provoke vomits, or otherwiſe diſcompoſe it.

SECONDLY, the ſpirit of nitre, or (which in our caſe comes almoſt to one) the aqua fortis, that is uſed about this medicine, ought to be cleared, as our refiners phraſe it, before the ſilver be put in; for (as I elſewhere note) in ſalt-petre there is oftentimes an undiſcerned mixture of ſea-ſalt, whoſe ſpirit coming over in diſtillation with that of nitre, is apt to precipitate the ſilver, which the ſpirit of nitre has diſſolved. This I take to be the reaſon of that practice of the beſt refiners to purify their aqua fortis, by caſting in ſome ſmall piece of ſilver, that they may afterwards ſecurely put into it greater quantities of the ſame metal to be diſſolved. For the ſaline ſpirits fall to the bottom, together with the corroded ſilver, which they precipitate as long as there is any of theſe ſaline ſpirits left in the menſtruum, which after this may be decanted clear; and though you had put a little more ſilver than needed to it, it neither does harm nor is loſt, the aqua fortis preſerving none unprecipitated, but what there were no more ſaline ſpirits to work upon; ſo that the ſuperfluous ſilver put in is already diſſolved to your hand.

THIRDLY, the dry mixture obtained from the ſolutions of cryſtals of nitre, and cryſtals of ſilver, muſt be often ſtirred and kept longer in the ſand, before all the offenſive ſpirits will be driven away, than, till experience had informed me, I did imagine.

FOURTHLY, if the cryſtals of ſilver be conſiderably blue or green, it is a ſign the ſilver was not ſufficiently purged from copper; elſe the mixture we have been ſpeaking of, will look of a white, good enough. And poſſibly it was by reaſon of the not being careful to take ſufficiently refined ſilver, and of the not knowing how to improve the cryſtals of ſilver, by the addition of thoſe of nitre, and eſpecially how to free them from the ſtinking and corroſive ſpirits of aqua fortis, that it is come to paſs, that though there being ſome chymical writers proceſſes not very unlike this, yet the cryſtals of ſilver have been cenſured and laid aſide, as not always ſafe, even by thoſe, who otherwiſe much magnify the efficacy of thoſe they uſed.

FIFTHLY, when you are about to make up this mixture with the crumb of bread into a maſs, and ſo into pills, it will not be amiſs to diſpatch that work at once; for uſually it leaves an ugly blackneſs on the fingers, that cannot under divers days be gotten off.

The doſe and uſe of theſe pills.

SIXTHLY, in taking of the pills care muſt be had, that they be ſufficiently lapped up either in a wafer wetted with milk, or the pulp of a roaſted apple, or ſome ſuch thing, that they may not touch the palate, or the throat, becauſe of the extreme and diſguſting bitterneſs, which is to be met with in the cryſtals of ſilver, and which is not the leaſt thing, that with nicer perſons does blemiſh theſe pills.

SEVENTHLY, the doſe is ſomewhat uncertain; becauſe they work much according to the conſtitution of the body, and eſpecially according as it abounds with ſerous humours: wherefore it is adviſeable to make the pills of the ſize of very ſmall peas, of which one given at bed-time is a ſufficient doſe for ſome bodies, others will require two; and in ſome we muſt aſcend to three: and if the patient be hydropical, or be otherwiſe much moleſted with ſerous humours, it is obſervable, that ſometimes one doſe will work two days, or four days, (may be five or ſix) ſucceſſively, but yet moderately

moderately and uſually, without weakening the patient, in proportion to ſuch copious evacuations.

EIGHTHLY, Beſides the dropſy, wherein we have mentioned this remedy as a ſpecifick, it often proves very available in other caſes, wherein men are troubled with ſerous humours. But the firſt diſtempers, which I heard it magnified for, were thoſe of the head, and *Genus nervoſum*; and a great virtuoſo of my acquaintance, that inherits a diſpoſition to the palſy, has ſeveral times told me, that if when he begins to find himſelf diſordered, he takes a doſe of theſe pills, he is thereby conſtantly relieved. But of the particular caſes, wherein we have had opportunity to take notice of their effects, we have not now, but may perchance another time, have leiſure to entertain you.

LASTLY, That ſkilful and ſucceſsful chymiſt Dr. *N. N.* who doth much both uſe and eſteem this remedy, being deſired by me to let me know, if he had any objections againſt it, informs me, that when he hath given theſe pills oftentimes, and without intervals, though they did not either ſalivate or vomit, or much weaken the patient, yet they would at laſt be attended with a kind of incipient leucophlegmatia, which he eaſily prevents by intermitting for a while the uſe of the pills, after every ſecond or third time, that he adminiſters them, and giving, when he expects it to be requiſite, ſome *Crocus Martis*, extract of juniper, or other aſtringent or hepatick medicines, to corroborate the viſcera, and preſerve their tone.

(Where mention is made of the cure of one, concluded to have a gangrene, by an inward medicine.)

THE cure mentioned in this place having been performed by that medicine, which from the name of that great commander as well as virtuoſo, who was the author of it, paſſes under the name of Sir *Walter Raleigh*'s cordial, and this being but one of many remarkable (and ſome of them ſtupendous) cures, which have been wrought by it from time to time, eſpecially of late, that it hath been more uſed, I am induced to annex here the yet unpubliſhed receipt; partly, becauſe there are divers receipts, that are each pretended to be the true, magnified by their ſeveral poſſeſſors; and I had the liberty of looking it out in a receipt-book, preſerved by the author's ſon; and partly becauſe, though I will not affirm, that a ſkilfuller or more promiſing compoſition of the ſame ingredients could not have been deviſed, yet the following receipt has been abundantly recommended by experience. And I remember, that but a while ſince a perſon of note having ſent to me, to deſire a taking of this cordial for a certain knight, who, after all that ſkilful phyſicians could do, had long lain a dying; I the other day chanced to meet this knight at *White-Hall*, well, lively, and with a face, whoſe ruddineſs argued a perfect recovery, and yet he is not very far from ſeventy years of age, and had, before he grew ſo ill, long conflicted with a tedious ague, and fever, which had reduced him to that extremity, when the cordial was brought, that, as himſelf told me, he neither was ſenſible, when they gave it him, nor had known what he did, or what was done unto him, during the ſpace of ſeveral days before.

Sir Walter Raleigh's *cordial, after Sir* R. K. *his way (ſet down* verbatim, *as I the author received it.)*

TAKE burrage-flowers, roſemary-flowers, marigold-flowers, red july-flowers, roſa-ſolis, elder-flowers, of each one pottle, after they are dried in the ſhade.

TAKE alſo of ſcordium, carduus, angelica, balm, mint, marjoram, ſetwall, betony, *ana* four handfuls, after they are dried in the ſhade.

TAKE alſo of the rinds of ſaſſafras of *Virginia*, lignum aloes, *ana* four ounces beaten to powder; of kermes, cubebs, cardamoms, zedoary, *ana* one ounce; of ſaffron half an ounce; juniper-berries, tormentil-roots, round birthwort roots, of each one ounce; of gentian-roots half an ounce.

DRAW the tincture or extract of theſe with ſpirit of wine *in balneo*, and ſave all the ingredients, after you have taken out the tinctures, and burn them, and put their ſalt into their tinctures.

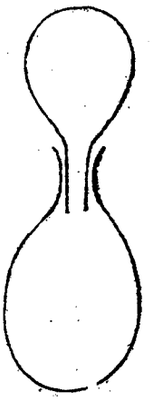
TAKE ſix ounces of the extracts of all theſe with their ſalt, and put thereto of the tincture of coral three ounces; terra ſigillata four ounces; pearl prepared two ounces; bezoar-ſtone three drachms, hartſhorn calcined four ounces, ambergreaſe four drachms, muſk *gr.* xxx; ſugar-candy one pound and an half, ground very fine, and ſearſed through a fine ſearſe.

THEN the muſk and amber muſt be ground, and by little and little mingled with it; the more you grind the amber, the better.

THEN put to the ſugar-candy all the dry materials before directed, and make all as ſmall as poſſibly you can.

THEN upon a great hollow grinding-ſtone mingle the tinctures, and dry things together, (which muſt be done by a ſtrong man uſed to that work:) and whilſt it is in grinding, put of ſyrup of lemons, and ſyrup of red roſes equal parts into it, elſe it will be ſo dry, that it will neither grind nor mingle.

How to make the tincture of Coral for this Cordial.



TAKE eight ounces of coral, and put it unbeaten into a calcining pot unluted, and let it ſtand twenty four hours in a calcining or glaſs-furnace, till the coral be as white as ſnow; then put it in three quarters of diſtilled vinegar in a long glaſs with a narrow mouth, and with another ſmall glaſs or phial put into the mouth of it, the belly upwards, to ſave the vinegar from waſting, thus; and ſet it in a ſand-furnace, ſo as the ſand may be as high as the vinegar.

LET it boil without intermiſſion twenty-four hours, by which time the vinegar will become red; ſo, when it is cold, pour off the vinegar into a glaſs-baſon, or a bell-glaſs, and vapour away

away all the vinegar *in balneo*, and gather the coral, being perfectly dry, for your uſe. You may ſtrike down your pearl with oil of vitriol, and oil of ſulphur, equal parts, which is accounted the beſt way to prepare the pearl: but Sir *R. K.* did uſe to prepare his pearl by juice of lemons.

[THE doſe for a man is about the bigneſs of a ſmall hazel-nut; but where prevention is only aimed at, or ſome ſuch uſe as the diſſipating the fumes of the ſpleen, as they call it, the bigneſs of an ordinary pea may ſuffice; ſo in urgent caſes the doſe may be increaſed to the quantity of a nutmeg. It is uſually given by it ſelf upon an empty ſtomach (the patient being kept warm after it, to promote ſweat) in fevers, want of ſpirits, violent fluxes, and ſeveral other diſtempers, where diaphoreticks and antidotes are proper, and (eſpecially) potent cordials are required.]

[To the 498th Page,
Where a receipt that cured fiſtula's is mentioned.]

A water for a fiſtula, and all manner of wounds and ſwellings, or old ulcers, cankers, tetters, boils, or ſcabs in any place, or green wounds.

TAKE of bole-armoniack four ounces, of camphire one ounce, of white vitriol four ounces; boil the camphire and the vitriol together in a little black earthen pot, till they become thin, ſtirring them together, till they become hard in ſettling; then bruiſe them in a mortar to powder, and beat the bole-armoniack it ſelf to powder, and then mingle them together, and keep the powder in a bladder, till ſuch time you uſe it. Then take a pottle of running water, and ſet it on the fire, till it begin to ſeeth; then take it from the fire, and put in three good ſpoonfuls of the powder into the water whilſt it is hot, and after put the water and powder into a glaſs, and ſhake it twice a day, to make the water ſtrong: but before you uſe it, let it be well ſettled and very clear, and apply it as hot as the patient can well ſuffer it; and lay a clean linnen cloth, four double, to the ſore, it being wet in that water, and bind it faſt with a roller to keep it warm; do it morning and evening, till it be whole. This water muſt be put into an oyſter-ſhell, not in a ſaucer, when you dreſs the ſore, for the pewter will ſuck it up. Remember you put three as good ſpoonfuls of powder as you can preſs into the ſpoon. Take heed no one drink of this water, for it is poiſon. To make it ſtronger, beat an ounce of alum to powder, and mingle it with the other powders.

TAKE of bole-armoniack half an ounce, white vitriol one ounce, of camphire two ounces, make them all into powder; then take a pottle of ſmiths-water, and as much ſpring-water, and mingling them, ſet them upon the fire. As ſoon as it begins to ſeeth, put in the powder very ſoftly, ſtirring it all the while: as ſoon as the powder is in, take it off the fire, and dreſs the wound with it twice a day, laying a cloth folded four times and wetted in the water, it being very hot, and ſo applied to the wound.

N. B. [THIS is the receipt *verbatim*, as I find it among my old papers, but I am not ſure, that among thoſe I cannot now come by, there may not be ſomething concerning a way of making a ſmall pliable tent, that may accommodate it ſelf to the crooked figure of the cavity of many fiſtula's. For methinks I remember, that the ſurgeon preſcribed the conveying the medicine by the means of ſuch a flexible tent a great way into the cavity, if not to the bottom of the fiſtula, which was thereby to be cleanſed.]

To the 507th Page.
Where ſoot is mentioned.

SOOT, *Pyrophilus*, is a production of fire, whoſe nature is almoſt as ſingular, as is the manner of its being produced; for it is (if I may ſo call it) a kind of volatile extract of the wood it proceeds from, made inſtead of a menſtruum by the fire, which haſtily diſſipating the parts of the body it acts on, hath time enough to ſever it into ſmaller particles, but not leiſure and aptitude to reduce it into ſuch differing ſubſtances, as paſs for chymical or peripatetick elements; but haſtily carries up the more volatile parts, which being not yet ſufficiently freed from the more fixed ones, take them up along with them in their ſudden flight, and ſo the aqueous, ſpirituous, ſaline, oleaginous and terreſtrial parts aſcending confuſedly together, do faſten themſelves to the ſides of the chimney in that looſe and irregular form of concretion, which we call ſoot: an inquiry into whoſe nature, as it may be conſidered in the ſurvey of the diſtinction of ſalts, muſt be elſewhere looked for; our mentioning it at preſent being only to take occaſion to tell you, that, as ill-ſcented and deſpiſed a body as it is, *Hartman*, (one of the moſt experienced and happy of chymical writers) ſcruples not to reckon the ſpirit and oil of it among the nobleſt *confortantia*; ſuch as prepared pearl, coral, amber-greeſe, and other eminent cheriſhers of nature. His preparation is for ſubſtance this: Take of the beſt ſoot, (ſuch as adheres to the lower part of the chimney, and ſhines almoſt like jet) what quantity you pleaſe, and with it fill up to the neck a very well-coated glaſs retort, or an earthen one, and luting on a capacious receiver, diſtil the matter in an open fire intended by degrees, whereby you will drive over the phlegm, the whitiſh ſpirits, and the oil, firſt of a yellow colour, and then of a red; ſeparate the phlegm, and for a while digeſt the ſpirit and the oil together, on which afterwards put half the quantity of ſpirit of wine, and diſtil them ſeveral times, whereby you will obtain, together with the ſpirit of wine, the ſpirit of ſoot, and alſo a very depurated oil, ſmelling like camphire. Out of the calcined *caput mortuum* after the common way extract a ſalt, which *Hartman* commends as a moſt excellent curer of exulcerated cancers: this ſalt, ſaith he, is drawn with vinegar, in which liquor, is a cold moiſt place; it is again diſſolved, and therewith the cancerous ulcers being once or twice anointed, the venenoſity will be viſibly drawn

Hartman's *preparation of ſpirit and oil of ſoot.*

Hartm. Prax. Chym. P. 12.

drawn out like a vapour, and then the forementioned oil being lightly ſprinkled upon the place, will breed on it a kind of cruſt like a ſkin, which ſpontaneouſly coming off in five or ſix days, will, by its falling off, argue the conſolidation of the ulcer. What this ſo extolled remedy will perform, I know not, having never made trial of it, nor thinking it very likely, that a bare alcalizate ſalt ſhould have ſuch ſpecifick virtues; nor is it requiſite I ſhould inſiſt on it, being here to diſcourſe to you of the diſtilled liquors of ſoot; in proſecution of which deſign, let me tell you, that *Hartman* preſcribes the adminiſtring of the ſpirit from ſix to ten grains, of the oil from two or three drops in wine, or any other convenient vehicle: and concerning the oil he adds, that if three drops of it be given in vinegar to an almoſt gaſping man, he will be thereby wonderfully refreſhed, and as it were revived; to which he annexeth this prognoſtick, that if the remedy produceth copious ſweats, it will recover the taker; but if not, he will die.

The author's directions concerning preparations from ſoot.

THAT this ſpirit of ſoot, deſcribed by *Hartman*, may be a very good medicine, I am very apt to think; but becauſe it is not a meer ſpirit of ſoot, but a mixed one of ſpirit of wine, and ſpirit of ſoot, we have rather choſen to proceed with the ſoot (of wood) without addition, both as to the diſtillation of it, and the ordering of the diſtilled liquors, after the manners to be mentioned ere long, when we ſhall acquaint you with our preparations of blood and hartſhorn; which if you pleaſe to apply to ſoot, you may ſave your ſelf, and me, the labour of repetitions. Yet it may not be amiſs to advertiſe you here of two things: the one, that if you employ very good and fat ſoot, and fill up the retort with it to the neck, you muſt be very careful to increaſe the fire orderly, and but by moderate degrees; or elſe you may chance to make the matter boil over out of the retort into the receiver; as it lately happened to us, when having warily ordered the fire for ſeveral hours, we thought our ſelves paſt any ſuch danger: and the other, that as to the medicinal virtues of the ſpirit, and ſalt of ſoot, I ſhall not now particularize them; partly that I may ſave time, and partly becauſe they may be well enough gathered from their affinity to the volatile ſalts and ſpirits of animal ſubſtances hereafter to be treated of; and from what I ſhall have occaſion to ſay, of the perfuming of the ſalt ſoot, towards the cloſe of this Appendix.

To the 507th Page.

Of the uſes of the preparations of urine.

URINE is a body, which, as homely and deſpiſed as it is wont to be, may, by ſkilful ways of ordering it, be made either alone, or in conjunction with other ingredients, to afford ſuch a variety of uſeful ſubſtances, that I find *Reuſnerus* publiſhed an entire treatiſe, which yet I never could get ſight of, under the title of *Synopſis remediorum ex urina præparatorum*, beſides what other chymiſts have ſince divulged on the ſame ſubject, which I forbear to mention; becauſe ſeveral of them I have not tried, and many others I think ſcarce worth trying. But becauſe even all our own obſervations, concerning the preparations and uſes of things afforded by urine, would take up more time and room, than I can now allow them, I ſhall here only take this occaſion to intimate thus much in general, that the ſpirit and ſalt of urine may be made far greater uſe of, than men yet are prone to think; not only in phyſick, but in chymiſtry, and perhaps I durſt add in natural philoſophy too. And though *Helmont* be not wont to laviſh his praiſes upon worthleſs remedies, yet he calls it *nobile ad icterum, alioſque morbos, remedium.* And in another place, ſpeaking of the ſaline cryſtals of urine, he hath this expreſſion: *Quæ quanquam ad veteres excrementorum oppilationes conferunt, nihil tamen adverſus lithiaſin*; which ſeems, by denying to the ſalt of urine ſome virtues aſcribed to it by many other chymiſts, to bring ſome credit to his praiſes of it. (And indeed a friend of mine, that has tried it in the jaundice, affirms it to deſerve the commendation he gives it in that diſeaſe.) And though I fear our author hyperbolizeth, where he (elſewhere) thus writes; *ſpernit eos ſapientia* (he means ſure that, which is proper to the Spagyriſts) *qui materiam ex qua diſpoſitiones, contenta, proprietates, progreſſum & ſignificationes lotii addiſcere recuſarent per ignem:* yet perhaps the hyperbole is not altogether ſo extravagant, as moſt readers will think it. And I remember, that a while ago, conferring with the publick miniſter of a foreign prince, who is a very inquiſitive and experienced perſon, he freely told me, that though he had travelled very much, and divers times not in a capacity, yet the greateſt chymiſt, that ever he could make acquaintance with, uſed to tell him, that ſalt of urine was ſo precious a thing, that it was a pity it ſhould be uſed in ordinary diſeaſes: but what his reaſons were for valuing it ſo much, he would not declare, and therefore I ſhall lay no great weight upon his teſtimony. And yet I muſt not at this time particularly declare, upon what account it is, that I do ſo value the volatile ſalt of urine, of whoſe virtues (whilſt it is ſingle) I ſhall only in a word obſerve to you now (what is pertinent to the occaſion of my mentioning it at preſent,) namely, that when it is well prepared [*according to the way plainly enough, though but very briefly touched already*] it differs ſo little in ſmell, taſte, volatility, penetrancy, and ſome other manifeſt qualities, from the ſalt of hartshorn, and that of man's blood; that ſuch effects, though perhaps ſomewhat leſs powerful, may be not improbably expected from it, as are produced by the other.

De Lithiaſt. c. 3. n. 3.

To the 508th Page.

Of the preparations of man's blood.

Though I have not in this place made any abſolute promiſe, of annexing any thing more particular touching the ſpirit of blood; and though I cannot now find, and I fear may have loſt thoſe of my papers concerning that ſubject, which were the leaſt unaccurate: yet, ſetting aſide former trials, a recent account brought me by a phyſician, whom I had entruſted with ſome of it, repreſents it as ſo very good a medicine,

dicine, that I am content to ſubjoin, what particulars I have lately found among my looſe papers concerning it, as I many years ago ſent them to a friend; and this I rather do, becauſe there being annexed to the proceſs divers obſervations of general import to ſuch kind of preparations, they will be the better underſtood with it, than without it, and I have not now the leiſure to new-mould them.

Thus then;

TAKE of the blood of an healthy young man, as much as you pleaſe, and whilſt it is yet warm, add to it * twice its weight of good ſpirit of wine, and incorporating them well together, ſhut them carefully up in a convenient glaſs-veſſel, wherein the matter muſt be ſet to digeſt *in balneo*, or horſe-dung, for ſix weeks, or more: then in a glaſs-head and body, placed in aſhes or ſand, draw off with a gentle heat as much liquor, as will come over without neceſſitating you to impreſs any empyreuma upon it; the remaining matter muſt be taken out, and put into a ſtrong and capacious retort, which being placed in ſand, and accommodated with a large receiver carefully luted to it, the matter therein lodged muſt be gradually preſſed with a vehement fire, which muſt at length be increaſed, till it be ſtrong enough to give the bottom of the retort a red heat. There will firſt come over (after perhaps a little phlegm) ſpirit, either accompanied or cloſely followed by a copious volatile ſalt, faſtening it ſelf to the ſides and top of the receiver; and much about the ſame time, there will alſo come over an oil or two, or more, (for I have not obſerved the oleaginous part to come conſtantly and regularly after the ſame manner.) The receiver being taken off, all that it contains may be poured together into a convenient phial, to be therein digeſted for a month, if you pleaſe; or otherwiſe without that previous digeſtion, you may waſh down the volatile ſalt adhering to the ſides of the receiver, with the ſpirit and oil well ſhaken about it, and pour all together into a large glaſs-funnel well lined with cap-paper, firſt moiſtened with ſpirit of fair water, through which the ſpirit, and as much of the volatile ſalt, as it and the phlegm can diſſolve, will paſs firſt, leaving the oil behind them in the paper, which muſt be ſeaſonably ſet aſide, or elſe the oil alſo, though more ſlowly, will paſs through the filtre. The phlegm, ſalt, and ſpirit muſt be rectified with a very gentle heat, ſo often, till the phlegm be perfectly ſeparated, and they leave no *fæces*: the oil alſo may be rectified two or three times from its own *caput mortuum* calcined, or elſe from ſalt of tartar, to deprive it of its muddineſs. The diſtempers, wherein this *arcanum* or ſpirit of man's blood is proper, are divers, but chiefly aſthma's, epilepſies, acute fevers, pleuriſies, and conſumptions. But to comply with my preſent haſte, I ſhall advertiſe you in the general, as to the uſe of this and the other remedies to be ſubſequently mentioned, that for them I muſt refer you to the particular narratives, which I ſhall ſcarce, if you ſeaſonably deſire them, refuſe you: and in the mean time, becauſe the volatile remedies are near enough of kin to each other, I ſhall add to this firſt proceſs (which is at the leaſt one of the nobleſt of them) ſome obſervations of a more general nature, that we may both of us avoid the trouble of needleſs repetitions.

OBSERVATIONS.

Obſervations touching the manner of drawing the volatile ſalts and ſpirits of ſalt and blood, and other ſubſtances belonging to the animal kingdom.

1. I IGNORE not, that there are extant in *Burgravius*, *Beguinus*, and divers other chymical authors, very pompous and promiſing proceſſes of the eſſence of man's blood; to which they aſcribe ſuch ſtupendous faculties, as I ſhould not only wonder to find true, but admire, that they can hope the reader ſhould believe them ſo. But of theſe preparations, ſome being, as that of *Burgravius* in his *Biolychnium*, very myſtical and unlikely; and others, like *Beguinus* his ♃. *E. ſanguinis humani*, exceeding laborious, and not ſo clear, I have never put myſelf to the trouble of making them; but I ſhall be very forward to acknowledge their excellency, if any man ſhall vouchſafe me an experimental conviction of it. For though I think the preparation of blood no bad one, yet I am far from daring to affirm there cannot be a better.

2. HE that intends to have any conſiderable quantity of this ſpirit and ſalt, muſt provide himſelf of a large proportion of blood, or elſe he is like to fall ſhort of his expectation; becauſe as full of ſpirits as blood is ſuppoſed to be, it yields commonly (at leaſt the beſt I have hitherto met with) no leſs than two thirds, or more, of phlegm, beſides a not deſpicable quantity of terreſtrial and unſerviceable matter.

3. IT is requiſite, both that the retort, wherein the dried blood is diſtilled, be pretty large and ſtrong, and that the fire be very carefully and gradually adminiſtred, leſt either the copious fumes break the too narrow veſſels, or the matter too haſtily urged boil over into the neck of the retort or the receiver; both which dangers this advertiſement may help you to avoid at a cheaper rate, than I, who have not been forewarned of them but by unwelcome experience.

4. THERE is a friend of mine, an excellent chymiſt, whoſe rare cures firſt gave me a value for remedies made of blood, who uſeth (as himſelf aſſureth me) to mingle with the ſpirit that other liquor, drawn over at firſt in a head and body, and twice or thrice rectified by itſelf. But that liquor conſiſting almoſt totally of the ſpirit of wine, and the not over-grateful phlegm of the blood, though there may perhaps be paſſed into it ſome of the more fugitive particles of the volatile ſalt; yet they being ſo few as ſcarce diſcernable, this liquor ſeems fitter to be made a vehicle, than an aſſociate of our ſpirit, and perhaps too is not in all caſes the moſt proper vehicle, in which it may be adminiſtred: (though

* This, if I miſ-remember not, was the proportion I employed in the exacteſt of my experiments of this kind, but it ſeems to be eſſential to the goodneſs of the remedy; the ſpirit of wine ſerving chiefly but to keep the blood from corrupting.

(though if it were not for the ſpirit of wine, I ſhould ſomewhat ſuſpect, that the phlegm, though ſo deſtitute of the more active ingredients, as to be fit to be kept ſeparated from them, may not itſelf be quite devoid of ſpecifick virtues.) But my eſteem of the artiſt I have mentioned, doth make me think it fit to acquaint you with his practice, notwithſtanding that hitherto his authority be the chief thing, that recommends it to me.

5. DIVERS ways may be propoſed of purifying this ſpirit and ſalt we are diſcourſing of, but having tried ſeveral, that, which I now uſe is this, that follows: I put the ſalt, phlegm, and ſpirit together, in one of the higheſt and ſlendereſt bodies I can get, that the phlegm might not be able to aſcend eaſily into the head, and that the volatile ſalt may be the better ſeparated. Then in a very gentle heat (I moſt uſe that of a lamp-furnace) there will aſcend pure white and volatile ſalt, adhering to the cheeks and noſe of the glaſs-head, which if I deſire by itſelf, I ſweep it away before the ſpirit begins to riſe; but moſt commonly I ſuffer the diſtillation to proceed, and the aſcending ſpirit to carry down part of the volatile ſalt into the receiver, and ſo I continue the ſame degree of heat, till there ariſe ſo weak a ſpirit, that it plainly begins to diſſolve the volatile ſalt. Then ſhifting the receiver, I reſerve the ſtrong ſpirit and volatile ſalt by themſelves, and take the ſucceeding weaker ſpirit by itſelf alſo; to which, if I pleaſe to fortify it, I add as much of the volatile ſalt, formerly reſerved, as it is able to diſſolve. In the bottom of the cucurbit or phial there will remain a phlegmatick kind of liquor, which uſually contains ſome of the ſalt or ſpirit, and ſometimes too (which is ſomewhat odd) ſome of the oleaginous part of the blood, which did not before appear to have been aſſociated with the ſpirit, and to have paſſed through the filtre with it. This nauſeous liquor may be kept by itſelf, till you have a ſufficient quantity of it, to be worth the trouble of ſevering from it the nobler parts. The ſpirit and ſalt above mentioned may be again rectified *per ſe*, with the like gentle heat as before, ſo often, till they leave behind them no fæces, nor phlegm at all. But this is requiſite to be done only when, to maſter ſome ſtubborn diſeaſe, the medicine is to be exalted either to its ſupreme, or at leaſt to ſome approaching degree of purity and efficacy; for otherwiſe ſo exquiſite a depuration is not always neceſſary.

6. As for the oleaginous part, which the fire forceth out of blood, my obſervations of it hitherto have ſo little agreed, that I dare as yet ſpeak but heſitantly concerning it. For ſometimes but one oil hath been drawn over, ſometimes two: and I remember, laſt year, a parcel of blood, that was kept in a dung-hill for many months, yielded us a blackiſh and muddy oil, a purely red one, and another of pale amber colour, which would not mingle with the darker; of each of which ſorts I yet reſerve ſome by me. This difference may poſſibly proceed partly from the previous preparation, or unpreparedneſs, of the blood, and partly from the various adminiſtration of the fire employed to diſtil it. But for the moſt part we find theſe animal ſubſtances (if the degrees of fire be orderly adminiſtred, and the heat ſufficiently intended towards the cloſe of the diſtillation) to yield a double oil; the one more light and pure, which ſwims upon the ſpirit; the other more muddy, aduſt, and ponderous, which ſinks to the bottom of it. The uſe of theſe oils hath, by reaſon of their fetidneſs, been by moſt authors abſolutely rejected; and even thoſe few, that do not altogether reject them, forbid their inward uſe, and allow them to be but externally imployed. But conſidering, *Pyrophilus*, how much of the efficacy both of plants and animals is obſerved to reſide in their oleaginous part, it ſeemed not improbable to me, that theſe oils might deſerve a better uſage, than either to be wholly thrown away, or confined to outward ſervices; and therefore having not long ſince given a friend of mine ſome pure yellow oil of mens blood, diſſolved in ſpirit of wine, to try upon a patient of his, ſick of a hectick fever (in which diſeaſe I had ſeen the ſpirit of blood very ſucceſsful) within a few days he brought me word of the unexpected recovery of his patient, to whom he adminiſtred our medicine (that I may not conceal from you that circumſtance) in *Balſamus Samech*, made with ſpirit of vinegar inſtead of ſpirit of wine; the remaining part of this yellow mingled oil I keep yet by me, to make further trials with it. And that ſuch oils may not be loſt, I have been attempting (for I am yet upon my trials) ſeveral ways to make them ſerviceable. Some of them, that are of a more pure and defecated nature, I have (which is not unworthy your noting) found capable of readily uniting with ſpirit of wine, with which they may be allayed at pleaſure: in others I have ſeparated the finer and more volatile part, by drawing them over with a very gentle heat in a retort half full of water, which will carry over the lighter part of the oil with it into the receiver, wherein the oil will ſwim upon it, and may be afterwards ſever'd from it by a ſeparating glaſs, or any other convenient way; (but I fear that this method, though it finely clarifies oils, may rob them of the beſt part of the efficacy they may perchance derive from the latent admixtion of ſomewhat of the volatile ſalt:) at the bottom of the retort there will remain a dark and thick ſubſtance, whoſe nature I have not yet had opportunity to inquire into. Out of ſome oils (drawn from unprepared materials) which would not diſſolve in ſpirit of wine, I have, by digeſtion with ſpirit of wine, drawn much of the ſcent and taſte; the ſpirit probably imbibing ſome of the finer parts of the oil, or elſe aſſociating to it ſelf ſome volatile ſalt, that yet lay lurking in it: for ſometimes I have obſerved oils, after long keeping, to let fall a volatile ſalt undiſcerned in them before. Having alſo ſometimes mingled the heavier and lighter oils of the ſame body with dephlegmated ſpirit of wine, and in a low retort drawn over what will riſe in a very gentle heat (inferiour to that of a balneum) I have found the ſpirit of wine to carry over with it ſo many of the more ſubtile and active parts of the oil, that it was more richly impregnated therewith,

therewith, than you will be apt to expect. But of what use this oleaginous spirit may be in physick, I have not yet had time to consult experience; which I hope will, ere long, teach me better ways of improving the rejected oil, we have been speaking of, than are those almost obvious ones hitherto mentioned, wherein I am very far from acquiescing; especially since I cannot but suspect, but such active parts of such concretes would be found very capable of a great improvement, if we were as skilful to give it them.

7. THE terrestrial substance, that remains after the liquors are drawn off, if the blood have been duely prepared, affords but so inconsiderable a quantity of fixed salt, that unless the caput mortuum be exceeding copious, the alkali will hardly be worth extracting: besides, that if it could be obtained in a not despicable quantity, I should, whatever is pretended, very much doubt, whether it would be endowed with very extraordinary virtues; the violence of the fire usually depriving fixed salts of the specifick qualities of their concretes: and even in the first salt of serpents themselves, I have not discerned other than the wonted properties of alkalizate salts.

8. BECAUSE you may sometimes not have the leisure to wait six weeks for the preparation of blood, and because oftentimes the occasion of using the medicines we have been describing, may be so hasty and urgent, that unless some speedy course to relieve them be taken, before the physick can be prepared, the patients will be dead; I think it not amiss, *Pyrophilus*, to advertise you, that though without any previous preparation of blood you should immediately distil it, provided an orderly gradation of heat be carefully observed, it will yield you a reddish spirit, and (besides an oil or two) a volatile salt; which being rectified, are so little inferiour, in any properties discernible by the smell or taste, to the salt and spirit of predigested blood, that it is very probable their efficacy will emulate, though not altogether equal, that of the more laboriously prepared.

9. AND because it is difficult to get the blood of healthy men, and perhaps not safe to use that of unsound persons; and because many have a strong aversion, and some an insuperable, though groundless abhorrency, from medicines made of man's blood, I have thought it not amiss to try, whether that of some other animals, prepared the same way, might not afford us as hopeful medicines. And because the blood of deer is chiefly (and perhaps not causlesly) commended by authors, we have handled it according to the foregoing process, and thereby obtained of it a spirit, and salt, and oil, whose penetrancy, and other resemblances, make us hope, that they may prove good succedanea, in the defect of those analogous remedies (drawn from human materials) which we have been treating of.

AND to this let me, *Pyrophilus*, on this occasion, annex this advertisement, that though in these papers, and what I have further written of preparations of this nature, I name not any great number of concretes, as having drawn their volatile salts and spirits, yet I have endeavoured in these discourses to give you, in the instances I insist on, so much variety of examples, that either by the processes therein set down, or by the analogy to them, you may, I suppose, be directed, with the help of a few trials, to obtain the volatile salts and spirits of most concretes, that belong to the animal kingdom, and that are capable of affording any. For by the method we prescribe, a little varied according to the exigencies of particular bodies to be distilled, we have drawn the spirits, salts, and oils of sheep's blood, eels, vipers, *&c.* the latter of which yield a salt and liquor, which in *Italy*, by divers learned men, is superlatively extolled against obstructions, foulness of the blood, and I know not how many diseases proceeding from these two general causes. And though I dare not deny, that divers of those praises may be well enough deserved by the remedies, to which they are ascribed; yet I am not apt to think them much superiour to the generality of volatile salts: and even the spirit and salt of sheep's blood it self did, by their penetrancy of taste, and fugitiveness in gentle heats, promise little less efficacy than those others so much celebrated medicines.

How to draw tinctures, as of sulphur, &c. with the saline spirits.

10. NOR is it only by being administred itself, that one of this sulphureous and subtle kind of spirits may become a good remedy, but also by its being made a menstruum to prepare other bodies: for it will extract tinctures out of several sulphureous and resinous concretes, whose finer parts, by being associated with so piercing a vehicle, may probably gain a more intimate admission into the body, and have their virtues conveyed farther than otherwise they would reach. And a learned doctor, to whom I recommended such kind of remedies, confessed to me, that by the bare extractions of appropriated vegetables themselves, with spirit of urine, he performed no small matter. But one difficulty you may meet with in drawing the tincture of minerals, and other very compact bodies, even with good spirit of urine; (for that I account to be the cheapest of these volatile menstruums, and the most easy to be obtained in good quantities.) For we have found, but with a little heat, the more fugitive particles to ascend to the upper parts of the glass, and there fasten themselves in the form of a salt; by whose recess, the debilitated liquor was disabled from drawing the tincture so powerfully as was expected: wherefore we were reduced to make our extractions in short-necked glass-eggs or phials exquisitely stopped, (which may also be placed stooping in the sand) and when we perceived much to be lodged in the necks of the vessels, by barely inverting them, the hot liquor soon reimbibed the salt, and was fit to be placed again in sand; so that, notwithstanding this difficulty, we are able by this means, in no long time, to impregnate the spirit of urine, or of hartshorn (for I do not perfectly remember, which it was) with the tincture of flowers of sulphur, which may probably prove a noble medicine in divers affections of the lungs, since in them these volatile

liquors alone have been found very effectual. And I remember, I have ſometimes made much a ſhorter, and more odd preparation (which at any time you may command) of crude ſulphur, whereby in not many hours I have, by the means of ſalts, brought over ſuch a ſulphureous liquor or tincture, as even in the receiver was of a red colour, as well as of a ſtrongly ſulphureous ſcent.

To Page 511, *&c.*
Where *Ens Veneris* is treated of.

BUT before I enter upon particulars, I think it will not be amiſs to tell you, how this preparation firſt occurred to us, becauſe by that information your happier genius may peradventure hereafter be prompted to improve this remedy, or to deviſe one more approaching to the nature and excellency of that, which we endeavoured, but with very imperfect ſucceſs, to light on, or equal, by our *Ens Veneris*. I muſt then tell you, that an induſtrious chymiſt (of our acquaintance) and I, chancing to read one day together that odd treatiſe of *Helmont*, which he calls *Butler*; when we had attentively peruſed what he delivers of the nature, as well as ſcarce credible virtues of the *lapis Butleri* he there mentions, we fell into very ſerious thoughts, what might be the matter of ſo admirable a medicine, and the hopefulleſt manner of preparing that matter. And having freely propoſed to one another our conjectures, and examined them by what is delivered by *Helmont*, concerning the preparation of *Butler*'s ſtone, or ſome emulous remedy, we at length concurred in concluding, that either the *lapis Butleri* (as our author calls it,) or at leaſt ſome medicine of an approaching efficacy, might (if *Helmont* did not miſ-inform us) be prepared by deſtroying (as far as we could by calcination) the body of copper, and then ſubliming it with ſal armoniack.

How the author firſt happened upon the preparation of Ens Veneris.

AND becauſe the body of *Venus* ſeems leſs locked up in good vitriol, than its metalline form, we concluded, that it was beſt to calcine rather the vitriol, than the copper it ſelf; and, having freed the colcothar from its ſeparable ſalts, ſo to force it up with ſal armoniack. But the perſon I diſcourſed with, ſeeming ſomewhat diffident of this proceſs, by his unwillingneſs to attempt it, I deſired, and eaſily perſuaded him, at leaſt to put himſelf to the trouble of trying it with the requiſites to the work, which I undertook to provide, being at that time unable to proſecute it my ſelf, for want of a fit furnace in the place where I then chanced to lodge. And though at firſt we did not hit upon the beſt and moſt compendious way, yet during the ſublimation, he being ſuddenly ſurprized, as both himſelf and his domeſticks two days after told me, with a fit of ſickneſs, attended with very horrid and ſeemingly peſtilential ſymptoms, was reduced to take ſome of this medicine out of the veſſels before the due time, and upon the uſe of it found, as he told me, an almoſt immediate ceſſation of thoſe dreadful ſymptoms, but not of the paleneſs they had produced. This firſt proſperous experiment emboldened us to give our remedy the title of *Primum Ens Veneris*, which, for brevity's ſake, is wont to be called *Ens Veneris*; though I am far from thinking, that it is the admirable medicine, to which *Helmont* gives that name, at leaſt, if his *Ens Veneris* did really deſerve half the praiſes by him aſcribed to it. But ſuch as ours is, I ſhall now (as time and my yet incomplete trials will permit) acquaint you with that proceſs of it, which (among ſome others) we are moſt wont to employ, as the moſt eaſy, ſimple, and genuine.

The proceſs uſed by the author for the making of Ens Veneris.

TAKE then of the beſt Hungarian, or, if you cannot procure that, of the beſt Dantzick, or other good venereal vitriol, what quantity you pleaſe; calcine it in a ſtrong fire, till it be of a dark red; dulcify it by ſuch frequent affuſions of hot water, that at length the water, that hath paſſed through it, appear full as taſteleſs, as when it was poured on it. Let this, thus exquiſitely dulcified colcothar, when it is thoroughly dry, be very diligently ground with about an equal weight of good ſal armoniack, and let this mixture be put into a glaſs retort, and either in as ſtrong a heat as can conveniently be given in ſand, or elſe in a naked fire, force up as much of it as you can to the top of the neck of the retort; and this ſublimation being ended, out of the broken retort (laying the caput mortuum aſide) take all the ſublimate, and grind it well again, that if in any part the ſal armoniack appear ſublimed by it ſelf, it may be re-incorporated with the colcothar; reſublime this mixture *per ſe* in a glaſs-retort as before, and, if you pleaſe, you may once more elevate this ſecond ſublimate, but we have not found that always needful. And for the better underſtanding of this proceſs, be pleaſed to take notice of the following particulars.

Divers particular animadverſions concerning the preparations.

FIRST, We have always preferred ſuch vitriol as abounds with copper, before our common Engliſh vitriol, about the making of which, thoſe that keep the copperas-work at *Deptford* are wont, as themſelves have upon the place informed me, to uſe good ſtore of iron to increaſe the quantity of their vitriol.

SECONDLY, If you be unwilling to loſe the phlegm, ſpirit, and oil of that vitriol, with which you deſign to make *Ens Veneris*, you may diſtil them away in an earthen retort, or one of glaſs well coated. But though it be well known, that the diſtillation of oil of vitriol requires a very intenſe and laſting fire, (ſo that unleſs you have need of the liquors, the beſt way will be without any ceremony to calcine the vitriol in a naked fire and open) yet afterwards it will be for the moſt part requiſite, farther to calcine the caput mortuum in an open veſſel. For you muſt take notice, that unleſs the vitriol be very thoroughly calcined, it will be very troubleſome for you to dulcify it; and ſometimes we have obſerved, that the caput mortuum which looked red, and ſeemed indifferently well calcined, hath been, almoſt like crude vitriol, diſſolved in the fair water, which was poured on it, to dulcify it. The weight of the calx, in reference to the vitriol of which it was made, we cannot eaſily determine; but we have ſometimes found it neceſſary to reduce the vitriol

to

to leſs, perhaps much leſs than half its weight, to make fit for dulcification.

THIRDLY, The water, that hath been poured off the firſt and ſecond time, to edulcorate the calcined vitriol, may be filtrated and ſteamed away, till it come almoſt to the conſiſtence of a ſyrup or honey, and then may be put into a cold place to ſhoot; for after this manner we have ſometimes had many very regularly figured cryſtals or grains of ſalt: I ſay ſometimes, becauſe ſometimes alſo you may find it neceſſary to abſtract all the water, to obtain the whitiſh ſalt of vitriol, which we have known uſed as a good vomit, and which *Angelus Sala*, none of the leaſt ſober of the chymical writers, doth highly extol as an excellent emetick, in his *Ternary of vomitive remedies*, where he diſcourſeth at large of the virtues of it, and the way of adminiſtring it. And of this ſalt, as chymiſts are pleaſed to call it, we have had out of calcined copperas a very great quantity, and have ſometimes obſerved it to have been almoſt as deeply coloured, as the vitriol it ſelf was before calcination.

FOURTHLY, We ſeveral times tried to ſublime dulcified colcothar with ſal armoniack, in retorts and urinals placed in ſand; but whether by reaſon of the fixedneſs of the colcothar, or becauſe the furnace we were fain to uſe, though no very bad one, was none of the beſt, we never could that way obtain any conſiderable quantity of the deſired ſublimate, and that, which did aſcend, was but of a faint colour: wherefore, unleſs you have an extraordinary good ſand-furnace, if you will make uſe of glaſs-veſſels, which is the cleaneſt way, you will find it expedient to ſublime your colcothar in coated retorts with an open fire, except you have the dexterity to ſublime in a naked fire with glaſs retorts uncoated, which we have divers times ſeen performed by heating the bottom of the retort by degrees, and then placing it upon embers, with coals round about it, but to be kindled at a diſtance from it: for if this courſe be watchfully followed, the retort will be ſo well nealed, before it be reduced to endure any intenſe degree of heat, that after a while you may ſafely lay thoroughly kindled coals, not only round about it, but upon the top of it, (which needs not to be done till towards the end of the operation) and thereby drive moſt of the ſublimate into one lump, and into the neck of the retort. And by this way you may ſublime any furnace upon a bare hearth; but if you deſire to give a more intenſe heat, you may lay firſt ſome warm aſhes in an ordinary iron pot, and having with them, and a few ſmall coals well kindled, nealed your retort, you may afterwards proſecute the ſublimation in the ſame pot, which being once throughly heated *it* ſelf by the fire, will afterwards conſiderably increaſe the heat of it.

FIFTHLY, Though it be moſt commonly requiſite to reſublime the ſublimate, that comes the firſt time up, that the ſalt and colcothar may be more exquiſitely mixed, yet as far as we can gueſs by ſome trials, it will not be expedient to reſublime it above once (or at moſt) twice. For in thoſe trials we have found the *Ens Veneris* oftner reſublimed of a paler colour, than that which was reſublimed but once. And (*N B*) perhaps, by farther ſublimations, the ſalt, inſtead of being more intimately united with the colcothar, may be almoſt totally ſever'd from it, according to what we elſewhere in other caſes declare.

SIXTHLY, Of theſe ſublimates, that, which hath the higheſt colour, ſeems to be the beſt, as being moſt enriched with the colcothar, from whence the redneſs proceeds. But at the firſt ſublimation I have often obſerved a pretty part of the ſal armoniack to come up firſt white by it ſelf, eſpecially if it had not been very diligently mixed with the colcothar. But at the ſecond ſublimation the ingredients (which we have ſometimes almoſt totally forced up without leaving a caput mortuum in the bottom of the retort) will be more accurately mixed, and the ſublimate will appear yellow, and perhaps reddiſh, of which ſort we have ſometimes had, when the operation hath been carefully managed.

SEVENTHLY, How great a proportion of the ingredients committed to ſublimation will ariſe in the form of *Ens Veneris*, we dare not preciſely define; but ſublimate amounting to the fourth part of the whole mixture, you will ſcarce, if you work ſkilfully, fail of.

EIGHTHLY, We ſometimes made a ſublimate of equal parts of pure ſal armoniack and ſalt of tartar, both of them very throughly dried, (for elſe they will be apt to yield rather a ſpirit than a ſublimate,) well ground together, and ſo ſublimed. And with this ſublimate inſtead of ſimple ſal armoniac we intended to make *Ens Veneris*, but by ſome intervening accidents and avocations we were not able to perfect the experiment, of which we nevertheleſs think it fit to give you this hint, becauſe of the great efficacy, which an excellent phyſician of my acquaintance, to whom I gave ſome of it, aſſures me he has found in it againſt obſtructions, and ſome diſtempers, that are wont to ſpring from them.

NINTHLY, When you are about to make your firſt ſublimate, you may, if you pleaſe, lute to the retort, whereinto you put the ingredients, a ſmall receiver to catch the liquor that oftentimes comes over. For that liquor, though you will very ſeldom get much of it, yet it may be worth your preſerving, by reaſon of the volatile and urinous ſalt wherewith it will ſometimes ſo abound, that it may paſs for a weak ſpirit of ſal armoniack.

TENTHLY, The caput mortuum, that remains after the firſt ſublimation, may be put into a clean glaſs, and ſet in a cellar, where it will run *per deliquium*, into a thick and high coloured liquor, very richly impregnated (as we elſewhere manifeſt on another occaſion) with the ſomewhat opened body of copper; from whence, if half thoſe praiſes be true, which even the beſt chymiſts are pleaſed to give to copper, it may be very well concluded to have derived no ſmall virtues againſt ulcers, and divers affections, which we are not here to inſiſt on.

ELEVENTHLY, We have ſometimes doubted whether or no our *Ens Veneris* did really contain

tain any thing of cupreous or colcotharine in it, partly becauſe of the fixedneſs or ſluggiſhneſs of colcothar, and of the copper therein contained; and partly becauſe, that if ſal armoniack be two or three times ſublimed by it ſelf, its flowers frequently enough will aſcend yellow, like the paler ſort of *Ens Veneris*. But firſt, that ſal armoniac is capable of carrying up even fixed and ſluggiſh bodies, ſeemed probable to us, partly upon our incorporating and ſubliming it with finely powdered corals, (from which, though but very little of it aſcended, yet ſome of that little was no leſs red, than the corals themſelves before their being beaten) and partly upon our ſubliming it from copper, both crude and calcined, ſince of either of thoſe bodies it carried up a little with it, as appeared by the blue colour of ſome parts of the ſublimates.

And ſecondly, that the reddiſhneſs of our *Ens Veneris* proceeded partly, if not altogether from the colcothar, ſeemed probable to us, not only by the taſte, and ſome other properties of it, but alſo by this, that having knowingly committed the firſt ſublimate to a fire too weak to reſublime it; and having after ſome hours taken the veſſel out of the ſand, we found that the fire, which we ſuppoſed was not ſtrong enough to carry up the whole matter, had raiſed the ſal armoniack to the upper part of the urinal in flowers, that were either white or but pale yellow; whereas the remaining part of the mixture, that lay in good quantity in the bottom of the veſſel, was of a deep red, and a fragment of it of about the bigneſs of a large pea, being caſt upon glowing coals, and nimbly blown with a pair of bellows, coloured the flame with ſomewhat greeniſh blue, like that, but more faint, which we elſewhere have obſerved to proceed from the well-opened body of copper.

But thoſe trials, I confeſs, would rather increaſe my doubts than leſſen them, becauſe in our *Ens Veneris* the colour is not blue, but reddiſh; if I did not conſider, that colcothar is a body, that conſiſts of ſome other matter beſides common copper, (as it is alſo far more difficult to reduce, though but in part, into a metal, than is vulgar calcined copper) and conſequently when corpuſcles of differing natures are by the ſal armoniack elevated together, that, which is not metalline, may, with the aſſiſtance of the fire's operation, alter the nature of what it is, and thereby produce a colour differing from blue. But to diſpatch whatever further trials ſhall inform us, touching this queſtion, whether or no any true and reducible copper do make an ingredient in our *Ens Veneris*, yet there being in colcothar other parts as well as thoſe, that by fuſion you may reduce into a pure metal, and our remedy ſeeming by its ſomniferous property to partake of them, it will not be neceſſary to the giving our medicine a right to the appellation I commonly chooſe of *Flores Colcotharis*, that in it there is ſomething of the colcothar carried up, though poſſibly the quantity be but ſmall, and not all reducible into a metalline form. But perhaps the queſtion is not worth a longer debate, it being ſufficient to excuſe the name, and recommend the thing to ſuch a perſon as you, that colcothar is employed in the making of it, and that the thing prepared is a noble medicine, and hath ſome of the great virtues aſcribed to vitriol; whether that mineral be an ingredient of it, or no.

The doſe and uſe of Ens Veneris.

The doſe of *Ens Veneris* may be very much varied: to little children we give ſometimes one, ſometimes two, and ſometimes three grains for many nights together, as we find them able, without inconvenience, to bear the operation. To perſons of ripe years we commonly adminiſter four, five or ſix grains at a time. But one, to whom we have given quantities of it to lie by him, tells us, that he hath taken to above thirty grains at once without any inconvenience. We are wont to give it in two or three ſpoonfuls of ſack, or other wine, if the conſtitution of the patient, or the nature of the diſeaſe do not forbid it; and, in ſuch caſes, we give it in any cordial liquor, that is temperate, or any other convenient vehicle.

To children it may be given in beer, or ale, or clear poſſet-drink, but not in milk. If the patient hath ſupped at a ſeaſonable hour, we commonly adminiſter it, when he is going to ſleep. It works for the moſt part by ſweat and a little by urine, but more by ſweat at the beginning, than after the body is uſed to it; yet to ſome bodies it proves ſo ſudorifick, that two grains, or leſs of it, have often made me ſweat. That it hath once proved emetick, I have heard, but never obſerved it my ſelf to provoke vomits.

As for the medical uſe of *Ens Veneris*, divers great phyſicians will perhaps think it were not deſpicable, though it were no other than oftentimes to prove a ſafe and moderately ſomniferous medicine in fevers, without having any thing in it of opium, whoſe narcotick power they find as difficult to correct, as oftentimes proves dangerous, when being not well corrected, it is adminiſtred without very great circumſpection. But—*********

To the 514, 515, 516th Pages.

[*Finding among my looſe notes, together with thoſe, that do immediately concern the preparations of ſulphur and hartſhorn (delivered in theſe pages) ſome other particulars, that may alſo ſerve, either to afford ſome light to readers leſs ſkilled in chymiſtry, or contribute ſomewhat or other towards the relief of ſome patients, I am content to let thoſe papers go together, as I long ſince addreſſed them to a friend.*]

Of hartſhorn.

Hartſhorn, *Pyrophilus*, is a heteroclite body in nature, which hath but few reſemblers in the univerſe; for it grows to a conſiderable bulk like a vegetable, and is (unlike moſt other horns of animals) at certain ſet periods of time, deciduous; and though it be of a bony ſubſtance, yet that middle part of it which differs from the reſt in colour, does (at leaſt in grown horns) much more reſemble the pith of ſome plants than the marrow of bones: and yet this plant-animal (if I may ſo call it) does, when ſkilfully expoſed to the fire, afford the ſame differing ſubſtances, with the blood, fleſh, and other part of animals. It is no wonder therefore,

therefore, if phyſicians and chymiſts have hoped to find extraordinary virtues in ſo extraordinary a ſubject, of which we ſhall paſs by the uſual preparations, as not ſo pertinent to our preſent deſign, inſinuating only in the general, that though even the more vulgar preparations, as well as that which phyſicians have been pleaſed to call philoſophical, afford us medicines not deſpicable; yet theſe are much inferiour to thoſe remedies wherewith dexterous diſtillations are capable of preſenting us. And certainly if we allow of the chymical theory, (whoſe truth in theſe papers I queſtion not) harts-horn being generally acknowledged to be endued with properties very friendly to our nature, and even thoſe ways of preparing it, wherein the nobler and more active parts are not truly freed from thoſe cumberſome ones that fetter him, and hinder them to diſplay their powerful energies, proving yet oftentimes not unavailable: the ſpirit and ſalt of harts-horn would be in more requeſt, were not men deterred from making trials of it, partly by the over-apprehended unpleaſantneſs of the ſmell, and partly by the difficulties commonly met with in its diſtillation; the latter of which determents hath ſo frighted even chymiſts from diſtilling this cordial ſubſtance, that we have very rarely ſeen any, either ſpirit or ſalt of hartſhorn, ſave what our ſelves have been induced to prepare.

Three ways of diſtilling hartſhorn. THERE are three ways propoſed by the authors I have have met with, to diſtil hartſhorn: the one in coated glaſs retorts; the other in earthen ones; and the third in *Glauber*'s ſecond philoſophical furnace.

IN the firſt of theſe ways, ſome very ſkilful diſtillers, that have often practiſed it, have ſo complained of their frequent breaking their veſſels by the copiouſneſs, and impetuoſity of the fumes, that ruſh out of the matter, when it once begins to be preſt with a conſiderable heat, that I confeſs to you ingenuouſly, *Pyrophilus*, they have hitherto frighted me from making trial of that way; though I ſee no very great reaſon why, by a ſlow and regular gradation of the fire, the miſchances incident to this way of diſtillation may not (at leaſt moſt commonly) be avoided.

To diſtil the matter we diſcourſe of in earthen retorts, is a ſafer way than the former, if the earth be cloſe and good, and have been ſufficiently baked; as we find in the right *Heſſian* retorts, wherein we have known the operation proceed very proſperouſly, though a conſiderable quantity of the matter hath been diſtilled at once; but the retorts made of earth, that is ſpongy, or any other ways unfit, or in whoſe baking fuel hath been ſpared, are commonly (as experience hath informed us) improper for this ſervice, wherein they are eaſily broken: beſides that it is much to be feared, that all retorts made of earth, except it be extraordinarily compact and baked, are apt to imbibe the more ſubtile and more penetrant parts of harts-horn, and other volatile ſubſtances diſtilled in them; which we have obſerved in ſome, wherein the matter hath tranſudated quite though the ſubſtance of the retort, and been manifeſtly diſcernable on the outſide of it.

THE third way of diſtilling harts-horn is performed by the inſtrument deſcribed by *Glauber*, in his ſecond philoſophical furnace: but neither is this way without its inconveniencies: for beſides that, if the earth whereof the veſſel to be employed is made, be not very good and well baked earth, it will be apt to crack, in ſo violent a fire, as is requiſite in this way of diſtillation, or elſe it will imbibe part of the fineſt ſpirit it ſhould tranſmit into the receiver: and beſides that it is difficult to work long this way, without letting ſome of the active part of the ſpirit eſcape between the wide orifice of the retort and the cover: beſides theſe inconveniencies, I ſay, it is to be feared, that the matter being to be caſt immediately into the veſſel, made red-hot before-hand, it will receive a ſtronger empyreuma, or impreſſion of the fire, than it would do in the ordinary way of diſtillation; wherein the fire being orderly and ſucceſſively increaſed, much of the ſpirit and ſalt comes over into the receiver, before that laſt degree of fire is adminiſtred; which is requiſite chiefly to force over the more ſluggiſh and heavy oil, which therefore (to ſpeak congruouſly to the moſt received theory of diſtillation) favours much more of the fire, and is grown almoſt infamous for its aduſtion.

BUT notwithſtanding theſe inconveniencies, *Pyrophilus*, we have found theſe retorts of *Glauber*'s not unſerviceable, when we have had occaſion to diſtil conſiderable quantities of ſuch materials, as were not ſo precious, as to make the loſs of a part of what they were to afford us, conſiderable.

AND this advertiſement may take place, eſpecially if you take along with you what we have declared, touching the ways we ſubſtitute, to avoid, as much as may be, the newly objected inconveniences. But having in other papers taken notice particularly enough of the ways we mean, I ſhall forbear to mention them in this place, though one of them may eaſily be made applicable, as experience hath aſſured us, even to ordinary retorts: for it is not difficult to apply *theſe*, the perforated receivers, which being almoſt of the ſhape of pears, open at both ends, by holes of about two or three inches diameter (according to the capacity of the veſſel) may be with great facility taken aſunder and made clean; and may, by the convenient inſertion of their extremities into one another, be eaſily luted together (in a level) two or three, or as many of them as neceſſity ſhall require: and then, provided there be applied to the remoter extremity of the laſt of them, ſome convenient veſſel open but at one end, the receivers will very ſeldom break: the fumes that come over too copiouſly to be contained in one of them, paſſing freely thence into the ſecond or the third (for we very rarely exceed three in all) which will be manifeſtly cool, and ſo, ſpeedily turn into liquor, the fumes it receives; whilſt the firſt recipient is perhaps hotter than the hand can endure: but of theſe mechanical contrivances elſewhere.

Now

Animadverſions on ſome preparations of hartſhorn of Glauber *and* Hartman.

Now whereas *Glauber* preſcribes to mingle with the diſtilled liquors of hartſhorn rectified ſpirit of wine, to waſh out the volatile ſalt, and directs the diſtilling again of both thoſe ſpirits (of wine and hartſhorn) together; his method of proceeding may be juſtly queſtioned. For firſt, dephlegmed ſpirit of wine will not ſo readily, in the way he ſuppoſeth, diſſolve the volatile ſalt of hartſhorn; and next, the ſpirit this way drawn is not a ſimple ſpirit of hartshorn, but a compounded liquor of the ſpirit of hartſhorn, and that of wine; the latter of which may poſſibly, in divers caſes, rather impair than improve the virtue of the former. For ſpirit of hartſhorn, by reaſon of its opening and reſolving, as well as cordial virtues, is ſafely and ſucceſsfully given in fevers, wherein it is not obſerved to inflame the blood; whereas ſpirit of wine in ſuch caſes is counted dangerous. And this brings into my thoughts a very queſtionable preparation of the experienced and ingenious *Hartman*, who much extols for the worms in the ſtomach, ſpirit of hartſhorn in general, but eſpecially that which he is pleaſed to call *Eſſenſificated*, (that is, as himſelf expounds it) with which its own fixed ſalt, extracted with ſome convenient water, and its volatile duly depurated, have been diſſolved and united. For firſt, the fixed ſalt of hartſhorn hath been perhaps never yet prepared by any man: and if hartſhorn doth yield a fixed ſalt (as I dare not abſolutely deny, but that out of many pounds a few grains may be extracted) it may well be doubted, whether that ſalt be endowed with ſpecifical virtues: and next, the ſpirit of hartſhorn, if it be well dephlegmed, will not (for aught I could ever find) diſſolve its own ſalt, unleſs aſſiſted by the external warmth of the ambient air. Inſomuch that I uſually keep the ſpirit and ſalt in the ſame phial, where they remain unmixed; and the ſpirit, that will diſſolve any of its own ſalt, I account not ſufficiently dephlegmed, but to have yet an aqueous alloy, whereby the ſalt is imbibed. And I remember, that having once exquiſitely rectified ſome ſpirit of hartſhorn, and cloſed it up in a phial, after divers months it let fall a conſiderable quantity of volatile ſalt; ſo far was it from being able, without the help of ſome peculiar way, to have diſſolved more, had I caſt more into it. I deny not, that the ſpirit of hartſhorn may, by the mediation of heat, be brought to take in ſome of the ſalt of the ſame body: but of what uſe this violent impregnation of the liquor can be, unleſs it be quickly adminiſtered, I do not yet underſtand; having often ſeen the ſpirit let fall again in the cold, the volatile ſalt it had diſſolved by the aſſiſtance of heat.

Tract. Chym. p. 190.

A fourth way of preparations of hartshorn, uſed by the author.

And having thus, *Pyrophilus*, laid before you the difficulties we have met with, in the above-mentioned ways of making of ſpirit of hartſhorn, propoſed by authors, (neither of which we would yet have you altogether reject) I muſt acquaint you, with our having attempted a fourth way, which when the matter to be diſtilled is not very much, I chuſe rather to practiſe than any of the other, as hitherto ſeeming more ſafe and free from inconveniences. Take then (for inſtance) two pounds of hartſhorn broken on an anvil into pieces, each of about the bigneſs of one's finger, (for if it be raſped, there is danger, that it ſhould emit its fumes too plentifully at once) and put it into a ſtrong glaſs-retort uncoated, big enough to contain at leaſt twice as much matter: ſet this in ſand, and fit to it a pretty large and ſtrong (either ſingle or double) receiver; then give a ſlow fire for three, four, or ſix hours, to ſend away firſt the phlegm, and more fugitive parts of the ſpirit. Then increaſing the fire, but warily, and gradually for divers hours, drive over the ſpirit (which is wont to drop down ſomewhat tinged) and the more volatile parts of the ſalt; and at length intend your fire till the bottom of the retort be glowing hot, and heap alſo at laſt quick coals upon the ſand round about the retort, to give, as it were, a fire of ſuppreſſion, and ſo force over the more ſluggiſh remaining parts of the ſalt, and with it the oil: all which, are to be afterwards proceeded with, according to the directions given concerning the ſpirit, ſalt, and oil of man's blood; which having been ſufficiently inſiſted on before, will not (I ſuppoſe) need to be repeated now. Only it may not be impertinent to advertiſe you, 1. That we have more than once had the bottom of the retort melted, yet not broken, the melted glaſs being ſupported by the ſubſtrated ſand. 2. That ſometimes in filtration, ſome of the thinner parts of the oil have unperceivedly paſſed through the paper with the ſpirit and ſalt, and have not been diſcovered, but by rectification; wherein I have almoſt admired to ſee the oil, with a gentle heat of a lamp, aſcend to the top of a very tall head and body: touching which circumſtance it may yet be farther inquired, whether it proceed barely from the volatileneſs of the oil it ſelf, or alſo from its being carried up by the ſalt and ſpirit, wherewith it was aſſociated. 3. That by this way of diſtillation, we uſually have out of a pound of hartſhorn between four and five ounces (ſeldom or never ſo little as four, and often nearer five) of volatile ſalt, ſpirit, oil, and phlegm; (of the laſt of which, if the hartshorn be not recent, there will be no great quantity:) and when we diſtilled two pound of the matter at a time, we found the operation to ſucceed altogether as well, and to yield us a fully proportionable quantity of liquor.

The uſe and effects of the ſpirit of ſalt of hartſhorn, and the doſe of it.

The virtues of the ſpirit and ſalt of hartshorn, which differ not much in doſe, or efficacy, are probably very great in divers diſtempers, wherein we have yet made no trial of them. For they are conſiderable in reſiſting putrefaction, comforting nature, opening obſtructions, mortifying the acidities it meets with in the blood; and, by rendering that volatile, promoting its circulation, we have known conſiderable effects of it in fevers, pleuriſies, obſtructions of the meſentery, and ſpleen; and chiefly (which perhaps you will think ſtrange) in coughs and diſtempers of the brain, and nervous parts: in ſo much that I have, by God's bleſſing, ſometimes ſtopped very violent (but not inveterate coughs) with this medicine in a few hours. And preſcribing it to one, who

was almoſt daily aſſaulted with epileptical fits, a few doſes of it did, in a pretty while at firſt, make his fits come but ſeldom, and after, not at all: but whether he be perfectly cured, not having heard of him of late, nor having had opportunity to make farther trial of the medicine in that diſeaſe, I am not certain. We preſcribed it likewiſe, not long ſince, to a perſon, who had long lain both diſtracted, and almoſt bed-rid, and was in a ſhort time ſtrangely relieved by the uſe of it, though not perfectly cured, (perhaps, becauſe the patient took but little of the medicine, we being, then, not well ſtored with it;) and on ſome, that have been by fevers rendered ſtupid, it hath had very eminent operations. But for a farther account of its virtues, I muſt refer you to the particular narratives I may, when we meet, give you by word of mouth: and till then, it may ſuffice to tell you, that it works chiefly by ſweat, (and ſomewhat by urine) without being obſerved to leave behind it ſuch heat as divers ſudorificks are wont to do: only there muſt be care not to adminiſter it, when the *primæ viæ* and paſſages are too much ſtuffed and choked up by groſs humours, leſt by agitating the blood, and putting it into a nimble motion, it occaſion greater obſtructions. The doſe is from five drops, or grains, to a drachm (ten or fifteen drops are wont to make me ſweat) in wine, *carduus benedictus* water, or any vehicle appropriated to the diſeaſe; only taking care, that nothing acid be adminiſtered with it, becauſe acid and ſulphureous ſalts mortify, and diſarm one another. *Hartman* commends it againſt the worms of the ſtomach, againſt which it may very probably be available, by reaſon of its penetrant and ſaline nature, and its enmity to putrefaction. *Glauber* writes, that the oil rectified from ſalt of tartar cures quartans, and inward wounds, and cures the pains produced by falls, convulſions, *&c.* being adminiſtered from ſix to twenty drops to a patient placed in his bed to ſweat after it: but of this my experience will not enable me to ſay any thing. And I fear, *Pyrophilus*, that I have already too long entertained you about harts-horn: and yet I fear too, that you expect that, before I forſake this ſubject, I ſhould ſay ſomething to you concerning a much controverted particular relating thereunto. The inquiry is, whether or no, when it is diſtilled, the ſalt diſpoſe itſelf, in the receiver, into the figures of hartſhorn: the affirmative is maintained by many chymiſts, and a friend of mine, who is very ſevere, and not at all credulous, having aſſured me, that he himſelf had obſerved the inſide of his receiver over-laid with ſuch figures or horns, I dare not deny, but that accidentally the particles of the volatile ſalt may ſometimes repreſent as well the ſhape of hartſhorns, as of divers other things. But for our parts, having ſeveral ways, and not unfrequently diſtilled that matter, we could never ſee the pretended ſaline hartſhorns, ſo clearly as we thought we ſaw cauſe to eſteem, that thoſe who affirmed they conſtantly ſaw them ſo diſtinctly, looked through the ſpectacles of prepoſſeſſed imagination: not to mention, that it is the uſual method of nature in ſalts to make the bigger concretions of the ſame figures with the ſmaller grains, as we obſerve in nitre, roch-allum, *&c.* And the grains of the ſalt of hartſhorn, though I have attentively enough conſidered their ſhapes, I remember not ever to have obſerved of a figure like that of the horns they came from: but it is the nature of volatile ſalts to faſten themſelves to the receiver in various figures, according as the degree of fire, that urges them up, and other concurrent circumſtances, do chance to exact; and conſonantly hereunto, we have often obſerved the volatile ſalt of the ſame hartſhorn to be very variouſly figured in the ſame receiver. And I remember, that, not long ſince, ſubliming ſome volatile ſalt of urine, it adhered to the upper part of the veſſel in figures, much liker hartſhorns, than ever I had ſeen their volatile ſalt make up: ſo that, unleſs we will merrily ſay, that the man, whoſe urine was diſtilled, had horns given him by his wife, we muſt acknowledge, that nature ſeems to give herſelf liberty to play in the configuration of volatile ſalts, and that caſualties have no unuſual influence on them; or, to ſpeak more properly, that the various degrees of fire, the differing copiouſneſs of the fumes, and many other intervening accidents, do keep thoſe configurations from being conſtantly regular. And I remember, that, a while ſince, filtering through cap-paper a tincture of glaſs of antimony, made with ſpirit of vinegar and ſpirit of wine, almoſt according to *Baſilius*; the matter, which remained in the paper (which was placed in a glaſs-funnel, and was of the ſame ſhape) did of it ſelf, when it began to grow dry, cleave into the figures of trees, whoſe trunks, greater boughs, and ſmaller branches, were, both for their ſhape and proportion, as lively repreſented as if they had been drawn by the curious pencil of ſome ſkilful painter: which paper I ſhewed to ſome perſons, that beheld it not without wonder, and, for aught I know, I am yet able to ſhew it you. Nor is this the only inſtance I could give you, if need were, if I had not trifled too long already to manifeſt at preſent, that now and then chance may make nature ſeem to emulate art.

Q. Whether in the diſtillation of hartſhorn, the ſalt diſpoſe it ſelf into the figure of the horn.

BUT as long as I have dwelt, *Pyrophilus*, on this ſubject, before I paſs to another, I muſt not forget to advertiſe you, that in caſe ſtags-horns cannot be procured for the preparation of the above-mentioned remedies, you may without much diſadvantage ſubſtitute bucks-horns in their ſtead: for almoſt all the trials we have had opportunity to make of the medicines we have been lately diſcourſing of, have been made with remedies, whereto bucks-horns afforded materials.

That bucks-horns may be ſubſtituted for ſtags-horns.

I HAD almoſt forgot, *Pyrophilus*, to tell you, that to keep the rectified ſpirit of harts-horn, blood, or the like, is more uneaſy, than any thing but trial would make one think; and yet to keep the volatile ſalt is more difficult than to preſerve the ſpirit: for more than once, when I have kept theſe fugitive animal ſalts by themſelves, they have penetrated the corks, and ſcarce left me in the well ſtopped glaſſes any foot-ſteps of their having been there, and therefore

How to keep the ſpirit and ſalt of hartſhorn.

therefore thoſe chymiſts, that are not ſtrangers to theſe ſalts, have taken much pains to no great purpoſe, to keep them from avolation: ſome of the recenteſt and ingenioufeſt are wont, that they may moderate their uncurbed wildneſs, to pour on them as much of ſome ſuch acid ſpirit, as that of ſalt of vitriol, *&c.* as will produce any manifeſt conflict with the volatile ſalt; never conſidering, that as this courſe doth indeed diveſt them of their fugacity, ſo it doth in effect diveſt them of a great part of their nature, and conſequently of their peculiar virtues. For I have elſewhere ſhewn, that the ſaline corpuſcles, obtainable by the fire from urine, being united with a ſufficient proportion of ſpirit of ſalt, will ceaſe to be what they were, and with the ſaline parts of the acid liquor, will make up a kind of ſal armoniack. But it is eaſier for me in this our caſe to ſhew, that another man's expedient is not good, than to ſubſtitute a good one; eſpecially in this place, where for ſome reaſons I muſt not ſet down the way, that I the beſt approve of: only I ſhall tell you, that my way long was (nor do I yet deſpiſe it) to preſerve volatile ſalts in their own rectified ſpirit, which ſwimming over them, kept them from the immediate contact of the air, and preſerved them ſo well, that by this means I have ſecured even ſmall parcels of the fugitive ſalt of human blood for many years.

[*BUT ſince the ſpirit and ſalt even of this ſort of horns will not, I fear, be found ſo eaſy for every man, eſpecially, if he be a novice in chymiſtry, to procure in any conſiderable quantity; and ſince the declared intent of my communicating to the reader my obſervations about theſe ſpirits of hartſhorn, blood,* &c. *was to furniſh him with ſuch chymical remedies, that men may by their eaſineſs and cheapneſs be invited to provide them, for the uſe of the poor; I preſume it will not be improper to preſent him with a* ſuccedaneum *or two, that may be eaſily enough obtained from ſal-armoniack, though theſe preparations have ſuch connexion with divers other paſſages, wherewith they were written to the perſon I here call* Pyrophilus, *that, to avoid the too much diſmembering thoſe papers, and to make theſe proceſſes the better underſtood, I muſt content my ſelf to leave out thoſe particulars, that can beſt be ſpared; hoping, that the reſt will be eaſily excuſed, at leaſt by thoſe, who know, how much ſome chymiſts themſelves have been deluded in their trials of the divulged proceſſes, divers of which are either falſe or very uncertain, and others, though they ſhould ſucceed, would give but a ſophiſtical ſpirit, much of the obtained liquor coming from the diſtillable concretes, that muſt, according to ſuch proceſſes, be mingled with the ſal-armoniack, of which I could eaſily give inſtances, even out of modern and applauded writers.*]

Of the ſpirit of ſal armoniack, and divers attempts and ways of preparing it.

THE ſpirit of ſal armoniack, *Pyrophilus*, hath ſuch wonders aſcribed to it by chymiſts, that, if I ſhould conclude theſe papers touching ſpirits of an urinous nature, without ſaying ſomething to you of that, you might think I had left the conſiderableſt of them unmentioned; but as I the rather acquaint you with the little I know of it, becauſe, though I have met with divers authors, that extol it, I have ſcarce met with any, that teaches intelligibly, and candidly, how to prepare it, which perhaps moſt of them did not know themſelves; ſo I hope you will exact an accurate account of it the leſs rigidly, becauſe I can preſent to you but little on that ſubject, beſides the few obſervations, wherewith my own curioſity has ſupplied me; having ſcarce ever (to my knowledge) ſeen any ſpirit of ſal armoniack, ſave what my own furnaces have afforded me. And therefore without preſuming to ſet down ſolemn proceſſes about a ſubject, wherein I have found a ſmall variation of circumſtances hinder the operations made on it from producing uniform effects, I ſhall content myſelf to give you as true an information, as my memory will afford me, of a few of my proceedings with this nice ſalt, and the ſucceſſes of them: only premiſing, in a word, that by ſal armoniack I here mean the factitious and venal, conſiſting of urine, ſoot, and ſea-ſalt.

AND firſt, according to the way propoſed by *Glauber* (in the ſecond part of his philoſophical furnaces) we diſtilled it out of an open retort (with a cover to clap on and take off, as occaſion requires) with a mixture of *lapis calaminaris*; and once we, that way, obtained a quantity of liquor, which ſeemed exceeding ſtrong: but before we could make any trials with it, the phial that contained it having been accidentally broken, we loſt the opportunity of ſatisfying ourſelves of the efficacy of it. And having not long ſince attempted to make ſuch a ſpirit the ſame way, there came over indeed a liquor, which ſeemed to be the ſpirit of ſal armoniack; but when we came to rectify it in a gentle heat, the greater part of it, to our wonder, coagulated in the retort, whereinto it was put to be diſtilled, into a perfect ſal armoniack, (a pretty quantity of which I keep by me) and thereby betrayed the above mentioned liquor, to have been little elſe than the ſal armoniack itſelf, forced over by the violence of the fire, without having ſuffered any ſeparation of its ingredients. Nor is it by us alone, that the proceſs ſet down by *Glauber* hath been unproſperouſly attempted; and yet perhaps it might have conſtantly enough ſucceeded with him, and the difference of the *lapis calaminaris* (in which we have obſerved much diſparity, according to the places it comes from) may have produced the complained of variety of ſucceſſes.

WE alſo attempted to diſtil a ſpirit from ſal armoniack (to pretermit divers other trials) by mixing it with equal parts of ſalt of tartar; but in this experiment we met with variety of ſucceſs: for having exquiſitely incorporated the two ſalts by the help of a little fair water, we have divers times had the upper part of the receiver (carefully luted on to a ſomewhat large retort) all candied over on the inſide with volatile ſalts of ſeveral ſhapes; and the liquor afterwards forced over hath ſometimes remained long enough in the form of a very ſubtile and penetrant ſpirit; and ſometimes again it hath in the very receiver almoſt totally coagulated it ſelf into at lump of cryſtalline ſalt: and when we had mixt the ſalt of tartar, and ſal armoniack, without any water or other

moiſture at all, our ſucceſſes have been very like thoſe above mentioned. Upon this occaſion I dare not omit acquainting you with an experiment, which yet I learnt not upon this occaſion. Take of pure ſalt of tartar, and of good ſal armoniack, equal parts (let them be both very dry, or elſe you may loſe your labour) and grind them very accurately together, though you be deterred from continuing that toil, by a very ſubtile and fetid urinous ſteam, wont to exhale from the mixture: theſe ſalts being thus exquiſitely incorporated, you muſt put them into a large glaſs retort, to which you may fit a receiver to catch a fetid liquor, that ſometimes we have obſerved to come over. Then adminiſtring by degrees a very ſtrong fire, the top and neck of the retort will be lined with a pure white ſublimate, which ſeems to partake as well (though nothing near ſo much) of the ſalt of tartar, as of the ſal armoniack and of its qualities, and yet to differ from either. And though this ſublimate be far enough from being the true volatile ſalt of tartar, ſo highly extolled by *Paracelſus* and *Helment*; yet it is no ignoble medicine in obſtructions, and ſome other diſtempers: and I remember one of the moſt expert chymiſts I know, having made trial of ſome I preſented him, told me he found ſuch effects of it, as made him divers times very preſſing and ſollicitous for more. The fetid liquor, that will come over, we have found ſometimes to be very little, and at other times much more copious, without being able to diſcern clearly, whence the diſparity proceeded; and the caput mortuum remaining in the retort, by ſolution, filtration, and coagulation, affords a pure ſalt of greater diuretical efficacy, than almoſt any I have hitherto met withal. Another way, by which we attempted to attain a ſpirit of ſal armoniack, was, by accurately mixing two parts of it with three or four of quick-lime, whoſe virtue had not been impaired by being expoſed to the air. This mixture being diſtilled in a retort, placed in ſand, with a ſtrong fire afforded us (together with ſome dry ſublimate in the neck of the retort, and, as I remember, a little volatile ſalt in the receiver) a very ſtrong and yellowiſh ſpirit, ſo exceedingly penetrant, and ſtinking, that it was not eaſy to hold one's noſe to the open mouth of the phial, wherein it was kept, without danger of being ſtruck down, or for a while diſabled to take breath, by the plenty and violence of the exhaling ſpirits. But the liquor forced over by this method, though exceeding vigorous as to its qualities, was inconſiderable as to its quantity; and therefore we now chuſe to vary a little this way of proceeding, and let the quick-lime lie abroad in the open air (but protected from all other moiſture, except that of the air) for divers days; in which time the imbibed humidity of the ambient air would in ſome degrees ſlake it, and make it ſomewhat brittler than it was before: and the lime thus prepared, being mingled with ſalt armoniack, and diſtilled in all circumſtances after the former manner, afforded us a liquor ſo copious, and yet ſo ſtrong, that we hitherto acquieſce in this way of diſtilling this wild ſalt, as the beſt we have yet met with. But note, that we uſed, towards the latter end, to increaſe the fire to that degree, by heaping up coals on the upper part of the retort, that the mixture in the retort hath been brought to flow. Note alſo, that though even the ſpirit thus drawn perſevered long in the form of a liquor, yet yeſterday coming to look upon a phial of it, which we reſerved, to try what effect time would have on it, we found, that about a fourth or fifth part of it had ſpontaneouſly coagulated it ſelf into exactly figured grains of a cryſtalline ſalt, the liquor ſwimming about it; retaining, nevertheleſs, a very ſtrange ſubtlety: which obſervation, concording with divers others, makes me apt to doubt, whether or no this ſo celebrated ſpirit of ſalt armoniack be really much, if at all, other than the reſolved ſalt of urine, and ſoot, of which that body conſiſts, ſomewhat ſubtiliated by the fire, and freed from the clogging ſociety of the ſea-ſalt, to which they were formerly aſſociated and united; though I confeſs it ſeemeth not improbable, by the great energy, which may be obſerved in this ſpirit, when it is dextrouſly drawn, that the entire concrete, and the quick-lime, may afford it ſomething, that it could not receive from either of the ingredients, whence the mixture did reſult, as we ſee in aqua regis, which diſſolves crude gold, though neither the ſalt armoniack, nor the petre, nor the vitriol alone affords, by the uſual ways, ſpirit capable of producing that effect. The great virtues, and uſes of ſalt armoniack, eſpecially in phyſick, I cannot now ſtay to treat of, but you will find them largely enough ſet down by *Glauber*; whoſe encomiums nevertheleſs muſt not be all adopted by me, who in this place mention the ſpirit of ſal armoniack but as a medicine, that is near of kin, and may ſerve for a ſuccedaneum to the ſpirits of hartſhorn, urine, blood, *&c.*

BUT although the laſt mentioned way, *Pyrophilus*, be the leaſt imperfect one we have hitherto met with, of diſtilling ſalt armoniack; yet becauſe you may ſometimes need a ſpirituous liquor impregnated with the activeſt parts of that noble concrete, when you want either retorts to diſtil in, or furnaces capable of giving ſtrong fires, I dare not omit to inform you, that we have ſometimes drawn over ſuch a liquor of ſalt armoniack after the following manner: Diſſolve pure ſalt armoniack in a ſmall quantity of fair water; then in a cucurbit put ſuch a quantity of ſtrong quick-lime powdered as may fill up a fifth or ſixth part of the veſſel, and water it very well by degrees with the former ſolution of the ſalt armoniack, and immediately clap an alembick on the cucurbit, and faſten a receiver to the alembick, cloſing the joints very accurately; and from this mixture, by the gentle heat of a bath or a lamp, you may obtain a liquor, that ſmells much like ſpirit of urine, and ſeems to be much of the ſame nature: and this volatile liquor being once or twice rectified *per ſe*, with a very mild heat grows exceeding fugitive and penetrant, and works by ſweat, and a little, perhaps, by urine.

And

And I remember, that when I firſt made it, having been induced by ſome analogical experiments, I had formerly made, to give it to one, that had a patient troubled with an extremely violent cough, I had an account quickly brought me, that he not ſlowly, but wonderfully mended upon the very firſt or ſecond doſe; and indeed the trials, that have hitherto been made of it, make me hope, that it will prove little inferiour in efficacy to the other above mentioned more coſtly ſpirits, ſcarce any of which being preparable by ſo ſafe and compendious a way, if this medicine emulate them in virtue, the eaſineſs of the preparation (wherein little time needs be ſpent, and leſs danger of breaking veſſels incurred) will much endear it to me. But, *Pyrophilus*, becauſe I would aſſiſt you to make variety of experiments about volatile ſalts, and becauſe divers trials may be more conveniently made, when the ſaline corpuſcles are in a dry form, than when they are in that of a liquor; I will take this occaſion to mention to you a way, by whoſe intervention a change on the fixed body employed about the newly mentioned experiment, hath ſometimes afforded me ſtore of volatile ſalt. This way was only to mingle exquiſitely a quantity of ſal armoniack, with about thrice its weight of ſtrong wood-aſhes. For the ſpirit, that we this way draw out of a retort placed in ſand, did quickly in the receiver coagulate into a ſalt; and this method was again experimented with like ſucceſs. And the ſalt thus made we found ſo extremely ſubtile and volatile, that it ſeemed to be much of the ſame nature with that of urine; and if it be indeed (as probably it is) only the volatile ſalt of the urine, and perhaps alſo of the ſoot, whereof the ſal armoniack conſiſts, this may paſs for a more compendious way of obtaining ſuch ſalts, than others, that are hitherto wont to be practiſed among chymiſts. But I will not undertake, that this way of obtaining rather ſalt than ſpirit ſhall conſtantly ſucceed. Yet if you find it do not, I ſhall not perchance refuſe you a better way. But if you could deviſe a method (which poſſibly is not unattainable) of bringing over into a ſpirit, not the bare urinous and fuliginous ingredients of ſal armoniack, but the whole body; it may be, you would have a menſtruum, that would make good, if not ſurpaſs even *Renanus*'s and *Glauber*'s elogies of the ſpirit of ſal armoniack.

Of preparations of ſaline and ſulphureous fetid liquors.

THE affinity betwixt volatile ſalts and ſulphurs doth, *Pyrophilus*, as well as your curioſity, invite me to acquaint you with ſome of the trials we have made about the preparation of ſulphureous fetid liquors; which I am the more inclined to do, becauſe, though I find mention made of ſome of them in chymical books, yet they are there delivered with ſo little encouragement, amongſt many other proceſſes, of which it appears not, that the preſcribers made trial, that when I had diſtilled ſome of thoſe ſulphurs, divers expert chymiſts were very deſirous to have a ſight of them, to ſatisfy themſelves, that ſuch liquors could be ſo prepared. The way of making the common balſam, or ruby of ſulphur, is too well known to need to be long inſiſted on. Only, becauſe there is ſome little variety by ſeveral in the preparation, it will not perhaps be amiſs to inform you, that we are wont to make it by mixing about three parts of oil of turpentine, with two of good flour of brimſtone, and ſetting them on a ſtrong urinal ſlightly ſtopped in an heat of ſand, only great enough to make the liquor with a little crackling noiſe (whenceſoever that proceeds) work upon the ſulphur, till it be all perfectly reſolved into a blood-red balſam, which will be performed in ſix, eight, or ten hours, according to the quantity of the ingredient to be united. This balſam, which is indeed in ſome caſes no deſpicable remedy, is by vulgar chymiſts, according to their cuſtom, very highly extolled, and ſometimes employed in diſtempers and conſtitutions, wherein, inſtead of performing the wonders by them expected, its heat doth more harm, than its drying and balſamick properties do good: but yet apparent it will be, by what we ſhall ſay anon, that by this preparation the body of the ſulphur is ſomewhat opened, and therefore (as we ſaid) in ſome caſes the ruby of ſulphur may prove no ineffectual remedy; which may probably be improved, if it be prepared by bare digeſtion in a very gentle heat, by which courſe we have proſperouſly prepared it, though not in ſo ſhort a time, when we made it not in order to ſome other medicine.

The way of making the common balſam, or ruby of ſulphur.

To volatilize the ſulphur thus reſolved, we took the balſam made the former way, in a few hours; and putting it in a retort, either with, or without fair water, which is ſuppoſed to help to carry up the ſuperfluous oil, we placed the veſſel in a ſand-furnace; and, with a gentle heat drawing off as much of the oil of turpentine, as would in that heat come over, we ſhifted the receiver, and carefully luted on the new one; and laſtly, giving fire by degrees, we forced over a liquor of a deep and darkiſh red, extremely penetrant, but of a ſmell ſo ſulphureous and diffuſive of it ſelf, that it was ſcarce to be reſtrained by corks, and was by great odds ſtronger than that of the ruby before diſtillation.

To volatilize the balſam of ſulphur.

THE like experiment we tried in a glaſs-head and body placed in ſand, and through that way likewiſe we obtained a volatile balſam of ſulphur, yet we found it too inconvenient to be equalable with the former. What long digeſtions of this liquor will do, to take away, or leſſen its empyreumatical and offenſive odour, we have not yet been by experience ſatisfied, no more than of its medical virtues; though probably, the great penetrancy of the liquor conſidered, they will not be languid.

AUTHORS alſo preſcribe the making a volatile balſam of ſulphur, by driving over, after the above-mentioned manner, a ſolution of flour of brimſtone in linſeed-oil, and this remedy they highly extol; but though it may probably prove a good medicine, yet ſince they commend it but by conjecture, and not upon experience, I ſee no great reaſon, why it ſhould be preferable to the other. For we find, that expreſſed oils are much more apt to receive an offenſive empyreuma, than oil of turpentine; which

which being much more volatile than they, requires nothing near ſo violent a heat to make it aſcend: and, unleſs it be found, that the ſulphureous particles are able to mitigate the corroſive ones, the diſtilled liquor of an expreſſed oil may prove noxious in the body. For by purpoſely (for trial's ſake) diſtilling oil-olive, by it ſelf, though not in a naked fire, we obtained a liquor of that exceeding ſharpneſs, that it would (taken inwardly) probably corrode, or fret either the ſtomach, or ſome other of the internal parts.

Penotus *his preparation of a ſulphureous balſam, with the author's advertiſements upon it.*

THERE is another way of preparing a ſulphureous balſam, to which *Penotus*, no ignoble chymiſt, aſcribes ſuch ſtupendous virtues, that though I have not yet made trial of it in diſeaſes, yet I dare not leave it altogether unmentioned; the proceſs being briefly but this: Take good balſam of ſulphur, made with ſpirit or oil of turpentine, and having freed it from its ſuperfluous oilineſs, pour on it well dephlegmed ſpirit of wine, and therewith draw, by affuſion of new ſpirit as often as need requires, a ſufficient quantity of a red tincture, which by filtration and abſtraction *in balneo* muſt be reduced to a balſamick conſiſtence. This liquor you may, if you pleaſe, by degrees of fire, drive through a retort placed in ſand, and thereby obtain a volatile balſam of very great penetrancy, and probably of no ſmall efficacy: but the trial I have made of this proceſs, gives me occaſion to advertiſe you;

1. THAT, unleſs your balſam be reduced to a ſtiff thickneſs, and almoſt to drineſs it ſelf, the operation will hardly ſucceed; we having fruitleſly digeſted for ſome months ſpirit of wine upon balſam, whoſe conſiſtence was ſomewhat too liquid.

2. THAT as ſoon as the ſpirit of wine is ſufficiently tinged, it ought to be decanted, and ſucceeded by new; leſt by too long digeſtion, inſtead of heightening its tincture, it let fall that, which it hath already acquired.

3. THAT upon a very ſlow abſtraction of moſt of the tinged ſpirit in a digeſting-furnace, we once found the remaining liquor not to be in the form of a balſam, but to conſiſt partly of ſpirit of wine, and partly of a ſeeming diſtinct oil, whereinto the ſulphureous tincture was reduced. The balſam of ſulphur thus made without diſtillation ſeems likely to be an innocenter and nobler medicine, than the common ruby of ſulphur, made with a hot and ill ſcented oil of turpentine: and by this preparation may alſo appear the truth of what we formerly ſaid, when we told you, that the body of the ſulphur was opened by ſolution in oleaginous liquors: for out of the common thickened balſam, as you may be informed by this proceſs, well rectified ſpirit of wine will, in a ſhort time, extract a blood-red tincture; whereas by long digeſtion of ſpirit of wine alone upon pure, but undiſſolved, flowers of brimſtone, we could not diſcern any change of colour in the menſtruum; though I dare not deny the poſſibility of what ſome authors affirm, who write, that ſpirit of wine very excellently dephlegmed will in time, of it ſelf, draw a tincture from flowers of ſulphur, which tincture they yet pretend not to make of a higher than a lemon-colour. And, by the way, let me tell you, that our red tincture formerly mentioned is (if it be well made) ſo ſtrong of the ſulphur, that probably it would make a very penetrant, and effectual outward remedy in aches, and divers other cold diſtempers of the nervous parts; for it hath been already found, that good ſpirit of wine alone is one of the powerfulleſt fomentations in divers caſes of that nature, (inſomuch that it hath been ſometimes found to arreſt the ſpreading mortification of gangrenes;) and therefore being ſo richly impregnated with ſulphur, which is, even without the aſſiſtance of ſo ſubtile a vehicle, very available in many diſaffections of the *genus nervoſum*, it is probable, that the ſkilful aſſociation of two ſuch active remedies may produce conſiderable effects.

* * * * * * * * * * * *

Of an excellent balſam of ſulphur, made only with oil-olive. The common way of preparing it.

TAKE of pure flowers of ſulphur one part, of the beſt oil-olive four or five parts; mix them well together in a ſtrong earthen pot, able to contain a much greater quantity of the ingredients than is to be put in it; ſet this veſſel over a moderate fire of charcoals, throughly kindled, till the oil, though ſlowly, have perfectly diſſolved all the flowers of ſulphur, which will (if you work it well) be performed in about half an hour, or an hour, (according to the quantity of your materials:) but you muſt have a great care, during the whole operation, firſt, that the oil catch not fire, whereby it would not only be loſt it ſelf, but perhaps endanger the firing of the houſe; and next, that the mixture be kept nimbly and conſtantly ſtirring from the firſt beginning of the oil's action on the ſulphur, till the ſolution be fully made; and the pot (having been taken off the fire) be grown cold again. The chief ſigns, whereby you may perceive, that you have not erred in the operations, are, firſt, if the ſulphur be perfectly diſſolved in the oil, which you muſt often try, before you take it from the fire, by taking up with the tip of a ſtick, a drop or two of the liquor yet in preparation, and letting it cool on white paper, or on your nail, whereby you may diſcern, when the ſolution is perfectly made, by the deep redneſs, and tranſparency of the liquor, and by its containing no more in it any undiſſolved flowers of the brimſtone; next, by the conſiſtency of the balſam, which ought to be neither too liquid (as you will find it, if it hath not ſtaid its due time on the fire;) nor too thick (as it is apt to become, if you remove it not ſeaſonably from the fire,) but of the conſiſtence of ſomewhat thin honey: and laſtly, by the ſmell, which ought to be ſtrong of the ſulphur, but not of the fire; for though the ſulphureous ſtink is, in this remedy, to be expected, that empyreumatical one, which proceeds from burning (and by ſkilful noſtrils may be eaſily diſcerned) is very poſſible to be avoided.

THE doſe of this balſam, when it is to be inwardly uſed, may be from two to fifteen, or twenty drops, according as the greatneſs of the diſtemper, and chiefly the ſtrength and conſtitution of the patient ſhall require and bear. It may be given upon a faſting ſtomach, either

alone, or brought to the conſiſtence of pills, or of a bolus, with powdered ſugar, liquorice, *&c.* or elſe diſſolved in any convenient vehicle, wherewith its oleaginous nature will permit it to mingle. Outwardly it may be adminiſtred either by bare inunction of the part affected, or elſe by incorporating it with any other convenient ointment, or plaiſter: after which, we are wont to preſcribe to have an application made to the part of two or three little bags filled with ſand, as warm as the patient can eaſily endure it, and ſhifted as ſoon as either of them begins to cool, that by this means, the pores being opened, the virtue of the balſam, by being made more penetrant, may reach the farther.

I HAVE been thus particular, *Pyrophilus*, in the mention of this remedy, becauſe though it ſeem but a ſlight and trivial preparation, yet experience hath given us a better opinion of it, than I fear the ſlightneſs of the preparation will as yet allow you: and indeed its virtues I am apt to think more than I have yet had occaſion to obſerve; and therefore muſt refer you to *Rulandus* his centuries, where they are often mentioned. But outwardly in ſtrains, old aches, bruiſes, and the like, it is wont to be very effectual; in the beginning of fits of the gout it hath ſeveral times (though not conſtantly) been proſperouſly applied both to Mr. *B. B.* and divers other perſons, and ſometimes it hath been found not ineffectual even in the ſciatica itſelf. And as for paralytical diſtempers, I have had by a ſkilful phyſician an account ſent me of ſcarce credible things, which it hath therein performed: to which I ſhall only add, that a while ſince I had great thanks returned me on the behalf of a fair young lady, to whom I proſperouſly preſcribed it againſt a great tumour in her neck, which was ſuppoſed to be the beginning of the king's-evil: but this tumour was recent enough, which circumſtance I think fit to ſpecify, becauſe I fear, that if the ſcrophulous tumour had been inveterate, the ſucceſs would not have been ſo good. Inwardly the chief uſe we made of it hath been in coughs, and diſtempers allied thereunto; but its balſamick nature, making it both healing and reſiſtive (if I may ſo ſpeak) of putrifaction, makes it probable, that its virtues may be more extenſive: to which purpoſe I remember, that a while ſince a friend of mine tried it with wonderful ſucceſs *in mictu ſanguinis ferè deplorato*, having firſt by a gentle heat reduced it to ſuch a conſiſtence, as allowed him to make it up into pills. But of the particular caſes, wherein our remedy hath been ſucceſsful, no more at preſent; we ſhall rather ſubjoin, that though this have been the way, which we have the oftener imployed in the making of the balſam, yet we muſt not conceal from you, that we have divers times met with accidents, which fruſtrated our endeavours and expectations. For if the fire adminiſtred be too languid, the ſolution of the ſulphur by the oil proceeds not well: and on the other ſide we have found, that not only a ſtrong heat is apt to burn the matter, or to make the oil boil over, and perhaps take fire; but even that upon a very little exceſs in the degree of heat, the oil and ſulphur would, before it could be expected, degenerate together into a heavy and viſcous lump, (almoſt of the colour of the liver of an animal;) which coagulated matter proved afterwards exceeding difficult to be by the affuſion of freſh oil diſſolved, and reduced to a due conſiſtence. Wherefore we tried to prepare this balſam, by putting the proportion of ingredients formerly mentioned into a ſtrong urinal, which we placed in ſand, and making under it no more fire than was ſufficient to make it ſlowly work upon the flowers, (which did often during their ſolution make a crackling noiſe;) we continued the operation for divers (perhaps many) hours, at the end of which, we found the ſulphur diſſolved, and the mixture reduced to a balſamick colour and conſiſtence. So that if you diſtruſt your dexterity to prepare this balſam by the former way with a naked fire, we muſt adviſe you to make uſe of this latter way, as that, which is the ſafer, though it be the longer way of proceeding. Nay, when we had leiſure enough, we did, for trial's ſake, proſperouſly attempt the ſolution of flowers of brimſtone, with common oil, by the far gentler heat of bare digeſtion, and by that means obtained a balſam perfectly free from aduſtion, but of ſomewhat too liquid a conſiſtence; which may be eaſily remedied by the mixture of powdered liquorice, ſugar, or any other ſuch convenient concrete. We muſt alſo advertiſe you, that this balſam may alſo be prepared with oil of nuts, of poppy-ſeeds, of hypericon, inſtead of oil-olive, or any other expreſſed oil, appropriated to the particular diſtemper, againſt which the phyſician intends to employ the remedy: only care muſt be had, that the ſpecifick qualities of the oil be not ſo fugitive, as to be deſtroyed by the ebullition requiſite to the making of the balſam; which if it be to be enriched with ſpecifick virtues in relation to any particular diſeaſe, may perhaps be beſt prepared by the laſt mentioned way (of digeſtion) wherein the ſubtile ſpirits, that impregnate the oil, are not in ſuch danger to be diſſipated by the fire.

Other ways of preparing this balſam.

A balſam of antimony.

THE knowing chymiſts themſelves, *Pyrophilus*, are wont ſo much (and perhaps not altogether undeſervedly) to extol the efficacy of antimony, that we were thereby invited, beſides divers preparations of it for internal uſe, to attempt the making of ſome remedies of it, that might alſo be externally applicable; and in proſecution of this deſign, we found, that by boiling four or five fingers height of good oil of turpentine upon very finely powdered antimony, put with the liquor into a ſtrong glaſs urinal, placed in ſand, the oil after ſome hours would grow exceeding high tinged; and being gently in great part abſtracted, would leave behind it a body of a balſamick conſiſtence, and a deep redneſs: which may, I preſume, be applied to reſolve, and diſcuſs hard tumours, and remedy divers other outward evils, with more effect, than the ſimple balſam of common ſulphur formerly deſcribed. And from this antimonial balſam abſtracted to a ſtiffer conſiſtence, we found, that ſpirit of wine would draw a tincture, which I likewiſe ſuppoſe might

prove a very powerful fomentation; though the ſpirit we uſed (perhaps becauſe it was not ſufficiently dephlegmated) did not in a few days attain to more than a very pale redneſs: but this tincture being ſlowly freed from the moſt part of the ſpirit of wine, became of the conſiſtence of ſomewhat liquid honey, and of a deeper colour, thereby affording us a purer balſam; which we have not yet, (being hindred by ſome accidents) attempted to bring over the helm. Nor did we here deſiſt, but by divers trials found, that the antimonial balſam, above mentioned, being put into a retort, placed in ſand, and preſſed by degrees of fire, would at length emit ſteams, which would condenſe in the neck of the rerort, and fall thence into the receiver in ſanguine drops. This volatile red balſam (eſpecially if by this volatilization the antimony have loſt its emetick property) we cannot but think endowed with more than ordinary virtues, outward and perhaps inward too; conſidering the great penetrancy of the liquor, and the energy of the mineral, with whoſe ſubtle parts it is richly impregnated, if it conſiſt not mainly of them. But we are yet in proſecution of this preparation, and therefore till we have ſeen, how far we are like to improve this remedy, we ſhall forbear any farther mention of it; eſpecially ſince we have already, in this very paper, given you, as we ſuppoſe, ſufficient proof, that we are more ſollicitous for your ſatisfaction and proficiency, than for our own reputation, (of being a ſevere critick in eſtimating of medicines;) for otherwiſe we ſhould not have been ſo indiſcreet, as to acquaint you with any preparation, of whoſe medical virtues we have not yet made much trial, whilſt we are not deſtitute of other remedies, whoſe efficacy hath been manifeſted to us by experience. But we have often obſerved, that divers uſeful chymical preparations are mentioned ſo obſcurely, and unintelligibly, by the authors, that write of them, or elſe are without any particular, or encouraging note of diſtinction mentioned amongſt a croud of other proceſſes; ſome of which have perhaps already been found to be falſe, or trivial, and others of which may be rationally enough diſtruſted, that moſt phyſicians, and chymiſts themſelves, are deterred from attempting to prepare thoſe remedies; not ſo much becauſe they ſeem unlikely to prove conſiderable, as becauſe they are afraid, that the proceſſes are falſe, or fraudulently ſet down; and conſequently, that concretes of ſuch a conſiſtence, colour, ſcent, and other obvious qualities, as are aſcribed to the remedies propoſed, are not preparable by the publiſhed directions.

Of the obſcure and cryptical way of writing of chymiſts.

And that you might ſee, *Pyrophilus*, what diſcouragements I have met with even from artiſts themſelves, to keep me from truſting to printed chymical proceſſes, I think it not amiſs to mention here a memorable paſſage of the famous and experienced *Alexander Van Suchten*, who is reported to have gotten more by the practice of chymical phyſick than any of the contemporary profeſſors of it: for he, towards the end of his book of the ſecrets of antimony (of which he clearly diſcloſeth not any in that treatiſe) gives this account of his cryptical way of writing: *Quod in hoc tractatu nullum* recipe *propoſuerim, ob id factum eſt, quod vos ſeducere nolo*; recipe *enim illa ſeducunt juniores medicos: ſed neque à* Theophraſto *ullum* recipe *ſcriptum eſt, quod ad medicinam, quin occultum ſenſum habeat, & in quo nihil vel deerit, vel abundet, & hoc non fit ſine magnis cauſis.* Wherefore I make account, that, beſides that ſuch changes of the qualities of bodies may afford much light to naturaliſts, he doth chymiſts no uſeleſs piece of ſervice, that acquaints them with the ſucceſs of the nobler ſort of proceſſes mentioned in authors, though he ſhould give them little or no account of the virtues of the remedies prepared by thoſe proceſſes. But this I hope is not altogether our caſe: for beſides that our obſervations are likely to ſave you much trouble, and perhaps ſome miſtakes, and miſadventures; beſides that, (I ſay) we have had opportunity to obſerve ſuch eminent effects of ſeveral of the volatile liquors deſcribed in theſe papers, as may juſtly give us promiſing expectations of the properties of the reſt, which are in their obvious qualities ſo near of kin to them. And this ſort of medicines having been found ſometimes to do wonders, and generally to be ſafe, (which of a few of the known operative, and not ſpecifick medicines, can be truly affirmed) I am apt to think, that he, that ſhall bring theſe remedies, in ſpite of their ill ſcent, into the good opinion of phyſicians, may make no inconſiderable number of patients beholden to him.

I SHOULD not, *Pyrophilus*, proceed to make you repent your curioſity to know my thoughts of the urinous, and ſulphureous remedies it hath hitherto made me treat of; were it not, that there yet remains ſomething to be ſaid, without which, all that hath been ſaid, will ſcarce ſignify very much towards the effectual recommending of thoſe medicines to your eſteem and practice.

Concerning the empyreuma of chymical extracts, and their offenſiveneſs, compared with the Galenical, and thoſe which are commonly uſed by the methodiſts.

FOR I do not ignore, *Pyrophilus*, that not only the generality of the Galenical phyſicians, but divers of the more eminent and judicious of the chymiſts themſelves, have been pleaſed to condemn the internal uſe of liquors, driven through a retort by the violence of fire, upon the ſcore of their being offenſively empyreumatical, and ſtinking: among which ſorts of liquors I cannot expect, that our ſpirits of blood, hartſhorn, &c. will eſcape the being reckoned. But foraſmuch as the proſperous effects I have had opportunity to ſee, of divers remedies of that nature, have given me for them rather an eſteem, than either a deteſtation or contempt; I ſuppoſe it may prove no unſeaſonable piece of juſtice to the ſpirit of blood, and the other noble, though fetid remedies I have been ſetting you down; nor no unſerviceable piece of charity to men, if in this place, and once for all, I ſpend ſome lines in endeavouring to reſcue theſe criminated medicines from the great prejudice they ſuffer under, and from a reputation, which whilſt it renders them more odious than even their ſmell can do, is likely to make men deny themſelves the benefit of them.

I MIGHT here on this occaſion call in queſtion whether not only Galeniſts, but even many chymiſts themſelves, be not ſomewhat more afraid than they need be, of what they call *Empyreuma*. But I will ſuſpend a while that queſtion, and at preſent confeſs to you, that I have ſometimes doubted whether or no that ſtink, which is generally called by the newly mentioned name, do always and neceſſarily proceed from the impreſſions of a violent fire. For to make a pure ſpirit, and ſalt of urine, there needs nothing, but to let it in a well-ſtopt veſſel putrify for a competent time (as we elſewhere teach) in a dunghil, or any reſembling warmth, (and that it ſelf, perhaps, is not neceſſary to its putrifaction;) and then to draw off an eighth or tenth part of the liquor, that firſt aſcends by the gentle heat of a bath: by which, or by the yet milder warmth of a lamp-furnace, it may be ſufficiently rectified, and brought to yield, beſides the ſpirit, good ſtore of ſalt. And ſince the ſpirit thus made differs ſo little in ſmell or taſte from thoſe of blood and hartſhorn, that moſt men's noſes are not critical enough to diſtinguiſh them, (and we have ſometimes taken pleaſure to make chymiſts themſelves to miſtake the one of thoſe liquors for the other;) it ſeems worth conſidering, whether or no the fetid and urinous taſte and ſmell, which in theſe ſpirits is ſaid to be empyreumatical, and to proceed from the aduſtion of the fire, be not the genuine taſte and odour of the ſpirituous and ſaline particles of the mixed bodies themſelves, which they would manifeſt, if they were copiouſly extricated (to ſpeak in the king's language) ſeparated from the other principles or ingredients, and aſſociated into one body, though without the violence of the fire. For to diſtil the ſpirit of putrified urine, wherein the like ſmell and taſte are eminent, there needs (as we ſaid) no greater heat than that of a lamp-furnace, or of horſe-dung, (ſince in the latter of theſe only, urine too long kept, and but negligently ſtopt, hath been obſerved to have loſt its volatile ſalt and ſpirit, before it was taken out of the horſe-dung. And ſuch a heat ſeems not great enough to impreſs an empyreuma upon ſuch a liquor: for we ſee, that moſt things diſtilled in the greater heat of a bath, are commended by phyſicians and chymiſts for their being free from empyreuma. And what activity may be acquired by the ſubtle parts of a mixed body, by the convening (if I may ſo ſpeak) of ſuch ſpirituous particles, diſengaged from thoſe other parts, which clogged or impriſoned them, without any empyreumatical impreſſion from any violent or external heat, may appear by the chymical oils of ſpices. For though they be uſually drawn by chymiſts and apothecaries, by the help of water in limbecks; and though they have by us been drawn after another manner, (which we may elſewhere teach you) with a much gentler heat (ſometimes not exceeding that of an ordinary balneum) yet theſe well-dephlegmed liquors retaining ſo well the genuine taſte and ſmell of the concretes they were drawn from, that they paſs unaccuſed of empyreuma, are ſome of them much ſtronger and hotter than the ſpirit or ſalt of man's blood, or hartſhorn. As may appear eſpecially by the oil of cinnamon, which if pure, is more penetrant and fretting, than any thing but trial could eaſily have perſuaded me. And leſt you ſhould object, that the fire doth conſiderably contribute to the ſtrength of theſe liquors, otherwiſe than by diſengaging the particles they conſiſt of from the unactive parts of the concrete, and aſſembling them together; I muſt advertiſe you, that I have obſerved little leſs heat and penetrancy, than in divers of theſe, in ſome liquors ſeparated without the aſſiſtance of diſtillation: as for inſtance, in the purer ſort of the true Peruvian balſam, and in another kind of natural balſam, almoſt of an amber colour, which belonged to an eaſtern prince (who carried it up and down with him as a jewel) whoſe domeſticks at his death ſold it, whereby I came to procure ſome of it, and found cauſe to wonder at its ſtrength both upon the tongue and in its operation. But granting, *Pyrophilus*, that the volatile remedies treated of in theſe papers may have their offenſive ſmell and taſte imputed to the fire, yet perhaps phyſicians would more ſlowly and more tenderly cenſure the remedies in queſtion for their empyreumatical ſtink, if they did but conſider, that they themſelves ſcruple not to uſe (to name thoſe among many others) ſenna and ſcammony, though the former be wont to gripe the guts, and the latter have an acrimony, heat, and mordacity ſo unkind to the bowels, that a few grains exceeded in the doſe turns it into poiſon; becauſe the ill qualities of theſe medicines may, by proper correctives, be ſomewhat mitigated; and the good they do, doth more than countervail the inconveniences, that attend the uſe of them. For the very ſame conſiderations, *Pyrophilus*, will be applicable to the excuſe of thoſe fetid medicines, for which we apologize. For though the empyreuma or impreſſion of the fire, for which they are rejected, be the quality, whoſe abſence from them were very deſireable; yet may that empyreuma by dextrous preparations be in ſome meaſure corrected, (inſomuch that I have known highly-rectified ſpirits of urine, by being digeſted for divers months in an exquiſitely ſtopt glaſs, brought to be of a ſcent, which to me ſeemed ſcarce at all ſtinking, and to others even pleaſant) and the prejudice, that may be juſtly feared from what remains, is advantagiouſly recompenſed by the benefits accruing from the efficacy of their more friendly endowments. And in effect we find, that the dogmatiſts themſelves are grown not to ſcruple the adminiſtring the ſpirit of ſalt, though extorted (if it be of the beſt) by a much greater ſtreſs of fire, than is requiſite to the diſtillation of any of the medicines we defend. And not only the famous *Riverius* (as we have elſewhere noted) extols the ſpirit of tartar, and ſoot, which are yet ſufficiently fetid and empyreumatical, but ſeveral other (and amongſt thoſe ſome of our eminent Engliſh) phyſicians frequently uſe, and commend the oil of guaiacum, forced through a retort. And no leſs do divers learned doctors eſteem, and employ the empyreumatical oil of amber;

And whether the offenſiveneſs of divers chymical medicines proceed from the violence of the fire, or the nature of the matter.

amber; though (to note ſo much by the way) that be in divers caſes far inferiour to the volatile ſalt, which (if the fire be ſkilfully adminiſtred) may at the ſame time, and by the ſame operation, be obtained. This ſalt, beſides the efficacy aſcribed to it in the convulſions of children, having been lately found by experience to be an excellent medicine againſt the epilepſies, even of well-grown perſons, being adminiſtred in the doſe of not above a ſcruple or half a drachm, in a due quantity of piony-water, or ſome other proper vehicle.

AND on this occaſion, you may alſo be pleaſed to take notice, that foliated gold is ordinarily and without ſcruple employed by phyſicians, not only to cover pills, but as a main ingredient (though how properly, I define not) of ſeveral of their richeſt cordial compoſitions extant in diſpenſatories; and yet to how great fire gold is wont to be expoſed before it be melted out of the ore (wherein it is uſually, at leaſt as far as we have obſerved, blended with other metals, and minerals) and to purify it upon the cupel, either with lead, or antimony, he, that is unacquainted with the operations of mineraliſts, and the art of refiners, will not eaſily imagine. And, *Pyrophilus*, to ſatisfy you yet farther, that the ſtrong impreſſion of fire in the medicines does not always make them ſo noxious, as they are commonly reputed; let me deſire you to take notice, that there is ſcarce any medicament more generally given, and applauded, even by methodical phyſicians, than ſteel, which is often adminiſtred in ſubſtance, made up with other ingredients, into the form either of pills, or electuaries. And yet we have wondered to ſee, what great fires, and violent blaſts of huge bellows, moved by water-engines, are uſed to melt iron firſt out of the ſtone; and if it be to be farther refined into ſteel (much of that uſed in phyſick being factitious) a new violence of the fire is requiſite. And though after all this, to make aſtringent *crocus per ſe* (which is accounted one of the beſt preparations of it) they are wont to keep *Mars* (as the chymiſts ſpeak) amidſt reverberated flames, or in ſome glaſs-man's furnace for many hours, yea ſometimes for divers days; yet this medicine is, with more ſucceſs than ſcruple, daily adminiſtered by learned phyſicians, in dyſenteries, fluxes, and other diſtempers, where aſtriction is required. And it is ſomewhat ſtrange to me, that the having been expoſed to no greater fire, than is requiſite to diſtil ſpirit of blood, or of hartſhorn, ſhould be much urged againſt thoſe medicines by thoſe, that ſcruple not to commend, and do almoſt daily, and oftentimes ſucceſsfully, preſcribe the lixiviate ſalts of plants, and particularly of wormwood, though theſe are not rightly made, but by the expoſing the concretes even to the violence of an incinerating fire. And as for the unpleaſantneſs of the ſmells of our ſpirits of blood, hartſhorn, *&c.* beſides that, to very many perſons there is no odour ſo loathſome, as that of a potion; we find, that the Galeniſts themſelves ſcruple not, in the fits of the mother, (which yet very rarely prove mortal) to repreſs (as men are wont to ſuppoſe) the unruly fumes by the ſmell of caſtoreum, aſſa fœtida, and even the empyreumatical odour of the burnt feathers of partridges: nor do they decline to uſe theſe homely, and ungrateful remedies to the patients of the tendereſt ſex, and higheſt quality; and indeed in dangerous caſes, I have known, fair ladies content to think it fitter to take down an ill-ſcented medicine, than venture the having their own bodies, in few days, reduced to worſe perfumes. And certainly we may juſtly ſay of health, as no leſs than an emperor ſaid, of the gain brought him by urine, that *it ſmells well, from what thing ſoever it comes.*

Ways of taking off the fetidneſs, from ſpirit of urine, hartſhorn, &c.

BUT, *Pyrophilus*, if your noſtrils were ſo nice, that they muſt needs be complied with, though with the hazard of impairing the virtues of the ſalts they are offended with, I could propoſe an effectual expedient to gratify them; and being now invited by ſo preſſing an occaſion, I ſhall not ſcruple to annex ſomething of it, and tell you, that if we may judge of the virtues of the ſpirit and ſalt of ſoot (which I am wont to make without addition) by their ſenſible qualities, they muſt be much of kin to thoſe of the ſpirit of hartſhorn, and of urine; (though theſe be animal ſubſtances.) And therefore having elſewhere more particularly, and by divers experiments, declared the affinity between theſe ſalts in divers regards; it will not, I preſume, be looked upon as an unuſeful or unſeaſonable hint, if I give you a ſummary, though but imperfect account, of what I remember my ſelf to have done, in order to the freeing of the volatile ſalt of ſoot, from that very offenſive ſmell, which may poſſibly make many, even of thoſe that need them; abominate thoſe medicines, how piercing and noble ſoever, which it blemiſheth. The proceſs is as followeth:

TAKE a quantity of a well-dephlegmed ſpirit of wine proportionate to the quantity of ſalt, whoſe odour you deſire to correct; into this ſpirit, drop as much oil of rhodium, or of any other odoriferous chymical oil, as will ſuffice to make the liquor as ſtrongly ſcented as you deſire it: ſhake the oil and ſpirit well together, and if they were both well made, the latter will imbibe the former, and ſometimes be thereby turned into a whitiſh ſubſtance; with which, if it ſmell not ſtrong enough of the oil, you may by agitation incorporate more oil; and if you judge the mixture too ſtrong already, you may dilute it at pleaſure, by the affuſion of more ſpirit of wine. This done, put the ſalt of ſoot into a bolt-head, or glaſs-egg, (according to the quantity, that you intend to ſublime,) furniſhed with ſomewhat a long neck or ſtem, and afterwards pouring on leiſurely your odoriferous liquor, you may with it waſh down the ſalt, that is wont to ſtick in the neck of the glaſs. After this, you muſt very carefully ſtop the veſſel with a cork, and ſtore of hard wax, if you cannot conveniently make uſe of an exacter way of colouring it. This glaſs you muſt place in a lamp-furnace, or ſome other, wherein you may give a very moderate heat, for that will ſuffice to elevate to the neck and upper part of the veſſel, the pure white ſalt of

ſoot,

ſoot, imbued (at the ſecond time, if not at the firſt) with the ſcent of the odoriferous oil, which you imployed about the preparation.

THIS experiment, *Pyrophilus*, may prove of that uſe in phyſick, that it may deſerve as well for its nobleneſs, as the watchfulneſs, which is requiſite in him that makes it, to be illuſtrated by the enſuing

OBSERVATIONS.

Obſervations concerning this method of taking off the empyreuma.

1. THEN it is requiſite, that the ſpirit of wine be very good. For that, which is not ſufficiently dephlegmed, will not readily and perfectly receive into it ſelf the odoriferous oil, wherewith it is to be performed. Nor would every chymical oil, although it were well ſcented, be fit for this preparation; for divers of them, as oil of turpentine, and oil of amber, will not ſufficiently mingle with ſpirit of wine, unleſs they be previouſly ſubtilized after a peculiar manner.

2. THE proportion betwixt the ſpirit of wine, and the oil that it is to be diſſolved in, it is not eaſy to determine; for a leſſer quantity will ſuffice of ſome oils, than of other. And the proportion of them muſt be varied, according as you would have the ſublimed ſalt to participate more or leſs of their odour, and other qualities.

3. GREAT diligence muſt be uſed in cloſing the top of the glaſs, becauſe of the great fugacity, and ſubtilty of the ſalt, whoſe avolation is to be prevented: but then much greater care is to be had, that the heat be not too ſtrong, but as equal as may be, and much inferiour to the moderate heat of an ordinary chymical balneum. For it is ſcarce credible, how eaſily this unruly ſalt will be excited either to make an eſcape at the mouth of the glaſs, or to break it in pieces. And I remember, among ſuch other accidents, which have befallen us in the preparation of this odoriferous ſalt, that having once ſet ſome of it to ſublime from a perfumed chymical oil, though we adminiſtered ſo gentle a heat, that we thought the veſſel out of all danger of being broken, or found open; yet in a ſhort time, the fugitive ſalt did with a great noiſe blow out the cork, that was waxed to the top of the veſſel, leaving in the bottom not a limpid oil, but a liquor of a red-colour, and a balſamick conſiſtence. But if the glaſs be wide enough to allow theſe fumes competent room, and if the heat be warily adminiſtred, the ſublimation may be well enough performed.

Of the medicinal quality of theſe aromatized ſalts.

OF the medicinal quality of this aromatical ſalt, *Pyrophilus*, we have not yet had opportunity to make trial; but ſome eſteem may be made of them, by calling to mind the virtues of the ſimple ſalt of ſoot, and conſidering the nature of the liquors, from which in this our preparation it hath been ſublimed. The principal, if not the only thing, that ſeems to be feared, is, that the ſalt of ſoot being it ſelf hot, and chymical oils being for the moſt part eminently ſo too, our ſalt may prove unfit for men of hot and cholerick complexions, and in ſuch diſtempers as proceed from exceſs of heat. But then it may be conſidered in the firſt place, that the ſalt of ſoot, being of an extremely aperitive, reſolving, and volatile nature, and carrying up with it in ſublimation, only the more fugitive parts of the liquor, from which it is ſublimed; it is very likely, that the heat produced by a medicine, which by reaſon of its fugacity would ſtay but a very ſhort time in the body, will not be ſo laſting as that of ordinary ſudorificks, which are nevertheleſs often adminiſtred with good ſucceſs, even in hot diſeaſes.

SECONDLY, That there are divers bodies and diſtempers, wherein remedies may be the more proper, for their being ſomewhat hot; and experience ſhews, that in dropſies (to mention no other diſeaſes) theſe volatile ſaline remedies, that ſet the blood a whirling, and powerfully promote its circulation, may prove very available.

THIRDLY, The heat, that may be feared upon the uſe of our ſalt, may be either prevented, or at leaſt moderated by the ſeaſonable uſe of ſuch cooling remedies, as may be no enemies to the operation of this ſalt, and yet no friends to the diſtemper, againſt which it is adminiſtred.

AND laſtly, ſuppoſing, that the inconveniences proceeding from this heat were not to be altogether avoided, yet the advantageous efficacy of ſo powerful and ſearching a remedy may very much outweigh that inconveniency: and therefore *Riverius*, as we formerly told you, commends the ſpirit of ſoot (though that ſeem at leaſt as hot as the ſalt) in pleuriſies; and in the ſame hot ſickneſs, we have, as we elſewhere relate, ſucceſsfully adminiſtred the ſpirit of hartſhorn, whoſe qualities are very near of kin to thoſe of ſalt of ſoot. Other inſtances of this nature you may meet with, diſperſed in other paſſages of my chymical papers: to which I muſt add, that upon the conſideration abovementioned, the methodiſts themſelves make no difficulty, in pills and other medicines, to uſe the chymical oil, either of cloves, or of nutmegs, or even of cinnamon. And ſome of our eminenteſt Engliſh doctors, as I lately noted, have not ſcrupled of late years to uſe the ſtrong and fetid chymical oils of amber and of guaiacum, (and the latter of theſe in large doſes;) whereas in our preparation, only the fineſt and moſt aromatick parts of the oils ſeem to be aſſociated with the fuliginous ſalt, ſince the oil remaining after the ſublimation has been obſerved to be thick and ropy almoſt like a ſyrup.

BUT whether or no this aromatick ſalt be a ſafe medicine in all hot bodies and diſeaſes, it ſeems very probable, that it will prove a very powerful remedy in thoſe diſtempers, for which it is proper. For firſt, whereas Spagyriſts have, with much ſtudy, but without much ſucceſs, endeavoured to make oils capable of being mixed with other liquors, by depriving them of their oleaginous form, in which *Helmont* himſelf complains, that they are offenſive, we have, by our preparation, their fineſt parts aſſociated with the penetrant and volatile ſalt: by whoſe aſſiſtance they are not only fit to communicate their virtues to liquors, but aſſiſted

to penetrate exceedingly; and perchance alſo, thereby to obtain ſuch an acceſs to the innermoſt parts of the body, as is ſeldom allowed to vegetable medicines. Secondly, we may have by this preparation one of the moſt noble and volatile ſalts of the world, not only freed from its ſtink, but imbued with the odour, and perhaps divers of the virtues, of what chymical oils we pleaſe. And ſince theſe chymical oils are by chymiſts and naturaliſts thought to contain the moſt noble and active parts of the vegetables, whence they have been diſtilled; and ſince alſo the ſalt of ſoot ſublimed from them carries up with it the fineſt parts of theſe oils, why may it not be hoped, that no ſmall number of diſtinct remedies may be afforded us by this ſingle experiment? Theſe remedies too may be the more acceptable both to phyſicians and patients, becauſe they have not in them any thing, that is mineral; and notwithſtanding their great penetrancy and efficacy, have in them nothing of corroſive, as many of the ſaline remedies preſcribed by phyſicians in their diſpenſatories. And thirdly, that the ſalt of ſoot thus ſublimed may be alſo enriched with the ſulphur or balſamick part of the ſpirit of wine, which was employed about its preparation, may appear probable enough to him, that ſhall examine, by his taſte and otherwiſe, ſuch rectified ſpirit of wine, as has had a ſufficient quantity of volatile ſalts ſublimed from it. And how balſamical a ſubſtance is diffuſed through pure ſpirit of wine, may be gueſſed at by the great change, which is made in the cauſtick ſalt of tartar, when it is ſo dulcified, as to make that excellent medicine, which *Helmont* extols againſt inward ulcers, and calls *Balſamus Samech*; which if one had the abſtruſe art of ſo preparing the ſalt and liquor, as to fit them for conjunction, might be made only by diſtilling very frequently pure ſpirit of wine from very fine ſalt of tartar. For by this means the fixed ſalt, retaining the ſulphureous ſalt or balſamick parts of the ſpirit of wine, (as may appear by the aquoſity of the liquor, that comes over the helm in this preparation) is thereby ſo deprived of its cauſtick taſte, that when it will rob no more ſpirit of wine, but ſuffer it to be drawn off as ſtrong as it was poured on, it will eaſily in a moiſt place run *per deliquium* into a liquor, not of a cauſtick, but balſamick (and, as it ſeemed to us, a pleaſant) taſte.

AND whereas, *Pyrophilus*, we have complained of the difficulty we have met with, to manage the unruly ſalt of ſoot, and keep it from breaking priſon, we muſt, to make this experiment be more practicable and uſeful, advertiſe you, that you may, if you pleaſe, inſtead of ſalt of ſoot, aromatize that of hartſhorn, or man's blood. And I might add, that a very ingenious friend of ours, Dr. *N. N.* has lately practiſed yet a more eaſy and preferable way of preparing medicines of this nature: but though I have partly tried his method, and found it to ſucceed well enough; yet ſince I had it but by communication from him, and that he makes a conſiderable advantage of it, I muſt forbear imparting it to you, till I ſhall have obtained his conſent to diſcloſe it.

I KNOW not, *Pyrophilus*, whether I ſhall need to add, that of theſe fetid remedies, which are volatile, and ſomewhat ſulphureous, as I choſe to mention to you but a few, to comply with my preſent haſte, which would not allow me to inſiſt on many: ſo in what I have delivered concerning theſe few, I have ſet down particulars the more fully and explicitely, becauſe I find the doctrine of volatile ſalts (though in my poor judgment worthy of a ſerious inquiry) perfunctorily, and indiſtinctly enough, handled by the chymical writers I have yet met with; which made me the willinger to contribute the few obſervations I could readily find, of thoſe I have had opportuuity to make about them, towards the illuſtration of ſo important a ſubject, of which having elſewhere ſpoken in relation to phyſiology (as theſe fugitive bodies belong to the commonwealth of ſalt,) I thought it might not be unacceptable to you, if I alſo conſidered them a while in relation to phyſick, and preſented you with ſome hints concerning their medical uſes.

To the 511th Page,

[*Where the author promiſes a delaration, how he would have his praiſes of medicines underſtood.*]

AND now, *Pyrophilus*, having finiſhed what I thought fit to add (at preſent) in the paſt appendix; I ſhould likewiſe put an end to the preſent exerciſe of your patience; but that this being my firſt treatiſe written to you concerning medical matters, and not being likely to be the laſt, which you will meet with among the papers deſigned you, I think it requiſite, and not unſeaſonable to declare to you here once for all, with what eyes I deſire you ſhould look upon what I have written, and ſhall write, to you concerning matters of that nature. And firſt, I muſt advertiſe you, that I am not ſo much a mountebank, as to recommend to you the remedies I mention as certain cures in the caſes, wherein they are proper. For he muſt have been extraordinarily happy, or very much unacquainted with the practice of phyſick, that has not found, that even thoſe medicines, which are moſt celebrated by the beſt authors, both Galenical and chymical, do ſometimes prove ineffectual as well as often proſperous; and the remedy preſcribed by the ſame phyſician to twenty patients ſick of the ſame diſeaſe has more than once been obſerved, though it have ſucceeded in nineteen, to fail in the twentieth. And indeed the cauſes of diſeaſes the conſtitution of patients, and the complications of diſtempers are ſo very various, intricate, and obſcure, that it is extremely difficult even for the moſt knowing and experienced phyſician, to make an accurate and conſtant experiment in the therapeutical part of phyſick; and conſequently ſuch experiments are much leſs to be expected from me, whoſe condition as well as diſabilities forbid me to make the practice of phyſick my buſineſs, and allow me only to adminiſter it occaſionally, either to my own particular acquaintance, or to ſuch poor people, as are not able to gratify phyſicians, or to ſuch as I meet with, where there are

not any: and thereby I am reduced to learn the virtues of divers of the remedies I have prepared by very few or none of my own immediate trials, but the relation of physicians, who do me the favour to administer them for me. And therefore, though I endeavour to put them into the hands of faithful as well as ingenious men; yet not being allowed to be my self a constant eye-witness of the effects they produce, I must here for all these reasons solemnly profess to you, that as I do not set down medicinal experiments with the same positiveness, that I do physiological ones, so I do not intend to venture the repute of being a faithful relater of experiments, upon the success of any medicinal receipt or process.

YET in the next place I must tell you, that you would perhaps do me but right, to think, not only that the chymical preparation of remedies are, if you understand them aright, candidly set down, though the virtues ascribed to them do not constantly upon all trials display themselves; but that I have not rashly and inconsiderately, or upon uncertain rumours, recorded the virtues of particular remedies, which may be good, though they be not infallible; it being sufficient to make a medicine deserve the title of good, that it be often (in some degree at least) successful, though now and then it prove not available; especially if it be otherways so safe and innocent, that even when it proves not prosperous, it weakens not nature, nor is otherwise noxious. And we must not, *Pyrophilus*, be so timid, as to suffer ourselves to be persuaded, that if a patient miscarry after the use of the remedies, the fault must necessarily belong to the exhibited medicine. For oftentimes nature will in spite of remedies make a metastasis of the peccant matter, and so impair the condition of the patient; and much oftner before death, the conflict of struggling nature and the conquering disease doth manifest itself in horrid and dreadful symptoms, which some envious or ignorant doctors (for the more learned are wont to be more equitable, and less partial) injuriously impute to the chymical remedy, given before the appearing of those symptoms; never considering, that the like accidents are wont to attend dangerous diseases, and dying persons, where Galenical remedies only, and no chymical ones at all, have been administred. And that divers of the most eminent, and methodical of our modern physicians scruple not to use frequently both *crocus metallorum*, *merc. dulcis*, and some other chymical remedies, and to impute the miscarriages of the patients, that use them to their diseases; though not many years since, all the frightful symptoms accompanying the dying persons, to whom they had been exhibited, were confidently imputed to those medicines. To which let me add, *Pyrophilus*, that oftentimes it may be very just to prize an empirical remedy more than a Galenical, though the methodist and the empirick have each of them, by his respective remedies, performed cures of divers patients in the same disease; partly because empirical chymists are seldom resorted to but in desperate cases, or till nature be almost spent, either by the violence of the disease, or the unprosperous operation of the medicines employed to remove it; and partly, because the methodist helps his remedies, by premising the wonted evacuations (by vomit, seige, or by phlebotomy) by varying them according to emergent circumstances, by skilfully and seasonably administring them, and by strict rules of diet; whereas the empirick oftentimes useth but a single remedy, and usually without premising general evacuations, exhibits it not to the greatest advantage in relation to him, and other circumstances, and is much more indulgent to his patient in point of diet: so that when an empirick and a rational physician do, both, in several patients, cure, for instance, the same pleurisy, the disease may be very often judged to have been removed into one of the patients chiefly by the physician, and in the other by the remedy.

Divers disadvantages of chymical and empirical physick in the way of ministration.

IN the third place, *Pyrophilus*, I must advertise you, that though I mention more chymical remedies than Galenical, yet it is not out of any partial fondness of the former, and much less from any undervaluation of the latter; but partly, because chymical processes being wont to be more unfaithfully, or obscurely, set down by authors than Galenical receipts, I thought it might save you some labour, to receive from me a frequenter account of those, than these; and partly, because in many chymical preparations, divers considerable changes being to be wrought upon the concretes to be prepared by them, there is oftentimes so much of philosophy to be learned by such processes, that the success of them may prove instructive to you, though it should acquaint you with their truth only, as they are chymical preparations, and not as they are medicinal receipts. But otherwise I love to look upon both chymical and Galenical remedies with an impartial eye, and think, that neither the former ought to be despised for the latter, nor the latter for the former: for as chymical remedies have commonly the advantages of being more durable, less clogging by their quantity, and less nauseated by patients; so Galenical remedies have, when they are of equal efficacy, the advantages of being more cheap, (at least quantity for quantity) more procurable, and sooner prepared. And such is the variety of cases arising from the variety of constitutions and distempers, that in some of them the former sort of remedies may be more proper, and in others, the latter may seem requisite; and in some also, both sorts may alternately be so useful, that neither of them can well be spared.

That chymical processes stand more in need of clear relations, than Galenical.

IN the fourth place, *Pyrophilus*, let me advertise you, that divers chymical remedies, and some specificks also, which are not chymical, have seemed upon trial less effectual than indeed they are, because they have been tried by such physicians as weaken their efficacy, by not administring them as they should. For some physicians will never exhibit a chymical remedy, till the patient's strength hath been almost tired, if not quite spent with the unprosperous use of divers others clogging and debilitating medicines. Others are so diffident of chymical remedies,

Errors in the time and dose of chymical remedies.

remedies,

remedies, that they never dare to exhibit them in a full doſe, nor by themſelves, but will blend a ſmall quantity of a chymical medicine, or a ſpecifick with other ingredients; which either conſtitute, with it, a medicine of new qualities, reſulting from that mixture, or at leaſt, much clog or enervate the activity and virtue of the chymical or ſpecifick ingredients: by which, even in ſo inconſiderable a doſe, theſe diſtruſtful doctors dare yet require, that great matters ſhould be performed. Of which injurious way of adminiſtring the remedies I recommend to you, *Pyrophilus*, I do not cauſeleſly deſire you to beware; as I may hereafter have occaſion to ſhew you, by particular inſtances, of the reaſonableneſs as well of this advertiſement, as of the others, which I either have given you, or ſhall give you, in this and other papers. And another ſort of phyſicians there is, who are of ſo deſpondent and rather partial an humour, that if a chymical remedy, or a ſpecifick, do not preſently perform the hoped-for cure though they find, that, even upon their diſadvantageous manner of adminiſtring it, it doth good, yet they will quickly deſiſt from the uſe of it; and becauſe it doth not do wonders, they will not ſcruple to affirm, that they have tried it, and found it do nothing: whereas they are wont to continue their own courſes of phyſick without diſcouragement, though it be uſually ſome weeks before the patient find any good by them, and oftentimes (as numbers of the printed obſervations of phyſicians, as well as daily experience teſtify) the patient is, by the tedious courſe of phyſick he has gone through, very little bettered, if not much impaired. Which I ſpeak, *Pyrophilus*, not with an intention to diſparage phyſicians in general, the moſt learned and ingenious of them being free enough from the partiality I here take notice of; but to keep good remedies from being diſparaged by the envious or unſkilful trials of bad adminiſters. And though indeed ſome chymiſts are ſo vain-glorious or unwary, as to promiſe, that the operation of their remedies ſhould be as well ſudden, as effectual; yet if the medicines themſelves be found available, although not ſwiftly ſo, that ſlowneſs ought to make us but condemn the boaſtings of the man, not reject the uſe of the remedies.

AND in the laſt place, *Pyrophilus*, I muſt advertiſe you, not to expect, that every one of the remedies I commend ſhould be phyſick and phyſician too: I mean, that it ſhould of it ſelf ſuffice to perform the cures of thoſe diſeaſes, againſt which it is commended. For medicines are but inſtruments in the hand of the phyſician, and, though they be never ſo well edged and tempered, require a ſkilful hand to manage them: and therefore I cannot but admire and diſapprove their boldneſs, that venture upon the practice of phyſick, wherein it is ſo dangerous to commit errors, barely upon the confidence of having good receipts. For though, by converſation with eminent phyſicians, I have found the learnedeſt of them to diſagree ſo much about the nature and cauſes of diſeaſes, that I dare not deny but that he may proſperouſly practiſe phyſick, that either ignores or diſſents from the received doctrines of the ſchools concerning the cauſes of diſeaſes, and ſome other pathological particulars; yet I cannot but diſlike their boldneſs, who venture to give active phyſick, either in intricate or acute diſeaſes, without at leaſt a mediocrity of knowledge in anatomy, and ſo much knowledge of the hiſtory of diſeaſes, as may ſuffice to inform them in a competent meaſure, what are the uſual ſymptoms of ſuch a diſeaſe, what courſe nature is wont to take in dealing with the peccant matter, and what diſcernible alterations in the patient's body do commonly fore-run, and thereby fore-tell a criſis, or otherwiſe the good or bad event of the diſeaſe. To all which is to be added ſome tolerable meaſure of knowledge, not only of the *materia medica*, and the chief ways of compounding ſeveral ingredients into medicines of ſeveral forms and conſiſtencies, as circumſtances may require; but alſo of the orderly and ſeaſonable adminiſtration of the helps affordable by them. Theſe particulars, *Pyrophilus*, might eaſily be enlarged on; but having neither the leiſure nor deſign to handle them common-place like, I ſhall only give you this account of my requiring, in the profeſſed practiſer of phyſick, ſome knowledge both of the *materia medica*, and the method of compounding and adminiſtring remedies, that (excepting perhaps the *arcana majora*, as chymiſts call them) even the beſt medicines, by being unſeaſonably or proſperouſly adminiſtred, eſpecially in acute diſeaſes, where nature's motions are to be diligently watched, and ſeconded, may do a patient as much harm, as the orderly and ſkilful adminiſtration of them can do him good. And that he, that has nothing but one good receipt for a diſtemper, and knows not how to vary it by adding, omitting, or ſubſtituting other parts of the *materia medica*, as urgent occaſion ſhall require, may oftentimes find himſelf reduced either to ſuffer his patient to languiſh helpleſs, or to venture by curing him of one diſeaſe to caſt him into another. For ſometimes the patient's conſtitution makes the medicine preſcribed by the receipt unfit to be adminiſtred; and ſometimes too the diſeaſe, for which the receipt is proper, is in the patient complicated with ſome other diſtemper, which may be as much increaſed by the ſpecifick, as the other diſeaſe may be leſſened. I know, for inſtance, ſome eminent men, that are wont to cure very ſtubborn venereal diſtempers, by a chymical preparation (which ſome of themſelves have been pleaſed to diſcloſe to me) of the Indian plants, ſarſaparilla, guaiacum, *&c.* But if theſe men met with patients, ſuch as thoſe, which *Euſtachius Rudius* mentions himſelf to have often met with, who, upon the uſe of the leaſt quantity of guaiacum, though corrected with cold ingredients, were wont to be preſently affected with ſuch ſharpneſs of urine, and inflammation of the parts, to which urine relates, as hazarded their lives; they would be reduced, as well as our author confeſſeth himſelf to have been, to have recourſe to mercurial or other remedies. To which we may add, that the uſe of ſarſaparilla, and guaiacum is generally forbidden by the warier ſort

That a competent meaſure of knowledge is abſolutely neceſſary to a practiſer of phyſick.

of

of phyſicians, in thoſe patients, whoſe venereal diſtempers are complicated with heat or inflammation of the kidneys or liver. And ſometimes alſo it happens, that the very outward form of the medicine preſcribed by the receipt, is not fit, or perhaps poſſible to be adminiſtred: for, not to mention, that divers patients can retain no purgative phyſick exhibited in the form of a potion; and ſome others are as apt to vomit up, whatever is given them in the form of pills; not to inſiſt on this, I ſay, I ſhall content my ſelf, to relate to you a memorable caſe, that happened a while ſince to a phyſician of my acquaintance. He was called to a luſty young woman, who, upon an accidental but violent cold, was ſuddenly taken with ſuch a conſtriction of the parts inſervient to ſpeech and deglutition, as made her altogether unable either to ſpeak or ſwallow any thing at all: and having thus continued ſome days in ſpite of clyſters or other remedies, preſcribed by a very learned phyſician, and in ſpite of endeavours to excite vomiting, by making her hold emetick things in her mouth; the poor woman was in great danger (when my acquaintance came to her) of periſhing for hunger. What in this caſe could be expected from the beſt remedies, that muſt neceſſarily be taken in at the mouth? Wherefore the phyſician finding her yet ſtrong enough, and without fever, and yet her caſe almoſt deſperate, did as judiciouſly as luckily preſcribe a clyſter, wherein to ordinary ingredients were added (as himſelf a very few days after told me) about four ounces of the infuſion of *crocus metallorum*, with an advice, that it ſhould be kept in as long as poſſibly ſhe could; and by this medicine, nature being ſufficiently irritated, there quickly followed upon it ſome violent vomiting, and upon them a liberty both of ſwallowing and ſpeaking. [And ſince this, a young gentleman and fellow-traveller of mine had the organs of deglutition ſo ſtrangely weakened without any manifeſt cauſe, that though he were able to make me a viſit, and acquaint me with his caſe, yet he was very apprehenſive, he ſhould in a very few days be ſtarved; and being unable to ſwallow remedies, had quickly periſhed in deſpite of the *arcana majora* themſelves, had he been maſter but of ſuch of them as (like thoſe wont to be magnified by chymiſts) muſt be taken into the body; if a very happy phyſician, to whom I directed him, had not by a very efficacious and ſpecifick medicine, externally to be applied, ſeaſonably reſcued him from ſo unuſual and deſperate a caſe.] But, *Pyrophilus*, as I would not, upon the ſcore of good receipts, have the phyſician's ſkill deſpiſed, or thought uſeleſs; ſo I wiſh, that the phyſician's ſkill may not make him deſpiſe good receipts. For we have often ſeen (eſpecially in outward affections) not only empiricks and chirurgeons, but even ladies and old wives, with a lucky compoſition preſcribed by a receipt, perform more conſtant and eaſy cures of the particular diſtemper, for which that receipt is proper, than even learned phyſicians by their extemporary, though pompous and artificial preſcriptions. And the illuſtrious Lord *Verulam* (one of the moſt judicious naturaliſts, that our age can boaſt) think fit to take notice of it as a deficiency, that receipts by long experience approved are not more cloſely, and, as he ſpeaks, religiouſly adhered to, but altered upon every light occaſion. And in the ſame chapter, to anſwer the principal, as well as the moſt obvious objection in this matter, 'That, ſays he, any man induced by ſome 'ſpecious reaſon ſhould be of opinion, that it 'is the part of a learned phyſician (reſpecting 'the complexions of patients, their age, the 'ſeaſon of the year, cuſtom, and the like) rather to accommodate his medicines as occaſions ſuggeſt, than to inſiſt upon ſome certain preſcripts, is a deceivable aſſertion, and 'which attributes too little to experience, too 'much to judgment.' And a little above, he goes much farther than we pretend to do; for ſpeaking of the neglect of the uſe of particular receipts, which, as he ſpeaks, by a kind of propriety, reſpect the cure of particular diſeaſes, he adds, ſeverely enough, 'that the phyſi- Crato's
'cians have fruſtrated and taken away the fruit judgment
'of traditions, and approved experience by had herein,
'their magiſtralities, in adding, and taking out, and the au-
'and changing ingredients of receipts at their thor concurs
'pleaſure, and almoſt after the manner of a- with that
'pothecaries, putting in *quid pro quo*; com- eminent
'manding ſo preſumptuouſly over the medi- phyſician.
'cine, as the medicine can no longer command
'the diſeaſe.' Thus far our judicious author: But I will rather chuſe to expreſs to you my ſenſe on this whole ſubject of receipts, in the words of that experienced phyſician to three emperors, *Johannes Crato: De morbi natura* (ſays he) *cauſa, locoque affecto, medicus diligenter cogitet, atque in eo plus quam in certis medicamentorum mirificis formis ſitum putet. Medicinam tamen expertam cum ratione adhibitam plus valere quàm ea, quæ interdum ſubitò à doctiſſimo etiam medico magna ratione exhibita excogitatur, non dubito: atque hac in parte rationales etiam medicos empiricis cedere debere de ſententia Hippocratis ſtatuo.* Only I muſt add by way of explanation, that this ſentence is to be underſtood to expreſs my ſenſe, when the medicines uſed are not very extraordinary, but ſuch, as *Crato* employed, and hath left us in his writings: for there may poſſibly be ſuch effectual ſpecificks, and ſuch powerful and commanding remedies, that the efficacy of the medicine may (at leaſt in ſome particular diſeaſes) excuſe and repair much want of ſkill in the preſcriber. Conſil. 322.

IF the teſtimony of *Helmont* concerning the *Arcana* of *Paracelſus* be conſiderable, even in a tract (where either out of emulation or judgment, he endeavours ſomewhat to depreciate both them and their author) much greater things might be boldly affirmed of ſome *Arcana*; for *Fateor lubens* (ſays he, ſpeaking of *Paracelſus*) *me ex ejus ſcriptis profeciſſe multum, illumque potuiſſe, per remedia ad unitatis ſymbolum aſcendentia, ſanare lepram, aſthma, tabem, paralyſin, epilepſiam, calculum, hydropem, podagram, cancrum, atque ejuſmodi vulgo incurabiles morbos: attamen Paracelſum fuiſſe ignarum radicis vitæ longæ, tam ex ejus ſcriptis & medicaminibus quam ex obitu collegi, &c.* And in the ſame tract, Helmont. in Arcan. Paracelſ. pag 787. Of the greater arcana, and more univerſal medicines, the efficacy of which may compenſate for want of skill in the preſcriber. Helmont. in Arcan. Paracelſ. pag. 790.

tract, jnſt before he comes to enumerate *Paracelſus*'s *Arcana*, *Concedo*, ſaith he, *univerſales aliquot medicinas, quæ ſub uniſono naturæ longè gratiſſimo, inſenſibiliter poſt ſe vinctum educunt hoſtem, cum egregia organorum depuratione; concedo pariter appropriatas aliquot quo univerſalis amplitudinem in ſpecificis morborum directionibus æmulantur.* And among thoſe *Arcana* themſelves, that is ranked but in the ſecond place, of which he gives this character; *Sequitur dein mercurius vitæ, ſtibii proles integri, quæ omnem morbi nervum penitus abſorbet.*

And becauſe another *Arcanum* doth not ſo powerfully renovate, as that laſt mentioned, and two more; he allows to thoſe three others the precedencies of that, whereof he yet ſaith, *Quarto loco eſt mercurius diaphoreticus, melle dulcior, & ad ignem fixus, ſolis horizontis omnes proprietates habet: perficit enim quicquid medicus & chirurgus poſſint optare ſanando.* But becauſe, that any medicine ſhould be qualified to deſerve ſuch ſuperlative encomiums, may ſeem a thing fitter to be wiſhed than credited, I would not diſſuade you, till the chymiſts cures have made good their maſters brags, to be altogether of our author's mind, who ſomewhere profeſſes, *Se morbum non diſtinguere, ſi remediis* (ſure he ſpeaks of ſuch remedies, as he thought he had) *ſit ſumma bonitas.* But yet you may perchance aſcribe much more even to remedies far inferiour to the *Arcana majora*, in the caſes, wherein they are moſt proper, than many are willing to believe. Inſomuch that I have ſometimes obſerved with wonder, that an excellent perſon (whom I need not name to you) cures the rickets generally in children of ſeveral ages and complexions, without having hitherto failed (as ſhe profeſſes) in any one, by preſcribing no other remedy, than the ſingle uſe of the above deſcribed colcotharine flowers, which I preſented her with. And a couple of phyſicians alſo, to whom I recommended them, tell me, they have tried them in the ſame diſeaſe with the like ſucceſs, as this lady hath hitherto met with. And I remember, that eminently learned and experienced phyſician Dr. *G. Boat*, (of whoſe ſkill both your excellent mother and you have had good proof) ſolemnly aſſured me, as I elſewhere alſo note, that he knew a phyſician, who conſtantly cured within two or three fits all agues, whether recent or radicated, in perſons of all ages, ſexes, and complexions indiſcriminately, with one ſingle outward application to the patients wriſts; but that this envious doctor would never part with it to our friend, or any elſe, no not upon his death-bed: only Dr. *Boat* diſcovered, that ſpiders, or ſomething coming from them, were main ingredients of his *Pericardia.*

The ſum and concluſion of the point in controverſy.

AND indeed there are certain preparations and compoſitions of remedies ſo lucky, and whoſe ſucceſs doth ſo much exceed expectation, and the efficacy of common compoſitions; that the ſame phyſician, whoſe they are, may upon ſeveral occaſions preſcribe an hundred others, each of which he may think as rational as any of thoſe, which nevertheleſs ſhall be all of them much inferiour thereunto. And therefore I wonder not, that the moſt learned of the methodiſts themſelves have much valued and celebrated ſome peculiar proceſſes and receipts, as here amongſt us (to mention no others) the famous Sir *Theodore Mayerne* was wont almoſt in all obſtructions, cachexies, and hydropical diſtempers, to magnify and uſe that peculiar ſalt of ſteel of his, which he was pleaſed to call *Anima hepatis.*

AND to theſe domeſtick inſtances (which I might eaſily accumulate) of the eſteem eminent phyſicians have made of receipts, I might add very many foreign ones. Nay, *Galen* himſelf, who has ſo copiouſly treated of the *Materia medica*, and the compoſition of medicaments, though he were ſufficiently expert at drawing up receipts, doth yet in his book *de compoſitione medicamentorum*, and elſewhere, tranſcribe, and ſometimes commend (and mention his having uſed) divers of the compoſitions of ancienter phyſicians, and eſpecially magnifies *Andromachus* his treacle.

I MIGHT, *Pyrophilus*, here mind you, that we ſee, that chymiſtry, as incompleat as yet it is, has been able ſo much to improve the preparation of remedies, as to afford us ſome, which are ſo innocent as well as efficacious, that in the diſeaſes they principally reſpect, they require not, as of neceſſity, near ſo much of theorical ſkill, as others do in the adminiſter. I might likewiſe take notice, that experience alſo teacheth, eſpecially by what we ſee performed by the *Spaw*, and ſome other mineral waters, that one medicine may be ſo richly endowed, as to be more effectual againſt ſeveral differing diſeaſes, than even the better ſort of other remedies againſt any one particular diſeaſe.

I MIGHT further repreſent, as ſomething that makes yet more to my preſent purpoſe, that though every body can adviſe his ſick friends to an air, that is famouſly healthful, if there be any within a convenient diſtance from them; yet there are ſome airs ſo eminently good, and that not upon the account of any one predominant quality, that makes them oppoſite to a diſeaſe ſpringing from its contrary, but from a hidden temperature, or certain friendly effluvia, that they alone often cure variety of diſeaſes in perſons of differing ages and complexions: as navigators obſerve in the Iſle of *St. Helen*, where the Spaniards and ſome other Europeans, in their paſſage to the *Indies*, often leave without phyſicians great numbers of ſick, whom they find for the moſt part recovered at their return. And that ſometimes even the acuteſt diſeaſes may by the ſanative ſteams, that enrich the air, be cured almoſt in a trice, is aſſured by thoſe, that have lived in *Grand Cairo*, who have affirmed to me, what the learned *Proſper Alpinus*, who ſo long practiſed phyſick there, aſſures us, that upon *Nilus*'s beginning to overflow, though in the heat of ſummer, there enſueth a ſudden recovery of thoſe multitudes of perſons of differing ages, temperatures, ſexes, *&c.* which there happen at that time to lie ſick of the plague. Theſe things I ſay, *Pyrophilus*, and more I might add, to what you find diſperſed here and there in the eſſays, which this paper accompanies, towards the inferring, that we ſhould not haſtily conclude

conclude it impoſible, that there may be found ſuch medicines, as may be more than particular and ſpecifick remedies, without requiring the giver to be a great phyſician. But to draw at length to a concluſion, I ſhall rather ſum up my preſent thoughts of this matter, thus.

ORDINARY receipts without an ordinary meaſure of ſkill in phyſick are not raſhly to be relied on, eſpecially in acute diſeaſes; where, by giving medicines, otherwiſe innocent enough, to loſe the opportunities of adminiſtring proper ones, may be very prejudicial; and where ſometimes the ſeveral ſeaſons of the diſeaſes do require ſuch differing remedies, if they be but ordinary ones, that a medicine proper enough for the diſeaſe at one ſeaſon of it, may do miſchief at another. But if indeed there be noble and extraordinary *Arcana*, that work rather by ſtrengthning and reſtoring nature, and reſolving, or otherwiſe deſtroying the peccant matter they find any where in the body, than by irritating and weakening nature, or putting her as it were to a troubleſome plunge; the uſe of ſuch remedies may deſerve to be a little otherwiſe conſidered, as that, which may not ordinarily (for I ſay not ever) require more inſtruction than may be afforded to perſons not indiſcreet, by ſuch directions and cautions as may be divulged, or otherwiſe communicated, together with the remedies themſelves: as we ſometimes ſee, that by the help of ſuch inſtructions unlearned perſons, and even old wives, do with ſome one ſovereign plaſter, balſam or other outward remedy, cure many and various tumours, ulcers, and other ſores, in perſons of differing ſexes, ages, and complexions. And becauſe you will eaſily grant, that this example does far leſs accommodate our preſent purpoſe than does the caſe it ſelf, as I juſt now put it; I hope you will allow me to repreſent further, that at leaſt it ſeems not ſo rational to judge of all the remedies, that art improving nature can afford us, by thoſe, that are hitherto in uſe, either among methodiſts or vulgar chymiſts; but rather to think, that the nobleneſs of remedies will be advanced according as the art of preparing them ſhall be promoted; and that it is not ſo ſafe and eaſy, poſitively to determine the efficacy of the former, otherwiſe than in proportion to the diſcoveries we have attained to in the latter.

The END *of the* FIRST VOLUME.

BOOKS Printed for and Sold by A. MILLAR, at *Buchanan's Head*, over-againſt *Katharine-Street* in the *Strand*, *London*.

FOLIO.

I. THE Works of FRANCIS BACON, Baron of *Verulam*, Viſcount *St. Alban*, Lord High Chancellor of *England*. With ſeveral *Additional Pieces*, never before printed in any Edition of the Works. To which is prefixed, A New Life of the Author, by Mr. MALLET. In 4 Vols.

N. B. The *Additional Pieces*, and *Life*, may be had alone, to compleat the former Edition.

II. A COMPLETE COLLECTION of the *Hiſtorical*, *Political*, and *Miſcellaneous Works* of JOHN MILTON: Correctly printed from the *Original Editions*. Containing ſeveral *Original Papers* of His, never *before* publiſhed. By T. BIRCH, M. A. and F. R. S. With an Hiſtorical and Critical Account of the Life and Writings of the Author:

To which is added, A Large Alphabetical Index, and a curious Head of the Author, engraven by Mr. VERTUE, from a Drawing by Mr. RICHARDSON. In 2 Vols.

III. The OCEANA and *Other Works* of JAMES HARRINGTON Eſq; Collected, Methodized, and Reviewed; with an exact Account of his Life prefixed, by *John Toland*. To which is added, An APPENDIX, Containing all the Political Tracts wrote by this Author, *omitted* in Mr. *Toland's* Edition.

N. B. The *Appendix* may be had alone, to compleat thoſe Gentlemen's Books, who have bought Mr. *Toland's* Edition.

IV. An HISTORICAL and POLITICAL DISCOURSE of the LAWS and GOVERNMENT of ENGLAND, from the *Firſt Times* to the End of the Reign of *Queen Elizabeth*. With a Vindication of the Ancient Way of Parliaments in *England*. Collected from ſome Manuſcript Notes of JOHN SELDEN Eſq; by NATHANIEL BACON, of *Gray's-Inn*, Eſq; The Fourth Edition: Corrected and improved by a Gentleman of the *Middle-Temple*.

N. B. There are a few of the above Four Books printed on a ſuperfine Writing-Paper.

V. A GENERAL DICTIONARY, *Hiſtorical* and *Critical*: In which a New and Accurate Tranſlation of that of the celebrated Mr. *Bayle*, with the Corrections and Obſervations printed in the late Edition at *Paris*, is included; and interſperſed with *ſeveral Thouſand Lives*, never before publiſhed. The whole containing the Hiſtory of the moſt Illuſtrious Perſons of all Ages and Nations, particularly thoſe of *Great-Britain* and *Ireland*, diſtinguiſhed by their Rank, Actions, Learning, and other Accompliſhments. With Reflections on ſuch Paſſages of Mr. *Bayle*, as ſeem to favour Scepticiſm and the *Manichee* Syſtem. By the Rev. Mr. JOHN PETER BERNARD, the Rev. Mr. THOMAS BIRCH, F. R. S. Mr. JOHN LOCKMAN, and *other Hands*. In 10 Vols.

VI. CYCLOPÆDIA: Or, *An Univerſal Dictionary of Arts and Sciences*; Containing an Explication of the Terms, and an Account of the Things ſignified thereby, in the ſeveral Arts, both Liberal and Mechanical; and the ſeveral Sciences, Human and Divine: The Figures, Kinds, Properties, Productions, Preparations, and Uſes of Things Natural and Artificial: The Riſe, Progreſs, and State of Things Eccleſiaſtical, Civil, Military, and Commercial: With the ſeveral Syſtems, Sects, Opinions, *&c.* among Philoſophers, Divines, Mathematicians, Phyſicians, Antiquaries, Criticks, *&c.* The whole intended as a Courſe of Ancient and Modern Learning. Extracted from the beſt Authors, Dictionaries, Journals, Memoirs, Tranſactions, Ephemerides, *&c.* in ſeveral Languages. By E. CHAMBERS, F. R. S. The Fourth Edition, corrected and amended; with ſome Additions. In 2 Vols.

VII. An UNIVERSAL HISTORY, from the Earlieſt Account of Time to the Preſent. Which comprizes not only the GENERAL HISTORY of the WORLD, but of each Empire, Kingdom and State, from its *Firſt Foundation* to its *Diſſolution*, or to the *Preſent Time*. With an exact Account of the Migrations and Conqueſts of every People, the Succeſſion and Reigns of their reſpective Princes, their Religion and Government, Trade, Cuſtoms, Learning, *&c.* The Whole forming a *Complete Body of Hiſtory*, and in itſelf an *Entire Library*, being a *Common-Place* of the various *Hiſtorians*, both *Ancient* and *Modern*, of all *Nations* and *People*, under their ſeveral *Forms* of *Government*, brought down to the *preſent Century*, properly *regulated* and *digeſted*. Immediately extracted from Original Authors, illuſtrated with Maps, Cuts, Chronological and other Tables.——Gentlemen may begin this Work by buying a Volume at a time, or be furniſhed with the whole Six Volumes.

N. B. This Undertaking is ſo well executed, and in ſuch Eſteem abroad, that it is tranſlated into ſeveral Languages in different Parts of *Europe*.

Vol. VII. *is in the Preſs, which finiſhes the Ancient Hiſtory.*

VIII. The HISTORY of LONDON, from its FOUNDATION by the *Romans*, to the PRESENT TIME. Containing a faithful Relation of the *Publick Tranſactions* of the CITIZENS; Accounts of the ſeveral *Pariſhes*; Parallels between *London* and *other great Cities*; its *Governments*, Civil, Eccleſiaſtical, and Military; *Commerce*, State of *Learning*, *Charitable Foundations*, &c. With the ſeveral Accounts of *Weſtminſter*, *Middleſex*, *Southwark*, and other Parts within the Bills of Mortality. In nine Books. The whole illuſtrated with twenty-five fine *Folio Cuts*, beſides 109 ſmall ones printed in the Body of the Work. With a complete Index. By WILLIAM MAITLAND, F. R. S.

IX. The BRITANNIC CONSTITUTION: Or the Fundamental Form of Government in *Great-Britain*. Demonſtrating the Original Contract entered into by King and People, according to the Primary Inſtitutions thereof in this Nation. Wherein is proved, That the placing on the Throne King WILLIAM III. was the *Natural Fruit* and *Effect* of the *Original Conſtitution*; and that the Succeſſion to this Crown, eſtabliſhed in the preſent Proteſtant Heirs, is *De Jure*, and juſtified by the Fundamental Laws of *Great-Britain*. And many important Original Powers and Privileges of both Houſes of Parliament, are exhibited. By ROGER ACHERLEY, late of the *Inner-Temple*, Eſq; The Second Edition. To which is added, A SUPPLEMENT, containing *Reaſons* for Uniformity in the State.

X. The Works of the learned ISAAC BARROW, D. D. late Maſter of Trinity-College, *Cambridge*: Being all his *Engliſh* Works. The Fifth Edition. In 3 Vols. Containing, in Vol. I. Thirty-two Sermons, preached upon ſeveral Occaſions; a brief Expoſition of the Creed, the Lord's Prayer, Decalogue, and the Doctrine of the Sacraments. A Treatiſe of the Pope's Supremacy; and a Diſcourſe on the Unity of the Church Vol. II. Thirty-four Sermons and Expoſitions upon all the Articles in the Apoſtles Creed. Vol. III. Forty-five Sermons upon ſeveral Occaſions. With Tables of Contents to each Volume. The whole publiſhed by his Grace Dr. JOHN TILLOTSON, late Lord Archbiſhop of *Canterbury*. To which is prefixed, Some Account of the Life of the Author.

OCTAVO.

XI. The Works of Mr. THOMSON, in 2 vols. with Cuts. Containing the *Seaſons*, a *Hymn*, a Poem to the Memory of Sir *Iſaac Newton*, *Britannia*, a Poem, and *Sophoniſba*, a Tragedy. Vol. II. Ancient and Modern *Italy* compared; *Greece*, *Rome*, *Britain*, and the *Proſpect*, being the Five Parts of *Liberty*, a Poem; *Agamemnon*, and *Edward* and *Eleonora*, Tragedies; and a Poem to the Memory of the late Lord Chancellor *Talbot*.

N. B. Either of the Volumes are to be had ſeparate, and moſt of the Pieces

XII. MATHO: Or, The *Coſmotheoria Puerilis*. A Dialogue. In which the firſt Principles of Philoſophy and Aſtronomy are accommodated to the Capacity of young Perſons; or ſuch as have yet no Tincture of theſe Sciences. Hence the Principles of Natural Religion are deduced. In 2 Vols.

XIII. An ENQUIRY into the *Nature* of the *Human Soul*; wherein the Immateriality of the Soul is evinced, from the Principles of Reaſon and Philoſophy. In 2 Vols. The Second Edition, corrected. By the Author of *Matho*.

" He who would ſee the juſteſt and preciſeſt Notions
" of God and the Soul, may read this Book; one of
" the moſt finiſhed of the kind, in my humble O-
" pinion, that the preſent Times, greatly advanced
" in true Philoſophy, have produced."

See Warburton's *Divine Legation of* Moſes *demonſtrated, p.* 395. *of the firſt Edition.*

XIII. The HISTORY of the *Propagation* of *Chriſtianity*, and the Overthrow of *Paganiſm*: Wherein the *Chriſtian Religion* is confirmed; the Riſe and Progreſs of Heatheniſh Idolatry is conſidered; the Overthrow of Paganiſm, and the ſpreading of Chriſtianity, in the ſeveral Ages of the Church, is explained; the preſent State of the Heathens is enquired into; and Methods for their Converſion propoſed. In 2 Vols. The Third Edition corrected, with Additions. By ROBERT MILLAR, A. M. *The Biſhop of* London, *in his Paſtoral Letters, p.* 133. *recommends this Book as written by a faithful and judicious Hand.*
